**Santo Domingo:** a country officially known as the Dominican Republic occupying the eastern part of the island of Hispaniola in the West Indies. Due to repeated revolutions, the United States established a provisional government there in 1914. However, in April 1916, the Dominican Republic minister of war attempted to overthrow the president of the Dominican Republic, and the US landed marines at several ports to repress internal disorders. A new treaty was requested by the US to collect customs under American control, to appoint a financial advisor and to establish a peace-keeping force officered by Americans. The new president of the Dominican Republic refused to agree to these conditions as they violated Dominican sovereignty. In retaliation, the US refused to turn over to the

Dominican government its share of the customs revenues and in November 1916 announced that the Dominican Republic was under United States military administration. There was great resentment against this US military rule, but the American occupation forces remained until September 1924, when the Dominican Republic adopted a new constitution. —9th ACC Volume 2 Approved Glossary

**Scientology 8-8008:** a book written by L. Ron Hubbard in 1952 which is a complete treatise of the anatomy of universes and the role played in them by a spiritual being. The definition of 8-8008 is the attainment of infinity by the reduction of the apparent infinity and power of the mest universe to a zero for himself, and the increase of the apparent zero of one's own universe to an infinity for oneself. It can be seen that infinity stood upright makes the number eight: thus, 8-8008 is not just another number, but serves to fix into the mind of the individual a route by which he can rehabilitate himself, his abilities, his ethics and his goals. - Serapis: see Jones, John Paul** in this glossary. —Freedom Congress Glossary, Sept 90
- Serapis:** the British man-of-war captured by John Paul Jones in 1779. John Paul Jones (1747 - 1792, often called «Father of the American Navy») took command of the Bonhomme Richard and led a small squadron into the Irish Sea (a part of the Atlantic between Ireland and England). On September 23, 1779 his squadron met a large British convoy. The Bonhomme Richard attacked the leading ship of the force, the Serapis. The Serapis was larger and better armed than

Jones' ship so Jones took his vessel alongside the Serapis. The ships were so close that their rigging became entangled and the muzzles of their guns touched each other. The British commander called on Jones to surrender and it was then that Jones said, «I have not yet begun to fight.» After three hours of terrible hand-to-hand fighting, the tall mast of the Serapis fell and the British surrendered. The Bonhomme Richard was so badly damaged that it sank the next day. Jones continued on to France in another ship. See also Bonhomme Richard in this glossary. —PDC 2 Approved Glossary

**service facilities:** things that make servicing easier; aids. —OEC - The Five Conditions App Mar 91

**service facsimile:** (1) a definitely nonsurvival situation contained in a facsimile which is called into action by the individual to explain his failures. A service facsimile may be one of an illness, an injury, or an inability. The facsimile begins with a down emotional curve and ends with an upward emotional curve. Between these it has pain. A service facsimile IS the pattern which is the chronic «psychosomatic illness.» It may contain coughs, fever, aches, rashes, any manifestation of a nonsurvival character, mental or physical. It may even be a suicide effort. It is complete with all perceptions. It has many similar facsimiles. It has many locks. The possession and use of a service facsimile distinguishes a Homo sapiens. (2) The reason service facsimiles are called «service facsimiles» is because («service») they «serve» him and («facsimiles») they are in mental image picture form. They explain his disabilities as well. The facsimile part is actually a self-installed disability that «explains» how he is not responsible for not being able to cope. So he is not wrong for not coping. Part of the «package» is to be right by making wrong. The service facsimile is therefore a picture containing an explanation of self condition and also a fixed method of making others wrong. —APA Glossary (app 11.7.90)

**service facsimile:** a computation generated by the individual to make self right and others wrong, to dominate or escape domination and to enhance own survival and injure that of others. **slip 'twixt cup and preclear, many a:** a variation of the expression there's many a slip 'twixt the cup and the lip: a plan, intention, etc., may easily go wrong before it is fully carried out; nothing is certain until it is actually obtained or fulfilled. From a Greek legend of Ancaeus, the son of Zeus, in which it is said that while planting a vineyard, he was told by a soothsayer that he would never drink of its wine. As soon as the grapes were ripe, he squeezed the juice into a cup and raising it to his lips, mocked the seer, who retorted with the phrase «there's many a slip between the cup and the lip.» At that moment it was announced that a wild boar was ravaging the land. Ancaeus set down the cup, leaving the wine untasted, hurried out and was killed by the boar. —SHSBC Binder 26 Approved Glossary

**Straightwire:** (1) the name of a process. It is the act of stringing a line between present time and some incident in the past, and stringing that line directly and without any detours. The auditor is stringing a straight «wire» of memory between the actual genus (origin) of a condition and present time, thus demonstrating that there is a difference of time and space in the condition then and the condition now, and that the preclear, conceding this difference, then rids himself of the condition or at least is able to handle it. (2) a process of recalling, from present time, with some perception or at least a concept, a past incident. The name Straightwire derives from the most communication process of connecting two points of a communications system. It is essentially memory work. It is applied to postulates, evaluations, incidents, scenes, emotions, or any data which may be in the storage banks of the mind without «sending the preclear» to the incident itself. It is done with the preclear sitting up, eyes open or shut. The auditor is very alert. Straightwire is done rapidly. The preclear is not permitted to wander or reminisce. He responds to questions on the part of the auditor. Many preclears dislike being questioned. The auditor must then first resolve the postulates against being questioned; this would be called «clearing for broad Straightwire.» —APA Glossary (app 11.7.90)

- symbolization:** the process of representing with a symbol or symbols. —Scientology 0-8 Glossary (app 11.7.90)
- Symbological Processing:** processing in which the preclear views unfinished symbols and decides what to make of them. The auditor then requires him, each time he has decided on a symbol, to tell what person or object or thing in the real universe, or what circumstance or state of being the symbol represents. The person being processed is then required to recall an incident involving this person or object or state of being. The goal of this processing is to bring into full view the latent and sometimes violent conflicts and turmoils which lie out of sight in what was once referred to as the «unconscious mind.» More bluntly, the use of this processing brings to light those things for which the processee will not take the responsibility and for which he is unwilling to have been cause. In many individuals the symbol alone can be faced, but once that is faced, the person or object of the incident can be faced, and then, at last, the incident itself may be confronted and by Lock Scanning or Repetitive Straightwire may be deintensified. We examine in symbols, not the source of difficulty, but the key to the source of difficulty. —History of Man Glossary (app. 11.7.90)
- symbolologies:** representations or expressions by means of symbolsÑthings that stand for, represent or suggest other things; especially objects used to represent abstracts. —Man's Relentless Search (Final approval circa 15.11.89)

- theory of relativity:** a scientific theory proposed in 1905 by Albert Einstein (1879 - 1955), German physicist, US citizen from 1940. Although complete understanding of this theory requires a knowledge of the most exotic branches of mathematics, these are some of its basic points: (1) Time is not an absolute. The faster a body moves, the slower its clock runs. A minute on Earth may pass in fifty-nine seconds or sixty-one seconds on planets traveling at speeds different from that of Earth. (2) The speed of light remains constant in all frames of reference. Whether you are moving toward a light source or away from it, the light will still reach you at the same speed (186,000 miles per second). (3) All motion is relative. Therefore, there can be no such thing as absolute rest. (4) Moving bodies acquire mass as they increase in speed. The faster a body travels, the heavier it becomes. As a body approaches the speed of light, it adds mass very rapidly. If it were to reach the speed of light, its mass would become infinite. If this were true it could be seen that no body could ever travel faster than the speed of light. The additional weight acquired by an accelerating body would make penetration of the light barrier impossible. (5) Mass and energy are mutually convertible. —HSSC Glossary, Sept 90

**thetan:** the person himself—not his body or his name, the physical universe, his mind, or anything else; that which is aware of being aware; the identity which is the individual. The thetan (spirit) is described in Scientology as having no mass, no wavelength, no energy and no time or location in space except by consideration or postulate. The spirit then is not a thing. It is the creator of things. The term was coined to eliminate any possible confusion with older, invalid concepts. It comes from the Greek letter theta ( $\theta$ ), to which an n is added to make a noun in the modern style used to create words in engineering. **theta perception:** that which one perceives by radiating toward an object and from the reflection perceiving various characteristics of the subject such as size, odor, tactile, sound, color, etc. Theta perception is increased by drilling in certainties as above. Theta perception is dependent upon willingness to handle energy and to create space, energy and objects. In view of the fact that the mest universe can be established easily to be an illusion, one must have an ability to perceive illusions before one can clearly perceive the mest universe. The thetan who cannot perceive the mest universe easily will also be found to be incapable of handling and orienting other kinds of illusions with certainty. Theta perception is also a direct index to responsibility, for responsibility is the willingness to handle force.

**theta pole:** a type of theta trap made up of a piece of metal or other material which, when a thetan begins to push against it, absorbs his energy and pulls him in harder. The really effective ones have no energy of their own at all but only use the energy of the thetan himself. The more he pushes, the more he is stuck to the trap, because it is on his wavelength, it's his energy. He could postulate himself off of the trap, but this thetan has lost the power to postulate and thinks the smart thing to do is to push the trap away from him. It is not unusual for a thetan to spend 18 to 20 thousand years on one of these traps. —FPRD Glossary, Aug 90

**time machine:** a system for keeping track of orders and compliance to orders. An executive will write an order, giving the original to the person being ordered and sending a carbon of the order to the time machine. The time machine itself consists of a series of baskets. For example, a one-week time machine would consist of seven baskets. When the carbon of the order is received, it is placed in the first basket. It is advanced one basket every day. When the original of the order comes in complied with, it is matched up with the carbon, clipped together and sent to the executive who issued the order. If the original does not arrive at the time machine, the carbon will "fall off" after it has been advanced through all the baskets. When this happens, the order is returned to the executive who issued the order to let him know that the order was not complied with. —Staff Status I Glossary (approved 25-9-90)

**two out and runners on first, second and third and being caught out:** (baseball) in a position where one has just lost his team's chance to score any further points or has just lost the game. In the game of baseball, there are four "bases" called first, second, third and home, laid out in a diamond shape, which players have to run through and touch in sequence in order to score points. The objective of the offensive team is to get players onto and through each of the bases, and the defensive team's aim is to prevent them. Specific actions on the part of the defensive team count as "outs" against the offense, and when the offense has accumulated three "outs," they become the defense, giving the other team a chance to score points. Thus, having runners on first, second and third would be a potential of three points which could be scored, but with two outs, one more out would mean the loss of that potential. —PDC 2 Approved Glossary

**VFP:\*\*\*** abbreviation for Valuable Final Product. Something that can be exchanged with other activities in return for support. The support usually adds up to food, clothing, shelter, money, tolerance and cooperation (goodwill). The actual precise definition of a VFP is that it must be valuable (can be exchanged elsewhere outside the area for something in return), final (does not need any further care or attention and is actually out of the shop totally) and product (something that was actually produced). A VFP is of course usually an object or a thing. It is something that can be counted. A thought or idea can become a VFP only if it emerges in concrete form in the physical universe and it can be exchanged only if you can carry it over and hand it to somebody and he can give you something back for it. —Staff Status II Glossary, Approved late Sept. 1990

He was the commander in chief of American forces during the American Revolutionary War (1776 - 1783) and first president of the United States (1789 - 1797). He led the American forces during an important victory at Trenton, New Jersey in December 1776. Scouting reports told him that Hessian troops in Trenton were scattered and practically without defenses. Despite a bitter storm, Washington crossed the Delaware River north of Trenton on Christmas night. The Americans quickly penetrated the picket lines and advanced through the city, taking the Hessians almost completely by surprise in the early hours of December 26. The mercenaries resisted briefly then surrendered. The victory gave new life to the American cause and led to the eventual withdrawal of the British from New Jersey. —State of Man Congress Approved GIs (14.5.92)
