

HUBBARD COMMUNICATIONS OFFICE
Saint Hill Manor, East Grinstead, Sussex

HCO POLICY LETTER OF 10 FEBRUARY 1980R
ISSUE I
REVISED 6 JANUARY 1981

Remimeo
Saint Hills
Only

(This checksheet has been updated and revised to include changes in the word clearing requirements in the TR8 section from M9 to M4, the addition of recent issues on TR8 and further relevant clay demos on TRs. Revisions also include the addition of Advanced E-Meter Drills CR0000-3, 4 and 5 in the E-Meter Drills section, and the rearrangement of the sections on Preparing a Folder, Method 4 Word Clearing and Method 9 Word Clearing.)

**SAINT HILL SPECIAL BRIEFING COURSE
LEVEL A CHECKSHEET
HUBBARD FUNDAMENTALS OF
AUDITING SPECIALIST**

(Cancels:

BPL 18 Mar 75R II, LEVEL FIVE CHECKSHEET
Rev. 25.3.77 SAINT HILL SPECIAL BRIEFING COURSE
BPL 25 Mar 77 SENIOR SAINT HILL SPECIAL
BRIEFING COURSE)

NAME: _____ ORG: _____

DATE STARTED: _____ DATE COMPLETED: _____

This checksheet contains the chronological development of Dianetic and Scientology technology' including LRH's basic books, from 1948 to 1955. It also covers TRs and all data needed to operate an E-Meter, Fly ruds, run havingness, do all forms of word Clearing and teaches the auditor how to handle the basics of an auditing session including admin.

PREREQUISITES: (1) Student Hat or PRD (2) New Era Dianetics Course (3) New Era Dianetics Internship (4) Class IV.

REQUISITE: Method 1 Word Clearing Completion (to be received as soon as possible after starting the SHSBC Courses).

PURPOSE: To provide the student with a background of the chronological development of tech from 1948 to 1955 and to teach him the auditing skills of operating an E-Meter, flying ruds, running havingness, delivering all forms of Word Clearing and how to handle the basics of an auditing session, including admin.

LENGTH: Full time (9:00 am - 10:30 pm) - 3¹/₂ weeks
Part time (9:00 am - 6:00 pm) - 5¹/₂ weeks
Foundation hours = 9 weeks.

STUDY TECH: This course is studied per HCO PL 25 Sep 79, Issue I - IMPORTANT, SUCCESSFUL TRAINING LINEUP, with full use of study tech.

R-FACTOR: The Theory and Practical Sections of this course are done concurrently The student audits daily either during his practical time or outside of course hours while continuing through the theory section of the checksheet.

E/P: Certainty that you can handle the basics of an auditing session and can do all forms of Word Clearing.

PRODUCT: An auditor who can handle the basics of an auditing session, can do all forms of Word Clearing and who has a back ground of the chronological development of tech from 1948 to 1955.

CERTIFICATE: SAINT HILL SPECIAL BRIEFING COURSE LEVEL A HUBBARD FUNDAMENTALS OF AUDITING SPECIALIST.

CHRONOLOGICAL THEORY SECTION:

1.	Vol I, Page 1 INTRODUCTION (p 1-4)			_____
2.	<u>BOOK:</u> DIANETICS: THE ORIGINAL THESIS (written 1948)			_____
	1.	Foreword		_____
	2.	Introduction.		_____
	3.	Primary Axioms.		_____
	4.	<u>DEMO:</u> The purpose of the mind.		_____
	5.	An Analogy of the Mind.		_____
	6.	The Dynamics.		_____
	7.	The Basic Individual.		_____
	8.	Engrams.		_____
	9.	<u>DEMO:</u> The difference between engramic thought, justified thought and rational thought .		_____
	10.	<u>DEMO:</u> How the datum "One has as much functioning analyzer as one has awareness of NOW is true.		_____
	11.	Aberrations.		_____

12. The Tone Scale. _____
13. The Character of Engrams. _____
14. DEMO: What happens when an engram is restimulated. _____
15. Dramatization. _____
16. DEMO: The relation of tone level to dramatization. _____
17. The Auditor's Code. _____
18. Auditing. _____
19. DEMO: What auditing technique consists of. _____
20. Diagnosis. _____
21. Exhaustion of Engrams. _____
22. DEMO: When the auditor should look for an earlier engram. _____
23. Engram Chains. _____
24. Prenatal, Birth and Infant Engrams. _____
25. The "Laws" of Returning. _____
26. DEMO: The three equations which demonstrate how and why the auditor and preclear can reach engrams and exhaust them. _____
27. Case Histories 1-3. _____
3. Vol 1, Page 6 TERRA INCOGNITA: THE MIND (p 6-10) _____
4. BOOK: DIANETICS: THE EVOLUTION OF A SCIENCE
 1. Pages 1 through 61. _____
 2. DEMO: How the analyzer gets held down sevens and how to handle. _____
 3. Pages 62 through 110. _____
 4. DEMO: How the reactive mind works. _____
5. BOOK: DIANETICS: THE: MODERN SCIENCE OF MENTAL HEALTH (May 9, 1950)
 1. How to read this book. _____
 - BOOK ONE: THE GOAL OF MAN**
 2. Chapter One. _____
 3. Chapter Two. _____
 4. DEMO: What recall is. _____
 5. DEMO: How returning differs from remembering. _____
 6. Chapter Three. _____
 7. DEMO: The survival suppressor and the survival dynamic. _____
 8. DEMO: What pleasure is, Dianetically. _____
 9. Chapter Four. _____
 10. Chapter Five. _____
 11. DEMO: The Potential Value equation. _____
 12. DEMO: How the Reactive Mind differs from the Somatic Mind. _____
 - BOOK TWO: THE SINGLE SOURCE OF ALL INORGANIC MENTAL AND ORGANIC PSYCHO-SOMATIC ILLS**
 1. Chapter One. _____
 2. DEMO: What the Analytical Mind is. _____
 3. Chapter Two. _____
 4. DEMO: How the Standard Memory Banks relate to the Analytical Mind and the Reactive Mind. _____
 5. DEMO: What the chief characteristic of the Standard Memory Banks is. _____
 6. Chapter Three. _____
 7. DEMO: What Justified Thought is. _____
 8. DEMO: What dramatization is and the source of it. _____
 9. Chapter Four. _____
 10. DEMO: Occlusion. _____
 11. Chapter Five. _____
 12. DEMO: What a psycho-somatic illness is. _____
 13. DEMO: What a key-in is. _____
 14. Chapter Six. _____

15. DEMO: The two divisions of emotions, give an example from your own experience of each. _____
16. DEMO: Engrammically, what the most aberrative type of valence is. _____
17. Chapter Seven. _____
18. DEMO: What the basic rule of unconsciousness is. _____
19. DEMO: A circuit. _____
20. Chapter Eight. _____
21. DEMO: The contagion of aberration. Give an instance, from your own observations, of this principle at work. _____
22. Chapter Nine. _____
23. DEMO: The Black Panther Mechanism. _____
24. Chapter Ten. _____

BOOR THREE: THERAPY

1. Chapter One. _____
2. DEMO: When can a mind be overloaded? _____
3. Chapter Two. _____
4. Chapter Three. _____
5. DEMO: What Basic-Basic means. _____
6. Chapter Four. _____
7. DEMO: The common source of Dub-in and the Lie Factory. _____
8. Chapter Five. _____
9. DEMO: What Reverie is. _____
10. DEMO: How Reverie is different from hypnosis. _____
11. Chapter Six. _____
12. DEMO: What effect a Denyer would have with regard to auditing. _____
13. DEMO: What effect a Holder would have with regard to auditing. _____
14. DEMO: What a Bouncer is. _____
15. DEMO: What a Grouper is. _____
16. DEMO: The Repeater Technique. _____
17. Chapter Seven. _____
18. Chapter Eight. _____
19. DEMO: The four types of engrams. _____
20. Chapter Nine Part One. _____
21. DEMO: The difference between the knowing restimulation of an engram by an Auditor and the unknowing restimulation of an engram by the environment. _____
22. Chapter Nine, Part Two. _____
23. DEMO: How the presence of tacit consent impedes auditing. _____
24. Chapter Ten. _____
25. Appendix. _____
6. Vol 1, Page 13 "The aims of the Hubbard Dianetic Research Foundation are . . ."
7. TAPE: 5008C30 Lect. PREVENTIVE DIANETICS
- 1 (30 mins) _____
8. DEMO:
(a) 3 examples of preventive Dianetics. _____
(b) Ethics. _____
(c) Morals. _____
9. TAPE: 5008C30Lect. PREVENTIVE DIANETICS
- 2 (30 mins) _____
10. The Analytical Mind (p 27-37). _____
11. DEMO: Demo how Dianetic processes were evolved. _____
12. DAB Vol 1, No. 5 THE PROCESSING OF
Nov 50 CHILDREN _____
13. DAB Vol 1, No. 6 HANDLING THE PSYCHOTIC
Dec 50 _____
14. Jan 51 THE CREDO OF A TRUE
GROUP MEMBER _____

15. Jan 51 THE CREDO OF A GOOD AND SKILLED MANAGER _____
16. DAB Vol 1, No. 9 THE PROBLEM OF _____
Mar 51 SEDATION _____
17. BOOK: SCIENCE OF SURVIVAL (Jun 51) _____
 1. The Goal of Dianetics. _____
 2. Introduction (The Introductory Section by LRH only). _____
 3. Chapter 1, Column A, THE TONE SCALE _____
 4. DEMO: The effect auditing has on the ratio of theta to enttheta in the individual. _____
 5. Chapter 2, Column B. DIANETIC EVALUATION _____
 6. DEMO: The “four valid therapies” and what they do. _____
 7. Chapter 3, Column C, PHYSIOLOGY AND BEHAVIOUR _____
 8. DEMO: How you could tell a person’s tone level by his motion and action level. _____
 9. Chapter 4, Column D, PSYCHIATRIC RANGE _____
 10. DEMO: The difference between a normal, a neurotic and a psychotic person. How you could tell if a psychotic had improved casewise. _____
 11. Chapter 5, Column E, MEDICAL RANGE _____
 12. Chapter 6, THE BASIC LAWS OF THETA, AFFINITY, REALITY, COMUNICATION _____
 13. DEMO: What the “strength of the dynamics in individual” could be determined by. _____
 14. Chapter 7, Column F. EMOTION _____
 15. DEMO: An example of displaying rationalemotion and an example of displaying irrational emotion. _____
 16. Chapter 8, Column G. AFFINITY _____
 17. DEMO: What happens to a person’s position on the affinity scale if affinity is repeatedly suppressed. _____
 18. Chapter 9, COMMUNICATION AND REALITY _____
 19. DEMO: The relation of perception to the definition of reality and what communication has to do with it. _____
 20. Chapter 10, Column H. SONIC _____
 21. DEMO: What an auditor would expect to happen to sonic recall as a pc progressed. _____
 22. Chapter 11, Column I, VISIO _____
 23. DEMO: What is meant by “Valence walls”. How the tone level of a pc can be determined by the visio in the incidents he runs. _____
 24. Chapter 12, Column J. SOMATICS _____
 25. DEMO: Why it may be necessary to run a case in “layers” secondaries and then engrams. _____
 26. Chapter 13, Column K, SPEECH, TALKS, SPEECH, LISTENS _____
 27. DEMO: How by observing how a person both listens and talks an opinion can be formed whether or not the person is operating on an engramic command. _____
 28. Chapter 14, Column L, SUBJECT’S HANDLING OF THE WRITTEN OR SPOKEN COMMUNICATION WHEN ACTING AS A RELAY POINT _____
 29. DEMO: Going from the top to the bottom of the scale at what point would a person begin to withhold vital info. _____
 30. Chapter 15, Column Y. REALITY (AGREEMENT) _____
 31. DEMO: What MEST reality is and how it differs from postulated reality. _____
 32. Chapter 16, Column N. CONDITION OF TRACK AND VALENCES _____

7. Chapter Four. _____
8. Chapter Five. _____
9. DEMO: The effect of telling someone where they are on the Tone Scale. _____
10. Chapter Six. _____
11. DEMO: An attention unit. _____
12. DEMO: How to determine if the pc is out of PT. _____
13. Chapter Seven. _____
14. Chapter Eight. _____
15. DEMO: When to run pleasure moments. _____
16. Chapter Nine. _____
17. DEMO: The use of imaginary incidents. _____
18. Chester Ten. _____
19. DEMO: When to address locks. _____
- 19A. Chapter Eleven. _____
20. DEMO: Lock scanning. _____
21. Chapter Twelve. _____
22. DEMO: How a person gets a confusion of identity. _____
23. Chapter Thirteen. _____
24. Chapter Fourteen. _____
25. Chapter Fifteen. _____
26. DEMO: The difference between a circuit and a valence. _____
27. Chapter Sixteen. _____
28. Chapter Seventeen. _____
29. Chapter Eighteen. _____
30. DEMO: The importance of aesthetics. _____
31. Chapter Nineteen. _____
32. DEMO: How theta converts entheta into theta. _____
33. DEMO: What a boil-off is. _____
34. Chapter Twenty. _____
35. Chapter Twenty-one. _____
36. DEMO: Why a pc must be correctly evaluated on the chart before processing. _____
37. DEMO: Use of positive processing. _____
38. Appendix. _____
18. BOOK: SELF ANALYSIS (Aug 51) _____
19. DEMO: How emotion is directly regulated by pro-survival and contra-survival factors in life. _____
20. DEMO: The use of Self Analysis. _____
21. Sep 51 SUPPLEMENT No. 1 TO SCIENCE OF SURVIVAL - ALL POSSIBLE ABERRATIONS _____
22. Sep 51 SUPPLEMENT No. 2 TO SCIENCE OF SURVIVAL - VALIDATION PROCESSING _____
23. BOOK: ADVANCED PROCEDURES AND AXIOMS _____
 1. Introduction. _____
 2. Seld-Determinism Processing. _____
 3. DEMO: How self-determinism relates to aberration. _____
 4. Justice. _____
 5. DEMO: ARC and aberration. _____
 6. The Role of the Auditor. _____
 7. The Evolution of Man. _____
 8. Advanced Procedure. _____
 9. DEMO: The goal of an auditor. _____
 10. Thought. _____
 11. Emotion. _____
 12. Effort. _____
 13. Effort Processing. _____
 14. DEMO: The emotional curve. _____

15. DEMO: The relationship between thought, emotion and effort. _____
16. Postulates. _____
17. DEMO: What is necessary for making a prime postulate. _____
18. Types of Cases. _____
19. Computations. _____
20. DEMO: A dramatizing psychotic. _____
21. DEMO: A computing psychotic. _____
22. DIAGRAM: A time track showing where types of cases would be, relative to PT. _____
23. Service Facsimile. _____
24. DEMO: A service facsimile. _____
25. Past Problems. _____
26. Future Goals. _____
27. DEMO: The importance of future goals. _____
28. The Emotional Curve. _____
29. Analysis of Self-determinism. _____
30. Responsibility. _____
31. DEMO: Responsibility. _____
32. Cause and Effect. _____
33. Definitions, Logics and Axioms. _____
34. DEMO: A logic and how it affects survival. _____
35. The Logics. _____
36. DEMO: Each logic. _____
24. BOOK: HANDBOOK FOR PRECLEARS
 1. How to use this book. _____
 2. On the State of Man. _____
 3. An Ideal State of Being. _____
 4. DEMO: How the lines on the Chart of Attitudes interrelate. _____
 5. The Goals of Man. _____
 6. The Human Mind. _____
 7. DEMO: Why a thetan should be made able handle facsimiles. _____
 8. The Control Center. _____
 9. Emotion. _____
 10. DEMO: Counter-emotion. _____
 11. Processing. _____
 12. Processing Section (The First Act) _____
 13. The Second Act. _____
 14. DEMO: How to get a person to agree with you. _____
 15. The Third Act. _____
 16. The Fourth Act. _____
 17. DEMO: What "raising necessity level" consists of. _____
 18. The Fifth Act. _____
 19. DEMO: How to remedy failed help. _____
 20. The Sixth Act. _____
 21. DEMO: Right and wrong as related to Art. _____
 22. DEMO: A service facsimile. _____
 23. The Seventh Act. _____
 24. The Eighth Act. _____
 25. The Ninth Act. _____
 26. DEMO: How to process a psychotic. _____
 27. The Tenth Act. _____
 28. The Eleventh Act. _____
 29. DEMO: The survival value of sympathy and the non-survival value of sympathy. _____
 30. The Twelfth Act. _____
 31. The Thirteenth Act. _____
 32. DEMO: The importance of restoring belief in one's decisions. _____
 33. The Fourteenth Act. _____

34. The Fiiteenth Act. _____
25. TAPE: 5203C03 SCL-1 INTRODUCTION TO SCIENTOLOGY: _____
MILESTONE ONE (60 mins) _____
26. DEMO: Why a person has a “no I shouldn’t, maybe I should”. _____
27. TAPE: 5203C03 HCL-2 INTRODUCTION TO SCIENTOLOGY: _____
OUTLINE OF THERAPY (60 mins) _____
28. DEMO: The relationship of thought, pictures and mest. _____
29. Electropsychometric Auditing - Operators Manual _____
30. BOOK: A HISTORY OF MAN _____
1. Foreword. _____
 2. Chapter One. _____
 3. DEMO: The four general fields of incidents. _____
 4. Chapter Two. _____
 5. DEMO: The important target for an auditor and why. _____
 6. Chapter Three. _____
 7. DEMO: Why it’s necessary to handle the pc’s present life. _____
 8. Chapter Four. _____
 9. DEMO: How the genetic line and theta line cross. _____
 10. Chapter Five. _____
 11. DEMO: The basis of a theta being’s identity. _____
 12. Chapter Six. _____
 13. Chapter Seven. _____
 14. DEMO: The types of invalidation. _____
 15. Chapter Eight. _____
 16. Chapter Nine. _____
 17. DEMO: A DED and a DEDEX. _____
 18. Chapter Ten. _____
 19. DEMO: Why it is necessary to run “transfer” into the body in order to achieve self-determined transfers out. _____
31. JOS 1-G Aug 52 WHAT IS SCIENTOLOGY? _____
32. JOS 1-G Aug 52 THE HANDLING OF ARTHRITIS _____
33. BOOK: SCIENTOLOGY 8-80 (Nov 52) _____
1. Chapter One. _____
 2. Chapter Two. _____
 3. DEMO: How a static acts as a mirror and what this results in. _____
 4. DEMO: A static and a kinetic. _____
 5. Chapter Three. _____
 6. DEMO: How energy created by a static reactivates a facsimile and causes restimulation. _____
 7. DEMO: What hangs up a facsimilie. _____
 8. DEMO: What ability is being rehabilitated in a pc. _____
 9. Chapter Four. _____
 10. DEMO: The only way theta will hold onto a facsimilie. _____
 11. Chapter Five. _____
 12. Chapter Six. _____
 13. Chapter Seven. _____
 14. DEMO: How black and white processing works. _____
 15. DEMO: The effect of a stuck flow. _____
 16. Chapter Eight. _____
 17. DEMO: A concept. _____
 18. Chapter Nine. _____
 19. DEMO: How to separate a preclear from past bodies. _____
 20. Chapter Ten. _____
 21. DEMO: 3 patterns of wave flows. _____
 22. DEMO: What happens when a thetan puts beauty into bodies and situations too long. _____
 23. Chapter Eleven. _____
 24. DEMO: On what does the speed of a preclear depend. _____

25. DEMO: How a being produces energy. _____
26. Chapter Twelve. _____
27. DEMO: Why a pc must be responsible for his facsimiles. _____
28. DEMO: The way tractor, pressor and puller beams work. _____
29. Chapter Thirteen. _____
30. DEMO: The reason dichotomies are run closer to thought than to effort. _____
31. Chapter Fourteen. _____
32. DEMO: Each manifestation of energy. _____
33. DEMO: The effect of imposing time and space on energy flows. _____
34. DEMO: How a thetan can become identified with a body. _____
35. Chapter Fifteen. _____
36. DEMO: The result of assigning responsibility to something outside oneself. _____
37. Chapter Sixteen. _____
38. DEMO: How a thetan gets to be subzero on the Tone Scale. _____
39. Chapter Seventeen. _____
40. DEMO: What causes demon circuits. _____
41. DEMO: The relationship between facsimiles and ridges. _____
34. BOOK: SCIENTOLOGY 8-8008 (Dec 52)
 - 1: Foreword. _____
 2. The Factors. _____
 3. DEMO: The Factors. _____
 4. The Beingness of Man. _____
 5. DEMO: The Optimum Solution. _____
 6. Theta Mest Theory. _____
 7. CLAY DEMO: Time. _____
 8. DEMO: The 3 conditions necessary to action. _____
 9. DEMO: The qualities of energy. _____
 10. DEMO: The interrelationships of matter, energy, space and time. _____
 11. Affinity, Communication and Reality. _____
 12. DEMO: Identity, Individuality and Beingness. _____
 13. DEMO: Definition of action. _____
 14. DEMO: The effect of reversal of havingness on a thetan. _____
 15. DEMO: The universe of a thetan. _____
 16. How to use double terminal processing and why. _____
 17. DEMO: Self-determined versus stimulus response ideas. _____
 18. DEMO: The cycle of action and havingness. _____
 19. Differentiation, Association and Identification. _____
 20. DEMO: Differentiation, Association, Identification and their positions on the Tone Scale. _____
 21. DEMO: Logic. _____
 22. DEMO: Each pattern of energy. _____
 23. DEMO: How a thetan views black and white energy. _____
 24. DEMO: How perception relates to energy. _____
 25. DEMO: Gradient scale of responsibility. _____
 26. DEMO: "8-8008". _____
 27. DEMO: The goal of postulate processing and creative processing. _____
 28. CLAY DEMO: Space and viewpoint. _____
 29. DEMO: How be, do and have correspond to space, energy and time. _____
 30. Standard Operating Procedure 8. _____
 31. Certainty Processing. _____
 32. Glossary. _____
 33. The Six Levels of Processing - Issue 5. _____
 34. Games Processing. _____
35. TAPE: 5212C01A SCIENTOLOGY: HOW TO UNDERSTAND AND STUDY IT (60 mins) _____
 PDC-1 _____

36.	<u>DEMO</u> : The difference between what we're studying in Scientology versus Dianetics.		_____
37.	JOS 14-G	Apr 53	CHILD SCIENTOLOGY
38.		1 May 53	Scientology 8-8008 Unlimited Techniques
39.	PAB 1	10 May 53	GENERAL COMMENTS, GROUP PROCESSING AND A SUMMARY OF NEW WORK: CERTAINTIES
40.	<u>CLAY DEMO</u> : The 3 universes - types of certainty.		_____
41.	<u>DEMO</u> : How responsibility relates to communication.		_____
42.	PAB 2	May 53	GENERAL COMMENTS, SOP 8 AND A SUMMARY OF SOP 8A

- 4. CONDITIONAL: The following drill is for use in a case where the
student is unable to master any one of the following E-Meter drills
on this checksheet despite all routine gradients and remedies
having been applied. It is not to be used indiscriminately at the first
sign of any difficulty, nor in such a way as to delay a students
progress through the checksheet.
It is used only when the student is still unable to pass a drill after
the following has been done:
a) standard drilling and coaching on the drill
b) the handling of any misunderstands
c) correction, on the right gradient, of any preceding meter drills,
including E-Meter Drill 1.
E-METER DRILL CR0000-3 CONFRONT THE E-METER

HCO POLICY LETTER OF 7 FEBRUARY 1965
REISSUED 15 JUNE 1970

(Corrected per Flag Issue 28.1.73)

Remimeo
Sthil Students
Assn/Org Sec Hat
HCO Sec Hat
Case Sup Hat
Ds of P Hat
Ds of T Hat
Staff Member Hat
Franchise
(issued May 1965)

Note: Neglect of this Pol Ltr has caused great hardship on staffs, has cost countless millions and made it necessary in 1970 to engage in an all out International effort to restore basic Scientology over the world. Within 5 years after the issue of this PL with me off the lines, violation had almost destroyed orgs. "Quickie grades" entered in and denied gain to tens of thousands of cases. Therefore actions which neglect or violate this Policy Letter are HIGH CRIMES resulting in Comm Evs on ADMINISTRATORS and EXECUTIVES. It is not "entirely a tech matter" as its neglect destroys orgs and caused a 2 year slump. IT IS THE BUSINESS OF EVERY STAFF MEMBER to enforce it.

ALL LEVELS

KEEPING SCIENTOLOGY WORKING

HCO Sec or Communicator Hat Check
on all personnel and new personnel
as taken on.

We have some time since passed the point of achieving uniformly workable technology.

The only thing now is getting the technology applied.

If you can't get the technology applied then you can't deliver what's promised. It's as simple as that. If you can get the technology applied, you can deliver what's promised.

The only thing you can be upbraided for by students or pcs is "no results". Trouble spots occur only where there are "no results". Attacks from governments or monopolies occur only where there are "no results" or "bad results".

Therefore the road before Scientology is clear and its ultimate success is assured if the technology is applied.

So it is the task of the Assn or Org Sec, the HCO Sec, the Case Supervisor, the D of P, the D of T and all staff members to get the correct technology applied.

Getting the correct technology applied consists of:

One: Having the correct technology.

Two: Knowing the technology.

Three: Knowing it is correct.

Four: Teaching correctly the correct technology.

Five: Applying the technology.

Six: Seeing that the technology is correctly applied.

Seven: Hammering out of existence incorrect technology.

Eight: Knocking out incorrect applications.

Nine: Closing the door on any possibility of incorrect technology.

Ten: Closing the door on incorrect application.

One above has been done.

Two has been achieved by many.

Three is achieved by the individual applying the correct technology in a proper manner and observing that it works that way.

Four is being done daily successfully in most parts of the world.

Five is consistently accomplished daily.

Six is achieved by instructors and supervisors consistently.

Seven is done by a few but is a weak point.

Eight is not worked on hard enough.

Nine is impeded by the "reasonable" attitude of the not quite bright.

Ten is seldom done with enough ferocity.

Seven, Eight, Nine and Ten are the only places Scientology can bog down in any area.

The reasons for this are not hard to find. (a) A weak certainty that it works in Three above can lead to weakness in Seven, Eight, Nine and Ten. (b) Further, the not-too-bright have a bad point on the button Self-Importance. (c) The lower the IQ, the more the individual is shut off from the fruits of observation. (d) The service faces of people make them defend themselves against anything they confront good or bad and seek to make it wrong. (e) The bank seeks to knock out the good and perpetuate the bad.

Thus, we as Scientologists and as an organization must be very alert to Seven, Eight, Nine and Ten.

In all the years I have been engaged in research I have kept my comm lines wide open for research data. I once had the idea that a group could evolve truth. A third of Century has thoroughly disabused me of that idea. Willing as I was to accept suggestions and data, only a handful of suggestions (less than twenty) had long run value and none were major or basic; and when I did accept major or basic suggestions and used them, we went astray and I repented and eventually had to "eat crow".

On the other hand there have been thousands and thousands of suggestions and writings which, if accepted and acted upon, would have resulted in the complete destruction of all our work as well as the sanity of pcs. So I know what a group of people will do and how insane they will go in accepting unworkable "technology". By actual record the percentages are

about twenty to 100,000 that a group of human beings will dream up bad technology to destroy good technology. As we could have gotten along without suggestions, then, we had better steel ourselves to continue to do so now that we have made it. This point will, of course, be attacked as “unpopular” “egotistical” and “undemocratic”. It very well may be. But it is also a survival point. And I don’t see that popular measures, self-abnegation and democracy have done anything for Man but push him further into the mud. Currently, popularity endorse degraded novels, self-abnegation has filled the South East Asian jungles with stone idols and corpses, and democracy has given us inflation and income tax.

Our technology has not been discovered by a group. True, if the group had no supported me in many ways I could not have discovered it either. But it remains that in its formative stages it was not discovered by a group, then group efforts, one can safely assume, will not add to it or successfully alter it in the future. I can only say this now that it is done. There remains, of course, group tabulation or co-ordination of what has been done, which will be valuable-only so long as it does not seek to alter basic principles and successful applications.

The contributions that were worth while in this period of forming the technology were help in the form of friendship, of defence, of organization, of dissemination, of application, of advices on results and of finance. These were great contributions and were, and are, appreciated. Many thousands contributed in this way and made us what we are. Discovery contribution was not however part of the broad picture.

We will not speculate here on why this was so or how I came to rise above the bank. We are dealing only in facts and the above is a fact-the group left to its own devices would not have evolved Scientology but with wild dramatization of the bank called “new ideas” would have wiped it out. Supporting this is the fact that Man has never before evolved workable mental technology and emphasizing it is the vicious technology he did evolve-psychiatry, psychology, surgery, shock treatment, whips, duress, punishment, etc, ad infinitum.

So realize that we have climbed out of the mud by whatever good luck and good sense, and refuse to sink back into it again. See that Seven, Eight, Nine and Ten above are ruthlessly followed and we will never be stopped. Relax them, get reasonable about it and we will perish.

So far, while keeping myself in complete communication with all suggestions, I have not failed on Seven, Eight, Nine and Ten in areas I could supervise closely. But it’s not good enough for just myself and a few others to work at this.

Whenever this control as per Seven, Eight, Nine and Ten has been relaxed the whole organizational area has failed. Witness Elizabeth, N.Y., Wichita, the early organizations and groups. They crashed only because I no longer did Seven, Eight, Nine and Ten. Then, when they were all messed up you saw the obvious “reasons” for failure. But ahead of that they ceased to deliver and that involved them in other reasons.

The common denominator of a group is the reactive bank. Thetans without banks have different responses. They only have their banks in common. They agree then only on bank principles. Person to person the bank is identical. So constructive ideas are individual and seldom get broad agreement in a human group. An individual must rise above an avid craving for agreement from a humanoid group to get anything decent done. The bank-agreement has been what has made Earth a Hell-and if you were looking for Hell and found Earth, it would certainly serve. War, famine, agony and disease has been the lot of Man. Right now the great governments of Earth have developed the means of frying every Man, Woman and Child on the planet. That is Bank. That is the result of Collective Thought Agreement. The decent, pleasant things on this planet come from individual actions and ideas that have somehow gotten by the Group Idea. For that matter, look how we ourselves are attacked by “public opinion” media. Yet there is no more ethical group on this planet than ourselves.

Thus each one of us can rise above the domination of the bank and then, as a group of freed beings, achieve freedom and reason. It is only the aberrated group, the mob, that is destructive.

When you don't do Seven, Eight, Nine and Ten actively, you are working for the Bank dominated mob. For it will surely, surely (a) introduce incorrect technology and swear by it, (b) apply technology as incorrectly as possible, (c) open the door to any destructive idea, and (d) encourage incorrect application.

It's the Bank that says the group is all and the individual nothing. It's the Bank that says we must fail.

So just don't play that tune. Do Seven. Eight, Nine and Ten and you will knock out of your road all the future thorns.

Here's an actual example in which a senior executive had to interfere because of a pc spin: A Case Supervisor told Instructor A to have Auditor B run Process X on Preclear C. Auditor B afterwards told Instructor A that "It didn't work." Instructor A was weak on Three above and didn't really believe in Seven, Eight, Nine and Ten. So Instructor A told the Case Supervisor "Process X didn't work on Preclear C." Now this strikes directly at each of One to Six above in Preclear C, Auditor B, Instructor A and the Case Supervisor. It opens the door to the introduction of "new technology" and to failure.

What happened here? Instructor A didn't jump down Auditor B's throat, that's all that happened. This is what he should have done: Grabbed the Auditor's report and looked it over, When a higher executive on this case did so she found what the Case Supervisor and the rest missed: that. Process X increased Preclear C's TA to 25 TA divisions for the session but that near session end Auditor B Qed and Aed with a cognition and abandoned Process X while it still gave high TA and went off running one of Auditor B's own manufacture, which nearly spun Preclear C. Auditor B's IQ on examination turned out to be about 75. Instructor A was found to have huge ideas of how you must never invalidate anyone, even a lunatic. The Case Supervisor was found to be "too busy with admin to have any time for actual cases".

All right, there's an all too typical example. The Instructor should have done Seven, Eight, Nine and Ten. This would have begun this way. Auditor B: "That process X didn't work." Instructor A: "What exactly did you do wrong?" Instant attack. "Where's your auditor's report for the session? Good. Look here, you were getting a lot of TA when you stopped Process X. What did you do?" Then the Pc wouldn't have come close to a spin and all four of these would have retained certainty.

In a year, I had four instances in one small group where the correct process recommended was reported not to have worked. But on review found that each one had (a) increased the TA, (b) had been abandoned, and (c) had been falsely reported as unworkable. Also, despite this abuse, in each of these four cases the recommended, correct process cracked the case. Yet they were reported as not having worked!

Similar examples exist in instruction and these are all the more deadly as every time instruction in correct technology is flubbed, then the resulting error, uncorrected in the auditor, is perpetuated on every pc that auditor audits thereafter. So Seven, Eight, Nine and Ten are even more important in a course than in supervision of cases.

Here's an example: A rave recommendation is given a graduating student "because he gets more TA on pcs than any other student on the course!" Figures of 435 TA divisions a session are reported. "Of course his model session is poor but it's just knack he has" is also included in the recommendation. A careful review is undertake because nobody at levels O to IV is going to get that much TA on pcs. It is found that this student was never taught to read an E-Meter dial! And no instructor observed his handling of a meter and it was not discovered that he "overcompensated" nervously swinging the TA 2 or 3 divisions beyond where it needed to

go to place the needle at “set”. So everyone was about to throw away standard processes and model session because this one student “got such remarkable TA”. They only read the reports and listened to the brags and never looked at this student. The pcs in actual fact were making slightly less than average gain, impeded by a rough model session and misworded processes. Thus, what was making the pcs win (actual Scientology) was hidden under a lot of departures and errors.

I recall one student who was squirreling on an Academy course and running a lot of off-beat whole track on other students after course hours. The academy students were in a state of electrification on all these new experiences and weren't quickly brought under control and the student himself never was given the works on Seven, Eight, Nine and Ten so they stuck. Subsequently, this student prevented another squirrel from being straightened out and his wife died of cancer resulting from physical abuse. A hard, tough instructor at that moment could have salvaged two squirrels and saved the life of a girl. But no, students had a right to do whatever they pleased.

Squirreling (going off into weird practices or altering Scientology) only comes about from non-comprehension. Usually the non-comprehension is not of Scientology but some earlier contact with an off-beat humanoid practice which in its turn was not understood.

When people can't get results from what they think is standard practice, they can be counted upon to squirrel to some degree. The most trouble in the past two years came from orgs where an executive in each could not assimilate straight Scientology under instruction in Scientology they were unable to define terms or demonstrate examples of principles. And the orgs where they were got into plenty of trouble. And worse, it could not be straightened out easily because neither one of these people could or would duplicate instructions. Hence, a debacle resulted in two places, directly traced to failures of instruction earlier. So proper instruction is vital. The D of T and his Instructors and all Scientology Instructors must be merciless in getting Four, Seven, Eight, Nine and Ten into effective action. That one student, dumb and impossible though he may seem and of no use to anyone, may yet some day be the cause of untold upset because nobody was interested enough to make sure Scientology got home to him.

With what we know now, there is no student we enrol who cannot be properly trained. As an instructor, one should be very alert to slow progress and should turn the sluggards inside out personally. No system will do it, only you or me with our sleeve rolled up can crack the back of bad studenting and we can only do it on an individual student, never on a whole class only. He's slow = something is awful wrong. Take fast action to correct it. Don't wait until next week. By then he's got other messes stuck to him. If you can't graduate them with their good sense appealed to and wisdom shining graduate them in such a state of shock they'll have nightmares if they contemplate squirreling. Then experience will gradually bring about Three in them and they'll know better than to chase butterflies when they should be auditing.

When somebody enrolls, consider he or she has joined up for the duration of the universe- never permit an “open-minded” approach. If they're going to quit let them quit fast. If they enrolled, they're aboard, and if they're aboard, they're here on the same terms as the rest of us- win or die in the attempt. Never let them be half-minded about being Scientologists. The finest organizations in history have been tough dedicated organizations. Not one namby-pamby bunch of panty-waist dilettantes have ever made anything. It's a tough universe. The social veneer makes it seem mild. But only the tigers survive-and even they have a hard time. We'll survive because we are tough and are dedicated. When we do instruct somebody properly he becomes more and more tiger. When we instruct half-mindedly and are afraid to offend, scared to enforce, we don't make students into good Scientologists and that let's everybody down. When Mrs. Pattycake comes to us to be taught, turn that wandering doubt in her eye into a fixed, dedicated glare and she'll win and we'll all win. Humour her and we all die a little. The proper instruction attitude is, “You're here so you're a Scientologist Now we're going to make you into an expert auditor no matter what happens. We'd rather have you dead that incapable.”

Fitting that into the economics of the situation and lack of adequate time and you see the cross we have to bear.

But we won't have to bear it forever. The bigger we get the more economics and time we will have to do our job. And the only things which can prevent us from getting that big fast are areas in from One to Ten. Keep those in mind and we'll be able to grow. Fast. And as we grow our shackles will be less and less. Failing to keep One to Ten, will make us grow less.

So the ogre which might eat us up is not the government or the High Priests. It's our possible failure to retain and practise our technology.

An Instructor or Supervisor or Executive must challenge with ferocity instances of "unworkability". They must uncover what did happen, what was run and what was done or not done.

If you have One and Two, you can only acquire Three for all by making sure of all the rest.

We're not playing some minor game in Scientology. It isn't cute or something to do for lack of something better.

The whole agonized future of this planet, every Man, Woman and Child on it, and your own destiny for the next endless trillions of years depends on what you do here and now with and in Scientology.

This is a deadly serious activity. And if we miss getting out of the trap now, we may never again have another chance.

Remember, this is a our first chance to do so in all the endless trillions of years of the past. Don't muff it now because it seems unpleasant or unsocial to do Seven, Eight, Nine and Ten.

Do them and we'll win.

*URGENT AND
IMPORTANT*

TECHNICAL DEGRADES

(This PL and HCO PL Feb 7, 1965 must be made part of every study pack as the first items and must be listed on checksheets.)

Any checksheet in use or in stock which carries on it any degrading statement must be destroyed and issued without qualifying statements.

Example: Level 0 to IV Checksheets SH carry "A. Background Material—This section is included as an historical background, but has much interest and value to the student. Most of the processes are no longer used, having been replaced by more modern technology. The student is only required to read this material and ensure he leaves no misunderstood." This heading covers such vital things as TRs, Op Pro by Dup! The statement is a falsehood.

These checksheets were not approved by myself, all the material of the Academy and SH courses IS in use.

Such actions as this gave us "Quickie Grades", ARC Broke the field and downgraded the Academy and SH Courses.

A condition of TREASON or cancellation of certificates or dismissal and a full investigation of the background of any person found guilty, will be activated in the case of anyone committing the following HIGH CRIMES.

1. Abbreviating an official Course in Dianetics and Scientology so as to lose the full theory, processes and effectiveness of the subjects.
2. Adding comments to checksheets or instructions labelling any material "background" or "not used now" or "old" or any similar action which will result in the student not knowing, using, and applying the data in which he is being trained.
3. Employing after 1 Sept 1970 any checksheet for any course not authorized by myself and the SO Organizing Bureau Flag.
4. Failing to strike from any checksheet remaining in use meanwhile any such comments as "historical", "background", "not used", "old", etc. or VERBALLY STATING IT TO STUDENTS.
5. Permitting a pc to attest to more than one grade at a time on the pc's own determinism without hint or evaluation.
6. Running only one process for a grade between 0 to IV.
7. Failing to use all processes for a level.

8. Boasting as to speed of delivery in a session, such as “I put in Grade zero in 3 minutes.” Etc.
9. Shortening time of application of auditing for financial or laborsaving considerations.
10. Acting in any way calculated to lose the technology of Dianetics and Scientology to use or impede its use or shorten its materials or its application.

REASON: The effort to get students through courses and get pcs processed in orgs was considered best handled by reducing materials or deleting processes from grades. The pressure exerted to speed up student completions and auditing completions was mistakenly answered by just not delivering.

The correct way to speed up a student’s progress is by using 2 way comm and applying the study materials to students.

The best way to really handle pcs is to ensure they make each level fully before going on to the next and repairing them when they do not.

The puzzle of the decline of the entire Scientology network in the late 60s is entirely answered by the actions taken to shorten time in study and in processing by deleting materials and actions.

Reinstituting full use and delivery of Dianetics and Scientology is the answer to any recovery.

The product of an org is well taught students and thoroughly audited pcs. When the product vanishes, so does the org. The orgs must survive for the sake of this planet.

SAFEGUARDING TECHNOLOGY

For some years we have had a word “squirreling”. It means altering Scientology, off-beat practices. It is a bad thing. I have found a way to explain why.

Scientology is a *workable* system. This does not mean it is the best possible system or a perfect system. Remember and use that definition. Scientology is a *workable system*.

In fifty thousand years of history on this planet alone, Man never evolved a workable system. It is doubtful if, in foreseeable history, he will ever evolve another.

Man is caught in a huge and complex labyrinth. To get out of it requires that he follow the closely taped path of Scientology.

Scientology will take him out of the labyrinth. But only if he follows the exact markings in the tunnels.

It has taken me a third of a century in this lifetime to tape this route out.

It has been proven that efforts by Man to find different routes came to nothing. It is also a clear fact that the route called Scientology does lead out of the labyrinth Therefore it is a workable system, a route that can be travelled.

What would you think of a guide who, because his party said it was dark and the road rough and who said another tunnel looked better, abandoned the route he knew would lead out and led his party to a lost nowhere in the dark. You’d think he was a pretty wishy-washy guide.

What would you think of a supervisor who let a student depart from procedure the supervisor knew worked. You’d think he was a pretty wishy-washy supervisor.

What would happen in a labyrinth if the guide let some girl stop in a pretty canyon and left her there forever to contemplate the rocks? You’d think he was a pretty heartless guide. You’d expect him to say at least, “Miss, those rocks may be pretty, but the road out doesn’t go that way.”

All right, how about an auditor who abandons the procedure which will make his preclear eventually clear just because the preclear had a cognition?

People have following the route mixed up with “the right to have their own ideas.” Anyone is certainly entitled to have opinions and ideas and cognitions—so long as these do not bar the route out for self and others.

Scientology is a workable system. It white tapes the road out of the labyrinth If there were no white tapes marking the right tunnels, Man would just go on wandering around and around the way he has for eons, darting off on wrong roads, going in circles, ending up in the sticky dark, alone.

Scientology, exactly and correctly followed, takes the person up and out of the mess.

So when you see somebody having a ball getting everyone to take peyote because it restimulates prenatales, know he is pulling people off the route. Realize he is squirreling. He isn't following the route.

Scientology is a new thing- it is a road out. There has not been one. Not all the salesmanship in the world can make a bad route a proper route. And an awful lot of bad routes are being sold. Their end product is further slavery, more darkness, more misery.

Scientology is the only workable system Man has. It has already taken people toward higher I.Q., better lives and all that. No other system has. So realize that it has no competitor.

Scientology is a workable system. It has the route taped. The search is done. Now the route only needs to be walked.

So put the feet of students and preclears on that route. Don't let them off of it no matter how fascinating the side roads seem to them. And move them on up and out.

Squirreling is today destructive of a workable system.

Don't let your party down. By whatever means, keep them on the route. And they'll be free. If you don't, they won't.

Tech Division—Qual Division

STUDENTS GUIDE TO ACCEPTABLE BEHAVIOUR

GENERAL

1. Adhere completely to the Code of a Scientologist for the duration of the course and behave in a manner becoming to a Scientologist at all times.
2. Get sufficient food and sleep. Always eat breakfast before class and morning sessions.
3. When being a preclear, be one, not a student or auditor. When being an auditor, be an Auditor, not a student or preclear. When in class and lectures, be a student not an auditor or a preclear.
4. Get off all your known withholds. Know definitely that you have absolutely no hope for case advancement unless you get these known withholds off to you auditor. Any violation of rules must be reported by the auditor on the auditing report for the preclear so that they are no longer withholds from L. Ron Hubbard, Mary Sue Hubbard or Supervisors.
5. If you don't know something or are confused about course data, ask a Supervisor or send a despatch. Do not ask other students as this creates progressively worsening errors in data. Also dispatches from you to L. Ron Hubbard will be relayed if you place all such in the basket marked "Students Out".
6. Students may only use the coin box telephone during non class periods.
7. You must get the permission of the Office of L. Ron Hubbard to leave course before you are allowed to leave. You won't be released if there is any doubt that you are inadequate technically or your case is considered in poor condition. Give an advanced warning as to when you are leaving.

AUDITING

8. Do not consume any alcoholic beverage between 6 a.m. on Sundays and after class on Fridays.
9. Do not consume or have administered to yourself or any other student any drug, antibiotics, aspirin, barbiturates, opiates, sedatives, hypnotics or medical stimulants for the duration of the course without the approval of the D of T.
10. Do not give any processing to anyone under any circumstances without direct permission of the D of T. (Emergency assists excepted.)
11. Do not receive any processing from anyone under any circumstances without the express permission of the D of T.

12. Do not engage in any “self-processing” under any circumstances during the course at any time.
13. Do not receive any treatment, guidance, or help from anyone in the healing arts, i.e. physician, dentist, etc, without the consent of the D of T/Ethics Officer. (Emergency treatment when the D of T is not available is excepted.)
14. Do not engage in any rite, ceremony, practice, exercise, meditation, diet, food therapy or any similar occult, mystical, religious, naturopathic, homoeopathic, chiropractic treatment or any other healing or mental therapy while on course without the express permission of the D of T/ Ethics Officer.
15. Do not discuss your case, your Auditor, your Supervisors, your classmates, L. Ron Hubbard, HCO WW personnel or HCO WW with anyone. Save your unkind or critical thoughts for your processing sessions or take up complaints with any supervisor.
16. Do not engage in any sexual relationships of any nature or kind or get emotionally involved with any classmate who is not your legal spouse.
17. Follow the Auditor’s Code during all sessions when being the Auditor.
18. Follow technical procedure as outlined on the course exactly and precisely.
19. Be honest at all times on your auditing report forms. Stating every process run, Tone Arm changes and times, sensitivity setting, cognitions of your preclear and any changes of physical appearance, reactions, communication level, or otherwise what you observe in your preclear.
20. Place all reports in the folder of your preclear after each session, turn into the Examiner for classification.
21. Students must not read their own report folder or that of another student, unless he is auditing that student.

PREMISES

22. Do not make any undue noise either indoors, or when leaving class.
23. Use the correct entrances for entering and leaving the premises.

QUARTERS

24. Do not put cigarettes out in plastic waste baskets or on the floors.
25. Keep all your bulletins, supplies and personal possessions in the space allotted to you and keep your space neat and orderly.
26. Students are allowed to smoke during breaks only and always outside any study or auditing quarters.
27. The basket marked “Student In” is the basket where all communications, bulletins or mail to students are placed. Always check this basket daily to see if you have received any communications.
28. Report and turn in any damaged property or goods used on the Course. Protect and keep the premises in good condition.

29. No food may be stored or eaten in the Classrooms at any time.

SCHEDULES

30. Be on time for class and all assignments.

31. Buy any books you need from the invoice clerk at appointed times.

32. Follow all schedules exactly.

33. Study and work during your class periods and over weekends. You have a lot to get checked out on in order to get a course completion. You can't afford to waste time.

HCO POLICY LETTER OF 16 MARCH 1971

Remimeo
Course Super Cse
Course Super Checksheets
LRH Comm to Enforce

WHAT IS A COURSE?

In Scientology a course consists of a checksheet with all the actions and material listed on it and all the materials on the checksheet available in the same order.

“Checksheet Material” means the policy letters, bulletins, tapes, mimeo issues, any reference book or any books mentioned.

“Materials” also include clay, furniture, tape players, bulletin boards, routing forms, supplies of pink sheets, roll book, student files, file cabinets and any other items that will be needed.

If you look this over carefully, it does not say, “materials on order” or except for those we haven’t got” or “in different order”. It means what it says exactly.

If a student is to have auditing or word clearing rundowns or must do auditing those are under ACTIONS and appear on the checksheet.

A course must have a supervisor. He may or may not be a graduate and experienced practitioner of the course he is supervising but HE MUST BE A TRAINED COURSE SUPERVISOR.

He is not expected to teach. He is expected to get the students there, rolls called, checkouts properly done, misunderstands handled by finding what the student doesn’t dig and getting the student to dig it. The supervisor who tells students answers is a waste of time and a course destroyer as he enters out data into the scene even if trained and actually especially if trained in the subject. The Supervisor is NOT an “instructor” that’s why he’s called a “supervisor”.

A Supervisor’s skill is in spotting dope-off, glee and other manifestations of misunderstands, and getting it cleaned up, not in knowing the data so he can tell the student.

A Supervisor should have an idea of what questions he will be asked and know where to direct the student for the answer.

Student blows foliow misunderstands. A Supervisor who is on the ball, never has blows as he caught them before they happened by observing the student’s misunderstanding before the student does and getting it tracked down by the student.

It is the Supervisor’s job to get the student through the checksheet fully and swiftly with minimum lost time.

The successful Supervisor is tough. He is not a kindly old fumbler. He sets high point targets for each student for the day and forces it to be met or else.

The Supervisor is spending Supervisor Minutes. He has just so many to spend. He is spending student hours. He has just so many of these to spend so he gets them spent wisely and saves any waste of them.

A Supervisor in a course of any size has a Course Administrator who has very exact duties in keeping up Course Admin and handing out and getting back materials and not losing any to damage or carelessness.

If Paragraphs One to Three above are violated it is the Course Administrator who is at fault. He must have checksheets and the matching material in adequate quantity to serve the Course. If he doesn't he has telexes flying and mimeo sweating. The Course Admin is in charge of routing lines and proper send off and return of students to Cramming or Auditing or Ethics.

The final and essential part of a course is students.

If a course conforms with this P/L exactly with no quibbles, is tough, precisely time scheduled and run hard, it will be a full expanding course and very successful. If it varies from this P/L it will stack up bodies in the shop, get blows and incompetent graduates.

The final valuable product of any course is graduates who can apply the material they studied successfully and be successful in the subject.

This answers the question What is a Course? If any of these points are out it is NOT a Scientology Course and it will not be successful.

Thus, the order "Put a Course there!" means this P/L in full force.

So here's the order, WHEN OFFERING TRAINING PUT A COURSE THERE.

COURSES—THEIR IDEAL SCENE

(REFERENCES:

HCO PL 7 Feb 65 KEEPING SCIENTOLOGY WORKING
Reiss. 15.6.70. Reiss. 28.1.73
HCO PL 7 May 69 II STUDENTS GUIDE TO ACCEPTABLE BEHAVIOUR
HCO PL 16 Apr 65 THE "HIDDEN DATA LINE"
HCO PL 24 Oct 68 SUPERVISOR KNOW-HOW, RUNNING THE CLASS
HCO PL 16 Mar 71R WHAT IS A COURSE?)

There are two ways a course can be run. It can be in-ethics or out-ethics.

An in-ethics course means that HCOBs are applied, verbal data doesn't exist whatsoever, schedules are strictly adhered to, musters are held, the Supervisor applies *all* the study tech, etc.

An out-ethics course would be anything less and sometimes becomes so obviously out-ethics that you see students goofing around on course, late arrivals for roll call, students taking cigarette breaks whenever they feel like it, verbal data running rampant, and a Course Supervisor that does nothing but stand around.

There's such a thing as group agreement and if a new student walks into an outethics course room, he will tend to go into agreement with it and join in.

There's no in-between point. A course (or any activity for that matter) cannot be run semi-standardly or with "pretty much in-ethics." It must be run with totally standard tech and in-ethics. If this is not the case you'll get a gradually lowered ethics level, admin will go out and standard tech slips down to "some of the tech being applied when we can."

When a student or Supervisor goes into a course room and sees things that are out-ethics or nonstandard or "not the way Ron says they should be" and doesn't do something effective to handle the scene then he himself will become part of it; he goes into agreement with it and will actually contribute to the out-ethics.

This situation is a widespread thing in our society today. It's not limited to our course rooms. You see it in marriages. It has become an acceptable thing to get divorced, create broken homes, cheat on your spouse. In the world of big business you're told to swindle Mr. X before he swindles you. This is group agreement. It is agreed upon out-ethics.

Now, if a course room is run like this you'll get auditors who won't keep auditing appointments, misapply tech, fail to handle their pcs' ethics, give and accept verbal data, have nonstandard admin, etc., etc. You will also train executives who will operate out-ethics, off-policy orgs. Either way, you're setting yourself up for losses.

Therefore, it is now a Comm Ev offense for a Course Supervisor or MAA (Ethics Officer) to allow the following out-ethics activities in their course rooms, with the result of declare of being a suppressive person:

1. Does not muster his students in the morning, after lunch, and after dinner. precisely on time, note absences and take action.
2. Permit students to talk to each other or wander around or take unscheduled breaks or goof off during course hours.
3. Permit students to eat or smoke in the course room.
4. Permitting persons to come into the course room and bother students for any reason.
5. Supervisor standing around or sitting at his desk not actively handling students who need help.
6. Not getting students through their course and graduated.

It goes without saying that all elements of HCO PL 16 March 71R WHAT IS A COURSE? should be in on a course. A Supervisor who does not run a course per checksheet, lets students study without dictionaries and demo kits, does not make all materials available and does not fully apply study tech and use Word Clearing is of course suppressive and should be declared, as he is actively blocking Scientologists from having and benefiting from Scientology.

Flag and FOLO observers and missions should always have a target to see that this policy letter is fully in.

You see, our success in clearing this planet depends upon the success of our courses as this is where we train our auditors, C/Ses, Supervisors and administrators and *that is the whole team!*

Interneships
Academies

INTERNESHIPS VS COURSES

Courses are those activities done in Div IV, Dept 11 for the purpose of training a student on the theory and materials necessary to perform certain skills. The product of a course is a graduate who has learned his materials and successfully applies what he has learned.

Interneships are those activities done in Div V, Dept 14 for the purpose of perfecting the interneer application of the basic skills learned on the Div IV course. The product of the interneship is a flubless professional.

Courses and interneships are two separate and distinct activities. When you confuse the two by failure to fully comprehend their actions and products you end up with overlong courses *and* overlong interneships.

FAST COURSES

A well-run course is where the student gets the theory. Through Word Clearing, demos, drills and actual practical application of the materials per his checksheet, the student is quickly gotten to a point where he grasps the simplicity of the fundamentals of the level and can apply them. Then from the viewpoint of experience with the basics he then rapidly studies the rest of the techniques that comprise the level. He can produce a competent result. This is a course graduate.

FAST INTERNESHIPS

Interneships are not where you learn theory. That belongs on the course. Interneships are there to add polish to professional level. Internes by definition train "onthe-job" under skilled supervision. They acquire skills by *doing*, not by reading their theory again. They audit. They C/S. They supervise. They get their errors corrected and they audit, C/S and supervise some more. When they have done this in volume and polished up their rough edges so they can think with their materials without hesitation on what to do, they become professionals. This is an interneship graduate.

EXISTING SCENE

All too often it is being found that interneships are being used to teach the course again. Weeks are being spent restudying the materials for checkouts. High Crime checkouts which have been done before are being done again. High Crime checkouts have become everything on a level rather than the basics which is *not* a lot of issues for any level. The purposes expressed in the 5 Qual OK to Audit Series plus polishing to professional standards the level just studied is the true purpose of interneships. Any course grad who wore his hat as a student should be able to sit down and check out his materials straight off as it is assumed he got it the first time.

So any attempt to turn an interneship into a redo of the original course must be a solution to quickied or badly supervised courses. The right handling would be to reform your courses and get them straight and require retreads on that course for any who show they missed the materials when on the course.

THE REMEDY

The internships will be streamlined on theory. Following HCOB 28 April 71 "OKAYS TO AUDIT IN HGCs," will make good auditors. To prevent the internships from becoming a long haul on theory it will now be required that the student pass an exam on the course materials before routing on to the internship. Passing grade will be 85%. Missed questions are handled in Cramming. Any who do not get a passing grade must retread the course before being allowed on the internship.

Should there be too many flunks then a Comm Ev must be requested by the org KOT or LRH Comm on the org's executives for neglect and failure to handle the courses.

SUMMARY

The theory and routine practical belong on the course. If an internship gets heavily into theory then there must be poor courses and they had better be corrected and fast. This should settle any questions on the matter.

(Cancels and replaces BPL 18 Oct 76RD,
Rev. 10.9.78 URGENT IMPORTANT
SUCCESSFUL TRAINING LINEUP
in order to reinstate Method One Word
Clearing.)

URGENT - IMPORTANT

SUCCESSFUL TRAINING LINEUP

(Ref:	HCOB	24 Jan 77	TECH CORRECTION ROUND-UP
	LRH ED	2 INT	ATTESTATION REINSTATED
		20 Jan 64	
	HCO PL	25 Sep 79	METHOD ONE WORD CLEARING
		Issue II	

BPL 18 Oct 76RD, Rev. 10.9.78 URGENT IMPORTANT, SUCCESSFUL TRAINING LINEUP is canceled because it dropped Method One Word Clearing out of training. It sought to solve students on Academy courses being held up due to incomplete Method One, by no longer requiring Method One. As a result Method One Word Clearing dropped *out* of use and Academy students and interns are now being delayed in training because they haven't had Method One. The "problem" of incomplete Method One isn't even a problem, all one would have *to* do is complete the Method One!

Method One Word Clearing is now being reinstated by HCO PL 25 Sep 79 II METHOD ONE WORD CLEARING.

The history of BPL 18 Oct 76 and its revisions is of interest because there have been some six people involved in writing and rewriting the various versions of this issue. Each sought to solve some real or imagined problem with training, by going unusual and altering or changing LRH Policy on training. As a result, arbitraries were entered into training and LRH Tech was dropped out of use. Each time this happened, training became less effective and slower. Instead of getting back to LRH policy on training each new revision entered a new arbitrary and omitted a vital piece of LRH Tech.

LRH has discovered that the troubles others have been having with training are due to: (a) the introduction of arbitraries and (b) omitted use of the Tech.

Nothing in this issue cancels or alters any LRH Policy, nor does anything in this issue permit anything less than full use of LRH Tech.

BPL 18 Oct 76RD had become long and difficult to read during all these revisions. The valid points from it follow in this issue.

STUDENT HAT COURSE

The Student Hat Course was put back onto the Training Route in 1976 by LRH when it was discovered that the course had disappeared from use. (See HCOB 24 Jan 77 TECH CORRECTION ROUND-UP)

FAST FLOW TRAINING

Definition: "A student attests his theory or practical class when he has fully covered the materials and can apply them. There is no examination." (LRH ED 2 INT)

The fast flow student passes courses by an attestation at Certs and Awards that he (a) enrolled properly on the course, (b) has paid for the course (or signed a no-charge invoice for 2 1/2 or 5 year contracted staff), (c) has studied and understands all the materials on the checksheet, (d) has done the drills called for by the checksheet, (e) can produce the result required in the course materials. Twin checkouts are suspended. Examinations are not required

Following are the rules of Fast Flow Training:

1. The only prerequisite for A student, staff or public to be able to Fast Flow his courses is Student Hat and Method One Word Clearing. Where a student has already done the full Primary Rundown, he is also qualified to Fast Flow his courses.
2. Method One Word Clearing must be fully done with each word taken to F/N as well as F/Ning the final assessment.
3. False attestations on Fast Flow Training equals a condition of Liability for the student and immediate cancellation of the cert and loss of Fast Flow Training privileges.

FAST FLOW AND QUAL

On Internships, the do the starrate checkouts required on each other. High Crime Checkouts and cramming actions requiring starrates are done starrated and not fast flow. (Per HCOB 24 Jan 77 TECH CORRECTION ROUND-UP.)

STAFF HATTING

The only prerequisite for staff hatting is BSM (Basic Study Manual) done per the checksheet. PRD (Primary Rundown is not a prerequisite, nor is a Student Hat, nor Method One. Where a staff member has only done the BSM he must not Fast Flow his training, and must take exams to graduate .

Staff members are urged to do the Student Hat and Method One as early as possible and must do these before a Major Course anyway. Staff can get Method One, by co-auditing it, from student auditing or in staff auditing. (If staff co-audit Method One, they get the added advantage of learning how to do word clearing.)

SUPERVISION

It is important that supervisors ensure that students are applying study tech at all times and pinksheet any outness they find.

In Fast Flow Training it is important that ethics is put in for any and every false attest, or the gains which can be gotten from Scientology training will get lost.

WHAT IS THE SUCCESSFUL TRAINING LINEUP?

It consists of following and keeping in the LRH HCO PLs on Training found in OEC Volume 4, making full use of LRH Study Tech and not allowing it to be omitted and keeping arbitraries off the line. Then there would be no trouble in training really professional Auditors, C/Ss, Supervisors, Administrative staff and Executives, rapidly and in great quantity. The Tech works when you use it. Use it and make competent people.

HUBBARD COMMUNICATIONS OFFICE
Saint Hill Manor, East Grinstead, Sussex

HCO POLICY LETTER OF 12 NOVEMBER AD 12

Sthil
CenOCon

**PURPOSE OF THE SAINT HILL SPECIAL
BRIEFING COURSE**

The purpose of the Saint Hill Special Briefing Course is first, foremost and only to make Clearing Auditors.

Clearing the student is incidental to teaching the student.

This to some degree is a shift of emphasis. It is made to reduce time spent on course.

It is impractical to treat this course as an HGC as clearing can be done more easily off the course under less hurried conditions.

Were we to turn Saint Hill into an HGC Scientology would bog down everywhere.

I agree it is desirable to have a cleared auditor. It is also true that auditors' cases get in the way of auditing. It is also true that clearing can happen, is happening and will continue to happen without cleared auditors.

At Saint Hill our responsibility is to train auditors.

It is the students' responsibility during and after Saint Hill to get clear.

By treating Saint Hill as an HGC, we could clear every student present. But also, by treating Saint Hill as an IIGC we would bog down Scientology everywhere.

Training is hereafter limited to 16 weeks with one month's extension in special cases. Students are now arriving better prepared and the clearing technology being taught at Saint Hill is now standardized.

HCO POLICY LETTER OF 9 JULY 1962

Sthil
Student

SPECIAL BRIEFING COURSE

The Saint Hill Special Briefing Course has certain distinct purposes.

The course was begun to do two things:

1. To study and resolve training and education;
2. To assist people who wanted to perfect their Scientology.

There has been no change in these purposes.

The first is succeeding very well. The second is achieving world wide recognition through people who have been here.

OPERATING PRINCIPLES

The Scientologists studying here are supposed to concentrate on only three things:

- (a) The acquisition of the ability to achieve a rapid and accurate understanding of data given to them for study and to put that material into effect;
- (b) To achieve auditing results;
- (c) To get a reality on the achieving of auditing results by exact duplication of current methodology and not by additives or extraordinary solutions.

If a course attendee can achieve these things Classification is inevitable. If all three things are not achieved, I refuse Classification on these grounds alone.

If an Instructor ever wants to know what he should be doing, examine (a), (b) and (c) above, regardless of any other policy or sheet. This is so thoroughly the case that an Instructor should not feel called upon to solve any student's problem by any other action than referring the student to the exact bulletin, tape or policy letter or advices covering the question's data, and by checking out the student's data, drill or action in the three course sections. To do more is to defeat the course purposes for the students.

All student difficulties and even depressions and threatened departures stem not from failure to handle the student, but failure to get (a), (b) and (c) into exact and forceful effect.

The student who wants to know how to complete this course easily need only understand and perform (a), (b) and (c) above.

Every time a student violates one of the three requisites above, I take special note of it and even if the student's check sheets were crowded with passes, given enough violation of (a), (b) and (c) I will not finally classify that student, for to classify such a student would be an overt.

A student who never misses on the E-Meter, can do the standard requirements of a session, gets fine results. Thus every time I see (c) violated I know that (a) has also been violated and act accordingly.

If I see a pc looking bad, I know that (a) has been violated and (c) as well and always find this to be the case every time I look into it.

The student should realize there is no "getting by" and no "fair" grade on this course. The Instructor who accepts less than perfect in all Theory and Drills and Auditing is setting up personal problems and blows. And the student who protests against perfect performance required is committing his own subtle suicide.

This is a tough course. Only become upset if it is anything less than tough. A lot of future depends on it.

HCO POLICY LETTER OF 10 FEBRUARY 1966

Applies to
Sthil only
Exec Secs
Qual and Tech Divs
D of T
Course Supervisors
Qual Sec & Qual Staff

**CHECK SHEETS COURSE
THEORY COURSES**

The check sheets of the Saint Hill Special Briefing Course Theory Courses will be changed as fast as is feasible to The Library Lists HCOB 30 November 1965.

These will be on a Zero rate.

Only the vital points like Axioms, Scales and key processes and Model Session are Star-Rated and these must be picked out and pointed up on the Check Sheets by the Tech Sec.

The Tech Sec is responsible for making up check sheets from the Library List omitting only any totally irrelevant HCOBs or books or pamphlets but keeping the amount of material as large as possible.

Obviously a student cannot have a copy of each bulletin or pamphlet so they are made up into sections of the level in a folder and the student hands it in when he has read it and it is reused. Students may buy copies of bulletins they want at the usual price and must pay for any they lose.

Tape check sheets will remain as they are at this time but will be added to when the Tape Library List is completed.

PRACTICAL COURSES

The Practical Courses will include the use of a doll. All auditing actions must be letter perfect using the doll before the Auditor is permitted a live pc.

A Grade Released pc for the level is required for the Classification to be assigned.

LEVEL VI

Level VI must include the entirety of the Whole Track materials assembled by M. Routsong and boxed.

These are Zero rated.

Practical for the Level consists of finding and running late implants on another pc for which the plot is known and given.

Solo Auditing Theory materials are then studied.

Practical is completed by Solo Auditing to Grade VI Release.

Persons taking this course with no earlier training must be given an E-Meter Check Sheet, rudimentary TRs and some Model Session before doing any of the above.

WARNING

There are two kinds of theory training. One is to go over a little material but very thoroughly. We have lately been doing this. The other method which I favour and have the best success with, is to go over LOTS of material lightly and swiftly and then go over a very small amount of very important material thoroughly.

Thus this is a shift in gears for Course Supervisors and they must not get in the students' way in going over lots of material beyond being sure it is actually covered and no misunderstood words exist in it. And they must be plain murder on the small bits that are Star rated. Axioms by heart mean Axioms by Heart and no "Ah—er ".

Remember that anyone enrolling in the SHSBC has been through the featherweight, small check sheet Academy Courses. These people lack a broad command of the subject. So we will give it to them.

EXAMINERS STUDENTS

The method of student examination is changed herewith.

THEORY

The Certificate Exam shall consist of:

1. Assurance the student has covered the broad body of data,
2. Assurance the student can parrot the Star Rated bits quickly, and
3. The student is not all at sea about the principles of the level and why it is a level.
4. The student can demonstrate the principles.

PRACTICAL

The student examiner on a Classification Exam must be sure the student can

1. Go through the motions of an auditor for that level;
2. Answer up to some practical questions about what to do;
3. Show evidence of having released a pc at that level and in a very proper, uncopied report.

The 5 GAEs if they appear at any time at any level constitute a flunk of the examination.

Examinations should only be carried on to a point where the Examiner knows whether the student doesn't know or knows but examination should be quite pitiless.

An Examiner finding a student is obviously too bad should always send the student to Review for an Assist before sending to Cramming.

The Assist should handle ARC Breaks and misunderstands before anything else.

Only flunking incorrectly or passing incorrectly upsets students. The truth leaves them cheerful. Whatever else happens.

These changes are not so much changes as you think. The original method of teaching the SHSBC is being resumed.

HUBBARD COMMUNICATIONS OFFICE
Saint Hill Manor, East Grinstead, Sussex

HCO POLICY LETTER OF 2 APRIL 1964

CenOCon
Field Auditors
Sthil Students

**TO THE SAINT HILL STUDENT:
INSTRUCTION TARGETS**

I have only a very few training targets for the Saint Hill student. These are:

1. How to perform flawlessly as an auditor;
2. How to run certain exact processes; and
3. Obtaining results with those processes by auditing well and exactly.

Your new check sheets for Class IV are now designed entirely around these principles.

Course conduct is organized entirely to forward them.

Materials exist for them and are being condensed even further.

If you wish to know what is expected of you as a student, see the above.
INFRACTIONS

All course infractions henceforward will be given solely upon technical matters and results.

Example: The student has "passed" an HCO B and does not seem to be able to apply it in a session. The cause of the infraction will be because the student is supposed to know it and doesn't and because the student could not make it work. The subject of the infraction will be that material required, and various allied matters.

DURATION OF COURSE

A student applying himself or herself in the future should be able to get through to Class IV within 16 weeks.

On Class VI the student already up on Class IV material should be able to get through the Theory and Practical of Class VI in a month of hard work.

Transferred to the Class VI Co-Audit the student should be able to make OT in well under 500 hours, barring unusual setbacks caused by wild auditing errors.

A student exceeding these times in the future is not working hard enough. There were various other reasons the times were being exceeded in the past and I have sought to eliminate them.

CLASS VI CO-AUDIT

As the student will be depending on the skill of one auditor it is up to him or her to make a sufficiently attractive showing as an auditor to be able to team up with another well-trained auditor.

At lower levels of auditing a weekly turn about and non-team (3 or more way) auditing rules assignment.

But at Class VI this is too hard on the auditor. Therefore the Class VI co-auditing is co-auditing in truth with a turn about on alternate days, 5 hours auditing, 5 hours being audited. And the same pair audit each other.

Therefore, early on in the Class VI course the student who has not come with a Co-Auditor should be considering who he or she will be teamed up with in the Class VI Co-audit and take an interest in the other fellow's progress too. The student should choose out his or her co-auditor unless of course a pair came from one area for that purpose and will be returning after the Class VI course. It is not required to stay for the Class VI Co-audit unless it is obvious that the student will have no auditing partner when he or she goes home. In such an event termination will be refused for every one's sake.

SUMMARY

The Saint Hill Course is not designed to be a starting auditors' course but only to fill in gaps and polish up to Class VI, to teach people to run GPMs in Class VI course and to audit toward OT in the Class VI Co-Audit. These are the 3 stages of Saint Hill training and auditing. No other stages are planned.

Therefore the course cannot help but be a flat out high pressure course.

You can remain in any course at Saint Hill as long as you like. We haven't booted anybody out for ages who didn't want to go. It is not the Saint Hill staff who holds people on and on except in a few cases where it would have been an overt not to persuade continuance, it is the student who continues himself or herself.

But the pressure is there to get you through—for the benefit of those waiting for you, for your own economics and for all our sakes. We need able people. We can make the able so far more able this spring that all our concentration is upon getting you moving along and doing well.

We are on the verge of great social progress for this planet. Nothing we have done before—and it is greater than others have done—compares with what we are doing now.

By being here, you become part of a great team.

We need you.

So do well.

HUBBARD COMMUNICATIONS OFFICE
Saint Hill Manor, East Grinstead, Sussex

HCO POLICY LETTER OF 11 JUNE 1964

Sthil Students

**NEW STUDENTS DATA
STAR RATED FOR NEW STUDENTS**

Tape Passes

On those live lectures you hear, when you take the Friday tape examination and keep your exam paper when it is handed back, and present it to Theory as evidence, any live lecture you have so heard is credited on your check sheet by Theory where the lecture appears on the check sheet.

Not all the lectures I give appear later on check sheets but many do and you should get credit for those you have heard.

If you have a Friday exam paper on any lecture you have heard live and the grade is above 90% for star rated and above 75Sb for a 75, any grade for a zero rate, if the lecture appears as a tape on your check sheets it will be marked off as passed and initialled by a Theory Instructor.

Auditing Assignments

In auditing before the Level VI Co-audit, it is customary to split up teams that will eventually co-audit to OT.

The reasons for this are:

1. Auditing skill tends to become adapted to one pc and deteriorate. This does not make a good pro, it makes only a co-auditor. I'm making you into a pro, not a co-auditor regardless of classification status. I can't do that by giving you just the pc you are already educated to run. You'd be a one pc auditor.
2. Mutual withholds develop in teams and restrain auditing results.
3. Your auditing skill tends to look better or worse than it is.

We don't even wholly guarantee you and your co-auditor that you will co-audit in the Level VI Co-audit for one team member may be Case type A and the other B. A Case type A can run through anything. A Case type B stops at a comma. Thus one gets too far out of pace with the other and it's just too hard on one member of the team who would be, of course, the Type B and already in trouble. It would be selfish indeed of a Type A to force a Type B to run GPMs far beyond where he or she has had them run. We will try to put the team together in the Level VI Co-audit and mostly do but this AB factor is a technical one and we can't do anything about it short of good auditing.

Student Rules

A lot of students come a cropper on the rules and try to carry on without concurrence.

You are only here for a few months. In your hands is your next multi-trillion years.

The rules are there to get you through. Breaking them, in my opinion, is too pricey.

Rapidity of Progress

A few new students arrive here in a high state of "know it all, just want a few new gimmicks".

Students who have this state of mind just don't learn or progress. And they really get stuck in. We're not doing it to them. They are trying to learn over the top of their own postulate that they already know it (when they don't) and so get into a ridge. They're not stuck in the course. They're stuck in this conflict.

In the first place, no new student at Saint Hill has ever been known to give a standard session on arrival, despite all the data being available. But they don't know enough about auditing to know whether they're doing well or not, much less know how to audit. Factually they usually look pretty pitiful. There they are making Gross Auditing Errors in an avalanche, missing comm cycles, feet in the pc's face with their meter upside down, telling the Class VI auditor who is his Instructor "I know all about it. We had a course in Slobovia much better than this one. The pcs audited the auditor and it _____"

Well you can't blame the instructor if he seems to be having a hard time to keep from laughing in the new student's face. It's only their courtesy that keeps them from reaching over and connecting the unconnected cans this new genius has failed to plug into the meter as a fitting touched

Some auditors trained elsewhere with great ARC but precious little "do it", don't have enough training to know they aren't trained. And it's always the very worst trained auditors who howl the loudest about how they don't need to know. The majority relaxedly study and improve their skill, get results and there it is.

I myself periodically study auditing and put a polish on my own skill. I don't have to say "I don't know", but I'm not so arrogant as to believe I'm above knowing how to do things. So if every year or two I can study how to audit without going into a long rigmarole about how I'm above all that, I can reasonably expect others to have a sane view of their own skill too. Any skill can be improved—one can know more about any subject—unless one has already decided he or she already knows all about it.

The successful progress of a student is inversely proportional to the student's preconception of knowing it already. An arrogant assumption of total knowing without inspection is the surest way to make no progress.

One does or does not know the data before him. That's elementary. Why should it become involved with emotionalism?

The fast student is not concerned with necessities to maintain status by asserting how much he or she already knows. The fast student is only interested in knowing what he does not know, studying it and then knowing that he knows it.

The slow student is so busy putting on that he knows that he never finds out he doesn't in fact know. To do this before a lot of experts such as Saint Hill Instructors seems pretty pointless.

Results today are by the text book. Lack of results are always attended by departures. One can or cannot get results with auditing. This means that one is or is not doing a text book job.

In our case the text book has 14 years of hard won experience behind it. So text book auditing gets the best results. It's that simple.

The statement "I know all about Scientology but I don't get very good results" is a pretty silly statement today. It's saying in fact "I pretend to more than I know and the flubs show up in my results".

Well, that's getting right down to the reasons for slow progress and calling a spade a spade, but it's awful true. It's really the only reason back of slow progress on course.

The speed with which you complete your course and get to OT is entirely regulated by the speed with which you discover there's something here to learn.

Most students handle this very early. I'm sure you will.

I give you my good wishes for a fast progress.

HCO POLICY LETTER OF 17 AUGUST 1966

Sthill only
All Staff

**ROUTING AND HANDLING
OF SHSBC STUDENTS**

ANY STUDENT ON THE DAY SHSBC IS FIRST AND FOREMOST A STUDENT.

This rule is true regardless of what other activities they undertake on their own time.

No student may hold a post on the Foundation, if, in the opinion of the Supervisor, it interferes with the student's progress on course.

Any student holding a Foundation post must be immediately replaced if course progress is being impeded.

ORDERS AND ROUTING

Any orders or routings given to a student by another section of the Org which will interfere with course hours must be done via the Tech Sec. D of T. and the Course Supervisor of the student concerned.

The sole intention of the latter is to prevent students from "disappearing" from course into the HGC, Review, or anywhere else, without the Supervisor having directly sent the Student.

**RETREADS ON SAINT HILL
SPECIAL BRIEFING COURSE**

Students on the Special Briefing Course who require leave of absence for emergencies may do so under the following conditions, otherwise they will be charged a retread fee irrespective of the length of time they have already been on Course.

2 weeks absence (with permission only)

3 months (by very special arrangements beforehand).

Other than that, any student leaving Course for any reason whatsoever will be charged a retread fee on returning. No part of the original fee is returnable.

STUDENTS TERMINATING

LEAVE OF ABSENCE
BLOWN STUDENTS

I. Students Terminating

Any student terminating the SHSBC, the Solo Audit Course, or the Ministers Course is to get an end of course clean-up by a qualified fellow student on a June 26 Form run as Auditing by List.

The D of T is responsible for seeing that this policy letter is put into effect.

Any student routing form now in use should be modified to include this step. The Unit Supervisor is to sign in the proper place.

In case of difficulty in the cleaning up of the form, the student should be routed to the Dept of Review for a formal review session

Ethics cannot OK the termination without the form signed by the Unit Supervisor, whether a review session occurred or not in the Dept of Review.

II. Leave of Absence

(a) Any student wanting to leave course should be treated as a kind of blow and sent to Review. Only after a review can any leave of absence be granted by the Tech Sec. on D of T's advice and after an Ethics clearance. Valid evidence of the necessity for a leave must be presented by the student. In no case can it exceed two weeks—exceptional leave of absence exceeding a two week period can only be granted by the Ad Council upon presentation of strong evidence of the necessity for such and after the above routine has been gone through.

(b) A short leave of absence of a day or so can be granted by the Unit Supervisor without any further okay than by the Dir of Training.

III. Blown Students

Blown students are handled as per HCO Pol Ltr of April 5, 1965, HCO Justice Data re Academy and HGC—Handling the Suppressive Person, page 6—"Blown Students" and any other policy letters dealing with suppressive acts.

BOARD POLICY LETTER

17 MAY 1971 RA
ISSUE II RA
REVISED 13 NOVEMBER 1972
REVISED & REISSUED 10 JUNE 1974 AS BPL

Remimeo
All Staff
All Students

CANCELS
HCO POLICY LETTER OF 17 MAY 1971R
ISSUE II
SAME TITLE

STUDY POINTS AND CONDITIONS
(Revises and replaces HCO PL 25 Oct 70
of same title for all checksheets)

GOES INTO EFFECT WEEK ENDING 27 JUNE 1974.

This revised issue has been designed to even out earlier inequities which gave artificial surges and slumps in students' graphs, and adds points for handling misunderstands to further reward application of Study Tech.

The following point system is the standard point system and is to be used on all Scientology and Dianetics Courses. It cancels all previous point systems.

A point system is used so that students may accurately measure their progress through a course. It further provides a quantitative measurement of the production of a course, Academy or Org.

The system itself is based on (1) how long a particular study action takes and (2) the type of action it is. Thus the practical is more heavily weighted than the theory, since the purpose of study is application.

ALL POINTS MUST BE EARNED.

The point system assumes that the student knows and can apply all the data for which he has gotten points. (See HCO PL 26 May 1961 "Quality Counts".)

PARTICULAR EMPHASIS ON TOUGH EXCELLENT TRS AND METERING AND UNDERSTANDING OF AUDITORS CODE IS REQUIRED.

SUPERLITERATES (those who have completed PRD) count their points exactly the same as others. Eg. .an item marked starrate on a checksheet is so counted by the SUPERLITERATE even though not checked out by another.

	<u>STUDY ACTION</u>	<u>POINTS</u>
0.	Misunderstood word from materials defined and cleared. or Word defined and cleared on the PRD	1 point per word. 3 points per word.
1.	Any written material (except O-rate as noted otherwise below).	3 points per page *-rate 5 points per page
2.	Tapes	O-rate 60 (60 min tape) O-rate 90 (90 min tape) *-rate 75 (60 min tape) *-rate 100 (90 min tape)

3.	Clay demonstrations (only credited if done precisely per HCO B 11 Oct 67 "Clay Table Training". Demos must be of good large size and show what's being demonstrated. Points are counted per demo rather than per item on check-sheet where any one item required more than one demo.)	25
4.	Essays	10
5.	Study LRH C/Sed Sessions	10 per session
6.	TRs (Wherever TRs are done, the following is required):	
	OT TR-O to major stable win	50 per hour plus 50 for passing
	TR-O to a major stable win nonbullbaited pass.	50 per hour plus 100 for passing
	TR-O Bullbaited to a major stable win	50 per hour plus 50 for passing
	Other TRs to 10 unflunked consecutive actions. Each previous TR to be <u>in</u> .	60 each
	TR 101	25
	TR 102 (All done thoroughly.	50
	TR 103 All TRs to be in.)	75
	TR 104	100
7.	E-Meter Drills (except for the following)	15 per drill
	E-Meter Drills 17, 20, 21, 26	25 per drill
	Instant Read and Assessment Drills	50 per drill
	Dating drills	120 per drill
8.	Doll Drills - All thoroughly done to a good pass - thoroughly done with TRs in.	30
	Bullbaited Drills coached to a flubless pass.	75
9.	Films	O-rate same as for tapes *-rate same as for tapes

10.	Codes and Axioms- To be thoroughly understood. If clay demos done, the clay demo points apply.	O-rate 1 per code or Axiom *-rate 10 per code or Axiom
11.	Scales - To be thoroughly understood. If clay demos done, the clay demo points apply.	O-rate 15 per scale *-rate 25 per scale
12.	Charts 1 column of a chart or 1 level	*-rate 75 O-rate 25 *-rate 15 O-rate 10
13.	Student Auditing requirements Flunked Session Not Flunked Session Well Done Session Very Well Done Session	0 60 per auditing hr 100 per auditing hr 120 per auditing hr
14.	Student Folder Error Summaries Student PC Program - correct and accepted. Dianetic Flow table	10 per session 100 100
15.	Student C/S - correct and accepted.	15 per C/S (includes session admin time)
16.	Coaching another student through a drill Completing a student fully on Dianetics or on Expanded Grade Coaching another student but failure to complete to a pass	same points as student for that drill 500 point bonus - provided student delivered at a minimum rate of 25 WDAHs in the chair per week in delivering the grade. 0
17.	Twin Checkouts - not coaching M3 on another student	5 per checkout given whether flunked or passed 3 points for each word found and cleared
18.	Official Examinations	200 for exam passed

- or
100 for attest
19. Specialist Training - practical, not otherwise covered. 60 points per hour

ADDITIONAL:

- A. Hat checkouts, etc. follow study points system for individual items
- B. Full Org Board drawn up and posted - for any purpose. 120

STUDENT CONDITIONS

FULL TIME STUDY = 8 hours a day, 7 days a week.

PART TIME STUDY = 2 1/2 hours a day, 7 days a week.

CONDITION	POINTS PART TIME	POINTS FULL TIME
POWER	1800 or above	5600 or above
AFFLUENCE	1600 - 1799	5000 - 5599
NORMAL	1400 - 1599	4500 - 4999
EMERGENCY	1200 - 1399	4000 - 4499
DANGER	1000 - 1199	3400 - 3999
NON - EXISTENCE	Less than 1000	Less than 3400

NOTE: The trend of the student's stat graph is always taken into account per HCO PL 3 October 1970 " Stat Interpretation ".

OEC Checksheet

READING STATISTICS

In a local org area one reads the Division stats for the WEEK. A Dept reads its stats by the DAY. A section does it by the HOUR. You can also read all Div GDSes by the day; successful orgs do.

TRENDS are used in more remote areas from the org. to indicate successful leadership or broad admin or tech situations. TRENDS are used locally to estimate expansion or warn of contraction.

Thus in weekly condition assignments one only considers two things: that exact week and the slant of that one line. Steep near vertical down: Non E. Down: Danger. Slightly down or level: Emergency. Slightly up: Normal. Steeply up: Affluence. Near vertical up: Power.

The volume of the stat has little to do with it. Level at high or level at low are alike Emergency.

The proof of this is that you always find a why and it's always some change.

Typical argument about stats: "I know it's down a bit but it's so high generally that it's Power." "I know it rose but it's so low that it's really Non E." All this is being reasonable. Status think.

When you don't value stats this way you don't catch the improvements or flubs that, piled up, wreck an org.

I recall a D of T who had high high stats. One week they plunged. He said, "Oh of course. We graduated some students and " But I rejected that and looked and looked and lo and behold they'd changed their method of handling students! This, found and repaired, sent their stats soaring!

When you let status reasoning get into stat assignment of conditions, the org has had it!

The weekly condition assignments must be accurate. Only in that way can one maintain expansion.

Also, it's a bit mean to nag around about a rise. "But it isn't much of a rise, you're really in too low a range to have a rise count "

A rise is a rise. They at least got more. Now, better organizing, they will get more than that. Week by week it goes up.

Similarly to discount a fall just because stats are high high high is folly. They could do week before last's as they did it. So what was wrong that they couldn't do it again? If they got exhausted at it week before last they need more help, obviously. Or better organization.

Only if you use the single week can you properly locally manage.

If you keep it up the org will start to occupy more space, need more people, need more equipment. Actually the area control of the org increases and stability and viability increase.

If stat declines for the week are brushed off the org will shrink, become less stable, will demand more work by fewer and will be a burden.

When you manage by the stat you don't go wrong. But it has to be an honest stat and explanations that aren't the real why have to be rejected.

As you work with this, all becomes revealed. And one has a total control of survival.

**E-METERS AND BOOKS FOR
ACADEMY STUDENTS**

There is a policy for Academies that each student own his own E-Meter. This is true for any level Academy Course.

It's up to the D of T to make sure his students own their own meters and are using E-Meters as per policy.

TEXTBOOKS

An Org Tech Div or any other part of the organization may not provide a library as a substitute for students buying their own textbooks. In any non-state supported grade school and in any college or university students are expected to buy their own textbooks for their courses. They are told what to buy before starting the course and do so. Don't violate this custom.

Also, students will do better if they own their own textbooks as, naturally, they will need them for reference.

Any Scientology book on a check sheet must be bought by the student for that course. This is true of Foundation courses also.

HCO POLICY LETTER OF 8 JUNE 1970
Issue II

(CANCELS HCO PL 29 Oct 65 Student Auditing of Preclears, HCO PL 23 May 69 Issue II Dianetic Course Student Auditing, HCO PL 17 May 65 Free Scientology Center and HCO PL 17 May 65 Issue II Academy Processing.)

STUDENT AUDITING

The following policies regarding student auditing are made with reference to LRH ED 104 INT 2 Jun 70 "Only training gives low cost auditing from fellow students" and LRH ED 107 INT 3 Jun 70 "See that students do a lot of mutual auditing".

Students may not audit any public preclear. (Unfinished but promised pcs existing at this date of issue may be assigned to the student as a Charity pc by the Chaplain.)

Students may audit students who have been enrolled and who have paid in full for a Scientology level 0 or above or Dianetic Course. They may also audit contracted staff members and may be required to audit organization preclears under the D of P who are not enrolled on a course in order to complete their auditing requirements.

The course supervisor is to ensure that each student preclear's folder is C/Sed for each session to be given and that any needed folder error summaries are done.

The course supervisor must make the auditing requirements of students and preclears known on a scheduling board so that student auditors can be assigned to preclears and sessions scheduled. Regular sessions may be scheduled during course hours besides any other mutually agreed upon time.

The Classification requirement for each level is that the student successfully audits several preclears to the attainment of the grade of release of the same level by auditing each of the many processes of the grade to its end phenomenon.

The auditor must produce consistent well done or very well done sessions on at least three preclears in which all standard tech for that grade has been exactly applied. Every effort must be made to see that the student audits each process of the grade.

Scientology course students may audit Dianetic Course students on any needed Scientology actions.

Any student auditing successfully for the Director of Processing may be given an honors class for the level.

A student who has honors for every level may be awarded an honors final certificate and the certificate clearly marked and permanent. He also may be awarded an Internship for his highest class qualifying him as a C/S for that Class providing he also does the C/S checksheet well for that class Internship.

Students not permitted to audit for the D of P and who otherwise qualify as students are awarded PROVISIONAL certificates made permanent only after a year.

Students may NOT audit local residents for classification and the Free Scientology Centre is not now permitted. They may of course audit anyone after graduation and if for fee, must charge at least as much as the full org price. They may of course, if qualified, audit friends and family free of charge.

This does not prevent the Chaplain or D of P from assigning charity cases to students at the discretion of the org.

Tape Course Series 4

TAPE PLAYERS—DESCRIPTION AND CARE

Tape Players are the machines used on a Tape Course for playing back on already recorded magnetic tape.

Tape Recorders are the machines used to record the tapes in the first place.

Some tape machines will do both actions of *recording* and *playback*. On a Tape Course if these machines are used the button that is used for “recording” should be removed or sealed up so it can not be used. It will wipe the tape clean and lose the valuable course materials if pushed accidentally by a student. (This button is usually colored red.)

Tape players come in many makes and models. The controls and switches are arranged in various places and styles but are all pretty much the same in function.

1. *Plug* to electricity mains.
2. *Power inlet plug* to tape machine.
3. *Plug in to* foot pedal start-stop control.
4. *Start-stop* foot pedal.
5. *Start-stop* foot switch.
6. *On/Off* switch and volume control.
7. *Power on* indicator light.
8. *Tone* control.
9. *Plug in* for earphones.
10. *Hi fidelity* earphones.
11. *New Tape* to be played.
12. *Playing head* sensitive to magnetic sound impressions on the tape.
13. *Tape passed through* between playing head and felt pad.
14. *Tape passed round* roller protecting guides.
15. *Empty tape spool*. (Tape is wound onto this.)
16. *Tape Counter* window and zero setting button.
17. *Recording key* removed or sealed up.
18. *Start key* for starting tape by hand.
19. *Stop key* for stopping tape by hand.
20. *Pause key* (stops tape while held down only—tape continues to play as soon as released).
21. *Fast wind key* forward.
22. *Rewind key* (fast backward).
23. *Track Selector* Switch (some tapes have several sound tracks recorded on the one side).
24. *Speed Selector* Switch (tapes can be recorded at different speeds and so some must be played at different speeds to others).
25. *Indicator dial* and buttons connected with recording—not used when playing tapes.

Here are some points to help you use the tape player:

- (a) When placing a tape on the machine, an arrow on top of the tape reel indicates an opening in which you place the tape end. Keep this end very small. Long loose ends break off and can jam the machine.

- (b) The *dull* brown colored side of the tape must always face inwards against the playing head when threading the tape. This is the side that Ron's lectures are recorded on.
- (c) To wind back or fast wind the machine always press the stop key first. Harm is done if the playing tape is suddenly switched over to reverse or fast forward by-passing the stop button.
- (d) The magnetic materials of the earphones can harm the tape so never leave the earphones lying on top of an uncovered tape player.
- (e) Keep all dirt out of the tape player and when away from the player replace the lid to avoid dust entering into the machine.
- (f) Every care must be taken to avoid rough handling of tapes. Do not misplace tapes into incorrect boxes and never permit loose ends to protrude out of the closed box.
- (g) Switch off the tape player when not in use (break time) and when you have finished with the machine. This prevents overheating of inner parts and drive belts.
- (h) The tape counter indicator should be set at zero when you first start playing the tape. This counter will register your place whenever you stop the tape. Do not insert a piece of paper or anything else between the tape as a method of registering your place.
- (i) At the first sign of any fault with the tape player please call the Supervisor and report what it is to him or her.
- (j) Twisting or knotting the earphone cord is strictly forbidden as this leads to inner wire breakage, which results in a concealed fault that can be difficult to locate.
- (k) The metal "playing head" across which the tape moves when playing must be cleaned at regular intervals as it picks up dust from the tape resulting in blurred poor quality sound. This playing head should be cleaned after every 8 hours of playing time *or* whenever the sound becomes blurred. The playing head is cleaned by use of a cotton swab on the end of a toothpick and cleaning fluid. This is wiped with firm pressure across the playing head until the dirt and dust are removed and the metal is clean again. *Great care* must be taken not to scratch the playing head as the tape would then be damaged as it passed across.
- (l) The tape player must also be demagnetized after every 8 hours playing time. This is done with a special demagnetizer designed for the purpose. The playing head and all the metal parts on the tape "path" are demagnetized in this manner.

These parts build up a magnetic attraction with continuous tape playing and this can be harmful to the quality of sound on the tape if not handled and removed as above.

It is the Supervisor's or Course Administrator's responsibility to learn to do this action and to do it at least once per day on all tape players.

- (m) The moving parts of the tape machine mechanism also need regular cleaning and lubrication with a very fine lubricant. This procedure can be carefully learned by the Course Administrator from a professional at the job and can be done by him thereafter.

Tape Course Series 6R

TAPES, HOW TO USE

(Reissued 23 November 1971 verbatim
additionally as a Tape Course Series HCO B.)

FOREWORD

The most appalling ignorance has existed on the use of magnetic recording tapes.

It is therefore of the greatest possible importance that the subject of tape use be grasped and gotten rapidly into effect.

Probably half the technology of admin and tech exists only on tape.

Tapes, incorrectly used, can be the source of endless misunderstands. Because tapes have been almost uniformly misused in the past, these misunderstands have added up to a general misunderstood on the subject of tapes themselves.

Students have been known to copy down the whole tape so they could study it. This is a complete waste of time and misuse of student study hours.

Some orgs even played advanced study tapes to the public.

European orgs have even played translation quality tapes (usually not auditorium quality) of OEC Volumes as raw public lectures! (And lost their audience through lack of quality and inaudible and strange words.)

Casual staff briefing tapes, not okay for release, of very bad quality, have been played to staffs of other orgs and the public.

There is no end to the abuses.

Therefore, for the benefit of understanding words alone, it is VITAL that tapes be properly used and not abused.

TYPES OF TAPES

There are four classes of tapes. These are:

1. Course study tapes.
2. Public lecture tapes.

3. Briefing tapes.
4. Model performance tapes.

COURSE STUDY TAPES

Tapes made for courses are of two varieties:

- (a) English, usually by LRH.
- (b) Translations, done by translators.

They are FOR COURSE USE. This is what the org sells—training on Tech or Admin.

These tapes appear on checksheets and are done at the points of checksheets where they are called for, and are done by Method 2 for tapes or Method 3 for tapes as required.

The foreign language tape courses are done from a special tape checksheet and are done exactly as laid down by Method 2 or Method 3.

None of these tapes are all written out by the student and then studied. This is a waste of time.

Further, such tapes are NOT played straight through with the student making notes of any misunderstood words “to look up later”. This will blank out the tape content on the student’s mind and knock out the student.

So to play a course tape straight through to any student is to risk a stupidity and a blow. IT IS NOT DONE. It does not matter whether the student takes notes of misunderstands or not. A COURSE TAPE IS NOT PLAYED STRAIGHT THROUGH. Only the earphone, footpedal start-stop control procedures are used.

A course tape is NEVER PLAYED TO A GROUP OF STUDENTS. When played to more than one student, *some* student is going to get a misunderstood and there goes a blank student.

Two students don’t even listen to a tape even on Method 2 Tape Word Clearing! One has the meter and footpedal and the other the earphones. The word clearer stops at each read. He does not otherwise listen.

Course tape quality must be good. All the words must be hearable and not inaudible. They must not be slurred or hard to make out.

The earphones and tape player used must be high fidelity just any old earphones won’t do.

The tape player “playing head” across which the tape passes must be clean—done by a cotton swab on a toothpick and cleaning fluid. The tape coating comes off on the playing head and after a time the sound is badly blurred.

Using a course tape any other way is now FORBIDDEN. Tests have shown that violations of this are the reason for student failures and blows and out-Ethics.

It goes without saying that the general handling of tape players and tapes must be well learned and practiced by Course Supervisors and students.

PUBLIC LECTURE TAPES

The probable reason stats fall after tape congresses is the misunderstood word.

Congresses seldom use really high fidelity equipment. Further, tape copying is often done by outside firms and the tape copies themselves may be of poor quality. The combination is deadly.

We looked for the reason for stat drops after tape congresses and this is the only explanation which has come forth.

Doingness congresses that are mainly seminars have been very successful. (By doingness is meant TRs—training drills—and other ACTIONS.) The relay of data to a public whose vocabulary is usually inadequate is not likely to win, as it hits their faulty vocabulary for one thing and uses new words for another. You can *show* somebody how to do things far better than you can tell him.

This then extends into Div 6 Introductory Actions as well. The relay of data comes AFTER the demonstration in action terms.

The possibility of possible bad playing speakers, possible low tape copy quality, the barriers of languages not learned in the first place and the introduction of new mental concepts combine into a hurdle that makes tape or film public presentation adventurous.

Listening to public type tapes, by using footpedal start-stop tape players, is being put in a special public course category.

Raw public tape and film presentations are however a must to keep the flavor and meaning of Dianetics and Scientology. So ensure excellent quality tapes and equipment are used with correct tapes for that public and you will have success.

BRIEFING TAPES

These are not to be confused with Special Briefing Course Tapes.

A briefing tape is done to brief or debrief missionaries or to record a conference or to record special instructions to a person or group. It can then be used for reference or to settle any dispute. It can also be used to inform a staff or several staffs.

A briefing tape is then a tape designed for a special and informed audience.

If the tape quality is good and the audience is already a familiar or trained audience, a briefing tape can be played **ONLY TO THE AUDIENCE FOR WHICH IT WAS INTENDED**.

To do otherwise is to risk misunderstood words and non-comprehension of what it is all about in general.

“Ron’s Journals” were *staff* briefing tapes. They began to be used for public. While they were not without success, one could no longer brief staffs on this line and the line was therefore cut. One could not make them with a security that they would be played to staffs.

An isolated briefing to a single executive on “these are our future hopes” has been thereafter used as a staff briefing of many orgs as “these are your orders”.

Any tape is designed for a specific public.

Briefing tapes are especially subject to abuse by being played to wrong publics.

Any briefing tape which contains specific orders and plans which could be misunderstood should be played only to the individuals concerned with a stop-start footpedal and Method 3 Word Clearing, not going past any misunderstood.

After a person has been briefed verbally, it is very revelatory to then Word Clear 2 the tape made at the same time. It will often be found that misunderstood words lead to potential alter-is in the actions required.

Tape in this instance is an enormous help in assisting and clarifying briefings.

A group can be briefed if thereafter each is Word Cleared Method 3 or 2 on the *tape* afterwards, using standard tape word clearing.

Needless to say such tapes must be of good quality.

MODEL PERFORMANCE TAPES

Tapes exist which give a standard of performance.

In Dianetic and Scientology Auditing student auditors have never been known to achieve a high standard of session presence and Communication (and accordingly high results) without the careful study of tapes made of similar sessions by high level auditors.

A student musician is unlikely to achieve professional performance level unless he has heard a professional play.

It would take a film or live demonstration to communicate a high standard of performance in a purely action subject. For instance for centuries no one believed that Robin Hood could split his first target arrow with a second until a new generation worked on it and a few painfully recovered the lost art of archery and then demonstrated how it was done for others to *see*.

Tapes and films serve a vital purpose in maintaining a performance standard.

As these tapes and films show HOW it is done and the ATMOSPHERE and RHYTHM of ACTION they are not subject to word clearing.

CONCLUSION

Tape and film training is vital, valuable and has its role.

But like showing a child how to open a book and read, there is exact technology in USING tapes and films.

The first thing one must realize is that the use of tape and film is itself a technical subject that must be studied and learned. One does not naturally know it.

The failures of universities to make educated and civilized men is because their own professors know nothing of misunderstood words and so lectured happily on and on to a snoring student body. One professor of physics used to open the classroom windows wide in freezing winter "to keep his students from going to sleep in HIS class". And then stood on the platform and defined nothing as he rambled on. All it did for his class was give them coughs between snores!

The handling and use of tape and film in training and administration IS a subject.

By failing to know it and use that information, one can block the road for himself and all others to being learned and being free.

(This issue has been changed from TC Series 9
to TC Series 7. Points 10-19 have been revised.)

Tape Course Series 7

SETTING UP AND USING A TAPE PLAYER

Tapes of course materials must always be listened to through high quality high fidelity earphones. This permits the listener to be undisturbed by other noises in the area, as well as prevents others from being disturbed by the tape being played. High fidelity earphones permit the listener to have his undivided attention on the tape and produce a pleasant and easy to listen to sound which closely duplicates what is spoken on the tape.

The tape player used must also be of high quality to reproduce the sound without adding to or distorting what is on the tape. Poor quality sound is difficult and annoying to listen to and causes misunderstandings by preventing the listener from hearing exactly what is said. Properly cared for and regularly maintained, a high quality player will last several times as long as one costing half as much which never does produce a good quality sound.

SETTING UP THE TAPE PLAYER

1. The tape player is set up on a steady bench, table or platform at a comfortable height so the student can operate the controls easily when seated in front of it.
2. If possible, the tape machines should be set up so that the student is facing the Supervisor of the Course, rather than the student having his back to the Supervisor. This enables the Supervisor to spot easily if the student has gone dull or sleepy from a misunderstood word.
3. The tape machine is plugged in, switched on, to check if the power is on and that the machine is operating.
4. The tape machine must be the type that is set up to operate with a start/stop foot pedal switch. These can easily be obtained and fitted to existing tape players that do not already have them.

This is very important as the machine will be started and stopped many times by the student (with his foot on the pedal) while he is using his hands to look up words in the dictionary, fill in his checksheet, etc.

The connected foot pedal is placed where it is in easy reach of the student's foot.

Test it to ensure it is working.

5. The tape player “playing head” across which the tape passes, is checked to ensure that it is clean. The tape coating comes off on the playing head and after a time the sound is badly blurred.

If the playing head appears dirty or the sound is blurred, the tape head must be cleaned. This is done using a cotton swab on a toothpick and cleaning fluid. It is rubbed across the playing head until all the tape coating is removed.

6. The tape that is to be heard is obtained and put on the player and set up for start-by passing the “coloured leader” on the tape past the playing head and onto the empty spool. Make sure it is passed around the “roller guides” (designed to ensure it runs freely and doesn’t catch and tear on any sharp edges).
7. Plug in the earphones, put them on, and switch on the tape to test them (to ensure they are working and the quality of sound is good). Adjust the tone and volume to suitable levels. Switch off the tape.
8. Place a good dictionary, a “demonstration kit”, the Course checksheet and a notebook and pen where they are in easy reach while seated at the tape machine.
9. Set the “tape counter” at zero and the tape at the beginning (by winding it back if it has started into the Course lecture during the tests).

USING THE TAPE PLAYER

10. Play the tape at its *correct* speed.
11. Listen to the tapes in the order they are entered on your Course checksheet.
12. Mark off each *item* on your Course checksheet as you finish listening to it (or when you have checked out on it if a checkout is required).
13. Mark the “tape counter reading” of *each* item on your checksheet as that item begins on the tape. This gives you a reference by which you can find any item later on. You may be required to restudy some items by the Supervisor and you may want to hear some of them again yourself to clarify them with later tapes.
14. If a word(s) or phrase on a tape cannot be understood, call for the Supervisor. The Supervisor listens to the tape and if he can’t distinguish what is being said, with the help of the Course Admin, gets hold of the English text and locates the word or phrase, then using a good foreign language dictionary translates the word or phrase for the student. This cycle should only take a couple of minutes.
15. If a student bogs on listening to a translated tape, he is first Word Cleared. Should the confusion not clear up, the translated tape is compared to the English material and if found to be a translation error the Supervisor or Word Clearer, with the use of a good dictionary, translates the English text correctly for the student. The Supervisor makes a note of the translation error by entering the error on a card which is placed in the Tape Box for student use, and sends a report to TU Chief Pubs DK.
16. When rewinding a tape back a bit wait until the tape stops before you press the start button otherwise the tape is liable to break through mishandling.
17. Rewind each tape onto its correct spool as you finish listening to it and turn off the tape machine. Replace it in its box and return it to its correct place from which it came.
18. Replace the cover on the tape machine when the machine has been finished with.

19. Use BTB 26 November 1971R, Rev. 17 Aug 74, "Handling Misunderstood Words on Tape Recorded Materials", and BTB 27 Nov 71R, "Method 2 Word Clearing on Tapes and Tape Courses".

HCO BULLETIN OF 21 NOVEMBER 1971 R
Issue II
REVISED 23 OCTOBER 1974

Remimeo

Cancels BTB 21 November 1971 RA

(Revisions in this type style)

Tape Course Series 3R

TEACHING A TAPE COURSE

(HCO Policy Letter of 6 December 1970,
Issue II, Revised and Reissued as an HCOB.
Changes in this type style.)

The instruction of students by tape is done by individual tape playbacks equipped with earphones and a foot pedal start-stop control.

It is imperative that the earphone quality be of the highest, and the tape copy have very good sound quality. Otherwise students go to sleep over misunderstood words.

The individual tape player method is used because (a) it can handle a large or small number of students, (b) it works where there is a trickle of students starting at different times, (c) it works where students studying subjects different from each other are using the same classroom. It takes more tape players and must be earphone equipped but it prevents students going past misunderstandings as can occur if they are all listening to a group tape play.

The foot controlled start-stop pedal is necessary so the student can use his hands freely to take notes and look up words in the dictionary. It also enables the tape to be stopped instantly without the time lag it takes to reach for and push a finger button—thus going past the place where the stop is desired.

RULES & DESCRIPTION

Only the Glossary, course rules and checksheets, with course description are translated into the language being used for teaching and mimeographed or printed into small booklets.

The description must include how to handle tape players and caution against machine or tape damage and inadvertent erasure of a tape. (To guard against actual erasure it is wisest to tape over the record button or preferably, to have the recording unit disengaged. Also, it is sometimes possible to buy, at cheaper prices, playback units only (tape machines in which the recording unit hasn't been installed). They must however be of good quality.

ENROLLMENT

Enrollment is done no matter how informal the course is. A waiver of accident or damage holding the school not responsible, must be signed by the student and, if a minor, by his parents or guardian on any tape course.

An enrollment invoice showing full course payment must be in the hands of the supervisor, giving the date of enrollment, home address and local address.

A roll book has every student's name, address and the course enrolled in and date. This must not be omitted as it is the only permanent record and is often resorted to to prove contentions.

FILES

A student file system must exist. A folder with the student's name on it and which will receive his completed checksheets, exam results, etc, must be made up at once.

CHECKSHEET

A checksheet for the course must exist, breaking the course down into small easily attained segments of Theory and Practical.

It must be in the student's language.

It has blanks opposite each segment so that a student checkout can be initialed with date by the person checking him out.

NOTEBOOKS

A student is expected to keep a notebook from his tape listening. This should be neat and complete. The student never copies out the whole tape. He takes exact verbatim notes of any Process Commands or Lists and notes down also the important technical rules.

A sample notebook should be provided.

A student should leave frequent spaces so he can enter new notes on a second and third play of the materials.

CHECKOUT

Where only tapes exist *and a checkout is required* students check each other out from the *actual tape, not from their notes.*

"Give me an example," is the keynote of such a checkout. (a) What is the , (b) Give me an example.

PRACTICAL

Each area of the course has demonstration and practical drills.

These drills must be written up and must match the basic personal skills required by the materials.

CLAY TABLE

Clay table training is a vital part of the Course curriculum.

The materials must be available.

And clay, not just modelling clay, can be used.

Flat surfaces must be provided.

Tape Course Series 5

TRANSLATED TAPES FOR STAFF AND STUDENT USE

Translated tapes shipped to Orgs and Missions are primarily for staff and student use. As follows:

TRANSLATED ADMINISTRATIVE AND HAT MATERIALS

Translated administrative and hat materials are translated onto tape in the item by item sequence of the hat checksheet or staff course checksheet. The checksheets are themselves not translated onto tape but onto paper and accompany the translation tapes along with a mimeographed glossary of technical terms and phrases, and course rules.

Every Org with non-English speaking staff members needs translated tape copies of at least Staff Status I and II, OEC Vols 0-7 and the Professional Salesmanship Course BPL 22 July 74 with their accompanying checksheets, glossaries and course instructions translated onto paper.

Training of staffs on admin and hat materials is done in the *Academy*, Div 4, Dept 11, under a Supervisor and in accordance with “What is a Course?” PL 16 March 1971.

Translated administrative and hat materials may not be played to the Public. They are not for public issue or distribution free or for charge.

TRANSLATED COURSE MATERIALS

Use of Course Study Tapes is well covered in HCO B 10 November 71, Revised 21 Sept 74, "Tapes, How to Use", Tape Course Series 6R. This same issue applies to admin and hat materials also.

Course materials may be heard by those persons who have legally enrolled on and paid for the course concerned.

Students and course graduates can buy translation course tapes from Pubs DK or their Org. Evidence of course enrollment or graduation from a Tape Course must accompany the tape order.

Translated Course tapes may not be played to the general Public who are not enrolled on a specific course. They are not for public issue or distribution, free or for charge.

TAPE NOTES

A notebook is to be used and kept neat and complete by each student.

In order for the student to quickly find any reference on a tape after he has listened to it, he must mark down in his notebook the "counter" number on the tape machine at the beginning of each HCOPL, HCO B, Book, Chapter, etc, and also identify the type of machine.

IMPORTANT: AT THE START OF THE TAPE, THE STUDENT MUST ENSURE THE COUNTER ON THE TAPE MACHINE READS AT 0.

When checkouts are required, students check each other out from the actual tapes *not* from the notes.

Tape notes may not be recopied by another or distributed amongst other students. They are for the student's own use, and are not for public distribution. Such notebooks may never be mimeographed or published as they often contain errors.

PROTECTION

To guard against any possibility of students reissuing their course notes in printed form or allowing another to recopy the tape notes, a Waiver is to be drawn up and signed by the student, or by his parents or guardian, if a minor, before commencing the Tape Course. The Waiver states that he understands the material is given him for training purposes only and should he reissue his notes to anyone outside the Org, or allow another to recopy he will be billed for \$1,000.

NO TRANSLATION TAPES MAY BE TRANSCRIBED IN WRITTEN FORM. THE TAPES ARE PROTECTED BY COPYRIGHT FROM PRINTED OR TAPE COPYING.

CARE OF

Translated tape packages are filed as a complete package altogether—NEVER split up and filed by date order or in some other fashion.

The Master Card File kept by the Course Admin is a record of what items are on what tapes. Each tape has its own Card File with contents listed and is the index of the actual translated tape package itself. Card Files can be made up from the tape *box* which has listed on the back the tape contents for sides one and two. Course and Hat Checksheets are filed alphabetically in file folders with their glossaries and course instructions and rules for student use.

Qual needs their own Master Card File system for Library contents filed in alphabetical order which says where each tape and checksheet, etc, is to be located.

CRAMMING

Cramming of students and staff on translated tape material is done in Qual Div, Dept 15.

Staff do not have to be enrolled on any course in order to be crammed. Public course students are sent to Cramming by their Course Supervisor or by the Student Examiner.

The Cramming Officer checks out staff and students from the translated tapes NEVER from the tape notes as notes are too far removed from the Source material and subject to misduplication. Before a Cramming Officer could give a checkout from a tape he must have listened to that section on the tape himself.

In addition to Tech, Qual have their own tape players equipped with foot pedal start-stop control situated in Qual for student and staff member use in Cramming and Word Clearing.

QUAL LIBRARY

A special tape listening area needs to be set up in the Qual Library space where Org staff members can come and go at their own free will to listen to any taped HCO Bs, HCO PLs, etc, undisturbed.

At least two copies of every translated tape package along with checksheets and glossaries are filed alphabetically in the Qual Library easily accessible for Auditors, C/Ses and student and staff Cramming purposes, Word Clearing and for staff who need to refer to or check out on individual issues contained within the translated tapes.

STAY PUT

Translated tape courses and translated administrative and hat materials on tape are the responsibility of and under the protection of Tech and Qual Divs. They may NEVER be removed from these areas as they invariably get lost or misplaced or damaged.

AVAILABILITY

Every effort must be made to make translated admin and hat materials and translated course materials readily available for student and staff member use and to remove any stops or arbitraries which might prevent staff or students knowing and applying the tech of Dianetics and Scientology.

It is of vital interest to Keepers of Tech to ensure that full sets of translated Tech and Admin materials exist and are used.

Introduction

There is adequate and long background to Dianetics and Scientology. For fifty thousand years Man has been faced with the enigma of himself and his fellows. And Man has been victimized by impulses and brutal instincts which have caused him to erect in self-protection, prisons and legal codes and complex social systems. Man has not felt safe from Man. And indeed, the conduct of men down the ages has not much justified belief or faith. Wars, murder and arson, treachery and betrayal, cynicism and destruction have marred his progress until history itself has become a long montage of battles, murders and running blood.

Confronted with this aspect in himself and his fellows, Man has long searched for an answer to the riddle of his own behavior and for ways to remedy that behavior. Long before Diogenes, Man was searching for such answers to his questions. In Babylon, Chaldea, India and even into distant and primitive times those men who could think found concern in the antisocial and unreasonable conduct of their fellows. Throughout all these ages, little by little, bits of the answer were forthcoming.

No flashing and spectacular result in modern times can gainsay the brilliance of achievement of the early searchers in the field of the human mind, for these, out of the morass of superstition and taboo, sorted out the first phenomena vital to the solution of the problem.

Man's search for the answer to his own riddle was quickened during the last century by two things: the first was the energy and curiosity of Sigmund Freud and the second was the mathematics of James Clerk Maxwell who gave to us the fundamentals of energy.

To talk of the faults of Freud, as do those who practice psychoanalysis today, is ungenerous. This great pioneer, against the violent objections of medical doctors and the psychiatrists of his day, ventured to put forth the theory that memory was connected with present time behavior and that by talk alone a patient could be made well. Whatever the repute of the libido theory, whatever the disillusionment of this great man himself—for he admitted defeat before he died—his work and method of address were a valuable step toward an eventual solution.

The probable reason why this solution did not earlier appear has to do with the knowledge we have gained in this century about the physical universe and its structure. The mind was a problem which had to be solved from a knowledge both of humanity and of nuclear physics and modern mathematics. The final solution was simple. The route to it required the physical universe knowledge given to us by searchers in the physical sciences and mathematics.

The story of how Scientology and Dianetics came about will demonstrate this. It will illustrate the background knowledge which was apparently necessary to carry forth to conclusion work which was initiated by Freud and the countless generations behind him.

In the Twenties I was fortunate enough to know Commander Thompson of the Medical Corps of the United States Navy. He was a colorful man, poised, polished, greatly traveled, curious in half a hundred sciences. The United States Navy, having heard much of the work of Freud in Vienna, sent an officer, Commander Thompson, to study under Freud and bring back to the Navy any benefit from psychoanalysis. When I knew Thompson he was but lately returned from long study with the master. And Thompson was not too impatient and not too bored to communicate something of Freud's teachings to a boy. As a dashing and brilliant figure, Thompson was enough to incite enthusiasm in any youngster and I fear I imposed greatly on his patience and his time.

But a career in the humanities was not on schedule for me. My father, a naval officer, decreed that I would study engineering and mathematics and so I found myself obediently

studying the physical sciences at George Washington University in Washington, D.C. A course called "Atomic and Molecular Phenomena" had been instituted there. Today we call it Nuclear Physics. I was fortunate enough to be an early student of that subject in what I believe was the first course in nuclear physics formally taught in the United States.

While at the university I adventured upon certain researches which were off curriculum. I wanted to find the smallest particle or unit of energy Man could contact. And, recalling Thompson's teachings, decided to investigate the energy of the human mind.

Considerable travel and examination of the cultures of Man, considerable study in philosophy, occasional encouragement from such men as Will Durant brought me by 1938 into possession of the basic formulas of human behavior. They were rough, those early conclusions. They were crude. And they lacked a technique of application.

The basic nature of Man is not bad. It is good. One should realize that as a possibility. The basic nature of Man itself is not at fault. But the basic primitive adventures of Man were violent and savage and, as Freud supposed, it is that imposed brutality which Man must hold in check.

Living with the beasts of the jungle, caught at every hand by death and terror, early Man could not but develop brutal reactions. Murder and war were the commonplace. Man had not learned to control his environment and so he had to combat it. Every walk forth from his cave might mean death or battle. Every mischance might bring about catastrophe. Man had no choice to be anything but brutal and savage.

Then came civilization. Then came law and order and the right to eat without being killed. Then came the partial control of the surroundings sufficient to call Man's state civilized.

But Man could not wholly escape his heritage. Here today, when Man supposedly can reason, murder, arson and war stalk his shaded streets and homes.

Man, in an apparent civilization, is haunted by instincts he cannot understand. He has prisons where he puts men such as one cages wild beasts. He has institutions which house millions upon millions of men who are insane and can no longer reason. And Man gazes with collective horror upon the prospect of being obliterated by a weapon so sweeping and terrible that all of civilization may perish in the click of a button—the atomic bomb.

Man is grasping wildly today for some method of restraining the brutality of his fellows or even himself.

And he is motivated in that brutality by all the crimes of his yesterdays.

Man is subjugated and made afraid, he is made brutal and wicked by basic instincts. In order to be civilized Man must repress those instincts. The moment he represses them he becomes sick. Thus the solution is impossible. *Unless* Man can reach inside himself and eradicate in some manner the things which make him kill and steal and make war.

Can instincts be eradicated from the mind? They certainly can be and with less trouble than anyone ever suspected.

And is Man healthy and better with them gone? He is so much better, so much more reliable, so much healthier, so much happier that one immediately finds in him new hope for Mankind.

What is the basic nature of Man? Man is basically good. But between him and that goodness lies a savage and twisted past, inherited from all the centuries of his being, the instincts which he had to wear as a primitive, as a savage. They are still there, on full record, there in a world which now must be civilized if Man is not to perish from the earth.

The basic impulse of Man is to help his fellows. He is not a monomaniacal fiend, intent only upon his own gain. But the instincts, fears and rages he represses make him seem so. He wants to help his fellows. He wants Man to live. He wants the world to survive. But because he has been taught in the brutal school of tooth and claw that life can be treacherous, he seeks unreasonable and treacherous means of achieving his ends.

Take away the savage antisocial impulses of Man, of any man or woman or child, and he is FREE, free to act, to be happy, to gain and to be without fear of what he might do if he let himself loose.

Take away these unwanted brutalities and Man's intelligence rises or even doubles. Take away these impulses and Man's health of being evidently improves beyond past knowledge.

In 1938 I codified certain axioms and phenomena into what I called "Scientology". Scientology is the science of knowledge or the codification of epistemology. Dianetics was evolved from these.

Over two hundred axioms comprise Scientology and embrace Dianetics. Over two hundred new phenomena concerning the human mind have been discovered and cataloged as to their relative importance.

In 1948 I wrote a thesis on an elementary technique of application and submitted it to the medical and psychiatric professions for their use or consideration. The data was not utilized. In 1950, I issued a popular book on the subject called *Dianetics. The Modern Science of Mental Health*. The book, much to the astonishment of myself and everyone else, became a best seller immediately and still sells regularly. Other books followed.

The address of Dianetics and Scientology is not to the ill, the insane or the criminal. It is effective in these fields. But its intention is toward the improvement of the able. Men who already can accomplish things can accomplish more. The problems of the society depend upon clear-thinking and sane men. Processing can bring about that state according to long experience.

Processing has now become relatively simple. The auditor first must understand the basic axioms of the subject and their meaning in processing. He must have a good grasp of his essential tools. He can gain this understanding in a few weeks if he is quick and intelligent. He must then be able to handle the techniques of application. These are effective and swift.

When one starts to handle primitive instincts in a human being, that human being sometimes has the sensation of having lived before. We know the instincts from distant times are there and we know where they are filed and we know how to change the record. It is relatively simple to call up in any human being the basic and underlying records which have haunted Man for generations. No matter how solidly he is repressing them, the instincts are there. When they are in sight and deintensified, he is able to relax, to be free, and to be effective.

The simplicity of the present techniques seems to belie the arduousness of their discovery. But they contain all the thousands of years of Man's search for what makes Man hate Man.

Dianetics and Scientology are no more than reason joining research in the humanities and research in the fields of energy and the physical sciences. Once this knowledge was joined, the answers were readily available.

Perhaps now it may be possible, in an overwrought world, to do something about the criminals, the insane, about war and the antisocial hatred Man feels for Man. Can we do

something for the savage in civilized garb before he ruins this world and all Man? That is a question which the future must answer. I cannot do more than the work I have done and to publish and make available what has been done.

Every facility which I have and every knowledge which we have gained is at your disposal. It is at your disposal to improve you, to make crime a thing of yesterday, to banish war forever. But it is up to you.

INTRODUCTION

In nineteen thirty-two an investigation was undertaken to determine the dynamic principle of existence in a workable form which might lead to the resolution of some of the problems of mankind. A long research in ancient and modern philosophy culminated, in nineteen thirty-eight, in the heuristically discovered primary law. A work was written at that time which embraced man and his activities. In the following years further research was undertaken in order to prove or disprove the axioms so established.

Certain experiences during the war made it necessary for the writer to resolve the work into applicable equations and an intensive program was begun in nineteen forty-five toward this end.

A year later many techniques had been discovered or evolved and a nebulous form of the present work was formulated. Financed chiefly by a lump sum disability compensation, that form of Dianetics was intensively applied to volunteer subjects, and the work gradually developed to its present form.

Dianetics has been under test by the writer, as here delineated, for the past three years. The last series of random volunteers, numbering twenty, were rehabilitated, twenty out of twenty, with an average number of work hours of 151.2 per subject. Dianetics offers the first anatomy of the human mind and techniques for handling the hitherto unknown reactive mind, which causes irrational and psychosomatic behavior. It has successfully removed any compulsions, repressions, neuroses and psychoses to which it has been applied.

L. R. H.
January, 1948

PRIMARY AXIOMS

Dianetics is an heuristic science built upon axioms. Workability rather than Idealism has been consulted. The only claim made for these axioms is that by their use certain definite and predictable results can be obtained.

The principal achievement of Dianetics lies in its organization. Almost any of its parts can be found somewhere in history, even when they were independently evolved by the writer. There are no principal sources, and where a practice or a principle is borrowed from some past school the connection is usually accidental and does not admit any further use or validity of that school. Dianetics will work, and can only be worked, when regarded and used as a unity. When diluted by broader applications of older practices, it will no longer produce results. To avoid confusion and prevent semantic difficulties, new and simplified terminology has been used and is used only as defined herein.

Dianetics is actually a family of sciences. It is here addressed in the form of a science of thought applicable to psychosomatic ills and individual aberrations.

The field of thought may be divided into two areas which have been classified as the “knowable” and the “unknowable.” We are here concerned only with the “knowable.” In the “unknowable” we place that data which we do not need to know in order to solve the problem of improving or resolving aberrations of the human mind. By thus splitting the broad field of thought, we need not now concern ourselves with such indefinites as spiritualism, deism, telepathy, clairvoyance, or, for instance, the human soul.

Conceiving this split as a line drawn through the area, we can assign a dynamic principle of existence to all that data remaining in the “knowable” field.

After exhaustive research one word was selected as embracing the finite universe as a dynamic principle of existence. This word can be used as a guide or a measuring stick and by it can be evaluated much information. It is therefore our first and our controlling axiom.

The first axiom is:

SURVIVE!

This can be seen to be the lowest common denominator of the finite universe. It embraces all forms of energy. It further delineates the purpose of that energy so far as it is now viewable by us in the “knowable” field. The activity of the finite universe can easily be seen to obey this axiom as though it were a command. All works and energies can be considered to be

motivated by it. The various kingdoms have this as their lowest common denominator, for animals, vegetables and minerals are all striving for survival. We do not know to what end we are surviving, and in our field of the “knowable” and in our choice of only the workable axioms, we do not know and have no immediate reason to ask why.

All forms of energy are then surviving to some unknown end, for some unknown purpose. We need only to know that they *are* surviving and that, as units or species, they must survive.

By derivation from the first workable axiom, we come into possession of the second. In obedience to the command “survive,” life took on the form of a cell which, joining with other cells, formed a colony. The cell, by procreating, expanded the colony. The colony, by procreation, formed other colonies. Colonies of different types united and necessity, mutation and natural selection brought about specializing which increased the complexity of the colonies until they became an aggregation. The problems of the colonial aggregation were those of food, protection and procreation. In various ways a colonial aggregation of cells became a

standardized unity and any advanced colonial aggregation came into possession by necessity, mutation and natural selection of a central control system .

The purpose of the colonial aggregation was to survive. To do this it had to have food, means of defense, protection and means of procreation. The control center which had developed had as its primary command, Survive! Its prime purpose was the food, defense, protection and means of procreation.

Thus can be stated the second workable axiom:

THE PURPOSE OF THE MIND IS TO SOLVE PROBLEMS RELATING TO SURVIVAL.

The ultimate success of the organism, its species or life would be, at its unimaginable extreme, immortality. The final failure in obedience to the law *survive* would be death. Between eternal survival and death lie innumerable gradations. In the middle ground of such a scale would be mere existence without hope of much success and without fear of failure. Below this point would lie, step by step, innumerable small errors, accidents, losses, each one of which would tend to abbreviate the chances of reaching the ultimate goal. Above this point would lie the small successes, appreciations, and triumphs which would tend to secure the desirable goal.

As an axiom, the mind can then be said to act in obedience to a central basic command, *survive*, and to direct or manage the organism in its efforts to accomplish the ultimate goal for the individual or species or life, and to avoid for the individual or species or life any part of the final failure, which leads to the stated axiom:

THE MIND DIRECTS THE ORGANISM, THE SPECIES, ITS SYMBIOTES OR LIFE IN THE EFFORT OF SURVIVAL.

A study of the field of evolution will indicate that survival has been, will be, and is the sole test of an organism, whether the organism is treated in the form of daily activity or the life of the species. No action of the organism will be found to lie without the field of survival, for the organism is acting within its environment upon information received or recorded, and error or failure does not alter the fact that its basic impulse was motivated by survival.

Another axiom may then be formulated as follows:

THE MIND AS THE CENTRAL DIRECTION SYSTEM OF THE BODY, POSES, PERCEIVES AND RESOLVES PROBLEMS OF SURVIVAL AND DIRECTS OR FAILS TO DIRECT THEIR EXECUTION.

As there are many organisms in the same species, all attempting to accomplish the same end, and as there are many species, and as matter itself is attempting in one unit form or another to survive, there is necessarily conflict and contest amongst the individuals of the species, species, or units of matter. Species cannot survive without being interested primarily in the species. Natural selection and other causes have established this as a primary rule for survival: *That the unit remain alive as long as possible as a unit and, by association and procreation, that the species remain alive as a species.* Second grade interest is paid by the unit or the species to its symbiotes. Third grade interest is paid to inanimate matter. As this is apparently the most workable solution, natural selection best preserves those species which follow this working rule. And the symbiotes of the successful species therefore have enhanced opportunity for survival.

Man is the most successful organism currently in existence, at least on this planet. Man is currently winning in the perpetual cosmic election which possibly may select the thinker of the new *THOUGHT*.

Man is heir to the experience and construction of his own ancestors. As cellular conservatism is one of the factors of survival, his brain is basically the same brain which directed and resolved the problems of his animal forebears. By evolution and natural selection, this brain therefore has the primary priority in emergencies. Superimposed on this animal brain has been developed an enormously complex analyzer, which probably exists in his frontal lobe.

The command, *survive*, is variable in individuals and species to the extent that it may be strong or weak. Superior strength of the command in the individual or species is normally, but variably, a survival factor. The primary facet of personality is the basic strength of the DYNAMIC drive.

The DYNAMIC is variable from individual to individual and race to race. It is varied by physiology, environment, and experience. Its manifestation in the animal brain affects the tenacity of the individual to life or purpose, and it affects the activity of the analyzer. The first characteristic of the individual which should be considered is the basic strength of his DYNAMIC. By this an axiom can be formulated:

THE PERSISTENCY OF THE INDIVIDUAL IN LIFE IS DIRECTED BY THE STRENGTH OF HIS BASIC DYNAMIC.

The analytical, human or, as it has elsewhere been called erroneously, the conscious mind, is variable from individual to individual and race to race in its ability to perceive and resolve problems. Another axiom can then be formulated:

INTELLIGENCE IS THE ABILITY OF AN INDIVIDUAL, GROUP, OR RACE TO RESOLVE PROBLEMS RELATING TO SURVIVAL.

It should be noted that there is a distinct difference between the DYNAMIC and the intelligence. High intelligence may not denote high DYNAMIC. High DYNAMIC may not denote high intelligence. Intelligence is mental sensitivity and analytical ability. DYNAMIC is the persistency of the individual in obedience to the command, *survive!*

It has been noted that there is a gradation in the scale of survival. Gains toward the ultimate goal are pleasurable. Failures toward the final defeat are sorrowful or painful. Pleasure is therefore the perception of wellbeing, or an advance toward the ultimate goal. Pain, therefore, is the perception of a reduction toward the final defeat. Both are necessary survival factors.

For the purpose of Dianetics, good and evil must be defined. Those things which may be classified as good by an individual are only those things which aid himself, his family, his group, his race, mankind or life in its dynamic obedience to the command, modified by the observations of the individual, his family, his group, his race, or life.

As *evil* may be classified those things which tend to limit the dynamic thrust of the individual, his family, his group, his race, or life in general in the dynamic drive, also limited by the observation, the observer and his ability to observe.

Good may be defined as constructive. *Evil* may be defined as destructive—definitions modified by viewpoint. The individual man is an organism attempting to survive in affinity or contest with other men, races, and the three kingdoms. His goal is survival for himself, his progeny, his group, his race, his symbiotes, life and the universe in general in contest with any efforts or entities which threaten or impede his efforts to attain the goal.

His happiness depends upon making, consolidating, or contemplating gains toward his goal.

It is a purpose of Dianetics to pass man across the abyss of irrational, solely reactive thought and enter him upon a new stage of constructive progression to the ultimate goal.

AN ANALOGY OF THE MIND

It is not the purpose of Dianetics to reconstruct the human mind. The purpose of Dianetics is to delete from the existing mind those physically painful experiences which have resulted in the aberration of the analytical mind, to resolve the physical manifestations of mental aberration, and to restore in its entirety the proper working function of a brain not otherwise physically deranged. Dianetics thus *embraces* the various aspects of psychosomatic conditions, including the glandular balance or imbalance of the organism, as influenced by painful physical experience. However, its purpose is not one of healing, and its address is not to such psychosomatic manifestations specifically, but rather to those aberrative experiences in which these conditions have their roots.

The initial adjustments of the individual are included in Child Dianetics and Educational Dianetics. Judicial Dianetics, Political Dianetics and Military Dianetics are elsewhere touched upon or allocated for study. Dianetics, as a family of sciences, proceeds however from the axioms cursorily touched upon in the last chapter and is uniformly governed by the principles of the behavior of the human mind.

When an individual is acting contrary to survival of himself, his group, progeny, race, mankind, or life he can be considered to be unintelligent, uninformed or aberrated. *Every single instance of aberrated conduct threatening the general goal of the individual as outlined in the last chapter can be proven to have a source which will specifically be found to be a painful experience containing data not available to the analytical mind.* Every single instance and facet of aberrated conduct has its exact causation in the physically painful error which has been introduced during a moment of absence of the analytical power.

Dianetics consists of discovering the aberration in the individual, finding the physically painful experience which corresponds to it and placing the data therein contained at the disposal of the analytical mind. More as an effort to demonstrate how that is accomplished than as an actual outline of the character of the mind, the following analogy is offered.

First there is the physio-animal section of the brain, containing the motor controls, the sub-brains, and the physical nervous system in general, including the physical aspect of the analytical section of the brain. The control of all voluntary and involuntary muscles is contained in this section. It commands all body fluids, blood flow, respiration, glandular secretion, cellular construction, and the activity of various parts of the body. Experimentation has adequately demonstrated this. The physio-animal mind has specific methods of "thinking." These are entirely reactive. Animal experimentation—rats, dogs, etc.—is experimentation on and with precisely this mind and little more. *It is a fully conscious mind and should never be denoted by any term which denies it "consciousness" since there is no period in the life of the organism from conception to death when this mind is not awake, observing, and recording percepts.* This is the mind of a dog, cat, or rat and is also the basic mind of a man so far as its operating characteristics are concerned. A man in the deepest possible somnambulistic sleep is still in possession of more mind and thinking and coordinating ability than a lower animal.

The term "consciousness" is no more than a designation of the awareness of *now*. The physio-animal mind never ceases to be aware of *now* and never ceases to record the successive instances of *now* which in their composite make up a *time track* connecting memory in an orderly chain. Cessation of life alone discontinues the recording of perceptions on this orderly track. *Unconsciousness* is a condition wherein the organism is discoordinated only in its analytical process and motor control direction. In the physio-animal section of the brain, a complete time track and a complete memory record of all perceptions for all moments of the organism's existence is available.

As life progresses, for instance, from a blade of grass, greater and greater complexities and degrees of selfdeterminism are possible. Energy in its various forms is the primary motivator in the lower orders, but as the complexity of the order is increased into the animal

kingdom, the physio-animal brain attains more and more command of the entire organism until it itself begins to possess the second section of the mind.

All animals possess in some slight degree an analyzer. This, which we designate the *analytical mind*, is present even in lower orders, since it is only that section of the brain which possesses the self-deterministic coordinative command of the physio-animal brain and thus of the body. In a rat, for instance, it is no more than its “conscious” awareness of *now* applying to lessons of *then* without rationality but with instinct and painful experience. This is the analytical section of the mind in a lower animal but it is the *reactive mind* in a man whose *analytical mind* is so highly attuned and intricate that it can command entirely the physio-animal brain and thus the body.

Man not only possesses a superior physio-animal mind but possesses as well an *analytical mind* of such power and complexity that it has no real rival in any other species. The *analytical mind* of man cannot be studied by observing the reactions of animals under any situations. Not only is it more sensitive but it possesses factors and sensitivities not elsewhere found.

Continuing this analogy: Lying between the *analytical mind* and the physio-animal mind may be conceived the *reactive mind*. This is the coordinated responses of the physio-animal mind, the “analytical” mind of animals, and the first post of emergency command in man. All errors of a psychic or psychosomatic nature can be considered for the purposes of this analogy to lie in the *reactive mind*. The first human *analytical mind* took command of the body and physio-animal mind under strained and dangerous circumstances when man was still in violent contest with other species around him. It can be considered that the *analytical mind* received command with the single proviso that instantaneous emergency would be handled by the outdated but faster *reactive mind*.

Any and all errors in thinking and action derive from the reactive mind as it is increased in strength and power by painful experience. It can be called a shadow mind, instantaneously reactive when any of its content is perceived in the environment of the individual, at which time it urgently bypasses the analytical mind and causes immediate reaction in the physio-animal mind and in the body. Additionally, the reactive mind is in continual presence when chronically restimulated by a constantly present restimulator—which is to say, an approximation of the reactive mind’s content or some part thereof continually perceived in the environment of the organism. The reactive mind is in action so long as it is activated by an exact or nearly exact approximation of its content. But given too continuous a restimulation, it can and does derange both the physio-animal mind and body below it and the analytical mind above it. It was created by deranging circumstances of a physical nature, hence it deranges.

The entire content of the reactive mind is records of physical pain with its accompanying perceptions during disconnection of the analyzer. All aberrated conduct and error on the part of an individual is occasioned by restimulation of his reactive mind.

None of these minds are “unconscious,” nor are they subconscious. The entire organism is always conscious but the temporary dispersion of the thought processes of the analytical mind brings about a condition whereby that mind, having been dispersed and considering itself the residence of the person, is unable to obtain and reach data perceived and received by the organism during the analytical mind’s condition of dispersion. That the analytical mind can be thrown, by pain or shock, out of circuit is a survival factor of its own: as sensitive “machinery” it must be protected by a fuse system.

THE DYNAMICS

The basic dynamic, SURVIVE, increases in complexity as the complexity of the organism evolves. Energy may be considered to have taken many paths through eternity to arrive intact at the infinite goal. The “why” of the goal may lie above the finite line but below it, demarked by the word SURVIVE, definite manifestations are visible. Energy collects into various forms of matter which collect and aggregate in various materials and compounds. Life evolves from the simplest basic into complex forms since evolutionary change is in itself a method of survival.

Conflict amongst species and individuals within the species is additionally a survival factor. Affinity of individuals for groups, races, and the whole of its species, and for other species, is additionally a survival factor, as strong or stronger than conflict.

Drive is defined as the dynamic thrust through time toward the attainment of the goal. Survive is considered to be the lowest common denominator of all energy efforts and all forms. It can then be subdivided specifically into several drive lines as applicable to each form or species. The unaberrated self contains eight main drives which are held in common with man.

The dynamics are: One, self; Two, sex; Three, group; Four, mankind; Five, life; Six, the physical universe; Seven, thought; Eight, universal thought or infinity.

An entire philosophy can be built around each one of these dynamics which will account for all the actions of an individual. Any one of these philosophies is so complete that it can be logically made to include the other seven. In other words, all purpose of an individual can be rationalized into the dynamic of self. A philosophy exists which attempts to rationalize everything into the sexual dynamic, and so on with all the dynamics. Observing that each one can stand as a logical unity, one finds it necessary to retire to the lowest common denominator of the basic dynamic which actually does explain the eight subdivisions. As each one of the subdivisions is capable of supporting the whole weight of a rational argument, it can readily be deduced that each is of nearly equal importance in the individual. The aberrated conditions of a society tend to vary the stress on these dynamics, making first one and then another the keynote of the society.

In an unaberrated individual or society, the validity of all eight would be recognized.

The unaberrated individual may physiologically possess or environmentally stress one or more of these dynamics above the others. In terms of basic personality, the physiological-environmental-educational aspect of the individual is of varied strength in the eight dynamics.

Each one of the eight dynamics breaks further into purposes which are specific and complex. Purposes and other factors entangle these dynamics, and varying situations and the observational power of the individual may conflict one of these dynamics against another within the individual himself. This is a basic complex factor of unaberrated personality.

I. *THE DYNAMIC OF SELF* consists of the dynamic thrust to survive as an individual, to obtain pleasure as an individual, and to avoid pain. It covers the general field of food, clothing and shelter, personal ambition, and general individual purpose.

II. *THE DYNAMIC OF SEX* embraces the procreation of progeny, the care of that progeny, and the securing for that progeny of better survival conditions and abilities in the future.

III. *THE DYNAMIC OF GROUP* embraces the various units of the species man, such as the association, the military company, the people in the surrounding countryside, the nation

and the race. It is characterized by activity on the part of the individual to obtain and maintain the survival of the group of which he is a part.

IV. *THE MANKIND DYNAMIC* embraces the survival of the species.

Note: The first four dynamics belong to Dianetics. The upper four, introduced late 1950, complete the full eight dynamics of Scien to logy .

V. *THE DYNAMIC OF LIFE* is the urge of the individual to survive for life and for life to survive for itself.

VI. *THE PHYSICAL UNIVERSE DYNAMIC* is the drive of the individual to enhance the survival of all matter, energy, time and space.

VII. *THE THOUGHT DYNAMIC* concerns the urge of the individual to survive as thought.

VIII. *THE DYNAMIC OF UNIVERSAL THOUGHT* is the urge of the individual to survive for the Creator.

While man is concerned with any one of the above dynamics, any one of them may become antipathetic to his own survival. This is *rational conflict* and is normally and commonly incidental to survival. It is non-aberrative in that it is rational within the educational limitation.

The family as a unit is not a dynamic but a combination of dynamics. And in this and other societies it attains a position of interest which is not necessarily inherent in the individual or group.

Basically simple, complexity is introduced amongst the dynamics by individual and group irrationalities. The basic (unaberrated) individual has continual difficulty rationalizing the problems of importances and choices amongst these dynamics. When the basic individual becomes aberrated and is attendantly unable to reason freely on all problems, a selection of importances amongst these dynamics becomes nearly impossible and produces aberrated solutions which may resolve such an extreme as the destruction of the individual himself, by himself, under the mistaken solution that he may thus obey the primary command.

Note: All self-destructive effort is irrationality of a precise nature which will often be found by the auditor in his preclear⁴ during auditing⁵ but which forms no part of the basic personality of that individual.

4 preclear: this term covers anyone who is not CLEAR; however, it is principally used to describe a person who, through auditing, is finding out more about himself and life.

5 auditing: the application of Dianetic procedures to a preclear by a trained Dianetic auditor.

THE BASIC INDIVIDUAL

For the purposes of this work the terms *basic individual* and *Clear* are nearly synonymous since they denote the unaberrated self in complete integration and in a state of highest possible rationality; a *Clear* is one who has become the *basic individual* through auditing.

The precise personality of the basic individual is of interest to the auditor. His complete characteristic is established by: 1. The strength of his basic DYNAMIC; 2. The relative strengths of his dynamics; 3. The sensitivity, which is to say the intelligence, of his analyzer; 4. The coordination of his motor controls; 5. His physiological and glandular condition; 6. His environment and education.

The experiences of each individual also create an individual composite and so may additionally designate individuality. There are as many distinct individuals on earth as there are men, women and children. That we can establish a common denominator of drive and basic function does not, cannot, and will not alter the fact that individuals are amazingly varied one from the next.

It will be found by experience and exhaustive research, as it has been clinically established, that the basic individual is invariably responsive in all the dynamics and is essentially "good." There are varying degrees of courage but in the basic individual there is no pusillanimity. The virtues of the basic individual are innumerable. His intentional vices and destructive dramatizations are non-existent. He is in close alignment with that ideal which mankind recognizes as an ideal. This is a necessary part of an auditor's working knowledge, since deviations from it denote the existence of aberration, and such departures are unnatural and enforced and are no part of the self-determinism of the individual.

Man is not a reactive animal. He is capable of self-determinism. He has will power. He ordinarily has high analytical ability. He is rational and he is happy and integrated only when he is his own basic personality.

The most desirable state in an individual is complete self-determinism. Such self-determinism may be altered and shaped to some degree by education and environment, but so long as the individual is not aberrated, he is in possession of self-determinism. So long as he is self-determined in his actions he adjusts himself successfully to the degree that his environment will permit such an adjustment. He will be more forceful, effective and happier in that environment than when aberrated.

That the basic personality is "good" does not mean that he cannot be a terribly effective enemy of those things rationally recognizable as destructive to himself and to his.

The basic individual is not a buried unknown or a different person, but an intensity of all that is best and most able in the person. The basic individual equals the same person minus his pain and dramatizations.

The drive strength of the person does not derive from his aberrations. The aberrations lessen the drive strength. Artistry, personal force, personality, all are residual in the basic personality. This is derived from clinical research and experimentation. The only reason an aberrant occasionally holds hard to his aberrations is due to the fact that his engrams have a content which forbids their removal.

The reactive mind consists of a collection of experiences received during an unanalytical moment which contain pain and actual or conceived antagonism to the survival of the individual. An engram is a perceptic entity which can be precisely defined. The aggregate of engrams compose the reactive mind.

A new sub-field entitled “Perceptics” has been originated here to define adequately engramic data. Perceptics contains as one of its facets the field of semantics. Precisely as the field of semantics is organized so is organized in perceptics each sensory perception.

The audio-syllabic communication system of man has its counterpart in various languages observable in lower animals. Words are sounds in syllabic form delivered with a definite timbre, pitch, and volume or sight recognition in each case. Words are a highly specialized form of audio-perceptics. The quality of the sound in uttering the word is nearly as important as the word itself. The written word belongs in part to visio-perceptics. Having but lately acquired his extensive vocabulary, the mind of man is least adjusted to words and their sense. The mind is better able to differentiate amongst qualities of utterance than amongst the meanings of words themselves.

Included in perceptics in the same fashion and on the same axioms as semantics are the other sensory perceptions—organic sensation, the tactile sense, the olfactory sense and the senses involved with sight and hearing. Each has its own grouping. And each carries its class of messages with highly complex meanings. Each one of these divisions of the senses is plotted in time according to the earliest or most forceful significances. Each class of messages is so filed as to lead the individual toward pleasure and away from pain. The classifications and study of this varied sensory file has been designated “Perceptics.”

Engrams are received into the mind forming a reactive area during moments of lowered analytical awareness of the individual, and they contain physical pain and antagonism to survival. The engram is a packaged perceptic not available to the analytical mind but intimately connected to the physio-animal mind. Under normal conditions it reacts as a dramatization of itself when approximated by the organism’s perceptions of its content in the immediate environment during periods of weariness, illness, or hypnotic moments in the life of the individual.

When injury or illness supplants the analytical mind producing what is commonly known as “unconsciousness” and when physical pain and antagonism to the survival of the organism are present, an engram is received by the individual. Subsequently, during moments when the potential of the analytical mind is reduced by weariness, illness or similar circumstances, one or more of the perceptics contained in the engram may be observed by the individual in his environment, and without his perceiving that he has observed it (or the identity of it) the individual dramatizes the moment of receipt of the engram.

An engram impedes one or more dynamics of the basic individual. Being antagonistic to his survival it can be considered analogically to consist of a reverse charge.

As an example, the analytical mind can be said to possess multiple scanners in layers. Ordinary or pleasurable memory can be considered to have, as an analogy only, a positive charge. The multiple scanners are able to sweep these areas and make available memory data to the analytical mind so that it can arrive by various mathematical means at a solution for its various problems.

The engram, as a specific memory package, can be considered to have a reverse charge which cannot be reached by the scanner of the analytical mind but which is directly connected to the motor controls and other physical functions and which can exert, at a depth not nearly as basic as the basic drive but nevertheless low, a hidden influence upon the analytical mind through another circuit. The analytical mind in awareness of now, nevertheless, is unable to discover, without assistance from an auditor, the existence of such an impediment since it was received during a moment of extremely low potential on the part of the analytical mind.

As a further analogy, and for demonstration only, an engram can be considered to be a bundle of perceptions of a precise nature. An engram is an entire dramatic sequence, implanted during unconsciousness, which possesses specific perceptic keys, any one of which, when

unanalytically perceived by the individual in his environment, may in greater or lesser degrees set the engram into reaction.

Denied to the analytical mind at its reception, it is denied to the analytical mind in its exact character during its dramatization. Its content is literal and, on the physio-animal level, demands action. Man's analytical ability and his vocabulary are imposed above both the physio-animal mind and the reactive mind, both on the evolutionary time track and in awareness. The charge contained in the engram is inexhaustible and remains reactive in full force whenever keyed into the circuit by restimulators.

Restimulators are those approximations in the environment of an individual of the content of an engram. Restimulators can exist in any of the various senses. The orderly filing of perceptics in the memory does not, apparently, include the content of engrams, these being filed separately under an "immediate danger" heading.

There are three kinds of thought: the first is *engramic*, or *literal*. It demands immediate action without examination by the analytical mind. A hand being withdrawn from a hot stove when burned is being governed by the reactive principle, but as the ensuing instant of unconsciousness caused by the shock is ordinarily slight, no real engram can be said to have formed.

The second type of thought is *justified thought*. Engramic thought is literal, without reason, irrational. Justified thought is the attempt of the analytical mind to explain the reactive, engramic reactions of the organism in the ordinary course of living. Every engram may cause some form of aberrated conduct on the part of the individual. Justified thought is the effort of the conscious mind to explain away that aberration without admitting, as it cannot do normally, that it has failed the organism.

The third and optimum type of thought is *rational thought*. This is the thought used by a "Clear."

An engram is an apparent surcharge in the mental circuit with certain definite finite content. That charge is not reached or examined by the analytical mind but that charge is capable of acting as an independent command.

When the basic drive of the individual is boosted in potential by an observed necessity, the residual charge in an engram is insufficient to contest, at times, the raised purpose. The analytical mind can then be seen to function in entire command of the organism without serious modification by engramic command.

At other times, hostility in the environment and confusion of the analytical mind combine to reduce the dynamic potential to such a degree that the engramic command, in comparison to the basic drive, can be seen to be extremely powerful. It is at such times, in the presence of even faint restimulators, that the individual most demonstrates his aberrations.

EXAMPLE: Engram received at the age of three and one-half years. Adult preclear. As child in dental chair, against his will, under antagonistic conditions, given nitrous oxide and tricked by dentist. During painful portion of treatment the dentist says, "He is asleep. He can't hear, feel or see anything. Stay there."

The perceptics which can be restimulated in this are the quality, pitch and volume of the dentist's voice; the sound of the dentist's drill; the slap of the cable running the drill; street noises of a specific kind; the tactile of the mouth being forcibly held open; the smell of the mask; the sound of running water; the smell of nitrous oxide; and in short, several of each perceptic class, excluding only sight.

The effect of this experience, being a part of an engramic chain which contained two earlier experiences, was in some small degree to trance the individual and maintain some portion of him in a regressed state.

This engram is too brief and extraordinarily simple but it will serve as an example to the auditor. The timeless quality of the suggestions, the conceived antagonism, precursors⁹ on the engramic chain awakened and re-enforced, all these things confused the time sense of the individual and were otherwise reactive in later life.

For every engram there is a somatic as part of that engram. No aberration exists without its somatics unless it is a racial-educational aberration, in which instance it is compatible with its environment and so is not considered irrational.

Every aberration contains its exact command in some engram.

The numbers of engrams per individual are relatively few. The aberrated condition of the individual does not depend on the number of engrams but the severity of individual engrams.

An engram is severe in the exact ratio that it is conceived by the organism to have been a moment of threat to survival. The character of the threat and the perceptic content produce the aberration. A number of engrams with similar perceptics in an individual produce a complex aberration pattern which nevertheless has for its parts individual engrams.

An aberration is the manifestation of an engram and is serious only when it influences the competence of the individual in his environment.

Engrams are of two types depending upon the duration of restimulation. There are "floaters" and "chronics." A floater has not been restimulated in the individual during the lifetime succeeding it. A chronic is an engram which has been more or less continuously restimulated so that it has become an apparent portion of the individual. A chronic begins to gather "locks." A floater has not accumulated locks since it has never been restimulated.

A lock can be conceived to be joined to an engram in such a way that it can be reached by the multiple scanners of the analytical mind which cannot reach the engram. A lock is a painful mental experience. It is or is not regarded by the analytical mind as a source of difficulty or aberration. It is a period of mental anguish and is wholly dependent upon an engram for its pain value. When an engram is activated into a chronic, it accumulates numerous locks along the time track of the individual. The engram itself is not immediately locatable, except somatically, along the time track of the individual. Locks are of some diagnostic value but, as they exist as experiences more or less recallable by the analytical mind, they can be depended upon to vanish upon the removal of the engram from the reactive mind.

The running of a lock as a lock has some value but the exhaustion of locks from an aberrated individual is long and arduous and is seldom productive of any lasting result. Upon the location and exhaustion of the engram from the reactive mind, all of its locks vanish. An engram may exist unactivated as a floater for any number of years or for the entire duration of an individual's life. At any future moment after the receipt of an engram, whether that time period consists of days or decades, the floater may reactivate at which time it becomes part of the command obeyed by the analytical mind in its efforts to rationalize. The removal of the individual from his restimulators, which is to say, the environment in which the engram was reactive, is in itself a form of therapy, since the engram may then return to its status as a floater.

EXAMPLE: Engram—At birth occurs the phrase, "No good," uttered during a moment of headache and gasping on the part of a child.

Lock: At the age of seven while the child was ill with a minor malady, the mother in a fit of rage said that he was "no good."

The removal of the engram also removes, ordinarily without further attention, the lock.

Note: Birth remained inactive in the above case as a floater until the moment of reduced analytical power at the age of seven when a birth phrase was repeated. It is worth remarking that the entire content of the birth engram is given simultaneously both to the child and to the mother, with only the difference of somatics. It is further worthy of note that the mother quite often perceives in the child a restimulator and uses against it the phrases which were said when the child gave the mother the greatest pain, namely, birth. The child is then victimized into various psychosomatic ills by the repetition of its birth engram restimulators, which may develop even more seriously into actual disease.

The brain controls the multiple and complex functions of the growth and condition of the organism. Containing organic sensation as one of its perceptics, the engram then, when reactivated, causes a somatic and additionally may deny body fluids, i.e. hormones and blood, to some portion of the anatomy, occasioning psychosomatic ills. The denial of fluid or adequate blood supply may result in a potentially infective area. The psychosomatic reduces the resistance of some portion of the body to actual disease.

Somatic and other sensory errors find their basis in unconscious antagonistic moments. A somatic may be adjusted by an address to a lock but the permanency of adjustment obtains only until such time as the engram is again reactivated, causing another lock.

All aberrations are occasioned by engrams.

An engram is severely painful or severely threatening to the survival of the organism and is an engram only if it cannot be reached by the awake analytical mind.

A simple approximation of the action of an engram can be accomplished by an experiment in hypnotism whereby a positive suggestion which contains a posthypnotic signal is delivered to an amnesia-tranced person. The subject, having been commanded to forget the suggestion when awake, will then perform the act. This suggestion is then actually a light portion of the reactive mind. It is literally interpreted, unquestionably followed, since it is received during a period of unawareness of the analytical mind or some portion of it. The restimulator, which may be the act of the operator adjusting his tie, causes the subject to commit some act. The subject will then try to explain why he is doing what he is doing, no matter how illogical that action may be. The post-hypnotic suggestion is then recalled to the subject's mind and he remembers it. The compulsion vanishes (unless it is laid upon an actual engram).

The obedience of the subject to the command has, as its source, engramic thought. The explanation by the subject for his own action is the analytical mind observing the organism, which it supposes is in its sole charge, and justifying itself. The release of the post-hypnotic suggestion into the analytical mind brings about rational thought.

Engrams can be considered to be painfully inflicted, often timeless, post-hypnotic suggestions delivered antagonistically to the "unconscious" subject. The posthypnotic suggestion given the subject in the above example would not have any permanent effect on the subject even if it were not removed by the operator, because there was presumed to be no antagonism involved (unless, of course, it rested on a former engram).

The physio-animal mind of an organism never ceases recording on some level. The exact moment when recording begins in an organism has not at this date been accurately determined. It has been found to be very early, probably earlier than four months after conception and five months before birth. In the presence of pain, any moment prior to the age of two years may be considered to be unanalytical. Any painful experience received by the foetus contains its full perceptic package, including darkness.

Once an auditor has worked a prenatal engram and has seen its influence upon the engramic chain and the awake life of the adult, no question will remain in his

mind concerning the actuality of the experience. That the foetus does record is attributable to a phenomenon of the extension of perceptions during moments of pain and the absence of the analytical mind.

Laboratory experiment demonstrates that under hypnosis an individual's sensory perception may be artificially extended.

The existence of pain in any large degree is sufficient to extend the hearing of the foetus so that it records, during the existence of pain and the presence of exterior sound, the entire and complete record of the experience. As a chronic engram is but precariously fixed on the mind, the syllables or voice timbres contained in the prenatal will reactivate the somatic and the emotional engramic content whenever the approximations of that engram appear in the child's (or the adult's) vicinity.

The understanding of language is not necessary to reactivate an engram since the recording of the brain is so precise that the utterance of the identical words in similar tones during later prenatal periods or during birth, or immediately after birth, can and may occasion the original prenatal or any of the prenats to become reactive, producing locks, injuring the health of the infant or, for that matter, of the foetus.

The perceptics of the foetus are extended only during moments of pain. But a chain of prenatal engrams can occasion a condition wherein the hearing of the foetus is chronically extended, forming numerous locks before birth. These locks will vanish when the actual engrams are discovered and exhausted from the psyched.

Any painful unanalytical moment containing antagonism is not only a matter of record but a source of potential action in the human organism at any period during its lifetime, reserving, of course, the question of when the foetus first begins to record.

Birth is ordinarily a severely painful unconscious experience. It is ordinarily an engram of some magnitude. Anyone who has been born then possesses at least one engram. Any period of absence of analytical power during receipt of physical pain has some engramic potentiality.

Moments when the analytical power is present in some quantity, when physical pain is absent and only antagonism to the organism is present do not form engrams and are not responsible for the aberration of the individual.

Sociological maladjustments; parental punishments of a minor sort, even when they include pain; libidos; childhood struggles and jealousies are not capable of aberrating the individual. These can influence the personality and environmental adjustment of the individual but so long as he is not pathologically incompetent, he can and will resolve these problems and remain without aberration.

The human mind is an enormously powerful organism and its analytical ability is great. It is not overlaid above naturally unsocial or evil desires, but is founded upon powerful and constructive basics which only powerful, painful and antagonistic experiences can impede. Engrams will be found to have been conceived by the individual as intensely antagonistic to the survival of the organism.

The discovery of the basic engram is the first problem of the auditor. It normally results in an engramic chain. The content of that chain will be found to be physically severe.

An engram is physically painful, is conceived by the organism as an antagonistic threat to its survival, and is received during the absence of the analytical power of the mind. These

factors may vary within the engram so that an engram may be of minimal pain, maximal antagonism and minimal absence of the analytical power.

NOTE: ONE HAS AS MUCH FUNCTIONING ANALYZER AS ONE HAS AWARENESS OF *NOW*.

The body is to some degree reliving the experience of the engram whenever the experience is restimulated. A chronic psychosomatic, such as a painful arm, indicates the chronic, continuous coexistence with *NOW* of the moment the arm was broken or hurt. Several engrams reactivated into a chronic state bring several moments of unconsciousness, pain, and antagonism into a coexistence with *NOW*. The engram is a bundle of perceptics which include, as the primary manifestation, organic sensation. The organic sensation is enforced on the members of the body to a greater or lesser degree whenever, and as long as, the engram is restimulated. There is only *one* psychosomatic command which is common to all engrams. Any engram contains this as part of the command it will enforce upon the body. As a stomach may be made to ache chronically (ulcers), to feel broken, the engram also enforces a command upon the *organ* of the analytical mind. That command is common to every engram. Engrams are valid only when they are received during a momentary dispersal or shocked, null condition of the analytical mind. Every engram contains and enforces the command on the analytical mind that *it has been dispersed and is not operating*. This is common to every engram. This is reduction of the intellect by engrams totally aside from specific engramic content. It explains at once insanity and also the remarkable mental facility of a cleared or released individual.

ABERRATIONS

All aberrations of any kind are of precisely the same nature (as covered in the last chapter). It is the content of the engram which causes the aberration and forms its nature. Complexity amongst engramic contents may demonstrate a most complex aberration.

The various commands contained in the engrams, reactivating and modifying the basic dynamic command of the mind, produce abnormal characteristics in the behavior of the analytical mind, which are chronic or sporadic as the engrams occasioning them are restimulated. An entire concept of existence may be built from engramic content. Conflicts in the commands contained in engrams and conflicts between the basic drive and the engramic contents combine into behavior patterns.

When the organism has become so impeded that it can no longer influence or command its environment, it can be considered to be insane in that environment. Change of environment may relieve the condition or, more certainly, the exhaustion of the content of the reactive mind will restore the ability of the analytical mind to solve the problems with which it is confronted.

Whatever the engramic content of the reactive mind and its potential influence upon the behavior of the individual, it does not necessarily follow that the reactive mind need be chronically restimulated. However, when the reactive mind has been restimulated consistently, the analytical mind, called upon to solve the problems around and through antagonistic and incorrect data, may be unable to perform its task. In the absence of disease or injury, any mind not in a physiological amnesia state may be restored to normal function by the removal of the reactive mind. It should be noted however that this is modified by the fact that people who have received insulin shocks, prefrontal lobotomies, electric shocks and other treatments are regarded as equivocal and are temporarily classed with disease cases for lack of adequate observation in this stage of the experimental research.

People can be regarded as rational or irrational only insofar as they react in their customary environment. But any person in possession of a reactive mind is an unknown quantity until that reactive mind has been examined.

There are several factors contained in the engrams in the reactive mind which most certainly tend toward aberration. These include engramic commands which derange the time sense of the individual and thus apparently destroy his time track and engrams which contain restimulators of such timelessness and such perceptic content remain thereafter continually with the individual and seem to arrest him or regress him in time. Engrams containing commands which make the individual chronically unable to conceive differences are especially harmful since these tend to compare everything to engramic value and thus cause the individual to arrive at a chronic state of engramic thinking.

The mind resolves problems related to survival, utilizing its ability to conceive similarities and observe differences.

Engrams which destroy or tend to hold in suspension the analytical mind's ability to conceive associations most influence the apparent intelligence of the mind. But engrams which tend, by their command content, to destroy the mind's ability to conceive differences may produce severe aberration.

EXAMPLE: "All men are alike," received as powerful engramic content would tend to compare and associate every man with those men contained in the reactive mind as painful and dangerous.

An aberration may attain any form of complexion. As a rough analogy: a compulsion may be conceived to be an engramic command that the organism *must* do something; a repression is a command that the organism *must not* do something; a neurosis is an emotional state containing conflicts and emotional data inhibiting the abilities or welfare of the individual;

and a psychosis is a conflict of commands which seriously reduce the individual's ability to solve his problems in his environment to a point where he cannot adjust some vital phase of his environmental needs.

All this variety of manifestation of aberration is occasioned by the pain-enforced commands or contents of engrams.

Physical aberrations are occasioned by engrams when they are not the result of injury or disease; even, then, the aspect may be improved by the exhaustion of the reactive mind of the sick individual. The engram cannot manifest itself as a mental aberration without also manifesting itself to some degree as somatic aberration. Removal of the somatic content of engrams which is also necessary to obtain any other relief, can and does occasion glandular readjustment, cellular inhibition and other physiological corrections.

THE TONE SCALE

The tone scale denotes numerically, first the status of an engram in the reactive mind, next its erasure or reduction, and provides a measure for sanity in an individual.

The derivation of this scale is clinical and is based upon observation of engrams being worked. When an engram is located and developed, the extreme range it can follow begins with apathy, develops into anger (or the various facets of antagonism), proceeds into boredom, and arrives at last in cheerfulness or vanishes utterly.

The tone scale is essentially an assignation of numerical value by which individuals can be numerically classified. It is not arbitrary but will be found to approximate some actual governing law in nature.

Zero is equivalent to death. An individual with a zero tone would be dead.

Ranging upwards from zero to one then is that emotional bracket which may be denoted as apathy along its graduated scale from death to the beginnings of apathetic resentment.

From one to two is the range of antagonism, including suspicion, resentment, and anger.

Boredom and its equivalents, by which is denoted minor annoyance, begin at two and end at three.

From three to four are the emotions which range from carelessness to cheerfulness.

The term *tone four* denotes a person who has achieved rationality and cheerfulness.

Each engram residual in the reactive mind has its own independent tonal value. Serious engrams will be found in the apathy range. Dangerous engrams will be found in the anger range. Above two point five an engram could not be considered to have any great power to affect the analytical mind. Each engram in the reactive mind then can be said to possess a tone value. The composite sum of these engrams will give, if added, a numerical value to the reactive mind.

Engrams can be computed as they lie along the dynamics, and to each dynamic may be assigned a tone. The sum of the tones of the dynamics, divided by the number of the dynamics, will give a potential numerical value for an individual. This, of course, is variable depending on the existence of restimulators in his environment to reactivate the engrams.

The probable average of mankind at this writing may be in the vicinity of 3.0. Complete rationality depends upon exhaustion of the reactive mind and complete rationality is invariably the result of reaching tone four.

The initial diagnosis is done by the assignation of a general tone to denote the condition of an individual's reactive mind. His methods of meeting life, his emotional reaction to the problems in his environment, can be evaluated by the use of the tone scale.

In auditing, as will be covered later, an engram normally can be expected to run from its initial value in the apathy or anger range to tone four. Very shortly after it reaches tone four it should vanish. If it vanishes without attaining the laughter of tone four it can be assumed that the individual's basic engram has not been erased.

The tone scale has value in auditing and should be thoroughly understood.

THE CHARACTER OF ENGRAMS

There are several general types of engrams. It must be understood that the mind possesses a time track of one sort or another and that this track is a specific thing. The time track of an individual will include all those things available to his analytical mind when in a light trance or during regression. However, a person can be regressed and the data which he can easily contact along his time track is definitely not engramic even if it possesses an emotional charge. Everything on this track will be rational or justified experience. It will not include engrams. It may include locks—which is to say that it may include moments of mental anguish or antagonism and may even include instants of unconsciousness which have some slight engramic command value.

An engram has several specific, positive characteristics. It is received by the individual at some moment of physical pain. It is not available to the analyzer and it includes conceived or actual antagonism to the survival of the organism. Certain mechanics such as “forget it” may swerve a minimumly painful or unconscious experience off the time track. In that case it becomes possessed of engramic command value.

All engrams with power to derange the analytical mind and aberrate the physical body lie off the time track and are not available to the analytical mind.

By reason of its disorganization during the moment the engram was received, or because it has been forcibly instructed that the data in the engram is not to be recalled, the analyzer cannot reach the engram by ordinary means because the data has been erroneously labelled “dangerous,” “important,” or “too painful to touch.” The engram then, by a bypass circuit, feeds hidden commands into the analyzer. By a direct instantaneous circuit it is permanently connected to the motor controls, all perceptic channels, the glands, and heart. It is awaiting a moment of low general tone, weariness, or injury when the analytical mind has reduced powers. It is also awaiting the perception of one or more of the engram’s restimulators in the environment of the organism.

Continuous restimulation of the engrams can, in itself, cause a low general tone which in its turn permits more engrams to become restimulated. As the reactive mind comes into a more or less completely chronic state of restimulation, the individual becomes more and more governed by this mind. His thought becomes more and more engramic and he can be seen to drop in general tone on the tone scale down to the break point which may be arbitrarily placed somewhere between 2 and 2.5 and below which lies the region of insanity.

Engramic thought is irrational identity-thought by which the mind is made to conceive identities where only vague similarities may exist. It is necessary that the auditor thoroughly understand engramic thought, for it is with this complete irrationality of identity that he will basically deal. As he works with any preclear, he must continually employ in the bulk of his computation on the case the equation of engramic thinking.

Engramic thinking can be stated by: A equals A equals A equals A equals A.

The engram, when one or more of its restimulators is perceived in the environment during a moment of low general tone, may dramatize. The dramatization is the precise content of the engram. The aberration is the precise content of the engram. The reaction of an individual’s analytical mind when an engram is reactivated is justification.

There is reason to believe that part of this survival mechanism consists of the axiom: *The analyzer must never permit an incorrect solution.* The engram brings about many incorrect solutions. The analyzer may very well become entirely involved with the attempt to discover and deliver to a society, or to itself, adequate rational reasons for the behavior of the organism.

The analytical mind, though working from the command of the engram itself, is unaware of the source of the command. Not being able to discover the source,

it introverts more and more in an effort to solve a problem which contains danger to the organism. The analytical mind tends to find the danger without and within the organism.

There are five ways that the organism can react to a danger in its vicinity. It can attack it, avoid it, neglect it, run from it, or succumb to it. In just these ways can the analytical mind, which, it must be remembered, is possessed of self-determinism and will power, react to the reactive mind. As the general tone lowers, as the analytical mind becomes less and less powerful through weariness, continual reverses in general health, etc., the more and more heed it must give to the problems unsolved in the reactive mind. These are in essence unsolved problems. As such, they contain their own solutions. The analytical mind, unable to reach them, justifies the organism's reaction to them (succumbs to them), causes the organism to attempt to flee from them, apathetically may neglect them (as in prefrontal lobotomy), avoids them in many intricate ways, or attacks them. The analytical mind is not only not certain where the experience lies on the time track, it also does not know whether the menace is within the organism or without it. So it can become entirely indiscriminate, and eventually it may achieve highly irrational solutions by which it seeks to solve the problems of the highly irrational reactive mind.

The deep sensory perception channel entering the mind is evidently equipped with an "appreciator" which sorts according to the momentary general tone or potential of the analytical mind. The higher the general tone or potential of the analytical mind the better the data in the appreciator is sorted. The appreciator circuits are evidently fully apprised of engramic content in the reactive mind and evaluate restimulators perceived in the environment against the general tone of the analytical mind. When that is low, restimulators route more or less directly to the reactive mind which instantly responds by fixed connections into the motor controls. Commands to the various members, muscles, glands and organs of the body may be sporadic or constant, producing a high variety of responses in the body. Entire vocabularies are fed into the voice circuits directly from the reactive mind when an engram is restimulated. Orders to be active or inactive are fed to other portions. The individual time track of the engram spaces the commands to the organism and a dramatization is accomplished which may contain a portion or all of the content of the engram as governed by the situation. Psychosomatic ills, hysterias, rages, tantrums, criminal acts and any and all content prejudicial to the survival of the organism in which the organism is seen to be indulging has as its source the reactive mind.

The sole and only content of the reactive mind is *what exterior sources have done to the organism.*

None of the content of the reactive mind is selfmotivated. The auditor is then interested only in what is done to the person, not what the person himself has done, since, for purposes of auditing, the acts of the organism in its society can be discounted beyond diagnosis. Even then they are of small importance to the auditor.

An organism possessed of an analytical mind, not victimized by incapacitating disease or injury (and unimpeded) will commit no act knowingly prejudicial to the survival of the organism or other facets within the dynamics. It will combat only those dangers in society which are actual menaces.

Whatever may be the status of the "innate moral sense," the basic intent of the basic personality is to further various energy forms along the dynamics toward the goal. Only moments of actual dispersal of the awareness of the analytical mind permit data to be received which is prejudicial to the intent of the dynamics. Only from these "unconscious" moments can the basically stable and enormously powerful and able analytical mind be aberrated through the implantation of unanalyzed, painfully administered, and antagonistic information. It is the purpose of the auditor to find and exhaust these moments from the life of the individual. Dianetic auditing includes therefore, as its basic principle, the exhaustion of all the painfully

unconscious moments of a subject's life. By eradicating pain from the life of an individual, the auditor returns the individual to complete rationality and sanity.

The auditor should never be content with merely bringing the person back to normal. He should achieve with the person a tone 4 even though this is far in advance of the average state of society at this time. A tone 4 with his drives intact and powerful, with his rationality and intelligence increased to the optimum, becomes extremely valuable to the society, whatever his past.

Knowing this the auditor can expect a maximum result of lasting duration with any preclear not physically hopeless.

The entire purpose of the auditor is to rehabilitate the basic dynamic and the normal purpose or profession of the individual whom he audits. Anything implanted by positive suggestion or "education" in the course of auditing is harmful and must be cancelled if delivered. Only the basic personality of the individual can decide and evaluate things in his environment. Therefore, hypnotism as practiced with positive suggestions should be shunned since any and all hypnotic commands with the attendant forgetter mechanisms are no more than artificially implanted engrams. Indeed, it is quite usual for the auditor to have to exhaust hypnotically implanted material received either from some hypnotist or from the analytical mind itself when the person has been operating under auto-control. Hypnotism as such does not work, and a study and short practice in Dianetics will reveal exactly why.

The auditor is attempting to delete the reactive mind

from the individual. This reactive mind is an infestation of foreign, careless and unreasoning commands which disrupt the self-determinism of the individual to such an extent that he no longer has charge, through his analytical mind, of the organism itself but finds himself under the continual and chronic orders of unseen, neverreviewed exterior forces, often and usually antipathetic to the survival of the organism.

Engrams deal with identities where no identities exist. They therefore pose many strange and irrational problems which are seen as aberrations in preclears. If a human being has been born, he can be supposed to have at least one engram. Anyone who has a birth which has not been cleared by therapy has therefore a reactive mind. There is no disgrace attached to having a reactive mind since it was thrust without his consent and without his knowledge upon an unconscious and helpless individual. Sometimes this was done by persons with the best of imaginable intentions. A person not possessed of a rational mind cannot be rationally considered to be morally responsible, no matter the demands of the current society which hitherto lacked any method of determining responsibility.

The pain contained in the reactive mind is normally severe. The usual parental punishments, family complications, reprimands, minor accidents and the battle of the individual with his environment, influence but do not cause a reactive mind, nor do these things have the power to change materially the reactions of an individual.

In the background of any individual exist many hidden personalities contained in the reactive mind. Dealing in identities, the reactive mind often confuses identities of individuals. Therefore, irrational attachments and antipathies are formed by aberrated individuals who can often find no reason for such attachments or antipathies in their contemporary environment.

The content of an engram is literally interpreted, not as it was stated to the "unconscious" subject, but as it was received in its most literal phraseology and perception.

The organism possesses many inherent mechanisms and abilities by which it can learn or preserve or forward itself along the dynamics. Any one of them may be exaggerated by engrams to a point where it becomes an actual threat to the organism or impedes it. Engrams

can and do aberrate all the sensory perceptions, any and all parts of the body, and the mind itself. By demanding suicide the engram can destroy the entire organism.

The error of the reactive mind was introduced by the evolution of speech, for which the basic mechanism was not designed. When all perceptics save speech formed the reactive mind, it was to some degree serviceable. With speech came such complexities of perception and such interchanges of ideas that a whole series of illusions and delusions could be derived from the reactive mind's necessity to determine identities for purposes of emergency.

With speech the reactive mind came to possess far more power and extensive content. The analytical mind, being a delicate mechanism in some respects no matter how rugged and capable in others, then could become subjected to delusions and illusions which, however shadowy and unreal, must nevertheless be obeyed. By stripping the reactive mind of its past painful content the analytical mind may be placed in complete command of the organism.

The moment a man or a group becomes possessed of this ability, it becomes possessed of self-determinism. So long as these possess reactive minds, irrationalities will persist. Because it contains literal speech, no reactive mind can be conceived to be of any value whatsoever to the rational organism since the methods of that reactive mind remain intact and will continue to act to preserve the organism in times of "unconsciousness" of the analytical mind. There is no residual good in any reactive mind. It is capable of any illusion. It has no assist power along the dynamics save only to cancel or modify other reactive mind content. The source of the individual's power and purpose is not derived from the reactive mind but from the Basic Dynamic and its eight divisions. Any auditor will establish this to his own satisfaction after he has run a very few cases.

When an individual during auditing is attempting to "hold on to his aberrations," the auditor may be assured that that person has as part of the content of the reactive mind such phrases as, "don't dare get rid of it," which, identically translated, apparently applies to aberrations. It may, in fact, apply in an engram containing an attempted abortion.

The identity factor in the reactive mind may cause the analytical mind to respond irrationally in auditing and to justify the aberrations in many irrational ways. Whatever means he uses or statements he makes to avoid the exhaustion of his reactive mind is contained exactly in the reactive mind as a positive suggestion and has no application whatsoever in rational thought.

Individuality (if by that is meant a man's desires and habits) is not traced to the reactive mind save when by individuality is meant those flagrant eccentricities which pass in Dickens for characters.

A man is much more an individual after his reactive mind has been cleared.

DRAMATIZATION

Dramatization is the duplication of an engramic content, entire or in part, by an aberree in his present time environment. Aberrated conduct is entirely dramatization. Aberrated conduct will occur only when and if an engram exists in the reactive mind of the aberree. That conduct will be a duplication of such an engram. The degree of dramatization is in direct ratio to the degree of restimulation of the engrams causing it. A mild dramatization would be a similarity to the engram. A severe dramatization would be an identity with the engram.

The general tone of an aberree, when high—when his person is unwearied and he is well and not directly menaced in his environment—does not permit as great an influence by the reactive mind, since the tone level of the entire individual possesses too great a differential from the tone of the engram. As the general tone of the individual approaches the tone level of the engram under restimulation, dramatization becomes more severe.

The analytical mind is present to the degree that the general tone of the aberree is high. As this general tone lowers through ill health, reverses, or constant restimulation of the reactive mind, the analytical mind is proportionately less aware. Dramatization is demonstrated by the aberree in inverse ratio to the potential of the analytical mind. A geometrical progression is entered as general tone lowers to cause the analytical mind to lose its entire awareness potential.

Once every engram contains, as the common denominator of all engrams, the unconsciousness of the organ which is the analytical mind, dramatizations gain rapidly as this interaction progresses.

In the presence of a relatively high analytical mind awareness-potential dramatization takes the form of similarity. The data of the engram is present but is interspersed with or modified by justified thought. The physical pain which is always present as part of the dramatization is equally mild, a duplication of the pain which was present during the engram. The awareness potential of the analytical mind reduces in the restimulation of the engram which again reduces the general tone.

The aberree is subject to almost continuous dramatization of one engram or another as the restimulators appear in his vicinity. (Although the aberration may be so mild as to include only some chronically affected organ.) Complete dramatization is complete identity. It is the engram in full force in present time with the aberree taking one or more parts of the dramatis personae present in the engram. He may dramatize all the actors or merely one of them. His dramatization is identity, is unreasoned and always entirely reactive. When the analytical mind reaches the low point of awareness potential it held during the engramic incident, that point is also forced upon the aberree as a part of the dramatization. The aberree may also dramatize himself as he was at the moment of the engram's receipt.

The words, physical actions, expressions, and emotions of an aberree undergoing an identity dramatization are those of the single or various dramatis personae present in the engram.

An engram which can be dramatized may at any time in an aberree's future be dramatized as an identity dramatization, when and if his general tone is low and his environment becomes infiltrated by restimulators.

An aberree, because of high general tone and other factors, may not suffer the restimulation of an engram for a number of years after its receipt. A large number of engrams may be present and undramatized in any aberree, if he has never been presented with their particular restimulators in an optimum moment for restimulation. The common denominator of all insanity is the absence of all or almost all awareness potential in the analytical mind. Insanity can be acute or chronic. Any identity dramatization is insanity, by which is meant the entire absence of rationality.

The aberree commonly and chronically dramatizes locks. The engramic content may compel or repress the aberree whenever restimulated. An irrational person is irrational to the degree that he dramatizes or succumbs to engramic content in his reactive mind. The computations which can be made on the basis of dramatization are infinite. The reactive mind thinks in identities. Dramatizations are severe as they approach identity with the engrams which force them into being in the conduct of the aberree. The dianeticist can profit in many ways by these principles of dramatization. By examination of the rage or apathy or hysteria patterns of the preclear, the dianeticist will find himself in possession of the exact character of the engrams for which he is searching.

In the case of the manic, the fanatic, or the zealot an engram has entirely blocked at least one of the purpose lines deriving from a dynamic. The engram may be called an "assist engram." Its own surcharge (not the dynamic force) leads the individual to believe that he has a high purpose which will permit him to escape pain. This "purpose" is a false purpose not ordinarily sympathetic with the organism, having a hectic quality derived from the pain which is part of it, even though that pain is not wittingly experienced. This "assist engram" is using the native ability of the organism to accomplish its false "purpose" and brings about a furious and destructive effort on the part of the individual who, without this "assist engram" could have better accomplished the same goal. The worst feature of the "assist engram" is that the effort it commands is engramic dramatization of a particular sort, and if the engram itself is restimulated the individual becomes subject to the physical pain and fear which the entire experience contained. Therefore, the false purpose itself is subject to sporadic "sag." This sag becomes longer and longer in duration between periods of false thrust. It is easy to confuse, in casual observation, an "assist engram" and an actual, valid drive, unless one also observes the interspersed periods of "sag." The "assist engram" may or may not occasionally accomplish something, but it does accomplish a confusion in the society that the dynamics of the individual are derived from his bad experiences. This is a thing which is emphatically untrue.

Inherently the individual has great will power. This however can be aberrated. Will power or its absence occasions the attitude of the aberree toward his reactive mind.

The prevention of the dramatization of an engram or a lock further reduces dynamic thrust of the aberree. Chronic prevention lowers his general tone toward the break point. Unhampered dramatization, as it contains restimulation of a physical pain and the reduced potential of the analytical mind, produces other harmful effects.

Necessity can and does render inactive the entire reactive mind. Dramatization occurs most often in the absence of necessity or when the reactive mind has obscured the presence of necessity.

Dramatization is residual in the motor controls including speech and can be allayed by the physical exhaustion of the individual. The organism during dramatization tends to revivify toward the moment of the engram's occurrence—the engram containing, as one of its identity parts, the complete physical condition of the organism as at the moment of laying-in of the engram.

There is no folly or facet of human activity which cannot be dramatized. An immediate alleviation can be achieved when addressing an aberree who is in identity dramatization by acting upon the fact that the conditions of auditing, with no exception, already exist; i.e., the preclear returned to the moment of occurrence. Affinity may be established and dianetic auditing begun at once. He can be persuaded to listen for the phrases he is uttering and they can be alleviated by exhaustion on routine procedure.

THE AUDITOR'S CODE

Not because it is a pleasant thing to do or because it is a noble idea, the auditor must always treat a preclear in a certain definite way which can be outlined as the auditor's code. Failure to follow this code will cause trouble to the auditor, will considerably lengthen and disturb his work and may endanger the preclear. The auditor in the first place, at the optimum, should be himself cleared; otherwise he will find that many of his own engrams are restimulated as he listens to the engrams of his preclears. This restimulation may cause his own engrams to become chronic, victimizing him with various allergies and delusions and causing him to be, at best, extremely uncomfortable. An auditor can audit while he himself is being cleared as this is a peculiar and special method of locating his own engrams, since they become restimulated. Becoming painful to him, they can be found and speedily removed. Even if he is not himself cleared, the auditor must act like a Clear towards the preclear. The auditor's code is the natural activity of a Clear.

The auditor must act toward the preclear exactly in the way that the preclear as an organism would desire that his own conscious analytical mind would react to and consider the organism. An affinity must therefore be maintained at all costs.

The auditor must never permit himself to lose his temper, become aggravated, to scold or badger or antagonize the preclear in any way. To do so would not merely disturb the comfort of the preclear but might additionally derange him and might even prohibit further beneficial therapy by the auditor.

The code is nearly "Christlike."

The auditor must be confident in that he must continually reassure the preclear when restimulated engrams cause despondency on the preclear's part. A cheerful optimistic presence encourages the preclear through his most painful experiences.

The auditor must be courageous, never permitting himself to be intimidated by either the aggression or hostility of the preclear.

The auditor must be kind, never indulging in hostilities or personal prejudices. The auditor must be trustworthy, never betraying or capriciously denying a preclear and above all never breaking his word to the preclear. An auditor must be clean, for personal odors or bad breath may be restimulators to the preclear or may disturb him. The auditor must take care not to offend the concepts or sensibilities of the preclear.

The auditor must be persistent, never permitting the case of the preclear to either resist him or to remain unsolved until it is in a proper tone four, since the restimulation of engrams is a malady unto itself unless they are being properly exhausted.

The auditor must be patient, never hurrying or harassing the preclear beyond the needs of stirring an engram into view. He must be willing to work at any and all times necessary and for the length of time necessary to exhaust the engrams in process of elimination.

In addition to these things it may be remarked that a definite affinity is established between the auditor and preclear during the auditing. In the case of opposite sexes this affinity may amount to an infatuation. The auditor must remain aware of this and know that he can and should redirect the infatuation to some person or activity other than himself when auditing is at an end. Not to do so is to produce an eventual situation wherein the preclear may have to be rebuffed with consequent trouble for the auditor.

AUDITING

The auditing technique consists of assisting the preclear's analytical mind or some part of it with the auditor's analytical mind. The auditor then functions during each successive period of auditing, and only during the periods themselves, as an extra analytical mind of the preclear.

The reactive mind was received during the dispersal or inactivity of the analytical mind. The reactive mind is removed by "returning" the preclear to the engram, and laying its contents before the scrutiny of the analytical mind.

This technique may be considered the lowest common denominator of a number of techniques. *Anything* which will serve this purpose and permit auditing to be accomplished efficiently is valid technique.

The optimum is purely personal affinity brought about by understanding and communication with the preclear on agreeable subjects. Another and almost useless method is narcosynthesis together with the various drugs and hypnotics used to produce sleep. Methods can be found such as faith healing, books on

medical hypnosis, the techniques of Indian medicine men and so forth. It is pointless to delineate these methods here. They are currently available under the name of hypnotism but a caution should be enjoined that hypnosis as itself is not at all acceptable to Dianetics and indeed has extremely limited use. Briefly, however, it must be remarked that if hypnotism is studied to advance these techniques, all positive suggestion and post-hypnotic suggestion must be avoided as these suggestions depend for their effectiveness upon the already existing content of the reactive mind and will only form additional locks.

Any and all so-called hypnotic drugs have definite drawbacks since they, like so many other things, may be termed "shot-gun" methods. These paralyze not only the analytical mind but the remainder of the organism so that it is nearly impossible to obtain the proper somatic reaction in the preclear. They are not anesthetics but anesthetics. By using them the auditor instantly denies himself the main material which will lead him to the engram, which is to say, restimulated physical pain. Such restimulated pain is never of very great magnitude and is obliterated by the use of anesthetics.

At no time should the auditor permit the preclear to be under the delusion that he is being hypnotized. This is mentioned because hypnotism is a current fad and the principles of Dianetics have nothing whatever to do with hypnotism. Both are based upon simple natural laws but have between them an enormous gulf. One is the tool of the charlatan and the other is the science of the human mind.

Regression in its simplest form, hereafter called *return*, is employed in dianetic auditing.¹⁷ It would be an extraordinary case which required revivification. Return is the method of retaining the body and the awareness of the subject in present time while he is told to go back to a certain incident. Dates are not mentioned. His size is not mentioned. Various means are used to restimulate his memory. Any of the perceptics may be employed to return him to some period of his past. He is told simply to "go back to the time when— — —." He is asked to recount what he can of the incident. He is told that he is "right there" and that he can "recall this." Little else is said by the auditor save those hints necessary to return the preclear to the proper time.

The preclear is not allowed at any moment to revivify in that period since the data is drained as a surcharge from his time track to present time. He is told that he can remember this in present time since that will occasion the somatics to return to present time. Most of the data is located by observing some somatic pain in the individual or some somatic aberration and seeking to discover wherein it was received.

The somatics are employed primarily because the motor controls possess a less disturbed time track than the sensory strip. Anything which tends to lighten these somatics is then antipathetic to auditing. It must be remembered that there is no aberration without an accompanying somatic. The somatics alone, being physical ills of one sort or another, hold the aberrated content of the reactive mind in place. The motor controls can be returned to a period although the conscious or analytical mind believes itself to be entirely in present time. By talking to the muscles or motor controls or various bodily aches and pains, the auditor can shift them at will up and down their time track. This time track is not connected to the analytical mind and speech, but is apparently a parallel time track with greater reliability than the sensory track. The precision of data contained in the motor control time track is enormous. Muscles can be made to tense or relax. Coughs, aches, and pains can be made to come and go simply by uttering the right words for the engrams, or the wrong words.

It is the primary task of the auditor to cause the time tracks of the motor strip and the sensory strip to come into parallel. That the time track exists in the strips has not been proven but they can so be considered for the purposes of this explanation. That they exist is extremely apparent. The motor strip time track can be asked questions down to the smallest moment of time, and the area of an engram can be so located and its character determined.

As an analogy, a dream may be considered as the reception by the remaining analytical mind of a distortedly reflected and indirectly received picture of the engrams. This applies only when the dream is specifically directed at the reactive mind. It will be found that a preclear with a large and active reactive mind does not dream to any great extent in normal sleep but that a release may dream pleasantly and consistently. A dream in its normal function is that powerful and original mechanism called the imagination compositing or creating new pictures.

The use of the dream is not highly technical and has little value in Dianetics. The auditor gleans data from the preclear by his own remarks about any subject, or by the preclear's illogicalness on a subject. The auditor tells the preclear to dream about this data. When the preclear has had the dream he is directed to go back to the engram causing the dream. Quite often he will do so. If he does not, or if he becomes hostile, it is certain that an engram exists on the subject.

The lie detector, the encephalograph and many other means are of limited usefulness in determining both the character and the extent of the engrams since into these as into the dreams can be fed the restimulators of the preclear. A codified restimulator list can be created which will be found to be common to most preclears. It should include all types of illnesses, accidents, the common trite phrases of the society, and names of various persons who commonly surround a child during his childhood. Such a codified restimulator list would be interesting for experiment and every auditor can compose his own. These are best composed after auditing the individual preclear and after inquiry into his life to determine the various irrationalities of thought.

In that engrams are identity thought, the remarks of the preclear about his engrams will be found to be included in the content of those engrams. When the preclear is asked to imagine a bad situation at certain ages and under hypnotic conditions, he will very often deliver up a complete engram. The auditor must realize that every remark that a preclear makes while he is going over his reactive mind is probably some part of the content of that reactive mind. That mind is literal. The words the preclear uses when referring to it must be literally evaluated.

DIAGNOSIS

It is a useful and positive principle that whatever confronts or contests the analytical mind of the preclear will also confront and contest the analytical mind of the auditor. When the auditor is acting as the analytical mind of the preclear, whatever emotion or antagonism is directed towards him is the emotion or antagonism which is directed by the reactive mind toward the preclear's own analytical mind. If a preclear cannot hear what people are saying in his engrams, he has another engram about "can't hear." If he cannot feel anything in his engram, it is because he has an engram about "can't feel." If he cannot see, he has an engram about not being able to see, and so forth. If he cannot return, he has an engram about going back, or returning to childhood, or some such thing. If he is doubtful and skeptical about what is happening or what has happened to him, it is because he has an engram about being doubtful and skeptical. If he is antagonistic, his reactive mind contains a great deal of antagonism. If he is self-conscious or embarrassed, it is because his reactive mind contains self-consciousness or embarrassment. If he insists on maintaining his own control, refusing to do what the auditor tells him to do (although he is returned), it is because he has an engram about self-control, and so forth and so on. This is identity thought, and is used in diagnosis.

The return is the best method of learning the problems of the preclear. Trying to work the preclear into remembrance, hearing, seeing, feeling, going back and forward, going to sleep, awakening, and taking due notice of what he says about the entire process will form a rather complete diagnosis on one who is not insane. Questioning the preclear as to what is wrong with him while returned will elicit replies straight out of his principal engrams. Listening to an endless justification of his actions is both a delay and a waste of time but listening to what he has to say about what he thinks has happened to him or what he is afraid of is of definite value.

The insane form and pose a slightly different problem but essentially the same.

It is a clinically established observation that the reactive mind is relatively shallow. Below it lies the basic personality of the individual no matter how "insane" he may be. Therefore, by one means or another, a rational being may be reached within a person, a being which is not aberrated. It is this fact of non-aberration which makes the basic personality a difficult aid in diagnosis. Here however it can be established what the person really wants, what he hopes, what he actually feels. It has been observed that no matter what his raving state, providing his brain structure is normal and complete, the basic personality is entirely sound and sane and will cooperate. After auditing the person will become this strong, competent and able personality.

The reactive mind, when unable to exert itself to its aberrated full in the environment of the person, will break the person, or cause him to lose tone. Therefore it is of definite interest to discover what immediately preceded the break of the preclear or what is currently causing him unhappiness. Something is dispersing his dynamics. The probability is that he has a chronic restimulator in his vicinity. Wives, husbands, mothers, fathers, superiors, etc., can be the source of such breaking since they turn the purpose of the reactive mind, which pretends to desire above all else the best interest of the person, back upon the person himself. Thus these sources cause the individual to lower back into the tone of the reactive mind, apathy, or a low tone two.

The problem of the fixed person and the problem of the sympathy engram are both visible in the aberrated individual. The identity thought of the reactive mind has taken some part of the personality of some individual in the current environment and referred it to some part of the personality of an individual in the engramic past. The discovery of this identity is one of the principal problems in auditing. The sympathy engram is of a very specific nature, being the effort of the parent or guardian to be kind to a child who is severely hurt. If that parent or guardian has shown the child antagonism prior to the time of the injury, the adult (preclear) is prone to reactivate the injury in the presence of the identity personality with whom he is now

associated. This causes many somatic ills to present themselves in the present. Only the exact words of a sympathy engram will soothe the aberrated personality.

There are not many personality types. A human being learns through mimicry. If his own self is found to be too painful he can become another self and very often does. A tone four can become another person at will without being aberrated about it, thus enjoying books and plays by "being" the person portrayed. But an aberrated individual can become part of the engramic cast of his reactive mind and so solve all of his problems in such an aberrated fashion. Aberrated persons are not themselves since they do not possess their own determinism.

As has been stated, those emotions, doubts, worries and problems which confront the auditor when attempting to place the preclear in reverie or to work him in that reverie will lead the auditor into the basic content of the reactive mind.

There are certain definite manifestations which can be suspected and certain routines which follow every case. Every human being has been carried in the womb and every human being has been born. The discovery of the basic engram on each chain is extremely important. Finding the basic engram is like taking the enemy in the flank. There is nothing before it, therefore the end most remote from the adult life of the individual is the end most exposed for the attack of the auditor.

In the basic engram the preclear can see, feel, hear, and freely emote. When he is returned to later incidents, it may be found that he cannot do these things no matter how hard the auditor works to enable him to do so. By pursuing the engramic chain up its chronological sequence, this ability will be restored. Therefore it is necessary first and foremost to locate the basic engram. This may, in some few cases, lie later than birth. In the majority of the cases it will be found to lie at or before birth. No discussion is here entered about the ability of the human mind to remember at such remote periods. It can be stated however that when engramic data does exist, the time track is opened by pain and antagonism at these extreme points and can be contacted and exhausted. It is with the greatest difficulty that the auditor will find the basic engram. It is ordinarily quite painful, and since the scanning mechanism has as its purpose (or one of its purposes) the avoidance of pain, it will not easily reach them. Like the scanning mechanism on a cathode ray tube, the scanners of even a very reduced potential analytical mind sweep over, skipping and not touching the data on the engramic chain. By various means the auditor must then require the scanners to contact that data and force the data back onto the time track where it can be properly exhausted.

Light prenatsals are the best possible approach to a case. When the only prenatal is an extremely heavy one or an attempted abortion (which, by the way, are very common), the auditor must use a great deal of guile. It can be said that the basic engram and the beginning of the actual engram chains is very early, before, near, or during birth, is painful, and will not be easily contacted. In that few preclears have more than a few hundred serious engrams, the task is light when once begun but requires a great deal of imagination and persuasion.

A prenatal must always be suspected unless birth, when lifted, rises easily into a tone four. If none of the engrams will rise into a tone four, the auditor would suppose that he has not discovered the basic. There are three kinds of engrams: the precursor, the engram and the follower. By engram here is meant that experience which the auditor has found and is working upon. If it does not seem to be lifting after a few recountings, a precursor (earlier engram) must be suspected and returned to. In this way an earlier basic may be discovered. Blows in the womb, attempted abortions, and birth are the usual basics. Easily the most important are the prenatsals.

When a child is abnormally afraid of the dark, he probably has a severe engramic experience in prenatal. This prenatal experience will include all the sound data and sensory data of the incident. It is idiotic and identical. The preclear will have somatics. These on the first few recountings will be ordinarily faint and then become more severe as more data is located. The

data will finally be in a more or less complete state and the engram will begin to lift, rising up through the various tones. All prenatals are apathy experiences and are therefore serious. Minor taps and discomforts in the womb are of no consequence. A true engram will consist of such a thing as a knitting needle being rammed through the foetus, half of the foetus' head being badly injured, blows of various kinds bringing about foetal unconsciousness and so forth. Return eventually will find an opening into any period when there has been pain.

Disbeliefs and antagonisms from the preclear on the subject of such a thing as an attempted abortion should be overlooked by the auditor or taken into account as the sign of an existing engram. A case is recalled wherein a girl insisted that if an abortion had ever been attempted on her it should have been successful. Through several sessions, while an attempt was made to lift birth, she continued this assertion until the auditor realized that this was probably a remark made by the abortionist (or the mother) when his efforts failed. As soon as this was suggested to the girl she was able to contact the actual incident. A chronic apathy case under treatment for some years in an institution, she suddenly responded to auditing, brought the abortion to tone four, erased birth to tone four and recovered mentally and physically into a social asset well above normal.

The auditor should continue to suspect prenatals as long as he cannot get later engrams easily into tone four. Once an engramic chain has been lifted at its end nearest to conception, the preclear should begin to release relatively automatically, aided but little by the auditor. The erasure should be in terms of laughter at its optimum. This laughter is the reversing of charges residual in the locks which depended for their fear content or antagonistic content upon the basic engrams.

Abortion attempts are easy to recognize when an auditor has had some experience. The parent who attempted the abortion will, after the child's birth, likely be a source of anxiety to the individual who seems to require a great deal of affection and attraction from that parent. The individual will be found to be most fond of the parent (or other) who did not aid, or who actually tried to prevent the abortion attempt. At this time abortion attempts are extremely common. When an abortion attempt has been lifted, the engramic chain should easily be brought to the time track and exhausted.

Auditing is essentially very simple but it demands precise understanding of the principles involved and imagination and sympathy on the part of the auditor. He must learn to compute engrammatically—or learn to think with his analytical mind, only for the purposes of auditing others, engrammatically. His biggest problem is the discovery of the basic of basics. It may elude him for a considerable period of time.

There is, however, preparatory work to do in a case other than the discovery of the basic. Occasionally an entire time track must be rehabilitated in which “do not remember” and “can't remember” have obscured the track. Later locks can be found and exhausted in the same manner that engrams are exhausted, and rapid scanning methods may be developed in the future for these. The hysteria or fear of the individual can be momentarily allayed one way or the other and the problem of reaching the basic can be entered upon. There are as many types of case as there are cases, but these are the primary fundamentals.

An auditor must think his way through every case, taking as his data the constantly reiterated statements of the preclear during auditing, and accumulating experience as to how incidents can be thrust off the time track, burying them from sight by the analytical mind, thus forming a reactive mind to the detriment of the organism.

EXHAUSTION OF ENGRAMS

The technique of exhausting an engram is not complicated but it must be adhered to. An engram is an unconscious moment containing physical pain and conceived or actual antagonism to the organism. Therefore, that engram before it is discovered will exhibit antagonism toward the auditor trying to discover it. When it is first discovered, it may be found to be lacking in its essential data. There are many techniques by which this data can be developed. In a prenatal engram the analytical mind apparently must redevelop the situation. Many returns through the incident are therefore necessary.

When an engram will not exhaust, the first thing the auditor should suspect is an earlier engram. It is actually possible for a later one to contain essential information which will not permit the information to rise. In the course of auditing, when an engram is restimulated by the auditor but will not rise above apathy and does not seem to contain all the necessary data, the auditor must look for an earlier engram, and it almost inevitably will be found to exist. This precursor is then developed as the basic engram. If it follows the same behavior pattern of not lifting or becoming complete, another previous to it must be discovered. If at last the auditor is entirely certain that there is no engram ahead of the one being run, some possible locking mechanism later on may be found and exhausted, at which time the basic may show itself. Continual application of energy to the basic will at length bring it into full view and continual recounting of it will gradually develop it, raise its tone and lift it into tone four.

The principle of recounting is very simple. The preclear is merely told to go back to the beginning and to tell it all over again. He does this many times. As he does it the engram should lift in tone on each recounting. It may lose some of its data and gain other. If the preclear is recounting in the same words time after time, it is certain that he is playing a memory record of what he has told you before. He must then be sent immediately back to the actual engram and the somatics of it restimulated. He will then be found to somewhat vary his story. He must be returned to the consciousness of somatics continually until these are fully developed, begin to lighten and are then gone. Tone four will appear shortly afterwards. If the preclear is bored with the incident and refuses to go on with it, there is either an earlier engram or there is other data in the engram which has not been located.

The auditor will discover that occasionally an engram when lifted into a three, or even erased, without reaching laughter, will sag. This is a certain sign of an earlier basic on that chain. Any kind of sag from a tone four is impossible if tone four has truly been reached.

Tone four will not be reached if there are earlier basics. The engram may vanish and be erased, but there will be no cheerfulness or laughter about it at the end if it is not the basic.

Once the basic has been reached and brought into tone four, it will disappear. The next engram on the chain will be located and rather easily brought into tone four. If one is accidentally skipped, the third in line will be found to hold or sag. The intermediate must then be located and brought into a tone four. In such a way the chain will gradually come up into a complete tone four. At this time the locks, the merely mentally painful incidents in the person's life, will begin to release automatically. These will erase or lift without any attention from the auditor. While these are releasing, the auditor must concern himself with secondary engrams. These would be engrams on their own if they had not had forerunners. They therefore do not relieve after the removal of the basic but must be located as themselves. These in turn will start a chain of releasing locks which again need no attention. There may be entirely distinct engramic chains in the reactive mind which are not appended in any way to the original basic.

So long as a preclear retains any part of a reactive mind, he will be interested in himself (in the condition of his mind) and be introverted. Therefore, so long as he is interested in his own reactive mind, he is impeded in his dynamic pursuit of survival. A guarantee of a tone four is the patient's interest in positive action along his dynamics, and his application of himself to the world around him. Introversion is not natural nor is it necessary to the creation of anything.

It is a manifestation of the analytical mind trying to solve problems on improper data, and observing the organism being engaged in activities which are not conducive to survival along the dynamics. When a Clear has been reached, the basic personality and self-determinism of the individual will have asserted itself. No chronic somatics in the present will remain (excepting those which can be accounted for by actual disease, injury or malconstruction of the brain).

Though more germane to Child Dianetics, it is of help to the auditor to know that a child can be considered to have formed his general basic purpose in life somewhere around the age of two. This purpose is fairly reliable, as at that time his engrams have probably not gained much force over him since his responsibilities are slight. He will have tried to hold his main purpose throughout his life but it will undoubtedly have been warped both by his reactive mind's experience content and by his environment. The time when the purpose is formed varies and may indeed never have been manifested, as in the case of amentia. As the preclear is normally interested in this purpose and its rehabilitation, he will often take a more intense interest in auditing if there is an attempt made to discover it. This purpose is quite valid and the preclear can be expected to rehabilitate his life along its dictates unless he is too oppressed by his environment. (It can be remarked that a Release or Clear will ordinarily order or change his environment.)

Vocational therapies have as their source the tenet of the rehabilitation of the general purpose of an individual or the establishment of a false purpose in order to allay the activity of his reactive mind. It has little bearing on Dianetics, but an auditor, for the term of auditing may engage his preclear along the purpose line of becoming a Clear. This is not necessary and is indeed often automatic since the basic personality beholds at last a chance to manifest itself. However, it will occasionally aid the auditor.

The auditor should be prepared to have to solve many individual problems since above the basics are almost as many problems as there are cases. For example, in the case of a preclear who has several very nasty prenats it will be found that the formation of the body in the womb has overlaid or confused the time track so that a later prenatal must be partially lifted before an earlier prenatal can be exhausted. This is often true of a later period of life. In one case an entire series of prenats was held down by a dental operation under nitrous oxide at the age of twenty-five. Until some portion of this was removed, the bulk of the prenats were not available. In short, the circuits of the mind can become entangled to a point where even the motor control time track is confused.

Dispersal of purpose by some engram along some dynamic or purpose line is a common situation and is indeed the basic concept. As a stream of electrons would behave if they were to encounter a solid object in their path, so does a drive or purpose disperse. These many varied and faint tracks after impact with the engram are symptomatic. Along dynamic two, the sexual drive, promiscuity inevitably and invariably indicates a sexual engram of great magnitude. Once that engram is removed promiscuity can be expected to cease.

Anxiety is established in the preclear's mind by such dispersals and he dramatizes because of the dispersal. This is one of the manifestations of his malady. No pervert ever became a pervert without having been educated or abused by a pervert. And that abuse must have been very thorough. The contagion of engrams is an interesting manifestation which the auditor should and must observe. It can be said that insanity runs in families, not because this is a eugenic truth but because a standard patter during emergencies or stress creates certain types of engrams which in turn create types of insanities. Insanities are so definitely contagious that when a child is raised by aberrated parents, the child becomes aberrated. As would be delineated by Child Dianetics, the best way to guarantee a sane child is to provide it with cleared or released parents. This is of definite interest to the auditor since he will discover that in cases of severe prenats and birth the engrams were also received by the mother exactly as they were received by the child. The child will thereafter be a restimulator to the mother and the mother a restimulator to the child for the severe incidents. The mother, having received the exact wording of the engram, also contains the engram. Restimulation by the child will occasion the use of the engramic language toward the child. This brings the infant and child and

adolescent into the unhappy situation of having his birth engram or his prenatal engrams continually restimulated. This occasions dire results and very great unhappiness in the home and is one of the main sources of family difficulties.

A child, even if he despises them, will dramatize the actions of his parents when he himself is married and when he himself has children. In addition to this the other partner in the marriage also has his or her own engrams. Their engrams combine into doubled engrams in the children. The result of this is a contagion and a progression of aberration. Thus any society which does not have a high purpose finds itself declining and gaining greater numbers of insane. The contagion of aberration is at work progressively, and the children become progressively aberrated until at last the society itself is aberrated.

While the fate of society belongs definitely in Social and Political Dianetics, the auditor is interested in the fact that he can take the prenatal and birth content of the engrams of his preclear and run them to discover post-birth locks and secondary engrams. The mother will normally have used much the same data whenever the troubles of the child impinged upon her reactive mind; this of course accounts for the locks.

The auditor will also discover that where he has a married preclear who is aberrated, he should have two preclears, which is to say, the partner. It is useless to return a preclear to his or her aberrated spouse and expect domestic tranquility to result. While the release cannot and will not pick up his old engrams from the spouse in whom he has implanted them, he will, nevertheless, find his life made unbearable by the mere existence of a spouse that he himself may have aberrated.

Further, the children of these people will also need auditing, since they will be found (if the parent's aberrations were of any magnitude) to be sickly or aberrated or deficient in some way. The auditor should therefore, when he undertakes a case, be prepared to audit the family of his preclear, should an investigation of that preclear make it seem necessary.

Aberrations are contagious and where a person has been aberrated, his environment will to some degree also have become aberrated. The preclear may, for one thing, be somewhat victimized and impeded by his reactive mind which is now existing in his associates.

The auditor should not permit such terms as "psychoneurotic," "crazy," or "mentally exhausted" to exist for long in the preclear's mind. These are depressive and are actually aberrations in the society. It is true and provable that the preclear is on his way to being, not a person who is crazy or neurotic, but an individual who will have more stability and self-command and ability, possibly, than those around him. To be blunt: this is not the process of reviving corpses into a semblance of life. It is a process which, at its best usage, is taking the "normal" and "average" and giving them their birthright of happiness and creative attainment in the world of man.

ENGRAM CHAINS

More than one engramic chain will be found in every aberree. When this person becomes a preclear the dianeticist does well to discover the earliest chain. It is not always possible to do this with accuracy since apreclearis sometimes in such a nervous condition that he cannot be worked on his basic chain but must be alleviated in a greater or lesser degree by the exhaustion of a later and more available chain. This last, however, is not the usual case.

The dianeticist should clearly understand certain working principles and definitions. By an engram is meant a moment of unconsciousness accompanied by physical pain and conceived antagonism. The basic engram is the earliest engram on an engram chain. Also there may be engrams of the same character and kind on the same drive line as the basic engram of the chain. An engram chain is composed of a basic engram and a series of similar incidents. Engram chains also contain locks which are instances of mental anguish more or less known to the analytical mind. These are often mistaken by the preclear for the cause of his conduct. A true engram is unknown to the conscious computer of the preclear but underlies it as a false datum on which are erected almost equally unknown similar incidents and an enormous number of locks.

In order to release an engram chain it is vital and absolutely necessary to discover the basic of that chain. An individual will have more than one engram chain but he has a basic chain. This must be released as soon as possible after auditing is begun on the preclear.

When an engram is discovered by the dianeticist, he must examine the aspect of it to determine whether or not it is the basic. Discovering it is not, he must immediately determine an earlier basic, and so forth until he is obviously on the scene of the basic engram.

There are certain tests which he can apply. A basic engram will rise to laughter, "sag" slightly, and then rise to tone four and vanish. Successive engrams will then erase from that chain with very little work. Almost any engram on an engram chain can be exhausted, but if it is not a basic engram it will recede and vanish at times but will rise in part again when the basic engram has been reached and the preclear is brought forward into its area.

An engram not basic is subject to "sag." Which is to say that it may be brought to the two point zero (2.0) tone, but after a certain length of time has elapsed— from one to two days—it will be found to have "sagged" and to be, for instance, in a one point one (1.1) tone. It can be successively lifted until it is apparently in a three point zero (3.0) tone, at which point much of its content will disappear. This is reduction.

Any engram chain can be reduced to some degree without reaching the basic but when it has been reached the basic itself and subsequent engrams can be brought rapidly to tone four providing no engrams are skipped on the return up the time track.

When an engram chain has been brought to tone four, it can be considered to have vanished. The preclear can no longer find it on the time track (he may even be unable to recall some of its most painful and disheartening aspects). The mind apparently has been proofed against the data it has contained. A search for an engram chain after it has been exhausted and a tone four has been achieved should, for purposes of auditing, be entirely fruitless.

Once the basic has been discovered and the engram chain has been brought to tone four the locks will vanish of their own accord. If this does not occur then there is something remaining or the auditor has been too optimistic about the selection of his basic engram for the chain and has not, in reality, discovered it.

All engram chains should be exhausted from a preclear. These may be discovered to lie along the various dynamics but any chain may influence more than one dynamic.

Another type of engram is the cross engram. This is usually a childhood or adult engram which embraces more than one engram chain. The receipt of the cross engram, containing as it does the convergence of two or more engram chains, is often accompanied by a “nervous breakdown” or the sudden insanity of an individual. A cross engram may occur in a severe accident, in prolonged or severe illness under antagonistic circumstances, or a nitrous oxide operation. Cross engrams are very easy to locate but should not be addressed by the dianeticist as such since an enormous amount of work upon them will not exhaust them until the basic and the chains on which the cross engram depends have been brought to tone four.

Post-battle neurasthenia is almost always traceable to the receipt of a cross engram. This must be, of course, an engram in its own right on more than one chain. It is conceivable that it may be so severe that it “breaks” the individual even if it lies on only one chain.

There are certain rules the dianeticist may employ to establish the basic engram of a chain. In first entering a case these rules apply as well to the first goal which is the location of the basic engram of the basic chain.

Number one: No engram will lift if the basic of that chain has not been lifted.

Number two: The basic engram will not lift until the basic instant of the basic engram has been reached, which is to say, the first moment of the engram. Ordinarily this is the most obscure.

Number three: If after two or three test recountings of an engram it does not seem to be improving, the auditor should attempt to discover an earlier engram.

Number four: No engram is valid unless accompanied by somatic pain. This may be mild. Incidents which do not contain somatics are either not basic (the chain having been suspended by some such command as “can’t feel” in the basic) or else it may not even be an engram.

Cases should be entered as near as possible to the basic engram. Then they should be returned to earlier incidents until the basic is discovered.

The running of locks themselves may accomplish some alleviation of a case.

PRENATAL, BIRTH AND INFANT ENGRAMS

The human mind and the human anatomy are enormously more powerful and resilient than has commonly been supposed. Only incidents of the greatest magnitude in physical pain and hostile content are sufficient to aberrate a mind.

The ability of the mind to store data can scarcely be overrated. In early life before sound is analyzed as speech a human being receives and stores exact impressions of everything which occurs. At some future date, when similar perceptics are encountered, the reactive mind re-analyzes—on the basis of identities only—the content of the early mind. This becomes the foundation of the post-conception personality. The actual personality in the individual is powerful and very difficult to aberrate. Unlike animals which can be driven mad by minor mechanisms of experimental psychology, a man must be most severely handled before he begins to show any signs of derangement. That derangement proceeds from the ability of the reactive mind to store perceptions from the earliest moments of existence and retain them on either the analytical or the reactive plane for future reference.

The basic personality does not proceed from engrams, and the dynamics of the individual are impeded not enhanced by engrams. The dynamics are entirely separate and are as native to the individual as his basic personality, of which they are a part.

Information falls into two categories: the educational or experience level, banked and available to the analytical mind on at least its deeper levels; and aberrational, or data stored in the reactive mind and often used but never reached by the analytical mind, save through auditing. There would seem to be two types of recording. The first is cellular recording in which the cells would seem to store data. In that cells in procreating become themselves again—which is to say that when cell A divides, both halves are still cell A—cellular intelligence is not lost. Personal identity is duplicated. In the case of individual men, procreation is far more complex and individual identity is lost—the son is not the father but a genetic composite of vast numbers of ancestors.

The cells of the human being shortly after conception are capable of enormous perceptic and retentive power. After a very short time in the womb, the brain and nervous system are already operating. From then until birth the human being is apparently capable of computations of a rather complex nature on the analytical mind level. Far more certainly he retains information on the reactive level.

Fear, pain, and unconsciousness extend the range of perception of the individual. When the human being in the womb is injured his senses extend so as to record sounds outside the mother's body. He records them so well that their precise nature is stored for future reference. The human being in the womb responds exactly as it does after birth to the receipt of engrams, storing the data with precision and reacting to it.

The repair facilities available to a human being before birth are greatly enhanced by the presence of ample connective tissue, oxygen and sustenance. These repair facilities are unimaginably great so that a prenatal human being can be severely torn and ripped without becoming structurally deficient. It does, however, receive engrams and these are subject to restimulation. In many cases of attempted abortions it was found that large sections of the prenatal human being's brain could apparently be injured without the brain being deficient or even scarred after birth. These repair facilities do not however lessen the extreme severity of the engrams which can be received by the prenatal human being. The word *foetus* is dropped at this point and it is advised that it should be dropped from the language as a description of a pre-birth human being. Insufficient evidence is at hand to make an outright declaration that attempted abortions are responsible for the bulk of our criminal and insane aberrations. But according to the cases at hand the attempted abortion must be accounted responsible for the majority.

The attempted abortion is the most serious aberration producer. So exact is the recording of the pre-birth human being that the reactive mind makes no errors in recognizing its enemies after birth. The mind becomes aberrated in having to depend upon these same enemies for the ordinary sustenance of life while the child is a helpless infant. The diagnosis of a prenatal case is relatively simple. Nearly all preclears will be found to have at least one prenatal engram and the case will not solve unless that prenatal is reached and exhausted.

The dianeticist can usually establish the attempted abortion preclear by an investigation of the conduct of the infant and child. Uneasiness or unhappiness in the home, a feeling of not being wanted, unreasonable fear, and a strong attachment to grandparents or another non-parental member of the household are often signs of an attempted abortion. Fear of the dark is usually but not always a part of the attempted abortion case. The auditor should suspect an abortion attempt in every preclear he audits, at least for this next generation. Whether or not the preclear disbelieves the diagnosis is of no importance to the auditor as the prenatal engrams may very well contain the words, "Can't believe it." The parents themselves, as well as society, mislead the individual as to the enormous prevalence of this practice at this time. The attempted abortion preclear may not be discovered to be such until considerable auditing has already been done. Any auditing done on an attempted abortion preclear, unless it is solely addressed to making the case workable, is wasted until the attempted abortions are reached.

The post-birth aberree presents a somewhat different case than the prenatal since his case can be entered at any point and the earliest moments of it can be attained easily. This is not true of the attempted abortion preclear. Attempted abortions may run to any number. Since they are easily the most prevalent dramatization of engrams in the society, they are repeated time and again. The auditor will find it necessary to "unstack" the prenatal period. He will ordinarily reach the latest prenatal injury first. As he finds and examines it, it places itself on the time track. By going to earlier and earlier attempts, more and more of these engrams are revealed until at last the earliest is discovered. The auditor must be prepared to spend many hours of hard work in unstacking injuries. He will many times believe that he has reached the basic of that engram chain only to discover that another type of abortion was attempted prior to that moment. He need not address these engrams for any length of time before he goes on to the earlier one. He should only get some idea of them so that they will be easily locatable on the return. The basic engram on the attempted abortion case may be found shortly after the first missed period of the mother.

Its emotion will be exactly that of the person or persons attempting to perform the abortion. The prenatal human being identifies himself with himself but an adult returned to the prenatal period is reinterpreting the data and will find that he has and is confusing himself with other people associated in the attempts. This engramic data may have slumbered for years before it became violently restimulated and may indeed never have been awakened. It must be removed, however, before a release can be obtained. The auditor should be prepared to unstack fifty or more incidents before birth if necessary.

When he is at last in the vicinity of the basic, even the most skeptical preclear (one who has skepticism as part of the prenatal engram chains) will have no further question as to what is happening to him. The auditor should be prepared to encounter difficulty in the ability of the preclear to hear voices or feel pain, as it is quite common for the engramic content to contain such phrases as "Unconscious" and "Can't see, can't feel, can't hear," this having been the misconception of the society regarding prenatal life.

The auditor should never be appalled at the damage the prenatal human being has received and so question the validity of his preclear's data. Unless the umbilical cord is severed or the heart is stopped it is apparently the case that no damage, particularly in the earlier months, is too great for the organism to reconstruct. In that parents performing abortions are usually dramatizing attempted abortions which have been performed on them, rationality of content in the engrams should not be expected. Even the data given for it by the abortionist father, mother or professional is often entirely inaccurate.

The test of an engram is whether or not it will lift and whether or not the somatics which accompanied it disappear and a tone four is obtained. Rearranging data into other sequences will not obtain this. The exact content must be brought out. The attempted abortion human being is often struck unconscious by the earliest part of each attempt since the head is so available to the knitting needles, hat pins, orange-wood sticks, buttonhooks, and so forth which are employed. These periods of unconsciousness must be penetrated and will quite ordinarily release slowly.

The number of prenatal engrams should not particularly appall the auditor for when the basic has been discovered and a tone four achieved, the succeeding experiences will lift with greater and greater ease. The periods of consciousness interspersed between the prenatal engrams, being locks, will vanish.

Birth is in itself a severe experience and is recorded by the human being from the first moments of pain throughout the entire experience. Everything in a birth is engramic since the human being conceives the ministrations to be more or less antagonistic when they are accompanied by so much pain. A birth must be lifted as a matter of course but not until the presence or absence of prenatals has been established. Even after birth has been lifted, prenatals should be looked for, since prenatals may often be found only after birth has been exhausted. The habits of obstetricians, the presence of sound and speech in the delivery room, the swabbing of an infant's nostrils, the examination of its mouth, the severe treatment administered to start its breathing and the drops on the eyes may account in themselves for many psychosomatic ills. A cough, however, although it is present in birth and seems to be alleviated by the exhaustion of the birth engram, is quite ordinarily blood running down the throat of the prenatal during an attempted abortion. Any perception during birth, when difficulty is encountered with breathing, may become a restimulator for asthma. Clean fresh air and electric lights may cause allergies and may be the principal restimulators. Everything said during birth, as well as everything said during prenatal experiences, is recorded in the reactive mind and acts as aberrational matter which can and does cause psychological and physiological changes in the individual. Because the parents are not greatly in evidence at birth, this experience may not be restimulated for many years. Prenatals, on the other hand, restimulate more easily.

Infant life is very sentient. Delay in learning to talk is delay in learning the complexity of handling vocal muscles rather than an inability to record. Everything in infant life is recorded and the engrams received in it are extremely valid.

The auditor will find himself dealing mainly with prenatal, birth, and infant life. The cases are very rare which have many important basics in childhood or adult life. These last periods contain mainly other engrams which, though they must be addressed to create the release, should not engage much initial attention on the part of the dianeticist. Most of the experiences of mental anguish in childhood and adult life are founded on very early engrams and are locks which are almost self-removing.

Moments of unconsciousness which contain physical pain and conceived antagonism lying in childhood and adult life are serious and can produce aberration. Engram chains complete with basic may be found which will, all by themselves, exhaust.

THE "LAWS" OF RETURNING

By aberration is meant the aberree's reactions to and difficulties with his current environment.

By somatic is meant any physical or physically sensory abnormality which the preclear manifests generally or sporadically in his environment, or any such manifestation encountered and re-experienced during auditing.

The aberration is the mental error caused by engrams and the somatic is the physical error occasioned by the same source.

The auditor follows the general rule that no aberrations or somatics exist in a subject which cannot be accounted for by engrams. He may ordinarily be expected to discover that anything which reduces the physical or mental perfection of the subject is engramic. He applies this rule first and in practice admits no organic trouble of any character. Only when he has obviously obtained a Clear and when he has observed and has had that Clear medically examined after a period of sixty days to six months from the end of auditing should he be content to assign anything to organic origin. He cannot be expected to know until the final examination exactly what somatic was not engramic. In other words he must persistently adhere to one line of thought (that the preclear can be brought to mental and physical perfection) before he resigns any mental or physical error in the preclear to a purely organic category. Too little is known at this writing of the recoverability of the mind and body for a dianeticist to deny that ability to recover. Since primary research, considerable practice has demonstrated that this ability to reconstruct and recover is enormous, far beyond anything previously conceived possible.

Dianetics accounts for *all* faith healing phenomena on an entirely scientific basis and the dianeticist can expect himself to consort daily in his practice with what appear to be miracles.

In addition to knowledge of his subject, considerable intelligence and imagination, and a personality which inspires confidence, the dianetic auditor must possess persistency to a remarkable degree. In other words, his drives must be phenomenally high. There is no substitute for the auditor's having been cleared. It is possible for an individual to operate with Dianetics without having been released and he may do so for some time without repercussion, but as he audits he will most certainly encounter the perceptics contained in sorVe of his own engrams time after time until these engrams are so restimulated that he will become mentally or physically ill.

In psychoanalysis it was possible for the analyst to escape this fate because he dealt primarily with locks occurring in the post-speech life. The analyst might even experience relief from operating on patients since it might clarify his own locks which always had been more or less completely available to his analytical mind. This is very far from the case with the dianeticist who handles continually the vital and highly charged data which *cause* physical and mental aberrations. An auditor in Dianetics may work with impunity for a very short time only before his own condition demands that he himself be audited. While this is aside from the main subject of auditing, it has been too often observed to be neglected.

Every engram possesses some quality which denies it to the analytical mind. There are several types. First there is the "denyer" engram which contains the species of phrase, "Frank will never know about this," "Forget it!" "Cannot remember it!" and so forth. Second is the self-invalidating engram which contains the phrases, "Never happened," "Can't believe it," "Wouldn't possibly imagine it," and so on.

Third is the "bouncer" engram which contains the species of phrase, "Can't stay here," "Get out!" and other phrases which will not permit the preclear to remain in its vicinity but

return him to present time. A fourth is the “holder” engram which contains “Stay here,” “Hold still,” “Can’t get out,” and so on.

These are four of the general types which the dianeticist will find occasion him the greatest difficulty. The type of phrase being encountered, however, is easily diagnosed from preclear reaction.

There are many other types of engrams and phrases which will be encountered. There is the self-perpetuating engram which implies that, “It will always be this way,” and “It happens all the time.” The auditor will soon learn to recognize them, forming lists of his own.

An engram would not be an engram unless it had strong compulsive or repressive data contained in it. All engrams are self-locking to some degree, being well off the time track and touching it slightly, if at all, with some minor and apparently innocuous bit of information which the analytical mind disregards as unimportant. Classed with the denier variety are those phrases which deny perception of any kind. The dianetic auditor will continually encounter perception denial and will find it one of the primary reasons the preclear cannot recall and articulate the engram. “Can’t see,” “Can’t hear,” “Can’t feel,” and “Isn’t alive” tend to deny the whole engram containing any such phrases.

As the engram is a powerful surcharge of physical pain, it will without any phrases whatsoever deny itself to the analytical mind which, in seeking to scan the engram, is repelled by the operating principle that it must avoid pain for the organism. As has already been covered, there are five ways the organism can handle a source of pain. It can neglect it, attack it, succumb to it, flee from it, or avoid it. As the entire organism handles exterior pain sources, so does the analytical mind tend to react to engrams. There is an exterior world reaction of the organism to pain sources then. This is approximated when the analytical mind is addressed in regard to engrams. There is an excellent reason for this. Everything contained in the reactive mind is exterior source material. The analytical mind went out of circuit and was recording imperfectly if at all in the time period when the exterior source was entered into the reactive mind.

An analytical mind when asked to approach an engram reacts as it would have had it been present, which is to say, in circuit, at the moment when the engram was being received. Therefore, an artificial approach to the engram must be made which will permit the auditor to direct the subject’s analytical mind into but one source of action: Attack.

The actual incident must be located and re-experienced. In that the analytical mind has five possible ways of reacting to the engram and in that the auditor desires that only one of these—attack—be used, the preclear must be persuaded from using the remaining four.

On this general principle can be created many types of approach to the problem of obtaining a Clear. The one which is offered in this manual is that one which has met with quicker and more predictable results than others researched at this time. It has given, in use, one hundred per cent results. In the beginning, at this time, an auditor should not attempt to stray far from this offered technique. He should attempt to vary it only when he himself has had extensive and sufficient practice which will enable him to be very conversant with the nature of engrams. Better techniques will undoubtedly be established which will provide swifter exhaustion of the reactive mind. The offered technique has produced results in all types of cases so far encountered.

There are three equations which demonstrate how and why the auditor and preclear can reach engrams and exhaust them:

I. *The auditor’s dynamics are equal to or less than the engramic surcharge in the preclear.*

II. *The preclear’s dynamics are less than the engramic surcharge.*

III. *The auditor's dynamics plus the preclear's dynamics are greater than the engramic surcharge.*

When the preclear's dynamics are entirely or almost entirely reduced, as in the case of amnesia trance, drug trances and so forth, the auditor's dynamics are not always sufficient to force the preclear's analytical mind into an attack upon the engram.

The auditor's dynamics directed against an engram in a preclear who has not been subjected to a process which will inhibit the free play of his reactive mind and concentrate it, ordinarily provokes the preclear into one of the four unusable methods of succumbing, fleeing, avoiding or neglecting the engram. Demanding that the preclear "face reality," or "see reason," or that he "stop his foolish actions" falls precisely into this category. The auditor's dynamics operating against an awake preclear can produce an "insanity break," temporary or of considerable duration in the preclear.

When the preclear is in reverie some of his own dynamics are present and the auditor's dynamics added to these make a combination sufficient to overcome the engramic surcharge.

If the auditor releases his dynamics *against* the analytical mind of the preclear, which is to say, the person of the preclear, while an attempt is being made to reach an engram (in violation of the auditor's code, or with some erroneous idea that the whole person of the preclear is confronting him) he will receive in return all the fury of the engramic surcharge.

An engram can be dramatized innumerable times, for such is the character of the reactive mind that the surcharge of the engram cannot exhaust itself and will not exhaust itself regardless of its age or the number of times dramatized until it has been approached by the analytical mind of the subject.

The additive dynamic drive law must be made to apply before engrams are reached. It is occasionally very necessary to change dianetic auditors, for some preclears will work well only with either a male or a female auditor, or with one or another individual auditor. This will not be found necessary in many cases. Three cases are on record where the preclear was definitely antipathetic toward the auditor throughout the entire course of auditing. The dianeticist was found to be a restimulator for one or more of the persons contained in the engrams. Even so, these persons responded. Greater patience was required on the part of the auditor. Closer observance of the auditor's code was necessary and a longer time was required for auditing. It will be discovered that once the preclear understands what is desired of him and why, his basic personality is aroused to the extent that it will cooperate with any auditor in order to be free. It will suffer through many violations of the auditor's code. Once a preclear has started his auditing he will ordinarily continue to cooperate in the major requirements to the fullest extent, no matter what apparent antagonisms he may display in minor matters.

Reverie is a method that has been used with success. The analytical mind of the preclear, while reduced in its potential and under direction, is still capable of thinking its own thoughts and forming its own opinions. Implicit obedience to whatever the auditor suggests is not desirable as the preclear will inject extraneous material at the faintest suggestion of the auditor. Drugs inhibit the somatic and have no use in entering a case.

The fact that the dianeticist is interested solely in what has been done to the preclear and is not at all interested in what the preclear himself has done to others greatly facilitates auditing since there is no social disgrace in having been an unwitting victim.

In reverie the preclear is placed in a light state of "concentration" which is not to be confused with hypnosis. In the state of alliance, therefore, the mind of the preclear will be found to be, to some degree, detachable from his surroundings and directed interiorly. The first thing that the dianeticist will discover in most preclears is aberration of the sense of time. There are various ways that he can circumvent this and construct a time track along which he can

cause the preclear's mind to travel. Various early experiences which are easily reached are examined and an early diagnosis can be formed. Then begins an immediate effort to reach basic, with attempted abortion or prenatal accident predominating. Failures on the first attempts to reach prenatal experiences should not discourage the dianetic auditor since many hours may be consumed and many false basics reached and exhausted before the true prenatal basic is attained.

In this type of reverie the dianeticist can use and will observe certain apparently natural laws in force. They are as follows: The difficulties the analytical mind encounters when returned to or searching for an engram are identical to the command content of that engram .

An aberree in adult life is more or less obeying, as restimulated, the composite experiences contained in his engrams.

The preclear's behavior in reverie is regulated by the commands contained in the engram to which he is returned and is modified by the composite of chronologically preceding engrams on his time track.

The somatics of a preclear are at their highest in an engram where they were received and at the moment of reception in that experience.

When returned to a point prior to an engram, the commands and somatics of that engram are not effective on the preclear. As he is returned to the moment of an engram, the preclear experiences, as the common denominator of all engrams, a considerable lessening of his analytical potential. He speaks and acts in a modified version of the engram. All complaints he makes to the auditor should be regarded as possibly being verbatim from, first, the engram that he is reexperiencing or, second, from prior engrams.

At the precise moment of an engramic command the preclear experiences obedience to that command. The emotion a preclear experiences when regressed to an engram is identical to the emotional tone of that engram. Excesses of emotion will be found to be contained in the word content of the engram as commands.

When a preclear is returned to before the moment of reception of an engram he is not subject to any part of that engram, emotionally, aberrationally, or somatically.

When the time track is found to contain loops or is blurred in any portion, its crossings or confusions are directly attributable to engramic commands which precisely state the confusion.

Any difficulty a preclear may experience with returning, reaching engrams, perceiving, or recounting, is directly and precisely commanded by engrams.

An engram would not be an engram were it easy to reach, or if it gave the preclear no difficulty and contained no physical pain.

The characteristic of engrams is confusion. First, the confusion of the time track; second, the confusion of an engramic chain wherein similar words or somatics mix incidents; third, confusion of incidents with engrams.

This confusion is occasioned by the disconnected state of the analytical mind during the receipt of the engram. Auditing by location and identification of hidden incidents, first rebuilds at least the early part of the time track, locates and fixes engrams in relation to one another in time, and then locates the basic of the basic chain and exhausts it. The remainder of the chain must also be exhausted. Other engrams and incidents exhaust with ease after the erasure of the basic or the basic of any chain (within that chain). Locks vanish without being located. A tone four gained on basic permits the subsequent erasure on the time track to go forward with ease. A whole chain may rise to four without the basic chain having been located.

Any perception of pre-speech life during reverie denotes the existence of engramic experience as far back as the time track is open.

If the individual's general tone is clearly not tone four, if he is still interested in his engrams, another more basic chain than the one found still exists.

Engramic patterns tend to form an avoidance pattern for the preclear. From basic outward there is an observable and progressive divergence between the person himself and his returned self. In the basic engram of the basic chain and for a few subsequent incidents on that chain, he will be found within and receiving the experiences as himself. In subsequent incidents cleavage is observable, and in late engrams the preclear is found to be observing the action from outside of himself, almost as a disinterested party. This forms the principal primary test for the basic of the basic chain. Another test for basic is "sag."

Any engram may be exhausted to a point where it will recede without reaching tone four. Although it is temporarily and momentarily lost to the individual and apparently does not trouble him, that engram which has been exhausted in a chain without the basic having been reached will "sag" or reappear within twenty-four to sixty hours. Basic on any chain will not "sag" but will lift on a number of recountings, rise to tone four and will remain erased. Another test for basic is whether or not it begins to lift with ease. If an engram does not intensify or remain static after many recountings, it can be conceived to be at least a basic on some chain. Locks will lift and disappear without returning as they are not fixed by physical pain. Large numbers of locks can be exhausted bringing an alleviation of the preclear's difficulties and such a course may occasionally be pursued in the entrance of a case. The discovery and lifting of the basic to which the locks are appended removes the locks automatically.

These rules and laws even if modified in their statement will be found invariable. Incompetent auditing cannot be excused by the supposed discovery of a special case or exception. A physical derangement must be in the category of actually missing parts of the organism which cause permanent disability, and instances of this are not common.

CASE HISTORIES

The following case histories have been selected at random. Due to lack of time, these case histories are Releases, not Clears. The Releases have been fully diagnosed and researched.

**CASE NO. 1
HYPERTENSION, COMBAT FATIGUE
TUBERCULOSIS, ARRESTED
MYOPIC ASTIGMATISM**

A forty-three year old ex-Army officer and author; inclined to petty tyrannies; twice divorced; no children. Processed by army as psycho-neurotic.

Birth was discovered immediately but would not satisfactorily release. The preclear experienced great difficulty in visualizing and his aberrations intensified during auditing.

By use of dreams and restimulation of somatics the preclear was able to reach the beginning of the engramic chain as counted backwards from birth. Fifteen prenatal experiences were unstacked. They were found lying in two loops. The loops were corrected and the basic engram of the basic chain was reached. (A loop is a redoubling of the time track back on itself. In this case incidents are not in their correct place on the time track.)

The basic consisted of a severe quarrel between his mother and father with several abdominal blows being received by the mother. The mother was protesting that it would make her sick all of her life. At the same time the mother was coughing from a throat blow. The father was insisting that he was master in his own home and that people had to do what he told them. This quarrel occurred at about four and a half months after conception and resulted in the temporary paralysis of the preclear's right side. The remainder of the chain consisted of similar incidents, evidently dramatizations on the part of the father of his own engrams, as the words used were almost identical, one engram to the next. This chain accounted for and relieved the subject's fear that he would be ill and his desire to tyrannize others.

Birth was then found to consist of near suffocation and considerable antagonism between the doctor and the nurse. This was registered as commands to himself to the effect that he was blind and could not see. Birth was in the home and dust, camphor, the smell of clean sheets and greased metal were the restimulators for this severe lung irritation. This birth was not restimulated until the age of five and the prenats were not restimulated until entrance into the service when the need for authority manifested itself.

No locks were found to need attention and only one half hour of his war experience failed to release, that being a new basic.

Number of hours on case: fifty-five.

CASE NO. 2

APATHY, PRECLEAR HAD BEEN UNDER PSYCHIATRIC TREATMENT FOR TWO YEARS PRIOR TO DIANETIC AUDITING. SHE HAD EXPERIENCED NO RELIEF. MALNUTRITION.

An eighteen-year-old girl in a condition of apathy bordering upon a break and worsening. She had been recently married. Afraid of her husband. She had done very badly in school, sporadically engaged in sexual escapades, relapsing afterwards into an illness which was variously diagnosed.

Case was entered with ease. Birth was reached and would not exhaust. A search for prenatals was for ten hours fruitless, until certain somatics were artificially restimulated and intensified to the point that the preclear had to recall the incident to find relief. Eight prenatals were then unstacked and only two incidents were discovered in confusion with each other, held together with a head somatic.

The basic proved to be a mutual abortion attempt by the mother and father. The mother said she would die if anyone found out but that she would probably die anyway. The father said that the baby was probably like her and that he didn't want it. Eighteen penetrations of the head, throat and shoulders with a long orange-wood stick—probably in the third month. Several similar incidents completed this chain. Coitus followed each attempt at abortion. Another incident proved to be a basic without a chain and with innumerable locks: an attempted abortion by a professional abortionist who used some form of needle and scraper. Birth was found to be a mild experience. Three infant engrams with their own basic were discovered. They consisted of the mother's fear over the injury and the fear that the baby would die.

Contagion of attempted abortion engrams was particularly manifest in the mother's neurotic dwelling on fear of death, which was obviously a dramatization.

All neurotic and psychotic symptoms were relieved with a marked improvement in the health of the preclear and an increase of twenty-seven points on the Army Alpha test. Time of work: 65 hours.

CASE NO. 3

PSYCHOTIC MURDEROUS RAGES. CHRONIC SKIN RASH.

A thirty-year-old male negro, six feet four inches in height, about two hundred and fifty pounds—swamp worker. He was in continual trouble with police and had a considerable jail record. He continually dramatized a hatred of women. He also dramatized a continuous suspicion that he was about to be murdered. His I.Q. was about eighty-five.

Uniquely enough this case offered no difficulties in entrance. The subject was extremely cooperative with the dianeticist. Birth was found and exhausted without improvement in the case. A number of infant and childhood engrams were discovered and tested. Continual address of the preclear's attention to prenatal life finally brought about a convulsion in which terror and rage alternated. The dianeticist was able to induce the preclear to listen to the voices he was hearing and to go through with the experience.

The convulsion proved to be twenty engrams nearer birth than the basic, which lay on another chain and which was discovered by dream technique. The convulsion was caused by the dramatization of an engram involving the injection of turpentine into the uterus by the mother in an attempted abortion. The main engramic chain consisted of the mother's efforts to abort herself. From engramic content it was gathered that the mother was a prostitute, for as many as twenty experiences of coitus succeeded two of these abortion attempts. They were too numerous to be evaluated.

The basic chain contained many quarrels about money between the mother and her customers. The somatics of this chain were largely bruises and concussions caused by the mother ramming herself into pointed objects, or beating her stomach and abdomen. There were many loops in the basic chain caused by the similarity of incident and the confusion of coitus with abortion attempts. The basic incident was at last discovered and exhausted. It was found to lie about twenty days after conception, when the mother first discovered her pregnancy.

All engrams were exhausted in the basic chain. The convulsion was fully cleared and birth was suddenly found to have been a very painful experience, particularly because the child

was taken by others immediately after birth. Only one engram chain (unconsciousness resulting from fist fights) was found in childhood.

GLOSSARY

A.A.—An attempted abortion case.

ABERREE — An aberrated individual, sane or insane, containing unrelieved engrams.

ANALYTICAL MIND — The residence of consciousness in the individual and the seat of his basic personality. This is an analogical term. The analytical mind can be sub-divided.

ASSOCIATIVE RESTIMULATOR— A perceptic in the environment which is confused with an actual restimulator.

BREAK ENGRAM — The secondary engram after the receipt of which the individual experienced a lowering of general tone to 2.5 or below and became therefore unable to cope with his environment.

CLEAR—(1) *Dianetic Clear*: An individual who has been cleared of all engrams and chains and who has achieved a general tone four; a Dianetic Case Completion; one who through Dianetic processing has become free of those things which make a person susceptible to, and “hold in place,” psychosomatic ills, and is a healthy, happy human being. In this book Clear means Dianetic Clear. (2) *Scientology Clear*: A person who, having received all the processing gains from Dianetics to Grade VI (highest Scientology Release Grade), has then completed the Clearing Course at an Advanced Organization. A Scientology Clear has by definition the ability to be cause over mental matter, energy, space and time as regards the First Dynamic (ref. chapter *The Dynamics*, in this book).

CONFUSION — The condition of an area of an engram or the condition of a chain. Instants of existence which are not properly aligned on the time track.

CROSS ENGRAM — The severe engramic experience wherein two chains have met causing a marked change in the life of the individual. This is an engram which is on the time track of each of two or more chains.

DIANETICIST— A skilled user of dianetic therapy.

DIANETICS — Means “through the soul” (from Greek *dia*, through, and *noes*, soul). It is the first fully precise science of the mind. The world before Dianetics had never known a precision mental science.

DISPERSAL— The action of a dynamic or purpose meeting an engram. It is describable by an analogy of an electron stream striking impedance and showering around it, much weakened.

DYNAMIC — The dynamic thrust into time and space of an individual, a species, or a unit of matter or energy. Especially defined for the purpose of Dianetics as “Survive.”

DYNAMIC DIANETICS—The science of the basic drives of the individual and his basic personality. At this writing the branch of Dianetics most intensely under observation and research is this one. (See *Science of Survival* by L. Ron Hubbard.)

ENGRAM — A period of physical pain including unconsciousness and antagonism experienced by an individual, group or society and residing thereafter as irrational and restimulatable dramatizations.

ENGRAM CHAIN— A series of similar engrams on one or more dynamics which impede the dynamics of the individual.

LOCK— A period of mental anguish depending for its force upon an engram. It may or may not be available to the analytical mind but it does not contain actual unconsciousness.

PRECLEAR — Any individual receiving dianetic auditing for the purpose of being cleared; anyone not yet Clear.

PURPOSE—The survival route chosen by an individual, a species, or a unit of matter or energy in the accomplishment of its goal. (NOTE: The purpose is specific and may be closely defined being a subdivision of one of the sub-dynamics. It has been tentatively established by investigation that an individual human being has established his purpose for life at the age of two years and that the actual purpose is not derived in any degree from engrams but is only warped by them.)

REACTIVE MIND — That portion of the nervous system which contains reflexive or reactive data which does not clear through the analytical mind but is subject to dramatization or aberrations. It uses as a thought process the conception of identities. A equals A equals A. This is essentially the animal thinking mechanism.

RELEASE — (1) *Dianetic Release*: A preclear in whom the majority of emotional stress has been deleted from the reactive mind. Has had large gains from Dianetics, is not yet a Dianetic Case Completion. (2) *Scientology Release*: A series of major levels of gain wherein Scientology processing frees the person from the principal life difficulties or personal “blocks” stemming from the mind. Called Release Grades, each of these levels must be completed for one to be ready to undertake Scientology Clearing. Note: Release, in this book, refers to Dianetic Release.

RESTIMULATOR — The environmental perceptic which approximates a precise part of the engramic perceptics in the reactive mind.

SCIENTOLOGY — The study of knowledge in its fullest sense, and applied religious philosophy that covers man’s relationship to the universe. Dianetics is the forerunner of Scientology. Dianetics was the ultimate development of the mind of human beings. Scientology is the road from there to total freedom.

SOMATIC—The physiological counterpart of mental aberration. A somatic attends every aberration. This term is used in lieu of “physical pain” in auditing due to the high engramic value of the word pain and its failure to include in its meaning all painful perceptics.

TIME TRACK—The memory record of an individual, motor or sensory, precisely aligned in moments of time. In a Clear all such moments are available to the analytical mind. In an aberree areas of the time track are obscured, but the time track is considered to be in perfect condition, if partially and temporarily obscured. The existence of two time tracks is suspected—one sensory and one motor, the latter being more available to the dianeticist in the form of somatics. The time track is precise but as the analytical mind addresses it in the aberree, it is apparently obliterated in part, or tangled.

TONE—The emotional condition of an engram or the general condition of an individual.

TRAUMA — A term from a school of psychology implying an experience which would create a psychic scar. It is unused in Dianetics as being liable to misunderstanding of the nature of severe experiences. Scars cannot be removed; psychosomatic experiences can be.

UNCONSCIOUSNESS — A condition wherein the organism is discoordinated only in its analytical process and motor control direction. In the physio-animal section of the brain, a complete time track and a complete memory record of all perceptions for all moments of the organism’s existence is available.

Terra Incognita: The Mind

L. Ron Hubbard

Probably the strangest place an explorer can go is inside. The earth's frontiers are being rapidly gobbled up by the fleet flight of planes, the stars are not yet reached. But there still exists a dark unknown which, if a strange horizon for an adventurer, is nevertheless capable of producing some adventures scarcely rivaled by Livingston.

During the course of three minor expeditions before the war the realization came about that one of the most dangerous risks in the field of exploration is not located in the vicinity of the geographical goal, but is hard by from the first moment of planning until the last of disbanding—the unbalanced member of the party.

After some years of war it became even more of a conviction that there are some things more dangerous than the Kamikaze, just as they had been more dangerous than malaria.

For a mathematician and navigator to become involved in the complexities of the mental frontiers is not particularly strange; to produce something like results from his explorations into the further realms of the unknown definitely is.

There is no reason here to become expansive on the subject of Dianetics. The backbone of the science can be found where it belongs, in the textbook and in professional publications on the mind and body.

But in that Dianetics was evolved because of observations in exploration for the purpose of bettering exploration results and safeguarding the success of expeditions, it would be strange, indeed, to make no mention of it in its proper generative field.

Based on heuristic principles and specifically on the postulate that the mission of life is survival and that the survival is in several lines rather than merely one, Dianetics contains several basic axioms which seem to approximate natural laws. But regardless of what it approximates, it works. Man surviving as himself, as his progeny, as his group or race, is still surviving equally well. The mechanisms of his body and his society are evidently intended to follow this axiom since, by following it in a scientific manner, several other discoveries came about. That Dianetics is of interest to medicine—in that it apparently conquers and cures all psychosomatic ills and that it is of interest to institutions where it has a salutary effect upon the insane—is beyond the province of its original intention.

What was wanted was a therapy which could be applied by expedition commanders or doctors which would work easily and in all cases to restore rationale to party members unduly affected by hardship and, more important, which would provide a yardstick in the selection of personnel which would obviate potential mental and physical failure. That goal was gained and when gained was found to be relatively simple.

It was discovered that the human mind has not been too well credited for its actual ability. Rather than a weak and capricious organ, it was found to be inherently capable of amazing strength and stamina and that one of its primary purposes was to be right and always right. The normal mind can be restored to the optimum mind rather easily, but that is again beside the point.

The focus of infection of mental and psychosomatic ills was discovered in a hidden but relatively accessible place. During moments when the conscious mind (Dianetically, the analytical mind) is suspended in operation—by injury, anaesthesia, illness such as delirium—there is a more fundamental level still in operation, still recording. Anything said to a man when he is unconscious from pain or shock is registered in its entirety. It then operates, on the return of consciousness, as a posthypnotic suggestion, with the additional menace of holding in the body the pain of the incident. The content of the moment or period of unconsciousness is called, Dianetically, a *comanome* (Gr.—unconscious law). The words contained in the *comanome* are like commands, hidden but powerful when restimulated by an analogous situation in later life. The pain in the *comanome* becomes the psychosomatic illness. Any perceptic in the *comanome* is capable of reviving some of the strength of that *comanome* when it is observed in the environment. The *comanome so* planted in the mind has its content of

perceptics—smell, sound, sight, tactile, organic sensations. It has them in a precise order. The *comanome* can be played off like a drama when awake life perceptics restimulate it. Which is to say that for every perceptic in the *comanome* there are a variety of equivalents in awake environment. A man becomes weary, sees one or more of the perceptics in his surroundings and becomes subject to the *comanome* within him.

For example, a man falls into a crevasse and is knocked out. His companions haul him forth. One is angry and comments over the unconscious man that he was always a clumsy fool and that the party would be better off without him. Another member defends the unconscious man, saying he is a good fellow. The unconscious man received a blow on the head in his fall and his arm was slightly injured in the recovery.

After regaining consciousness the injured man has no “memory” of the incident, which is to say, he cannot recall it consciously. The incident may lie dormant and never become active. But, for our example, the man who criticized him one day says, at the moment when the formerly injured man is weary, that somebody is a clumsy fool. Unreasonably, the formerly injured man will become intensely antagonistic. He will also feel an unreasonable friendship for the man who spoke up for him. Now the *comanome* is “keyed in” or has become a part of the subject’s “behavior pattern.” The next time the injured man is on ice, the sight of it makes his head ache and his arm hurt in dwindling ratio to how tired he gets. Further, he may pick up a chronic headache or arthritis in his arm, the injuries being continually restimulated by such things as the smell of his parka, the presence of the other members, etc., etc.

That is a *comanome* at work. How far it is capable of reducing a man’s efficiency is a matter of many an explorer’s log. A case of malaria can be restimulated. A man has malaria in a certain environment. Now having had it he becomes far more susceptible to malaria *psychosomatically* in that same environment and with those people who tended him. He can become a serious drag on the party, for each new slight touch restimulates the old one and what should have been a mild case is a highly painful one, being the first case of malaria plus all the subsequent cases. Malaria is a bug. As a bug it can be handled. As a *comanome* it will defy cure, for there is no Atabrine for *comanomes* short of their removal.

Almost all serious *comanomes* occur early in life—amazingly early. The early ones form a basic structure to which it is very simple to append later *comanomes*. *Comanomes* can wait from childhood to be “keyed in” and active at 25, 50, 70 years of age.

The *comanome*, a period of unconsciousness which contained physical pain and apparent antagonism to the survival of the individual, has been isolated as the sole source of mental aberration. A certain part of the mind seems to be devoted to their reception and retention. In Dianetics, this part of the mind is called the *reactive mind*. From this source, without otherwise disclosing themselves, the *comanomes* act upon the body and cause the body to act in society in certain patterns. The *reactive mind* is alert during periods when the analytical mind—or conscious mind—is reduced in awareness.

It is a matter of clinical proof that the persistency, ambition, drive, will power and personal force are in no degree dependent upon these *comanomes*. The *comanome* can only inhibit the natural drives. The value of this unconscious experience is valuable in an animal. It is a distinct liability to Man who has outgrown his animal environment. The reactive mind, so long as it limits its activity to withdrawing, instinctively, a hand from a hot stove, is doing good service. With a vocabulary in it, it becomes deadly to the organism. Those familiar with General Semantics will understand how the reactive mind computes when it is stated that it “computes” in identities. The word “horse” in the reactive mind may mean a headache, a broken leg, and a scream. Such a *comanome*, one containing these things, would be computed that a broken leg equals a scream, a scream a broken leg, a horse equals a scream, etc., etc. If the *comanome* contained fright, then all these things are fright. The value of such a mental computation is entirely negative, inhibits the perfect calculations of which the analytical mind is capable and reduces the ability of the individual to be rational about, as noted, horses. *Comanomes* also contain complimentary material which can bring about a manic state and which, again, is of slight use in computations.

The technique of Dianetics deletes from the reactive mind all *comanomes*. They were hidden beneath layers of unconsciousness and unknown to the conscious mind before therapy. They were inhibitive to good impulses and productive of bad ones. After they are deleted by therapy the conscious mind gains certain attributes it did not possess before, the individual is

capable of greater efforts, his actual personality is greatly heightened and his ability to survive is enormously enhanced.

Comanomes are contagious. A man has one he dramatizes as a rage pattern, and everyone has many. He dramatizes it while another individual is partly unconscious. The *comanome* has now been implanted in the second individual.

Deletion of all *comanomes* is practicable. The technique is relatively simple. There is little space here to give more than a most cursory glance at it but an expedition commander can use it without any great knowledge of medicine and no other knowledge of psychiatry, which was the original goal at the beginning of research eleven years ago.

Therapy does not depend upon hypnosis. A state has been found which is much more desirable. Hypnosis is amnesia trance for the purpose of planting suggestions. The problem of hypnosis is to put the patient to sleep. The purpose of the Dianetic reverie is to wake the patient up. Narcosynthesis and other drug therapies have some slight use in Dianetics. But the primary technique consists of stimulants. The best stimulant is Benzedrine. In its absence an overdose of coffee will do.

The patient is made to lie down and shut his eyes. The operator begins to count. He suggests the patient relax. At length the patient's eyelids will flutter. (Medicine drumming will also accomplish this without producing a harmful amnesia hypnotic state.) He is permitted to relax further. Then the operator tells him that his "motor strip" (his sensory perceptions) is returning to a time of unconsciousness, the time being specifically named. With coaxing the patient will begin to feel the injury and sense himself in the location and time of the accident. He is then asked to recount all that happened, word for word, feeling by feeling. He is asked to do this several times, each time being "placed back" at the beginning of the incident. The period of unconsciousness he experienced then should begin to lighten and he can at length recount everything which went on when he was unconscious. It is necessary that he feel and see everything in the period of unconsciousness each time he recounts the incident. Nothing is said about his being able to remember and no hypnoanalysis technique is used. He merely recounts it until he cannot longer feel any pain in it, until he is entirely cheerful about it. Then he is brought to present time by just that command and told to again recount the incident. He may have to do this twice or three times in present time for the somatic pains will again have returned. The treatment is repeated two days later. All feeling of injury from it and all aberrative factors in the incident will vanish.

This technique is outlined here for use on a patient who is not "cleared" of *comanomes* prior to this new accident. A Dianetic clearing from the first unconsciousness of a lifetime to the present time places a man in a situation which is almost injury and aberration proof.

The emergency aspect of this technique is valuable. Clinical tests have shown that when shock is Dianetically removed immediately after an injury, the rate of healing is enormously accelerated, so much so that burns have healed in a few hours. Malaria and various fevers, when their peak effects are Dianetically removed, improve with great speed.

Incidents of hardship and deprivation can be markedly lightened in the recovery period by removing their psychic shock.

It is quite remarkable that the various manifestations and "cures" of native witchcraft and shamanism can be uniformly duplicated and bettered by a modern science like Dianetics. A *comanome* can bring about a mental hallucination (with a simple command like, "You can only listen to me!") which gives a demon aspect. The individual containing such a *comanome* would be considered by a shaman to have within him a demon, for the demon is the only sonic memory the individual would have.

While Dianetics does not consider the brain as an electronic computing machine except for purposes of analogy, it is nevertheless a member of that class of sciences to which belong General Semantics and Cybernetics and, as a matter of fact, forms a bridge between the two. There can be as many *comanomic* commands as there can be words in a language and as many *comanomic* injuries as there can be illnesses and accidents. Therefore, it is no surprise that circuits can be set up in the brain which approximate any school of witchcraft, shamanism and religion known to Man. The Banks Islander sitting around talking to his deceased relatives and getting answers would be found, on examination, to have a fine array of *comanomes* and a very active reactive mind.

The selection of personnel who will not be subject to sullen or hostile behavior and who will not become ill under various climatic conditions depends in a large measure on the

perceptions of the individual. If an individual can recall things he has heard by simply hearing them again (audio imagery), if he can recall things he has seen simply by seeing them again, in color, in his mind (visio imagery), if he can imagine in terms of color-visio and tone-audio (imagine in terms of color motion pictures with sound) and if he can recall his father and mother as of early childhood, the chances are very good that he will prove to be a very stable man. Additionally, he should prove to be, within the limits of his intelligence and physical being,, an able man. Unfortunately, such persons are quite rare.

If a man has definite anger patterns, worries about things and has unthinking prejudices, he may prove difficult, for these are the outward manifestations of a large reactive mind.

Taking a man back into a geographical area where he has many times been may be profitable from an experience standpoint, but a record of accidents and misadventures in that area would be a definite point of consideration. While it would not mean entirely that a man was a bad risk, there is a double factor involved. He might have had his accidents because he contained a variety of *comanomes* which commanded that he have accidents (the accident prone is the extreme case) and having had accidents in the area he probably gained several *comanomes* there which would reduce his efficiency in that area.

A man whose service in point of experience would be invaluable to an expedition might be, in point of potential aberration, a risk to that expedition. There is a remedy for such a valuable man: he can be cleared of his *comanomes*, in which case his past record of accidents and failures becomes entirely invalid as a criteria for future conduct.

Dianetics has been variously tested and has been found to work uniformly and predictably in all cases. There are many more aspects to it than have been elucidated here, but it is possible to use just these facts to obtain excellent results. In a true, complete erasure of past moments of unconsciousness, the *comanome* disappears utterly. In the above case it will probably only alleviate, return slightly in three days and then reduce to a null level of reaction and stay that way, no longer affecting the patient.

The science has the virtue that it can be worked by any intelligent man after only a few weeks of study. That is, for the entire art of clearing a case. An intelligent man could learn all he needed to know about alleviation of a case in a few hours of reading.

The original goal was to provide expedition commanders and doctors with a therapy tool which would increase the efficiency of personnel and reduce incidence of personnel failure. Dianetics, after eleven years of research and testing, bit off a trifle more than it had bargained for. There had been no intention to go holistic and solve the ills of mankind. That it began to cure psychosomatic illnesses such as arthritis, migraine, ulcers, coronary, asthma, frostbite, bursitis, allergies, etc., etc., that it did quick things about mental derangement on the institutional level and began to replace that strange barbarism, the prefrontal lobotomy, was entirely outside the initial scheme of research. That it would now sail off on a new course to chase down the cause of cancer and cure it was not on the chart.

If it does these things, as it appears to be doing, it is in the medical and psychiatric province. No such intentions existed when the Terra Incognita of the mind was explored for its answers. It was intended as a tool for the expedition commander and doctor who are faced with choosing personnel and maintaining that personnel in good health. It is hoped that to these it will be of good value. If it is not, then despite acclaim, it will in some measure have failed.

Evolution of a Science

by
L. Ron Hubbard

Introduction to Scientology

Scientology is different than any other Earth organization of information or knowledge to date. The word “science” as you know is a simple word meaning merely “truth”. Scientology means *knowing*, “Scio” (Latin), but “Scio” means something quite interesting. It doesn’t mean just knowing—it means *knowing in the fullest sense of the word*. Scientology is an aim at total know.

People have a great deal of difficulty describing Scientology to other people, for the excellent reason that they try to fit it into a frame of reference with other “knows”. They say, “Well then it’s like something or other”. Well, there have not been any other total “knows”.

As far as the basic attempt is concerned, there has been only one organisation of knowledge on earth which has had a similar goal—which is the goal of Total Freedom, being able to get out of the trap of confusion, being able to back up and take a look at it all, and that was Buddhism, practically 2500 years ago. Unfortunately Buddhism isn’t adequate as a comparable datum to Scientology because the Western World hasn’t a clue as to what Buddhism is all about, and we should understand that we’re embarked upon something that hasn’t been embarked upon for 2500 years. It isn’t that what we’re doing is as important as Buddhism. It isn’t that Buddhism is as important as Scientology. But both of them attempted to select out the important things—a selection of the importance’s of life, and to fill Man’s void of knowing with accurate observation.

Scientology is a practical, every-day philosophy—a technology of the human spirit. Through Scientology, Man has the means to better himself, increase his abilities and raise his IQ. Scientology evolved from Dianetics. Dianetics and its goals are outlined in *Dianetics, the Modern Science of Mental Health*, published on May 9th, 1950. Subsequently read by over one and a half million Americans and published abroad, this material occasions a great deal of interest because, primarily, it poses the hope to Man that he can disentrap himself from some of the difficulties in which he finds himself. It delineates certain phenomena of the mind which, when dealt with, brings about a considerable return of ability to the individual. It states in *Dianetics, the Modern Science of Mental Health* that after we had established the foundation, after we had put Dianetics into operation at least to some degree in the society, we would go on and investigate the origin and destination of Life, and the various problems that life itself as life is facing. So, Scientology began.

Scientology addresses Man the Spirit, not Man the Machine. As long as we address the spirit, as long as we return to the individual some belief and faith in himself, he gets better, brighter, his IQ. goes up, his ability to handle things gets better, he gets more powerful, more persistent and he becomes kinder and more merciful, more tolerant, less critical. If we start treating the Machine we get a patched up broken leg.

The spirit of Man has gotten so little acknowledgment and there’s been so much acknowledgment to the individual as a body, that people have begun to feel safe in the destruction of bodies because all a body can do is hit or fire a gun. What feeling of guilt could you possibly get? None. So we get a lessening of a feeling of moral responsibility.

Unless some few of us become active and thoughtful in the direction of a practical religion and technology of the spirit, and revive some feeling, some height, some decency, this planet will be as bald as a billiard ball. And this is a good playground. The back history of this place was destruction and more destruction and more destruction as far as this planet is concerned with less building and less building and less building. Until we get today where we can deliver the big punch to end it all. It never occurs to anybody that there might be some few amongst us who didn’t feel it necessary to end it all. It is to those few that Scientology is appealing. L. R. H. 1967

Dianetics

The Evolution of a Science

The optimum computing machine is a subject which many of us have studied. If you were building one, how would you design it?

First, the machine should be able to compute with perfect accuracy on any problem in the Universe and produce answers which were always and invariably right.

Second, the computer would have to be swift, working much more quickly than the problem and process could be vocally articulated.

Third, the computer would have to be able to handle large numbers of variables and large numbers of problems simultaneously.

Fourth, the computer would have to be able to evaluate its own data and there would have to remain available within it not only a record of its former conclusions but the evaluations leading to those conclusions.

Fifth, the computer would have to be served by a memory bank of nearly infinite capacity in which it could store observational data, tentative conclusions which might serve future computations and the data in the bank would have to be available to the analytical portion of the computer in the smallest fractions of a second.

Sixth, the computer would have to be able to rearrange former conclusions or alter them in the light of new experience.

Seventh, the computer would not need an exterior program director but would be entirely self-determined about its programming guided only by the necessity-value of the solution which it itself would determine.

Eighth, the computer should be self-servicing and self-arming against present and future damage and would be able to estimate future damage.

Ninth, the computer should be served by perception by which it could determine necessity-value. The equipment should include means of contacting all desirable characteristics in the finite world. This would mean color-visio, tone-audio, odor, tactile and self perceptions—for without the last it could not properly service itself.

Tenth, the memory bank should store perceptions as perceived, consecutive with time received with the smallest possible time divisions between perceptions. It would then store in color-visio (moving), tone-audio (flowing), odor, tactile and self sensation, all of them cross-co-ordinated.

Eleventh, for the purposes of solutions, it would have to be able to create new situations and imagine new perceptions hitherto not perceived and should be able to conceive these to itself in terms of tone-audio, color-visio, odor, tactile and self sensation and should be able to file anything so conceived as imagined labeled memories.

Twelfth, its memory banks should not exhaust on inspection but should furnish to the central perceptor of the computer, without distortion, perfect copies of everything- and anything in the banks in color-visio, tone-audio, odor, tactile and organic sensations.

Thirteenth, the entire machine should be portable.

There are other desirable characteristics but those listed above will do for the moment.

It might be somewhat astonishing, at first, to conceive of such a computer. But the fact is, the machine is in existence. There are about two billion of them in use today and many, many more billions have been made and used in the past.

In fact, you've got one. For we are dealing with the human mind.

The above is a generalization of the optimum brain. The optimum brain, aside from the fact that it is not always capable of solving every problem in the Universe, basically works exactly like that. It should have color-visio (in motion), tone-audio (flowing), odor, tactile and organic memory recall. And it should have color-visio (in motion), tone-audio (flowing), odor, tactile and organic imagination, also recallable after imagining like any other memory. And it should be able to differentiate between actuality and imagination with precision. And it should be able to recall any perception, even the trivial, asleep and awake from the beginning of life to death. That is the optimum brain, that and much, much more. It should think with such swiftness that vocal pondering would be utterly unable to keep pace with a thousandth part of one computation. And, modified by viewpoint and educational data, it should be *always* right, its answers *never* wrong.

That is the brain you have, potentially. That is the brain which can be restored to you unless you have had some section of it removed. If it does not do these things, it is slightly out of adjustment.

It took a long time to arrive at the data that this was an optimum brain. In the beginning it was not realized that some people had color-visio—moving-recall, for instance, and that some did not. I had no idea that many people imagined, and knew they were imagining, in tone-audio, et cetera, and would have received with surprise the data that somebody could smell and taste last Thanksgiving turkey when he recalled it.

Fifteen years ago, when the researches which culminated in Dianetics. (*Gr. dianoua* thought) were started in earnest, no such high optimum of the human brain was held. In fact, the project was not begun to trace function and restore optimum operation, but to know the key to human behavior and the code law which would reduce all knowledge.

My right to enter this field was an inquiring brain which had been trained in mathematics and engineering and which had a memory bank full of questions and far-flung observations.

It was the basic contention that the human mind with a problem in engineering and that all knowledge would surrender to an engineering approach.

And another primary assumption was made:

All answers are basically simple.

As it stands today, the science of Dianetics and its results—which are as demonstrable as the proposition that water, at fifteen pounds per square inch and 212° F. boils—is an engineering science, built heuristically on axioms. It works. That is the only claim for Dianetics or chemistry. They may not be True. But they work and work invariably in the finite world.

When the problem had been shuffled around, in the beginning, and when questions had been formulated to be asked of the Universe at large, there was no concept of the optimum brain. Attention was fixed upon the *normal* brain. The *normal* brain was considered to be the optimum brain. Attempts were made, when work finally got around to the problem of the brain itself, to obtain results comparable with the normal mind. Minds became aberrated. When restored they would be normal.

In fact, in the beginning, it was not even certain that minds could be restored. All that was required was an answer to existence and the reasons minds aberrated.

In a lifetime of wandering around many strange things had been observed. The medicine man of the Goldi people of Manchuria, shamans of North Borneo, Sioux medicine men, the cults of Los Angeles, and modern psychology. Amongst the people questioned about existence were a magician whose ancestors served in the court of Kublai Khan and a Hindu who could hypnotize cats. Dabbles had been made in mysticism, data had been studied from mythology to spiritualism. Odds and ends like these, countless odds and ends.

If you were constructing this science, where would you have started? Here were all the various cults and creeds and practices of a whole world to draw upon. Here were facts to a number which makes 1021 binary digits look small. If you were called upon to construct such a science and to come up with a workable answer, what would you have assumed, gone to observe, or computed?

Everybody and everything seemed to have a scrap of the answer. The cults of all the ages, of all the world seem, each one, to contain a fragment of the truth. How do we gather and assemble the fragments? Or do we give up this nearly impossible task and begin postulating our own answers?

Well, this is the story of how Dianetics was built. This, at least, was the approach made to the problem. Dianetics works, which is what an engineer asks, and it works all the time, which is what nature demands of the engineer.

First, attempts were made to discover what school or system was workable. Freud did occasionally. So did Chinese acupuncture. So did magic healing crystals in Australia and miracle shrines in South America. Faith healing, voodoo, narco-synthesis—and, understand this right here, no mystic mumbo jumbo need apply. An engineer has to have things he can measure. Later the word “demon” is used. That’s because Socrates describes one so well. Dianetic use of it, like Clerk-Maxwell’s, is descriptive slang. But no wild immeasurable guesses or opinions were wanted. When an engineer uses only those, bridges break, buildings fall, dynamos stop and a civilization goes to wrack.

A primary need, in arriving at a dynamic principle of existence, was to discover what one wanted to know about existence. One does not have to dabble long with the gods to know that they point unvaryingly if divinely up a very blind alley. And an engineering study of mysticism demonstrates that mysticism embraces largely what it cannot hope to state precisely.

The first proposition went off something on this order. Let us find out what we cannot consider or do not need to consider to get an answer we can use. Some tests seemed to demonstrate that the exact identity of the Prime Mover Unmoved was not necessary to the computation. Man has been convinced for a long time that He started this affair, so no great gain could be made in getting disputative about it. Let us then take a level immediately below the Prime Mover Unmoved.

Now let us see what else falls into the category of data unnecessary to the computation. Well, we’ve studied telepathy, demons, the Indian rope trick and the human soul and so far we have yet to find any constants in this class of data. So let us draw a line below that as our highest level of necessary information and now call this our highest line.

What do we have left? We have the finite world, blue serge suits, Salinas Valley, the Cathedral at Rheims as a building and several decayed empires and roast beef for dinner. We have left only what we can perceive with no higher level of abstraction.

Now, how do we perceive and on what and with what? Ensues here a lot of time spent— 1937—in computing out the brain as an electronic calculator with the probable mathematics of its operation plus the impossibility of such a structure capable of doing such

things. Let us then rule out the necessity of knowing structure and use this as an analogy only which can become a variable in the equation if necessary.

Now what do we have ? Well, we've been a little hard on demons and the human soul. These are popular but they refuse to stand out and submit to a thorough inspection and caliper mensuration and if they won't so cooperate, then neither will we. And so two things come from this reduction of equation factors necessary to solution. First, existence is probably finite and second, finite factors alone answered the need of the problem.

Probably we could be very obtuse and mathematical here, but no matter. A good, workable heuristic principle, a *workable* one, is worth an infinity of formulas based on Authority and opinions which do *not* work.

All we can do is try the principle. We need a dynamic principle of existence. We look in Spencer and we find something which reads awfully good. It read good when he took it from Indian writings, the same place Lucretius got it. But it only pretends to be dynamic because it doesn't compute. We need a *dynamic* principle, not a description.

But what does a principle mean in a sphere this large? And doesn't it need a better definition? Let us then call it a dynamic lowest common denominator of existence.

Will such a lowest common denominator lead us straight up above the highest level we have set and send us spinning off with a fist full of variables and no answer? It had better not. So let us pose some more questions and see if they clarify the principle.

What can we know? Can we know where life came from? Not just now. Can we know where life is going ? Well, that would be interesting but few of us will live to see that.

So what can we know? Who, when, why, where, what—WHAT! We can know WHAT life is doing.

Let us postulates now that life started somewhere and is going somewhere. To know where it came from might solve a lot of problems but that seems unnecessary to know at this time for this problem. And the somewhere might be known too some day but again we do not need to know that. So now we have something for the equation which will stay in terms of constants. WHAT is life doing enroute ?

Life is energy of some sort. The purpose seems to involve energy. We are being heuristic. No arguments necessary because all we want is something with a high degree of workability, that's all any scientist needs. If this won't work, we'll dream up another one and postulate until something does work.

What is energy doing ? It's surviving— changing form, but surviving.

What is life doing? It's surviving.

Now maybe it is doing a whole lot more, but we'll just try this on for size. What is the lowest common denominator of all existence which we have so far found ?

SURVIVE!

The only test of an organism is survival.

That can be computed.

We can even go so far as to make it colorful and say that there was a beginning of track and at this beginning of track Somebody said SURVIVE! He didn't say why and He didn't say until. All He said was SURVIVE!

Well, that's simple and it computes. It makes sense on the slide rule and it makes sense with a lot of activity and it seems pretty good. Let's see.

The brain was a computer-director evolved on the same principles and on the same plan as cells and by cells and is composed of cells. The brain resolved problems relating to survival, asked itself questions about survival, acted upon its own best conceived but personally viewpointed plan for survival.

If one sagged down towards unsurvival, one was goaded up the scale toward survival by pain. One was lured ahead by pleasure into survival. There was a graduated scale with one end in death and the other in immortality.

The brain thought in terms of differences, similarities and identities and all its problems were resolved on these lines and all these problems and all these activities were strictly and solely survival-motivated. The basic command data on which the body and brain operated was SURVIVE! That was all; nothing fell outside this.

It was postulated to see if it worked.

That was in 1938 after several years of study. The axioms began with SURVIVE! SURVIVE was the lowest common denominator of all existence. They proceeded through axioms as to what Man was doing and how he was doing it. Nice definitions for intelligence, drive, happiness, good, evil and so forth fell into line. Suicide, laughter, drunkenness and folly all fell inside this, too, as it computed out.

These computations stood the test of several years. And then, as you may have heard, came a war. But even wars end. Research was resumed, but now with the added necessity of applying the knowledge gained to the problems of friends who had not survived the war too well.

A researcher gets out on a rim of the unknown just so far and the guide books run out. In the libraries were thousands and thousands of mental cases, neatly recorded. *And not one case contained in it the essential data to its solution.* These cases might just as well have been written in vanishing ink for all the good they were. Beyond proving conclusively that people manifested strange mental aberrations they were worthless. How do you go about building a science of thought without being permitted to observe and without having any observed data?

Out of a multitude of personal observations in this and distant lands, it was the first task to find a constant. I had studied hypnotism in Asia. I knew hypnotism was, more or less, a fundamental. Whenever shamans, medicine men, exorcists or even modern psychologists go to work, they incline toward practices which are hypnotic.

But of what use is such a terrible, unpredictable variable as hypnotism. On some people it works. On most it doesn't. On those on whom it works it sometimes achieves good results, sometimes bad. Wild stuff, hypnotism.

The physical scientist, however, is not unacquainted with the use of a wild variable. Such erratic things usually hide real, important laws. Hypnotism was a sort of constant thread through all the cults—or hypnotic practices—but perhaps one might at least look at it.

So hypnotism was examined. A wild radical. The reason it was wild might be a good answer. The first investigation of it was quite brief. It did not need to be longer.

Examine a post-hypnotic suggestion. Patient in amnesia trance. Tell him that when he awakens he will remove his left shoe and put it on the mantel. Then tell him that he will forget he has been told and wake him up. He awakens, blinks for a while and then puts his foot forward and removes his shoe. Ask him why. "My foot's too hot." He puts the shoe on the

mantel. Why? "I hate to put on a damp shoe. Warmer up here and it will dry." Keep this in mind, this experiment. The full reason for its importance did not appear for nine years. But it was recognized that, with various suggestions, one could create the appearance of various neuroses, psychoses, compulsions and repression's listed by the psychiatrist. The examination promptly went no further. One had too few answers yet. But it was clear, that *hypnotism and insanity were, somehow, identities*. A search was begun for the reason why.

For a long time and with many, many people attempts were made to unlock the riddle. What caused hypnotism? What did it do? Why did it behave unpredictably?

Examination was made of hypno-analysis. It sounds good in the texts but it doesn't work. It doesn't work for several reasons, first among them being that you can't hypnotize everybody. Further it works only occasionally, even when a person can be hypnotized. So hypno-analysis was buried along with the water-cure of Bedlam and the pre-frontal lobotomy and the demon extraction techniques of the shamans of British Guyana, and the search for the key which could restore a mind to normal was continued.

But hypnotism wouldn't stay quite dead.

Narco-synthesize seemed a good lead, until some cases were discovered which had been "cured" by narco-synthesis. They were reworked with the technique just to discover what had occurred. Narco-synthesis sometimes seemed to fix a man up so his war neurosis could rise to even greater heights at some future date. No, that is not entirely fair. It produces slightly higher results than a magic healing crystal in the hands of an Australian medicine man. It seemed to do something beyond what it was supposed to do, and that something beyond was bad. Here was another wild variable, a piece of the puzzle of insanity's cause. We knew WHAT Man was doing. He was surviving. Somehow, some way, he occasionally became irrational. Where did hypnotism fit into this? Why did drug hypnotism affect people so adversely at times ?

These people one met and worked with did seem to be trapped somehow by something which modern methods almost never touched. And why did whole nations rise up to slaughter nations? And why did religious zealots carry a banner and crescent across three quarters of Europe? People behave as if they'd been cursed by something. Were they basically evil? Was social training a thin veneer? Was the evil curse a natural inheritance from the tooth and claw animal kingdom ? Was the brain *ever* capable of rationality? Hypnotism and narco-synthesis, unpredictable radicals, refused for a time to divulge answers.

Out of orbit again and without tools with which to work, it was necessary to hark back to the techniques of the Kayan Shaman of Borneo, amongst others. Their theory is crude; they exorcise demons. All right. We postulated that Man is evil, that the evil is native. Then we ought to be able to increase the civilized veneer by planting in him more civilization, using hypnotism. So the patient usually gets worse. That postulate didn't work. Provisional, let's try the postulate that Man is good and follow its conclusions. And we suppose something such as the Borneo shaman's *Toh* has entered into him which directs him to do evil things.

Man has believed longer that demons inhabit men than Man has believed they did not. We assume demons, We look for some demons, one way or another. *And we found some!*

This was a discovery almost as mad as some of the patients on hand. But the thing to do was try to measure and classify demons.

Strange work for an engineer and mathematician! But it was found that the "demons" could be classified. There were several "demons" in each patient, but there were only a few classes of "demons". There were audio demons, sub-audio demons, visio demons, interior demons, exterior demons, ordering demons, directing demons, critical demons, apathetic demons, angry demons, bored demons and "curtain" demons who merely occluded things. The

last seemed the most common. Looking into a few minds established soon that it was difficult to find anyone who didn't have some of these demons.

It was necessary to set up an optimum brain. That brain would be postulated, subject to change. It would be the combined best qualities of all brains studied. It would be able to visualize in color and hear with all tones and sounds present, all memories necessary to thought. It would think without talking to itself, thinking in concepts and conclusions rather than words. It would be able to imagine visually in color anything it cared to imagine and hear anything it cared to imagine it would hear. It was discovered eventually that it could also imagine smells and tactiles but this did not enter into the original. Finally it would know when it was recalling and know when it was imagining.

Now, for purposes of analogy it was necessary to go back to the electronic computer idea conceived in 1938. Circuits were drawn up for the visio and audio recall, for color and tone recall, for imagination visio and audio creation and color and tone creation. Then were drawn the memory bank circuits. All this was fairly easy at this time since some extensive work had been done on this in the thirties.

With this diagram, further circuits were set up. The optimum brain was a plain circuit. To this were added the "demon" circuits. It was found that by very ordinary electronics one could install every kind of a "demon" that had been observed.

The "demons", since none of them consented to present themselves for a proper examination as demons, were, it was concluded, installed in the brain in the same way one would install a new circuit in the optimum brain. But as there was just so much brain, it was obvious that these electronic "demons" were using parts of the optimum brain and that they were no more competent than the optimum brain inherently was. This was more postulating. All one wanted was a good result. If this hadn't worked something else would have been tried.

Thus the solution was entered upon. While the human brain is a shade too wonderful an instrument to be classified with anything as clumsy as contemporary electronics, as marvelous as modern electronics are, the analogy stands. It stands as an analogy. The whole science would hang together brightly now without that analogy. But it serves in this place.

There are no demons. No ghosts and ghouls or *Tohs*. But there are aberrative circuits. So it was reasoned. It was a postulate. And then it became something more.

One day a patient fell asleep.- When he awakened he was found to be "somebody else". As "somebody else" he was questioned very carefully. This patient, as "himself", had a sonic memory block, an audio memory block, and was color-blind. He was very nervous ordinarily. Just now, awakened into being "somebody else" he was calm. He spoke in a lower voice tone. Here, obviously, one was confronting one of these electronic screwups the savants call schizophrenics. But not so. This was the basic personality of the patient himself, possessed of an optimum brain!

It was very rapidly established that he had color-visio recall on anything, tone-audio recall, tone-audio and color-visio imagination and entire co-ordinative control. He knew when he was imagining and when he was recalling and that, too, was something he had not been able to do before.

He wanted to know something. He wanted to know when the operator was going to help him get himself squared around. He had a lot of things to do. He wanted to help his wife out so she wouldn't have to support the family. How unlike the patient of an hour before!

He obligingly did some mental computations with accuracy and clarity and then he was permitted to lie down and sleep. He woke up with no recollection of what had happened. He had his old symptoms. Nothing could shake those electronic blocks. He didn't even know if he

had eaten lunch, the color of my scarf, and as for his wife, served her right for being a condemned woman.

This was a first introduction to basic personality. It was a long way from a last acquaintance. It was found that it was possible to contact optimum brain operation in a number of people.

And the basic personalities contacted were invariably strong, hardy, and constructively good! They were the same personalities as the patients had in a normal state minus certain mental powers, plus electronic demons and plus general unhappiness. I found that a “hardened criminal” with an obvious “criminal mind” was, in basic personality, a sincere, intelligent being with ambition and cooperativeness.

This was incredible. If this was basic brain, then basic brain was good. Then Man was basically good. Social nature was inherent! If this was basic brain—

It was. That is, a “Clear”. But we pull ahead of the story.

People were uniformly miserable being aberrated. The most miserable patient on the rolls had an aberration that made her act “happy” and the most nervous aberrant one would ever care to encounter had a mastering aberration about being always “calm”. She said she was happy and tried to make herself and everyone believe it. He said he was calm. He instantly flew into a nervous fit if you told him he wasn’t calm.

Tentatively and cautiously a conclusion was, drawn that the optimum brain is the unaberrated brain, that the optimum brain is also the basic personality, that the basic personality, unless organically deranged, was good. If Man were basically good, then only a “black enchantment” could make him evil.

What was the source of this enchantment.

Did we admit superstitions and demons as actualities and suppose the source was something weird and wonderful in the way of ectoplasm? Or did we part company with many current beliefs and become something a little more scientific?

The source, then, must be the exterior world. A basic personality, so anxious to be strong, probably would not aberrate itself without some very powerful internal personal devil at work. But with the devils and “things that go boomp in the night” heaved into the scrap heap, what did we have left? There was the exterior world and only the exterior world.

Good enough: we’ll see if this works again. Somehow the exterior world gets interior. The individual becomes possessed of some unknowns which set up circuits against his consent, the individual is aberrated, and is less able to survive.

The next hunt was for the unknown factor.

The track looked pretty fair, so far, but the idea was to formulate a science, of thought. And a science, at least to an engineer, is something pretty precise. It had to be built on axioms to which there are precious few, if any, exceptions. It has to produce predictable results uniformly and *every time*.

Perhaps engineering sciences are this way because natural obstacles oppose the engineer, and matter has a rather unhandy way of refusing to be overlooked because someone has an opinion. If an engineer forms an opinion that trains can run in thin air and so omits the construction of a bridge across a stream, gravity is going to take over and spill one train into the stream.

Thus, if we are to have a science of thought, it is going to be necessary to have workable axioms which, applied with techniques, will produce uniform results in all cases and produce them invariably.

A great deal of compartmentation of the problems had already been done, as previously mentioned or in the course of the work. This was necessary in order to examine the problem proper which was Man in the Universe.

First we divided what we could probably think about and had to think about from what we probably didn't have to think about, for purposes of our solution. Next we had to think about all men. Then a few men. Finally the individual man and at last a portion of the aberrative pattern of an individual men.

How did the exterior world become an interior aberration ?

There were many false starts and blind passages just as there had been in determining what an optimum brain would be. There were still so many variables and possible erroneous combinations in the computation that it looked like something out of Kant. But there is no argument with results. There is no substitute for a bridge heavy enough to hold a train.

I tried, on the off-chance that they might be right, several schools of psychology—Jung, Adler. Even Freud. But not very seriously because over half the patients on the rolls had been given very extensive courses in psycho-analysis by experts, with no great results. The work of Pavlov was reviewed in case there was something there. But men aren't dogs. Looking back on these people's work now, a lot of things they did made sense. But reading their work and using it when one did *not* know, they didn't make sense, from which can be concluded that rear-view mirrors six feet wide tell more to a man who is driving with a peephole in front than he knew when he was approaching an object.

Then came up another of a multitude of the doctrines which had to be originated to resolve this work. *The selection of importance's*. One looked at a sea of facts. Every drop in the sea is like every other drop. Some few of the drops are of vast importance. How to find one? How to tell when it is important? A lot of prior art in the field of the mind—and as far as I was concerned, all of it—is like that. Ten thousand facts, all and each with one apparent unit importance value. Now, unerringly select the right one. Yes, once one has found, by some other means, the right one, it is very simple to look over the facts and pick out the proper one and say, "See? There it was all the time. Old Whoosis knew what he was doing." But try it before you know! It's a cinch Old Whoosis did not know or he would have red-tabbed the fact and thrown the others away. So, with this new doctrine of the selection of importance's, all data not of personal testing or discovery was jettisoned. I had been led up so many blind alleys by unthorough observation and careless work on the part of forerunners in this business that it was time to decide that it was much, much easier to construct a whole premise than it was to go needle-in-the-haystacking. It was a rather desperate turn of affairs when this came about. Nothing was working. I found I had imbibed, unconsciously, a lot of prior errors which were impeding the project. There were literally hundreds of these "why everybody knows that"—which had no more foundation in experimentation or observation than a Roman omen.

So it was concluded that the exterior world got interior through some process entirely unknown and unsuspected. There was memory. How much did we know about memory ? How many kinds of memory might there be? How many banks was the nervous system running on? The problem was not where they were. That was an off-track problem. The problem was *what* they were.

I drew up some fancy schematics, threw them away and drew some more. I drew up a genetic bank, a mimic bank, a social bank, a scientific bank. But they were all wrong. They couldn't be located in a brain as such.

Then a terrible thought came. There was this doctrine of the selection of importance's. But there was another, earlier doctrine—the introduction of an arbitrary. Introduce an arbitrary and if it is only an arbitrary, the whole computation goes out. What was I doing that had introduced an arbitrary? Was there another “why, everybody knows that—” still in this computation?

It's hard to make your wits kick out things which have been accepted, unquestioned, from earliest childhood, hard to suspect them. Another sea of facts, and these in the memory bank of the computer trying to find them.

There was an arbitrary. Who introduced it I don't know but it was probably about the third shaman who practiced shortly after the third generation of talking men had begun to talk.

Mind *and* body.

There's the pleasant little hooker. Take a good look at it. Mind AND body. This is one of those things like a ghost. Somebody said they saw one. They don't recall just who it was or where but they're *sure*—

Who said they were separate? Where's the evidence? Everybody who has measured a mind without the body being present please raise both his hands. Oh, yes, sure. In books. I'm talking to you but I'm not there in the room with you right now. So mind is naturally separate from body. Only it isn't. A man's body can leave footprints. Those are products of the body. The products of the mind can also be viewed when the body is not there, but these are *products of* and the product of the object is not the object.

There *can* be a mind without a body— *but* we must not confuse the products of the mind with the mind itself.

So let's consider these mental products and the body as a unity. Then the body remembers. It may co-ordinate its activities in a mechanism called the brain, but the fact is that the brain is also part of the nervous system and the nervous system extends all through the body. If you don't believe it, pinch yourself. Then wait ten minutes and go back to the time you pinched yourself. Time travel back. Pretend you are all back there. You will feel the pinch; that's memory.

All right. If the body remembers and if the mind and body are not necessarily two items, then what memories would be the strongest? Why, memories that have pain in them, of course. And then what memories would be the strongest? Those which would have the most physical pain. But these are not recallable!

Maybe it's the wrong postulate, maybe people are in fifty pieces not just one, but let's try it on for size.

So I pinched a few patients and made them pretend they had moved back to the moment of the pinch. And it hurt them again. And one young man, who cared a great deal about science and not much about his physical being volunteered for a nice, heavy knockout.

And I took him back to it and he recalled it.

Then came the idea that maybe people remembered their operations. And so a technique was invented and the next thing I knew I had a memory of a nitrous oxide dental operation laid wide open and in recall, complete with pain.

A great deal of experimentation and observation disclosed the fact that there were no moments of “unconsciousness”. And that was another misconception which had held up Man's progress.

“Unconsciousness”. Some day the word will either be gone or have a new meaning because just now it doesn’t really mean a thing.

The *unconscious mind* is the mind which is *always conscious*. So there is no “unconscious mind”. And there is no “unconsciousness”. This made modern psychology look like Tarawa after the marines had landed; for this is about as easy to prove as the statement that when an apple is held three feet in the air and let fall, it drops, conditions being normal.

It was necessary, then, to redraw all the circuit diagrams and to bring forth some terminology which would not be quite as erroneous as “unconsciousness” and “the unconscious mind”.

For handy purposes, in view of the fact that I had got myself into difficulties before by using words with accepted meanings, I turned some adjectives into nouns, scrambled a few syllables and tried to get as far as possible from the focus of infection: Authority. By using old terms, one interposes, in communication, the necessity of explaining away an old meaning before he can explain the new one. A whole chain of thought can get thoroughly jammed up in trying to explain that while this word meant . . . it now means . . . Usually, in communications, one is not permitted to get beyond an effort to explain one does not mean . . .

Now there is no reason here to go into an evolution of terms in Dianetics. The cycle of the evolution is not yet complete. And so I will place here terms which were long afterwards conceived. They are not yet set. But their definitions are not quibbles: the order of definition is clear in the order of apples are apples.

The important thing is what we are defining. There were several heuristic principles on which the initial work was based which were “understand”. One was that the human mind was capable of solving some of the riddles of existence. At this stage in the evolution of Dianetics, after “unconsciousness” had been smoked out of the “why, everybody knows that—” class of information and labeled for what it was, an error, it was necessary to look over some of the “understood” postulates of 1938. And one of those “everybody knows” postulates has been that the human mind is not capable of understanding the workings of the human mind.

And “everybody knew that” the human mind was liable to err, that it was stupid, and was very easily aberrated by such small things as because papa loved mama and Jimmy wanted to love mama too.

And “everybody knew that” the workings of the human mind were enormously complex; so involved that a complete direct solution of the problem was impossible. That, in effect, the human mind was a Rube Goldberg device built up of an enormously unstable and delicately balanced pile of oddshaped bits of emotion and experience, liable to collapse at any time.

From the engineering viewpoint, that seems a little strange. Two billion years of evolution, a billion successive test models, would tend to produce a fairly streamlined, functional mechanism. After that much experience, animal life would be expected to produce a truly functional mechanism—and Rube Goldberg’s devices are amusing because they are so insanely non-functional. It somehow doesn’t seem probable that two billion years of trial and error development could wind up with a clumsy, complex, poorly balanced mechanism for survival—and that jerry-built thing an absolute master of all other animal life!

Some of those “everybody knows that—” postulates needed checking sand checking out of the computation.

First, everybody knows that “to err is human”. And second everybody knows that we are pawns in the hairy grasp of some ogre who is and always will be unknown.

Only this didn’t sound like engineering to me. I’d listened to the voodoo drums in Cap Haitian and the bullhorns in the lama temples of the Western Hills. The people who beat those

drums and blew those horns were subject to disease, starvation and terror. Looked like we had a ratio at work here. The closer a civilization—or a man—moved toward admitting the ability of the human mind to compute—the closer the proposition was entered that natural obstacles and chaos were susceptible to orderly solution—the better he—or they—fared in the business of living. And here we were back with our original postulate again, SURVIVE! Now this computation would be warranted only if it worked.

But it was a not unwarrantable conclusion. I had had experience now with basic personality. Basic personality could compute like a well greased Univac. It was constructive. It was rational. It was sane.

And so we entered upon the next seven league boot stride in this evolution. What was sanity? It was rationality. A man was sane in the ratio that he could compute accurately, limited only by information and viewpoint.

What was the optimum brain? It was an entirely rational brain. What did one have to have to be entirely rational? What would any electronic computer have to have? All data must be available for inspection. All data it contained must be derived from its own computation or it must be able to compute and check the data it is fed. Take any electronic calculator . . . no, on second thought, don't take them. They're not smart enough to be on the same plane with the mind because they are of a greatly sub order of magnitude. Very well, let's take the mind itself, the optimum mind. Compare it to itself. When did Man become sentiently It's not absolutely necessary to the problem or these results to know just when or where Man began to THINK, but let's compare him to his fellow mammals. What does he have that the other mammals don't have? What can he do that they can't do? What does he have that they have?

All it takes is the right question. What does he have that they have? He does have something—and he has something more than they have. Is it the same order? More or less. You never met a dog yet that could drive a car, or a rat that could do arithmetic. But you have men that couldn't drive a car, and men that couldn't do much better arithmetic than a rat. How did such men vary from the average?

It seemed that the average man had a computer that was not only better, it was infinitely finer than any animal's brain. When something happens to the computer, Man is no longer MAN but a dog or a rat, for purposes of comparison in mental power.

Man's computer must be pretty good. After all those millions of years of evolution, it should be—in fact it should, by this time, have evolved a perfect computer, one that didn't give wrong answers because it couldn't make a mistake. We've already developed electronic computing machines so designed, with such built-in self-checking circuits, that they *can't* by their very nature, turn out a wrong answer. Those machines stop themselves and summon an operator if something goes wrong so that the computer starts producing a wrong answer. We know how to make a machine that would not only do that, but set up circuits to find the error, and correct the erring circuit. If men have figured out ways to do that with a machine already—

I had long since laid aside the idea that one could do this job by dissecting a neurone. Dead, they don't talk. Now I had to lay aside the idea that the brain's structural mechanism could even be guessed at this stage. But working on the heuristic basis of what works, it is not necessary to know *how* it is done in terms of physical mechanism if we can show that it *is* done. It was convenient to use electronic circuits as analogs, and the analogy of an electronic brain, because I knew the terms of these things. The brain may or may not run on electric currents; what things can be measured in and around it by voltmeters are interesting. But electricity itself is measured indirectly today. Temperature is measured by the coefficient of expansion caused by temperature. Encephalographs are useful working around a brain but that doesn't mean that the brain is as clumsy and crude as a vacuum tube rig. This was a necessary step because if the problem were to be solved one had to suppose that the brain could be patched up and with some method decidedly short of surgery.

So here was what I seemed to be working with: a computing machine that could work from data stored in memory banks, and was so designed that the computer circuits themselves were inherently incapable of miscomputation. The computer was equipped with sensing devices—the sensory organs—which enabled it to compare its conclusions with the external world, and thus to use the data of the external world as part of the checking feedback circuits. If the derived answer- did not match the observed external world, since the computing circuits were inherently incapable of producing a wrong computation, the data used in the problem must itself be wrong. Thus, a perfect, errorless computer can use external world data to check the validity of and evaluate its own data input. *Only* if the computational mechanism is inherently error-proof would this be possible. But men have already figured out mechanically simple ways of making an error-proof computer—and if Man can figure it out at this stage of the game, two billion years of evolution could *and* would.

How did the mind work ? Well, to solve this problem we did not have to know. Dr. Shannon commented that he had tried every way he could think of to compute the material in the memory bank of the brain, and he had been forced to conclude that the brain could not retain more than three months' worth of observations if it recorded everything. And Dianetic research reveals that everything is recorded and retained. Dr. McCulloch of the University of Illinois postulating the electronic brain in 1949 is said to have done some computation to the effect that if the human brain cost a million dollars to build, its vacuum tubes would have to cost about 0.1 cent each, that the amount of power it would consume would light New York City and that it would take Niagara Falls to cool it. To these competent gentlemen we deliver up the problems of structure. To date Dianetics has not violated anything actually known about structure. Indeed, by studious application of Dianetic principles, maybe the problem of structure can be better approached. But at a swoop, we have all this off our minds. We are dealing with function and ability and the adjustment of that function to the end of obtaining maximum operation. And we are dealing with an inherently *perfect* calculator.

We are dealing with a calculator which runs entirely on the principle that it must be right and must find out why if it isn't right. Its code might be stated as, "And I pledge myself to be right first, last and always and to be nothing but right and never to be, under any circumstances, wrong."

Now this is what you would expect of an organ dedicated to computing a life and death matter like survival. If you or I were building a calculator, we'd build one that would always give correct answers. Now, if the calculator we built was also itself, a personality, it would maintain that it was right as well.

Having observed this computer in its optimum state as the basic personality, the conclusion was very far from a mere postulate. And so we call this computer the "analytical mind". We could sub-divide things further and get complicated by saying that there is an "I" as well as a computer, but this leads off in another direction. And so the "analytical mind" or the "analyzer" is a computer and the "I" for our purposes. All we want is a good *workable solution*.

The next thing we must consider is what apparently makes Man a sentient being and that consideration leads us into the conclusion that possession of this analyzer raises Man far above his fellow mammals. For as long as Man is rational, he is superior. When that rationality reduces, so does his state of being. So it can be postulated that it is this analyzer which places the gap between a dog and a man.

Study of animals has long been popular with experimental psychologists, but they must not be mis-evaluated. Pavlov's work was interesting: it proved dogs will be dogs. Now by light of these new observations and deductions it proved more than Pavlov knew. It proved men *weren't* dogs. Must be an answer here somewhere. Let's see. I've trained a lot of dogs. I've also trained a lot of kids. Once I had a theory that if you trained a kid as patiently as you trained a dog, then you would have an obedient kid. Didn't work. Hm-m-m. That's right. It didn't work. The more calmly and patiently one tried to make that kid into a well-trained dog—

"Come here" and he'd run away—hm-m-m. Must be some difference between kids and dogs. Well, what do dogs have that kids don't have. Mentally, probably nothing. But what do kids have that dogs don't have. A good analytical mind!

Let us then observe this human analytical mind more closely. It must have a characteristic dissimilar to animal minds—minds in lower orders of mammals. We postulate that this characteristic must have a high survival value, it is evidently so prominent and widespread and the analyzer—hm-m-m.

The analyzer must have some quality which makes it a slightly different thinking apparatus than those observed in rats and dogs. Not just sensitivity and complexity. Must have something newer and better. Another principle? Well hardly a whole principle but—The more rational the mind, the more sane the man. The less rational the mind, the closer Man approaches in conduct his cousins of the mammalian family. What makes the mind irrational?

I set up a series of experiments, using the basic personalities I could contact above or below the level of the aberrated personalities and in these confirmed the clarity and optimum performance of the basic computer. Some of these patients were quite aberrated until they were in an hypnotic amnesia trance at which time they could be freed of operator control. The aberrations were not present. Stutterers did not stutter. Harlots became moral. Arithmetic was easy. Color-vision, tone audio recall. Color-vision, tone-audio imagination. Knowledge of what was imagination and what wasn't. The "demons" had got parked somewhere. The circuits and filters causing aberration had been by-passed to be more precisely technical and scientific.

Now let's postulate that the aberrative circuits have been somehow introduced from the external world—covered that ground pretty well, pretty solid ground.

And here's an answer. The introduced bypass circuits and filters became the aberrations in some way we did not yet understand. And what new complexion did this give the analyzer?

Further research tended to indicate that the answer might be contained in the term "determinism". A careful inspection of this computation confirmed observations. Nothing was violated. Did it work?

Let's postulate this perfect computer. It is *responsible*. It has to be responsible. It is *right*. It has to be right. What would make it wrong? Exterior determinism beyond its capacity to reject. If *it could not kick out a false datum it would have to compute with it*. Then, and only then, would the perfect computer get wrong answers. A perfect computer had to be self-determined within the limits of necessary efforts to solve a problem. No self-determinism, bad computation.

The machine had to be in a large measure *self-determined* or it would not work. That was the conclusion. Good or bad, did it lead to further results?

It did.

When exterior determinism was entered into a human being so as to overbalance his self-determinism the correctness of his solutions fell off rapidly.

Let's take any common adding machine. We put into it the order that all of its solutions must contain the figure 7. We hold down 7 and put on the computer the problem of 6×1 . The answer is wrong. But we still hold down 7. To all intents and purposes here, that machine is crazy. Why? Because it won't compute accurately so long as 7 is held down. Now we release 7 and put a very large problem on the machine and get a correct answer. The machine is now sane and rational. It gives correct answers. On an electronic computer we short the 7 so it is always added in, no matter what keys are punched. Then we give the machine to a store-keeper. He tries to use it and throws it on the junk heap because it won't give correct answers and he

doesn't know anything about troubleshooting electronics and cares less. All he wants is a correct total.

Admitting the analytical mind computation, and admitting it only so long as it works, where does it get a held-down 7—an enforced wrong datum?

Now a computer is not necessarily its memory bank. Memory banks can be added and detached to a standard computer of the electronic type. Where do we look for the error? Is it in the memory bank?

The search for what was holding down 7 involved quite a little hard work and speculation and guesses. Some more work had to be done on the computer—the analytical mind. And then came what seemed to be a bright thought. Supposing we set up the whole computer as the demon. A demon that is always and invariably right. Let's install one in a brain so that the computer can project outside the body and give the body orders. Let's make the computer a circuit independent of the individual. Well, hypnotism has some uses. Good tool for research sometimes even if it is a prime villain in aberration.

Two things happened the moment this was done. The computer could direct the body as an "exterior entity" and draw on the memory banks at will for anything. *Seven was no longer held down.*

Naturally this was a freak test, one that could be set up only in an excellent hypnotic patient. And it could be installed only as a temporary thing.

This artificial demon knew *everything*. The patient could hear him when the patient was awake. The demon was gifted with perfect recall. He directed the patient admirably. He did computations by moving the patient's hand—automatic writing—and he did things the patient evidently could not do. But why could it? We had artificially split the analyzer away from the aberrated patient, making a new by-pass circuit which by-passed all the aberrated circuits. This would have been a wonderful solution if it had not been for the fact that the patient was soon a slave to the demon and that the control, after a while, began to pick up aberrations out of the plentiful store the patient had. But it served to test the memory banks.

Something must be wrong about these banks. Everything else was in good order. The banks contained an infinity of data which appalled one in its very completeness. So there ensued a good, long search to find something awry in the banks. In amnesia sleep or under narco-synthesis, the banks could be very thoroughly ransacked. By automatic writing, speaking and clairvoyance they could be further tapped.

This was a mad sort of way to go about things. But once one started to investigate memory banks, so much data kept turning up that he had to continue.

There's no place here for a recital of everything that was found in the human memory bank, its completeness, exactness and minuteness or its fantastically complicated, but very smart cross-filing system. But a resume is necessary of some high points.

In the first place the banks contain a complete color-video record of a person's whole life, no matter the "demon" circuits. They do not occlude or falsify. They do not alter the bank or the accuracy of the bank. A "poor" memory means a curtailed memory, the memory being complete. *Every perception observed in a lifetime is to be found in the banks. S1* the perceptions. In good order.

Memories are filed by time. They have an age and emotional label, a state of physical being label, and a precise and exhaustive record of everything perceived by organic sensation, smell, taste, tactile, audio and visio perceptics *plus* the train of thought of the analyzer of that moment.

There is no inaccuracy in the banks. Inaccuracy can, of course, be caused by surgery or injury involving actually removed portions. Electric shock and other psychiatric efforts are equivocal. Pre-frontal lobotomy is such certain and complete mind-murder that one cannot be certain thereafter of anything in the patient except zombiism.

Anyway, the memory banks are so fantastically complete and in such good order behind the by-pass circuits in any man not organically tampered with, that I very nearly wore out the rug trying to conceive it. Very well, there was something between the banks and the analyzer. Must be. The banks were complete. The circuits were intact. In any patient organically sound, and that includes all patients who have psychosomatic ills—the basic personality was apparently intact, the banks were intact. But the banks and the analyzer somehow did not track.

Well, let's take another look. This is an engineering problem. So far it has surrendered beautifully to engineering thought and computation. Apparently it should go right on surrendering. But let's look at Freud. There's his Censor. Let's see if there's a censor between the banks and the analyzer.

That folded up in about two seconds Mex. The censor is a composite of by-pass circuits and is about as natural and necessary to a human being as the fifth wheel on a motorcycle. There isn't any censor. Served me right for trying to lean on Authority. In terms of authority, if you can spell it, it's right. In terms of engineering, if it can't be found and measured in some fashion, it's probably absent.

I rechecked the memory banks. How was I withdrawing data? I was using automatic writing for some, by-pass circuit for others, direct regression and revivification on the old line Hindu principle for others. I set about trying to classify what kind of data I was getting with each method of recall. All of a sudden the problem fell apart. By automatic writing I was getting data not available to the analyzer. By by-pass I was getting data not available otherwise. By regression and revivification material was being procured only a little better than could be recalled by the tranced subject. The data I could check was found to be invariably accurate by any of these methods. What was the difference between automatic writing data and simple trance data?

I took a patient's automatic data and regressed him to its period. He could not recall it. The data concerned a broken leg and a hospital. I bucked him into the incident by main force.

The patient received a very sharp pain in the area of the old break.

This was a long way from hypno-analysis. This was an effort to find an interposition between memory banks and analyzer, not an effort to relieve "traumatic experiences".

And there was the answer. Why not? Very simple. It had been sitting right there staring at me since 1938. Oh, these six-foot wide rear view mirrors! I had even made a law about it.

The function of the mind included the avoidance of pain. Pain was unsurvival. Avoid it.

And that's it—the way to hold down seven. You can hold it down with physical pain! The exterior world enters into the man and becomes memory bank. The analyzer uses memory bank. The analyzer uses the exterior world. The analyzer is caught between yesterday's exterior world now interior and today and tomorrow's exterior world, still exterior.

Can it just be that this analyzer gets its data on one perceptic circuit. Can it be that that perceptic circuit carries yesterday and today both? Well, however that may be, the analyzer certainly behaves to yesterday's interior world the same way it behaves to today's exterior world so far as the avoidance of pain goes. The law works both ways.

The analyzer avoids yesterday's pain as well as today's pain. Well, that's reasonable. If you avoid yesterday's pain in today's environment, you have a much better chance to survive. In fact. But see here, there's more to the problem than this. If the analyzer had a clear view of yesterday's pain it could better avoid it in today. That would be good operation.

That was the "flaw" in the machine. But it was a highly necessary "flaw". Just because an organism is built to survive, molded to survive and intended to survive does not mean that it will, as a matter of course, be perfect.

But the analyzer *was* perfect.

The banks were perfect.

The analyzer just plain wouldn't ever let the irrationalities of exterior world inside stay long as it could help it.

As long as it could help it!

I was probing now for the villain of the piece. He was not found for a while. Many experiments were made. Efforts were made to make several patients well by simply breaking through the pain wall the analyzer was "seeking to avoid". A lot of painful incidents were broken, mental and physical anguish by the library full, and without much relief. The patients relapsed.

Then it was discovered that when a patient was bucked through a period when he was "unconscious", he showed some improvement. Then it was discovered that these "unconscious" periods were rather like periods of hypnosis driven home by pain. The patient responded as though the "unconscious period" had been post-hypnotic suggestion!

From this series of experiments a prime datum was picked up.

You relieve the pain and the "unconsciousness" and the suggestive power goes away. The subject did not have to have any of the mumbo jumbo of hypnosis in this "unconscious period". But every perceptive perceived tended to aberrate him.

I did not realize until then that I was playing tag with a hitherto unappreciated mid-evolution step in Man. If he was once a polliwog, he had never lost any of the parts he had evolved through. How does a fish think ?

Well, let's see how a fish would respond to pain. He is swimming in brackish water of yellow color over a green bottom, tasting shrimp. A big fish hits him a whack, misses but does not kill him. Our fish lives to come back another day. This time he swims into an area of brackish water with a black bottom. He gets a little nervous. Then the water becomes a yellow color. The fish becomes very, very alert. He coasts along and gets over a green bottom. Then he tastes shrimp and instantly swims away at a terrific rate.

Now, what if Man still had his lower organism responses? Well, it seemed, on experiment, that he did. Drug him with ether and hurt him. Then give him a whiff of ether and he gets nervous. Start to put him out and he begins to fight. Other experiments all gave the same conclusion.

Lower organisms can be precisely and predictably determined in their responses. Pavlov's dog. Any dog you ever trained. The dog may have something of an analyzer too, but he is a pushbutton animal. And so is Man. Ah, yes, so is Man. You know, just like rats.

Only Man *isn't!* Man has a wide power of choice. Interfere with that wide power and there's Double brewing. Aberrate him enough and he's unpredictably push-buttonable. Cut his brain out with a knife—and he can be trained to speak woof-woof for his food. But by golly,

you better cut pretty well to get a good, satisfactory one hundred percent of the time woof-woof!

What happens when a man gets “knocked out”? He “isn’t there”. But *all the memory recordings during the period are*. What happens when you knock him half out? He does strange, automatic things. What happens when his analyzer is so aberrated that . . . hey! Wait! How would you build a good, sensitive analyzer? Would you leave it connected to every shock? Huhuh! You’d fuse it so it would live to think another day. In an emergency what kind of a response do you want ? Automatic!

Stove hot, hand on stove, withdraw hand. Do you do a computation on that ? No indeed. What withdrew the hand ? The analyzer ? No. What happened to the analyzer for an instant during the shock ? The analyzer goes out of circuit and leaves a mechanical determining director in full charge! A good, fast identity-thinking director.

The analyzer does not think in identities.

It thinks in differences, similarities. When it loses its power to differentiate and thinks in identities—no, it never does that. That’s madness and the analyzer does *not* go mad. But something around here thinks in identities. Start working on a patient and find out that hash equals snow equals an ache in the knee—that’s identity thinking.

We don’t know here what really happens to that analyzer. But we do know that we have found something which interposes between the banks and the computer. Something which thinks in identities, has a high priority over reason during moments of stress, can be found whenever a man is sent into some of yesterday’s unconscious moments.

We know what it does now. It takes command when the analyzer is out of circuit. Whether or not it is the old style mind which Man did not shed while graduating to sentience by developing an analyzer is beside the point. Whether or not it is a structural entity of a combination of “unconscious periods” is equally outside our concern here. We are working in function and we want answers that work every time.

Call this the *reactive mind* . It is a mind which is constructed to work in moments of enormous physical pain. It is rugged. It works all the way down to the bottom and within a millimeter of death. Maybe it’s almost impossible to build a sharply sentient mind which would operate under the terrible conditions of agony in which we find the reactive mind operating. Maybe the reactive mind . . . well, that’s structure. Here it is as function.

The reactive mind thinks in identities. It is a stimulus-response mind. Its actions are exteriorly determined. It has no power of choice. It puts physical pain data forward during moments of physical pain in an effort to save the organism. So long as its mandates and commands are obeyed it withholds the physical pain. As soon as the organism starts to go against its commands, it inflicts the pain.

The fish, had he failed to swim away when in a danger area where he had been attacked, would have been forced away by the crude mechanism of pain going into restimulation. No swim equals aching side. Swim equals all right.

The analyzer blows its fuses as any good machine would when its delicate mechanism is about to be destroyed by overload. That’s survival. The reactive mind kicks in when the analyzer is out. That’s survival.

But something must go wrong. This was a pretty good scheme of things. But it didn’t always work.

Or it worked too well.

Thus were discovered the reactive memory bank and its total contents, the engrams and their locks.

An engram is an energy-picture. It is made during a period of physical pain when the analyzer is out of circuit and the organism experiences something it conceives to be or which is contrary to survival. An engram is received only in the absence of the analytical power.

When the analyzer is out of circuit, data of high priority value can pass, without evaluation by the analyzer, into the memory bank. There it becomes a part of the emergency bank. This is a red-tab bank, the reactive mind, composed of high-priority, dangerous situations which the organism has experienced. The reactive mind has this bank as its sole source of information. The reactive mind thinks in identities with this red-tab bank. So long as the analyzer is *fully* in circuit the red-tab bank is null and void. With the analyzer partially out of circuit—as in weariness, drunkenness, or illness part of this bank can cut in.

Let's begin to call "unconsciousness" a new word: ANATEN. Analytical Attenuation. There is great or lesser anaten. A man goes under ether. He becomes anaten. He is hit in the jaw and is anaten.

Now what does an engram contain? Clinical examination of this object of interest demonstrates that the engram consists of anaten, time, physical age, emotion, physical pain, and every perception in order of sequence. Words, sights, smells, everything that was there.

We had to organize a new sub-science here to think about engrams properly. It's the science of Perceptics. Know your general semantics? Well, same organisation only we take in all the perceptics and we show where the meaning of each perceptic originates and why Man can't nonidentify with ease and aplomb so long as he has engrams.

The automatic writing I was getting was straight out of engrams. That and by-pass circuits would disclose data received during anaten—engrams. And then I discovered that these engrams had a peculiar faculty. They could create their own circuits, parasitically using the host circuits.

Here's how an engram can be established: Mary, age 2, knocked out by dog, dog bites. Content of engram: anaten; age 2 (physical structure); smell of environment and dog; sight of dog jaws gaping and white teeth; organic sensation of pain in back of head (hit pavement); pain in posterior; dog bite in cheek; tactile of dog fur, concrete (elbows on pavement), hot dog breath; emotion; physical pain plus endocrine response; audio of dog growl and passing car.

What Mary does with the engram: She does not "remember" the incident but sometimes plays she is a dog jumping on people and biting them. Otherwise no reaction. Then, at age 10 similar circumstances, no great anaten, the engram is restimulated. After this she has headaches when dogs bark or when cars pass that sound like *that* car, but only responds to the engram when she is tired or harassed otherwise. The engram was first dormant—data waiting just in case. Next it was keyed-in—stuff we have to watch out for. Then it was thereafter restimulated whenever any combination of its perceptics appeared while Mary was in slight anaten (weary). When forty years of age she responded in exactly the same way, and still has not the slightest conscious understanding of the real reason!

Now let's consider what would have happened if Mary's mama had yelled something really choice; "Be calm! Be calm! Oh, my darling, it's always this way. Get out, get out!" Something mama had tucked away as the proper thing to do and say when dogs bite daughters.

We here have what amounts to a post-hypnotic suggestion: identity (equals) thought. All the perceptics equal all the words equals a dog equals mama equals get out, et cetera, et cetera, et cetera, and each equals all and any part of each. No wonder nobody could compute a madman! This is irrationality deluxe. Literally this computation of identity thought makes no

sense. But it's survival data and it better be obeyed or the cheek will hurt, the head will ache and the elbows will get a permanent "dermatitis".

But remember that this engram also had, as a tab, anaten, the exact degree of anaten present during that moment. The analyzer is a fine device but it is also, evidently, a physical organ, probably the pre-frontal lobes and organic sensation includes several things. Restimulation brings about this state of affairs: "Analyzer shut-off." "Reactive mind to cells. Red-tab dog in sight. Shut off analyzer. This is a priority situation. That is all."

The degree of anaten is very far from the original in the facsimile. But it is sufficient to produce a reduced state of analyzing, in effect a reduced sanity. The subject just has a feeling of dull, stupid mental confusion many times, a sort of dumb, unreasoned and unidentified emotion that seems to stop thought in numbness. You've had it! Thus we have a situation which begins to approach a pushbutton determinism. The engram which has become keyed-in can, when the individual is slightly anaten—wary, ill, sleepy—be push buttoned. Use the key word to the slightly anaten subject which is contained in one of his engrams and one of that engram's reactions may be observed. Push the button thoroughly enough and a full dramatization can be effected—he will *re-enact* the original situation!

Thus the red-tab "memory" bank of the reactive mind. The discovery of this bank is one of the several original discoveries of Dianetics. Many parts of Dianetics can be found, if improperly evaluated, in old philosophic schools or in modern practice, but there remain a few entirely new facts which have no prior art. This red-tab bank is a very special affair and is quite different in composition, content and circuit from the analytical banks—conscious banks containing data which can be "remembered".

The reason this bank was never discovered before is not difficult to find. The red-tab bank content was implanted when the analyzer was out of circuit—unconscious. It is located then many strata below conscious awareness in the stupefaction of a physical knock-out. When one tried to get to it with hypnotism or narco-synthesis he was confronted with a patient who simply looked knocked-out, who was unresponsive to everything. As narco-synthesis and hypnotism both savor of sleep, the deeper sleep of the composite whole of all the past knock-outs of a lifetime render the patient entirely insensible even when one was squarely on top of the reactive bank. So this bank remained hidden and unknown. And that is a sad thing because unless one knows about this bank the entire problem of Man's imperfection, his insanity, his wars, his unhappiness, can go begging or get into the files of a shaman or a neurosurgeon. Much more widely, the hidden character of this bank can be said to be responsible for irrational conduct on the part of all Mankind. And how many lives has that cost in the last four thousand years?

It is a very peculiar sort of a bank. It is the *only* bank in the human mind from which any content can be exhausted. All its content is pain and unconsciousness. And only physical pain can be deleted from the mind. Now wouldn't you say that this was a peculiar sort of a bank? Here it is full of experiences which, because of the way they are filed, can drive a man to suicide or other madness. Here it is with its memories all ready to click into the motor controls of the body, ready, without so much as a by-your-leave from the sentient analyzer, to make a man run insanely until he drops from heart failure. Here it is able to change the perfect structure of the body into a nightmare thing with a fetus-like face and wasted or undeveloped limbs. Here it is ready to manufacture anything you can name by way of physical ills or at least to predispose them, possibly even cancer. Here it is filling hospitals, mental institutions and jails. And yet it is the one portion of human memory that can be modified and changed!

What price some of the old philosophies when the reducible "memory" is one of pain?

Try any technique you can name on a pleasant or even a merely passing memory in one of the conscious banks. It will stay right where it is, indelible, particularly the pleasurable ones. But a "memory" in the red-tab bank, when properly approached by Dianetic technique, will vanish out of that bank entirely. It refiles as a memory in the conscious level banks, and as

such, by the way, is fantastically difficult to locate the order of what you ate for dinner on June 2nd when you were two years of age and when found bears the tag “found to be nonsurvival data, do not permit it or similar data into any fundamental computations”. And one of these unconscious “memories” when treated, produces about the same emotional response afterwards as a mildly amusing joke.

The red-tab bank could cause circuits to be set up which looked and sounded like demons. It could occlude the conscious bank in part or so thoroughly that it appeared that there was no past. It could command and order a person about like a moron might control a robot. And yet it is perishable. And it can be de-intensified and refiled, with consequent great increase in the survival chances of a man. All its content is contra-survival. When it is gone, survival is demonstrably enhanced—and that means what it says and the fact can be proven in a clinical laboratory with an experiment on the order of “is this water?”

Pleasure memories can be attacked with various techniques. But they are set. They won't budge. Refile the reactive memories and the whole conscious lifetime of the individual springs into view, brilliant and clear, unmodified by the by-pass circuits which are madness. Reduce the reactive bank and the optimum mind for the individual comes into view. The reactive bank was neither the drive nor the personality of the individual—these are indelible and inherent.

And another thing happens. The by-pass circuits and the reactive bank apparently stand only between the conscious banks and the analyzer. They do not stand between, for instance, the ear and the sonic file in the conscious bank, the eye and the visio file, et cetera. This is a very important discovery in its own right, for it means that an aberration, for instance, about the inability to hear did not prevent all proper sound from being filed, about the inability to see color did not prevent all color from being filed. Clear away the reactive circuit which apparently prevented the observations and the analyzer finds itself possessed of whole banks of material it never knew it had, all in proper sound and color, et al.

For instance, a man who supposes that the whole world was ugly and sordid is guided through therapy. The aberration which made the world seem ugly and sordid folds up when the engram or engrams to that effect deintensify and refile. The by-pass circuit these engrams caused to be set up did *not* prevent a full, true recording to be made, via all sensory channels. Therefore, when the analyzer is permitted to enter the files, the individual discovers that he has innumerable pleasurable experiences which, when they occurred, appeared to him to be ugly and sordid but which are now bright.

This postulates another circumstance, interesting but not vital to Dianetics. The standard memory banks of the mind are evidently not filled with memories which are entities capable of willy-nilly determinism on the individual. They are not automatically restimulated by the perception of something which suggests them in the environment. They are not hooked into circuit on a permanent basis at all. They are filled with conclusions and the analyzer may pick up the old conclusions or create new ones which change the old. In other words, *the standard bank is at the command of the analyzer and the individual; the individual is not at the command of the standard banks.*

In short there is no such thing as conditioning. Conditioning is all right for rats and dogs and cats. They run on the reactive type bank. Therefore what we refer to, ordinarily, as conditioning, is actually an engram command laid down in a specific moment. This is easily susceptible of clinical proof. The conditioning of a lifetime on the subject, say, of eating with a knife, breaks down the instant that the engram command demanding it is de-intensified.

This is not theory, but actuality: conditioning in the absence of engrams on the subject does not and cannot exist. Conditioning can be removed and will stay removed. There are then two things at work: the reactive mind commands certain actions and these can be altered by the de-intensification of engrams. The analyzer can hook up and arrange certain automatic responses for various mechanical situations and actions. Call the reactive mind demand a habit,

call the analytical requirement a training pattern. There are habits: these can be removed. There are training patterns: these can be altered only with the consent of the analyzer, which is to say, the individual. Practically all the survival patterns which really lead to survival are laid down on the analytical level. The reactions in which people indulge which are contra-survival are laid down on the reactive level.

Conditioning, therefore, is another term which can be laid aside. The analyzer, working without impedance by engrams, can lay down or take up training patterns at will. The reactive mind can lay down commands which make habits only when the exterior world implants such commands in the absence of full analytical power. Dianetics can break up habits, simply by relieving the engrams which command them. Dianetics could only change a training pattern if the individual consented to it.

These discoveries were an additional proof that Man was a self-determined individual. Further investigation led to another finding; that although the reactive bank was exterior determinism this determinism was a variable on the individual. In other words, the determinism laid in by pain had a variable effect. The same engram introduced into three different people might bring about three different reactions. Man is so thoroughly a self-determined organism that he has a variable reaction to all attempted determinism Research brought about the fact that he could exercise a power of choice over the reactive bank, even if in a limited manner.

He had five ways to handle an engram: he could attack it and its counterpart in the exterior world, he could flee from it and its counterpart, he could avoid it and its counterpart, he could neglect and its counterpart, or he could succumb to it. He was self-determined to some degree within this group of reactions. And these are the reactions to any dangerous, contra-survival problem.

These are, by the way, known as the “black panther mechanisms” in Dianetic parlance. Imagine that a black panther is sitting on the stairs. There are five ways of handling the situation for a man sitting in the living room and who has a desire to go upstairs. He could attack the panther, he could flee from it, he could avoid it by going outside and coming up via the porch lattice or entice the panther away as another method of avoidance—he could simply refuse to admit it was a black panther and attempt to go up anyway, or he could simply lie still in fear paralysis and hope that the black panther would either eat him quietly without too much pain or merely walk off in antipathy to corpses. (Fear paralysis, denial of dangerousness.)

Now an analyzer does not handle conscious level—standard bank—memories in this fashion. The analyzer evaluates the present and future in terms of experience and education of the past plus imagination. The standard bank is used for computation, not for emotional reaction, guilt, self-revilement, et cetera. The only valid data is that data in the standard bank and in its search for success, happiness, pleasure or whatever desirable end or merely in the art of contemplation, the analyzer must have reliable information and observation. It uses memory, conclusions drawn from experience and conclusions drawn from its conclusions and computes in various ways to obtain correct answers. It avoids a false datum as a curse once it knows it is false. And it is constantly re-evaluating the memory files to reform conclusions. The more experience it has, the better its answers. Bad experience is fine data for computation because it brings in the necessity level. But the analyzer *cannot* compute reactive data, the “unconscious memories” it cannot reach and does not even know about.

So these reactive “memories” aren’t memories at all as we understand *memory*. They are something else. They were never meant to be recalled on the analytical level or to be analyzed in any way. The analyzer, trying to get around that red-tab bank sets up some circuits which would tax a Goldberg to duplicate. The analyzer is trying to reach its proper conscious level banks. If it can’t, it can’t compute right answers. If the analyzer keeps getting strange and seemingly sourceless material which nevertheless has pain to enforce its acceptance, that analyzer can get very wrong answers. And the structural body can go wrong. And motives go wrong. And somebody invents phrases like “it’s human to err”.

No, reactive “memories” aren’t memories. So we call them by a good medical term, *en-*grams—a lasting trace—and modify the definition by qualifying “lasting”. They were certainly lasting enough pre-Dianetics.

The engram is received, we can postulate, on a cellular level. The engram is cellular memory by the cells and stored in the cells. We won’t go further with this because at present we want to stay out of the problems of structure. But we can prove to anyone’s satisfaction that the reactive mind bank is apparently inside the cells themselves, and is not part of the human mind banks which are composited of, we suppose, nerve cells. Engrams are in any kind of cell in the whole aggregation. They do not in the least depend upon nervous structure to exist. They use and prey upon nervous structure as we know it. So we are not talking about memory when we talk about engrams. We are talking about cellular recordings on the order of phonograph records, smell records, organic sensation records, all very precise. And when we say reactive mind we are talking about no special part of the body but a composite, cellular level moronic method of remembering and computing. Someday somebody may cut off a chunk of brain and cry, “Eureka, this is the reactive mind”. Possibly. But staying with our functional computation, we can make good time and get workable results. And so we need to know no seat for the reactive mind. And we need to know nothing about the exact structure of its banks.

All we want to know is what they do.

The reactive engram comes in with pain when the analytical mind is more or less out of circuit. The engram is *not* recorded in the conscious level banks. It comes in on a cellular level, just as though the cells which compose the body, suddenly recognizing that the organism is in apparent danger of perishing, grab data in an effort to save themselves on the order of a disintegrated, every man for himself, effort. But the data they get is not disordered. It is most terribly precise, most alarmingly literal. It is exact. “Bean” means “bean” in all the ways the sound of “bean” can mean “bean”.

Once received, this engram can then lie dormant, inactive. It takes a remotely similar, conscious level experience to stir that engram up. This key-in moment evidently refiles the engram within the red-tab banks and gives it articulation. The words of the engram get meaning. The perceptions get hooked into the sensory organs. The engram is now in place. After this it can be very easily restimulated. The cells are now capable of back-seat driving.

Well, these are the discoveries. Once they had been made it was necessary to find out how they could be applied.

Man, we have postulated—and it is certainly working—is obeying the basic command, SURVIVE! This is a dynamic command. It demands action. In looking over the matter of obedience to this command numerous computations were necessary. Survive. Well, the first answer and the too obvious one is that Man is surviving as a unit organism. A very thorough computation on this—about two hundred thousand words—revealed the fact that while everything in the Universe could be explained by a few shifty turns of logic—in terms of personal survival, the thing was unwieldy and unworkable. We want things to be workable. This is engineering, not idle study. We have a definite goal. So let us see if Man is all out for Man.

The whole reason for the organism’s survival *can* be computed down into this single effort, the survival of contemporary Mankind. All the reason a unit organism survives is to let all Mankind survive. But that does not work well.

Now let us take a group, under which we put symbiotes. Let us postulate that the unit organism survives wholly for the group. Again, a computation can be made that explains everything down to group. Group is the only reason, says this computation. It’s unwieldy but there’s nothing wrong with it.

All right, let's try bringing it all down to sex. And still it can be computed perfectly, if it is a trifle unwieldy. The reason Man as a unit survives is to enjoy sex and create posterity. But it requires an enormous number of heavy, cumbersome manipulations of logic that no one would like.

Investigating in the mind—going to the object one is studying and really examining it instead of windily arguing about it and quoting authority—it was discovered that an apparent balance existed only when and if *all four drives* were relatively in force. Each one computed well enough, but taken as the four-fold goal they balance. The computing becomes very simple. Behavior begins to look good. Using all four, we can predict.

Now comes the proof. Can we use it? Does it work? It does. Impediments lie across these drives. They have their own energy, these impediments, a reverse polarity surcharge which inhibits the drive on which they lie. This is very schematic but it computes and we can use it in therapy. An unconscious period containing physical pain and conceived or actual antagonism to survival thwarts or blocks or impedes the flow of drive force. Begin to stack up these impedance's on a drive and it begins to damp markedly.

Now comes arithmetic. There's a good reason to use the figure four. There are four drives. There are four levels of physical tone. If a man's composite drive force is considered as four and his restimulated—acute or chronic, either way—reactive mind force is high enough to reduce that composite drive force below two, *the individual is insane*. In view of the fact that an engram can be currently restimulated to reduce that force below two, a condition of temporary insanity results.

An engram can consist of father beating mother during a child's anaten. When this engram is highly restimulated, the child, now an adult, may possibly dramatize it either as the father or the mother and will carry out the full drama, *word for word, blow for blow*.

In view of the fact that when father beat mother, father was probably dramatizing one of his own engrams, another factor can be found here which is highly interesting. It is contagion. *Engrams are contagious*. Papa has an engram. He beats mother into anaten. She now has an engram word for word from him. The child was anaten, maybe booted aside and knocked out. The child is part of mother's perceptics for that engram. Mother dramatizes the engram on the child. The child has the engram. He dramatizes it on another child. When adulthood is attained, the engram is dramatized over and over. Contagion.

Why do societies degenerate ? A race comes to a new place. New life, few restimulators— a restimulator being the environment's equivalent to the engram's perceptic content —and high necessity level which means high drive. The race thrives on the new frontier. And then begins this contagion, already present, brought in part from the old environment. And the descending spiral can be observed.

Having an engram makes one slightly anaten. Being slightly anaten one more easily receives new engrams. Engrams carry physical pain—psychosomatics—which reduces the general tone and brings on further anaten. And in a rapidly descending spiral, the individual decays.

These were the computations achieved by research and investigation. Now it came to making them work. If they didn't work, we'd have to change things and get new principles. It happens that the above works.

But to start them working was a difficult thing. There was no way of knowing how many engrams a patient might have. One could be cheerfully optimistic by this time. After all, there was a pretty good computation, some knowledge of the nature of the black enchantment, and it might be possible to bring about a "Clear"—optimum working condition of the analyzer—in almost any patient. But the road was full of stones.

Several techniques were developed all of which brought alleviation approximating a couple of thousand hours of psycho-analysis. But that wasn't good enough. They could bring about better results than hypno-analysis and bring them about much more easily. But that wasn't getting the train over the stream.

I found out about locks. A lock is a situation of mental anguish. It depends for its force on the engram to which it is appended. The lock is more or less known to the analyzer. It's a moment of severe restimulation of an engram. Psycho-analysis might be called a study of the locks. I discovered that any patient I had had thousands upon thousands of locks, enough to keep me busy forever. Removal of locks alleviates. It even knocks down chronic psychosomatic ills at times. It produces more results than anything else so far known elsewhere, but it doesn't *cure*. Removal of locks does not give the individual all his mental powers back, his audio-tone, visio-color, smell, taste, organic memory and imagination. And it doesn't particularly increase his IQ. I knew that I was far from the optimum analyzer.

It was necessary to go back and back in the lives of patients looking for real engrams, total anaten. Many were found. Some were found that would release when the patient was removed in time back to them and was made to go over and over them, perceptic by perceptic. But there were also engrams that would not release, and they should have, if the original computation was correct. The optimum computer must analyze the data on which it operates, and, once false data have been called to its attention for questioning, the self-checking feature of the computer should automatically reject that falsity.

The fact that an engram wouldn't release worried me: either the basic idea that the brain was a perfect computer was wrong, or —hm-m-m. Before too long it was found that one had to have the first instant of each perceptic before the later engram would go. That looked like order. Get the earliest pain associated with, for instance, a squeaking street car wheel and later street car wheels, even in bad engrams, gave no trouble. The perfect computer wouldn't overcome the short circuit at level 256 if the same circuit was shorted at level 21, but clear the short circuit—the false data—where it first appeared, and then the computer could readily find and correct the later errors.

Then began the most persistent search possible to find the earliest engram in any patient. This was mad work. Utterly weird.

One day I found myself with a complete birth engram on my hands. At first I did not know what it was. Then there was the doctor's patter. There was the headache, the eyedrops, Hello! People can remember birth when they're properly bucked into it! Aha! Birth's the earliest engram. Everybody has a birth. We'll all be Clears!

Ah, if it had been true! Everybody has a birth. And believe me, birth is quite an experience, very aberrative. Causes asthma and eyestrain and somatics galore. Birth is no picnic and the child is sometimes furious, sometimes apathetic but definitely recording, definitely a human being with a good idea of what's happening when he isn't anaten. And when the engram rises, he knows analytically all about it. (And he can dramatize it, if he's a doctor or she can dramatize it, if she's a mother.) But birth isn't all the answer. Because people didn't become Clears and stop stuttering and stop having ulcers and stop being aberrated and stop having demon circuits when birth was lifted. And sometimes birth didn't lift.

The last was enough for me. There was an axiom: find the earliest engram. Know where it wound up? *Shortly before conception*, for a body. Not all cases, fortunately. Some cases waited four days after conception before they got their first engram. The embryo anatens easily; evidently *there as cellular anaten*.

No statement as drastic as this—as far beyond previous experience as this can be accepted readily. I have no explanation of the structure involved; for the engineering answer of function, however, structural explanation is not immediately necessary. I was after one and

only one thing: a technical process whereby aberrations could be eliminated, and the full potentiality of the computational ability of the mind restored.

If that process involved accepting provisionally that human cells achieve awareness on the order of cellular engrams as little as a day or two after conception, then for the purposes at hand that proposition can, and must be, accepted. If it had been necessary to go back through two thousand years of genetic memory, I would still be going back to find that first engram—but fortunately there's no genetic memory, as such. But there definitely is something which the individual's mind regards as prenatal engrams. Their objective reality can be debated by anyone who chooses to do so; their subjective reality is beyond debate—so much so that the process works when, only when, and *invariably when* we accept the reality of those prenatal memories. We are seeking a process that cures aberrations, not an explanation of the Universe, the function of life, or anything else. Therefore we accept as a working—because it works—postulate that *prenatal engrams are recorded as early as shortly before conception*. The objective reality has been checked so far as time and limited means permitted. And the objective reality of prenatal engrams is evidently quite valid. Any psychologist can check this if he knows Dianetic technique and can find some twins separated at birth. But even if he found discrepancies the bald fact remains that individuals *cannot* be rehabilitated unless the prenatal engrams are accepted.

What happens to a child in a womb? The commonest events are accidents, illnesses—and *attempted abortions!*

Call the last an AA. Where do people get ulcers? In the womb usually, AA. Full registry of all perceptics down to the last syllable, material which can be fully dramatized. The largest part of the proof is that lifting the engram of such an event *resolves the ulcer!*

How does the fetus heal up with all this damage? Ask a doctor about twenty years hence—I've got my hands full. That's structure, and right now all I want is a Clear.

What's that chronic cough? That's mama's cough which compressed the baby into anaten when he was five days after conception. She said it hurt and happened all the time. So it did. What's arthritis? Fetal damage or embryo damage.

It so happens, it is now known, that a Clear can control all his body fluids. In an aberree the reactive mind does a job of that. The reactive mind says things have to be such and so and that's survival. So a man grows a withered arm. That's survival. Or he has inability to see, hysterical or actual blindness. That's survival. Sure it is. Good solid sense. Had an engram about it, didn't he?

What's TB? Predisposition of the respiratory system to infection. What's this, what's that? You've got the proposition now. It works. The psychosomatic ills, the arthritis, the impotence, this and that, they go away when the engrams are cleared from the bottom.

That was the essence of the derivation of the technical process. With the research stage completed the actual application was the remaining stage, and the gathering of data on the final, all-important question. The process worked—definitely and unequivocally worked. But the full definition of a science requires that it permit accurate description of how to produce a desired result *invariably*. Would the technique work on all types of minds, on every case?

By early 1950 over two hundred patients had been tested; of those two hundred people, two hundred cures had been obtained. Dianetics is a science because by following readily prescribed techniques, which can be specifically stated, based on definitely stated basic postulates, a specifically described result can be obtained in every case. There may, conceivably, be exceptions to the technique now worked out, but I tried honestly to find exceptions and did not; that's why I tried so many cases, of so many different types. And some of them were really gruesome cases.

Who is an aberree? Anybody who has one or more engrams. And since birth itself is a very engramic experience every human being born has at least one engram!

The whole world, according to the hypnotist, needs nothing but to be hypnotized. Just put another engram, an artificial one, into a man, even if it's a manic engram—makes the subject “big” or “strong” or “powerful” plus all other perceptics contained—and he's all right. That's the basic trouble. Reduction of self-determinism. So we don't use hypnotism. Besides, it's not workable on any high percentage. If you've followed this far without realizing that we are trying to wake up an analyzer, you made the same mistake I did for many months. I tried to work with hypnosis. Well, it works, after a sloppy fashion. But how you put a man to sleep who is already three-quarters asleep—normal, near as I can discover—is a problem I wish could be solved. But fortunately it doesn't need solution.

The analyzer went to sleep with each engram. Each engram had locks—like it, also engrams, but subsequent to it—and each chains of engrams—same species, people have about fifteen or twenty chains on the average of ten or fifteen engrams to the chain —has about a thousand locks. There are luckless people who have hundreds of engrams. They may be sane. There are people who have twenty engrams and are insane. There are people who are sane for years and suddenly get into just the right environment and get restimulated and go mad. And anybody who has an engram he has had fully restimulated has been mad—*vox populi*—for at least once, even if only for ten minutes.

When we start to treat a person, we are treating a partially asleep analyzer—and the problem is to wake him up in the first engram and then erase—that's right *erase*, they vanish out of the reactive bank on recounting over and over with each perceptic—all subsequent engrams. The locks blow out without being touched, the Doctrine of the True Datum working full blast and the analyzer refusing to tolerate what it suddenly notices to be nonsense. And as he recovers mental function enough to reach back a little way into his past, we begin to alleviate. Then we finally find out the reactive mind plot—why he had to keep on being aberrated—and we blow out the demons—upsetting the circuits —and all of a sudden we are at basic basic, first engram. Then we come forward, recounting each engram over and over until it blows away and refiles as experience as opposed to command.

A Clear has regression recall. Basic personality, in an aberree, isn't strong enough to go back so we use what we call the *Dianetic reverie*.

We found why narco-synthesis is so sloppy. It puts the partially restimulated engram into full restimulation, keys all of it in. The drug turns off the somatic—physical pain—so that it doesn't wholly go away. And narco has no chance of going back far enough to get basic basic and the one it reaches will pretend to erase and then will surge back in from sixty hours to sixty days.

Does any special thing hold up a case? Yes, the sympathy computation. Patient had a tough engramic background, then broke his leg and got sympathy. Thereafter he tends to go around with a simulated broken leg— arthritis, et cetera, et cetera. These are hard to crack sometimes, but they should be cracked first. They make a patient “want to be sick”. Sickness has a high survival value says the reactive mind. So it tailors up a body to be sick, good and sick. Allies are usually grandmothers who protested against the child being aborted—effort already made, child listening in, not knowing the words just then but he'll know them later when he knows his first words—nurses who were very kind; doctors who bawled mama out, et cetera, et cetera. Patient usually has an enormous despair charge around the loss of an ally. That'll hold up a case.

We've completely by-passed how this ties in with modern psychology. After all, modern psychology has labels for many observed conditions. How about schizophrenia, for instance ?

That's valences An aberree has a valence for every person in every engram. He has basically three, himself, mother and father. Every engram has dramatic personnel. A valence builds up in the reactive mind and walls off a compartment, absorbing some of the analyzer—which is shut down by restimulation. Multi-valence is common to every aberree. The valence of every aberree gets shifted day to day depending upon whom he meets. He tries to occupy the top dog valence in every engramic dramatization. Taking this is the highest survival computation that can be made by the reactive mind: always win. Break a dramatization and you break the patient into another valence. If you break him down to being himself in that engram he will probably anaten or get sick. Keep breaking his dramatizations and he is disabled mentally.

Who will practice Dianetics? In severe cases, doctors. They are well schooled in the art of healing, they are always being bombarded by psychosomatics and mental situations. The doctor has, like the engineer, a certain necessity for results. There are several methods of alleviation which will work in a few hours, break up a chronic illness in a child, change valences, change a person's position on the time track—people get caught in various places where the command says to be caught—alter dramatization pattern and generally handle the sick aberree.

In the general case, however—the psychotic, neurotic, or merely sub-optimum individual—Dianetics will probably be practiced by people of intelligence and good drive on their friends and families. Knowing all the axioms and mechanisms, Dianetics is easy to apply to the fairly normal individual and can relieve his occlusions and colds and arthritis and other psychosomatic ills. It can be used as well to prevent aberrations from occurring and can even be applied to determine the reactions of others. Although the fundamentals and mechanisms are simple and, with some study, very easily applied, partial information is dangerous, the technique may be the stuff of which sanity is made but one is after all engaging action with the very stuff which creates madness and he should at least inform himself with a few hours study before he experiments.

I have discussed here the evolution of Dianetics. Actually I have concentrated upon Abnormal Dianetics. There are Medical Dianetics, Dynamic Dianetics—drives and structure—Political Dianetics, Military Dianetics, Industrial Dianetics, et cetera, et cetera, and not the least PREVENTIVE DIANETICS. On that may hang the final answer to society.

And now as an epilogue, Dianetics is summarized in its current workable form. It does the following things, based on an ample series of cases:

1. Dianetics is an organized science of thought built on definite axioms; it apparently reveals the existence of natural laws by which behavior can uniformly be caused or predicted in the unit organism or society.

2. Dianetics offers a therapeutic technique with which we can treat any and all inorganic mental and organic psychosomatic ills, with assurance of complete cure in unselected cases. It produces a mental stability in the "cleared" patient which is far superior to the current norm. (This statement is accurate to date; it is conceded that further work may demonstrate some particular case somewhere which may not entirely respond.)

3. In Dianetics we have a method of time dislocation dissimilar to narco-synthesis or hypnosis which is called the Dianetic reverie; with it the patient is able to reach events hitherto hidden from him, erasing the physical and mental pain from his life.

4. Dianetics gives us an insight into the potential capabilities of the mind.

5. Dianetics reveals the basic nature of Man and his purposes and intents, with the discovery that these are basically constructive and not evil.

6. Dianetics gives us an appreciation of the magnitude of events necessary to aberrate an individual.

7. With Dianetics we discover the nature of pre-natal experience and its precise effect upon the post-natal individual.

8. Dianetics discovered the actual aberration factors of birth.

9. Dianetics elucidates the entire problem of “unconsciousness” and demonstrates conclusively that “total unconsciousness” does not exist short of death.

10. Dianetics shows that all memories of all kinds are recorded fully and retained.

11. Dianetics demonstrates that aberrative memories lie only in areas of “unconsciousness” and, conversely, that only “unconscious” memories are capable of aberrating.

12. Dianetics opens broad avenues for research and poses numerous problems for solution. One new field, for instance, is the sub-science of Perceptics—the structure and function of perceiving and identifying stimuli.

13. Dianetics sets forth the non-germ theory of disease, embracing, it has been estimated by competent physicians, the cure of some seventy percent of Man’s pathology.

14. Dianetics offers hope that the destruction of the function of the brain, by shock or surgery, will no longer be a necessary evil.

15. Dianetics offers a workable explanation of the various physiological effects of drugs and endocrine substances and points out numerous answers to former endocrine problems.

16. Dianetics gives a more fundamental explanation of the uses, principles and fundamentals of hypnotism and similar mental phenomena.

17. To sum up, Dianetics proposes and experimentally supports a new viewpoint on Man and his behavior. It carries with it the necessity of a new sort of mental hygiene. It indicates a new method of approach to the solution of the problems which confront governments, social agencies, industries, and, in short, Man’s sphere of endeavor. It suggests new fields of research. Finally it offers a glimmer of hope that Man may continue his process of evolution toward a higher organism without straying toward the danger point of his own destruction.

This is part of the story of the search. I wrote it for you this way because you have minds with which to think. For strictly professional publications, I can, will, and have dressed this up so it is almost impossible to understand, it’s so exact. Here I have told you the story as is and I have given you the major results exactly as they turned out.

It is indeed fortunate for Mankind that the social and personal aberrations, traveling from Egypt’s time and before, piling up higher and higher, being broken only by new lands and new mongrel races, have not been as impenetrable a barrier as they could have been. That barrier is slavery. Man’s effort to enslave Man so that Man can be free. Wrong equation. That’s the Road to nowhere.

We’ve a magic word to break it and a science to be applied. Dianetics is the beginning of the Road to Total Freedom for Mankind. Up there are the stars. Down in the arsenal is an atom bomb. Which one is it going to be?

DIANETICS

THE MODERN SCIENCE OF MENTAL HEALTH

A HANDBOOK OF DIANETIC PROCEDURE

By
L. RON HUBBARD

Dedicated to Will Durant

TABLE OF CONTENTS

SYNOPSIS	1
INTRODUCTION	7
HOW TO READ THIS BOOK	10
Book One THE GOAL OF MAN	12
CHAPTER I The Scope of Dianetics	13
CHAPTER II The Clear	16
CHAPTER III The Goal of Man	22
CHAPTER IV The Four Dynamics	30
CHAPTER V Summary	33
Book Two THE SOURCE OF ALL MENTAL AND PSYCHO-SOMATIC ILLS	36
CHAPTER I	37
CHAPTER II The Reactive Mind	41
CHAPTER III The Cell and the Organism	53
CHAPTER IV The “Demons”	61
CHAPTER V Psycho-somatic Illness	65
CHAPTER VI Emotion and the Dynamics	76
CHAPTER VII Prenatal Experience and Birth	84
CHAPTER VIII Contagion of Aberration	91
CHAPTER IX Keying-in the Engram	95
CHAPTER X Preventive Dianetics	102
Book Three THERAPY	108
CHAPTER I The Mind’s Protection	108
CHAPTER II Release or Clear	112
CHAPTER III The Auditor’s Role	114
CHAPTER IV Diagnosis	118
CHAPTER V Returning, the File Clerk, and the Time Track	127
CHAPTER VI The Laws of Returning	134
CHAPTER VII Emotion and the Life Force	146
CHAPTER VIII Some Types of Engrams	166
CHAPTER IX PART ONE Mechanisms and Aspects of Therapy	174
CHAPTER IX PART TWO Mechanisms and Aspects of Therapy	199
CHAPTER X Dianetics -- Past and Future	247
APPENDIX I The Philosophic Method	254
APPENDIX II The Scientific Method	255
APPENDIX III (A) Mind Schematic	259
APPENDIX III (B) Analyzer Schematic	261
APPENDIX IV Advice to the Pre-clear	263
Glossary	270

SYNOPSIS

The creation of dianetics is a milestone for Man comparable to his discovery of fire and superior to his inventions of the wheel and arch.

Dianetics (Gr., dianoua -- thought) is the science of mind. Far simpler than physics or chemistry, it compares with them in the exactness of its axioms and is on a considerably higher echelon of usefulness. The hidden source of all psycho-somatic ills and human aberration has been discovered and skills have been developed for their invariable cure.

Dianetics is actually a family of sciences embracing the various humanities and translating them into usefully precise definitions. The present volume deals with Individual Dianetics and is a handbook containing the necessary skills both for the handling of interpersonal relations and the treatment of the mind. With the techniques presented in this handbook the psychiatrist, psycho-analyst and intelligent layman can successfully and invariably treat all psycho-somatic ills and inorganic aberrations. More importantly, the skills offered in this handbook will produce the dianetic clear, an optimum individual with intelligence considerably greater than the current normal, or the dianetic release, an individual who has been freed from his major anxieties or illnesses. The release can be done in less than twenty hours of work and is a state superior to any produced by several years of psycho-analysis, since the release will not release.

Dianetics is an exact science and its application is on the order of, but simpler than, engineering. Its axioms should not be confused with theories since they demonstrably exist as natural laws hitherto undiscovered. Man has known many portions of dianetics in the past thousands of years, but the data was not evaluated for importance, was not organized into a body of precise knowledge. In addition to things known, if not evaluated, dianetics includes a large number of new discoveries of its own about thought and the mind.

The axioms may be found on Page 42 of this volume. Understood and applied, they embrace the field of human endeavor and thought and yield precision results.

The first contribution of dianetics is the discovery that the problems of thought and mental function can be resolved within the bounds of the finite universe, which is to say that all data needful to the solution of mental action and Man's endeavor can be measured, sensed and experienced as scientific truths independent of mysticism or metaphysics. The various axioms are not assumptions or theories -- the case of past ideas about the mind -- but are laws which can be subjected to the most vigorous laboratory and clinical tests.

The first law of dianetics is a statement of the dynamic principle of existence.

THE DYNAMIC PRINCIPLE OF EXISTENCE IS: SURVIVE!

No behavior or activity has been found to exist without this principle. It is not new that life is surviving. It is new that life has as its entire dynamic urge only survival.

Survival is divided into four dynamics. Survival can be understood to lie in any one of the dynamics and by faulty logic can be explained in terms of any one dynamic. A man can be said to survive for self alone and by this all behavior can be formulated. He can be said to survive for sex alone and by sex alone all behavior can be formulated. He can be said to survive for the group only or for Mankind only and in either of these the entire endeavor and behavior of the individual can be equated and explained. These are four equations of survival, each one apparently true. However, the entire problem of the purpose of Man cannot be resolved unless one admits all four dynamics in each individual. So equated, the behavior of

the individual can be estimated with precision. These dynamics then embrace the activity of one or many men.

DYNAMIC ONE: The urge of the individual to reach the highest potential of survival in terms of self and his immediate symbiotes.

DYNAMIC TWO: The urge of the individual to reach the highest potential of survival in terms of sex, the act and the creation of children and their rearing.

DYNAMIC THREE: The urge of the individual to reach the highest potential of survival in terms of the group, whether civil, political, or racial, and the symbiotes of that group.

DYNAMIC FOUR: The urge of the individual to reach the highest potential of survival in terms of Mankind and the symbiotes of Mankind.

Thus motivated, the individual or a society seeks survival and no human activity of any kind has other basis: experiment, investigation and long testing demonstrated that the unaberrated individual, the clear, was motivated in his actions and decisions by all the above dynamics and not one alone.

The clear, the goal of dianetic therapy, can be created from psychotic, neurotic, deranged, criminal or normal people if they have organically sound nervous systems. He demonstrates the basic nature of Mankind and that basic nature has been found uniformly and invariably to be good. That is now an established scientific fact, not an opinion.

The clear has attained a stable state on a very high plane. He is persistent and vigorous and pursues life with enthusiasm and satisfaction. He is motivated by the four dynamics as above. He has attained the full power and use of hitherto hidden abilities.

The inhibition of one or more dynamics in an individual causes an aberrated condition, tends toward mental derangement and psycho-somatic illness and causes the individual to make irrational conclusions and act, still in an effort to survive, in destructive ways.

Dianetic technique deletes, without drugs, hypnotism, surgery, shock or other artificial means, the blocks from these various dynamics. The removal of these blocks permits the free flow of the various dynamics and, of course, results in a heightened persistency in life and a much higher intelligence.

The precision of dianetics makes it possible to impede or release these dynamics at will with invariable results.

The hidden source of all inorganic mental disturbance and psycho-somatic illness was one of the discoveries of dianetics. This source had been unknown and unsuspected, though vigorously sought, for thousands of years. That the discovered source is the source requires less laboratory proof than would have been necessary to have proven the correctness of William Harvey's discovery of the circulation of the blood. The proof does not depend upon a laboratory test with complicated apparatus but can be made in any group of men by any intelligent individual.

The source of aberration has been found to be a hitherto unsuspected sub-mind which, complete with its own recordings, underlies what man understands to be his "conscious" mind. The concept of the unconscious mind is replaced in dianetics by the discovery that the "unconscious" mind is the only mind which is always conscious. In dianetics this sub-mind is called the reactive mind. A holdover from an earlier step in Man's evolution, the reactive mind possesses vigor and command power on a cellular level. It does not "remember"; it records and uses the recordings only to produce action. It does not "think"; it selects recordings and impinges them upon the "conscious" mind and the body without the knowledge or consent of the individual. The only information the individual has of such action is his occasional

perception that he is not acting rationally about one thing or another and cannot understand why. There is no Censor.

The reactive mind operates exclusively on physical pain and painful emotion. It is not capable of differentiative thought but acts on the stimulus-response basis. This is the principle on which the animal mind functions. It does not receive its recordings as memory or experience but only as forces to be reactivated. It receives its recordings as cellular engrams when the "conscious" mind is "unconscious."

In a drugged state, when anaesthetized as in an operation, when rendered "unconscious" by injury or illness, the individual yet has his reactive mind in full operation. He may not be "aware" of what has taken place, but, as dianetics has discovered and can prove, everything which happened to him in the interval of "unconsciousness" was fully and completely recorded. This information is unappraised by his conscious mind, neither evaluated nor reasoned. It can, at any future date, become reactivated by similar circumstances observed by the awake and conscious individual. When any such recording, an engram, becomes reactivated, it has command power. It shuts down the conscious mind to greater or lesser degree, takes over the motor controls of the body and causes behavior and action to which the conscious mind, the individual himself, would never consent. He is, nevertheless, handled like a marionette by his engrams.

The antagonistic forces of the exterior environment thus become entered into the individual himself without the knowledge or consent of the individual. And there they create an interior world of force which exerts itself not only against the exterior world but against the individual himself. Aberration is caused by what has been done to not done by the individual.

Man has unwittingly long aided the reactive mind by supposing that a person, when "unconscious" from drugs, illness, injury or anaesthetic, had no recording ability. This permits an enormous amount of data to enter into the reactive bank since none have been careful to maintain silence around an "unconscious" person. The invention of language and the entrance of language into the engram bank of the reactive mind seriously complicates the mechanistic reactions. The engrams containing language impinge themselves upon the conscious mind as commands. Engrams then contain command value much higher than any in the exterior world. Thought is directed and motivated by the irrational engrams. Thought processes are disturbed not only by these engramic commands but also by the fact that the reactive mind reduces, by regenerating unconsciousness, the actual ability to think. Few people possess, because of this, more than 10% of their potential awareness.

The entire physical pain and painful emotion of a lifetime, whether the individual "knows" about it or not, is contained, recorded, in the engram bank. Nothing is forgotten. And all physical pain and painful emotion, no matter how the individual may think he has handled it, is capable of re-inflicting itself upon him from this hidden level, unless that pain is removed by dianetic therapy.

The engram and only the engram causes aberration and psycho-somatic illness.

Dianetic therapy may be briefly stated. Dianetics deletes all the pain from a lifetime. When this pain is erased in the engram bank and refiled as memory and experience in the memory banks, all aberrations and psycho-somatic illnesses vanish, the dynamics are entirely rehabilitated and the physical and mental being regenerate.

Dianetics leaves an individual full memory but without pain. Exhaustive tests have demonstrated that hidden pain is not a necessity but is invariably and always a liability to the health, skill, happiness and survival potential of the individual. It has no survival value.

The method which is used to refile pain is another discovery. Man has unknowingly possessed another process of remembering of which he has not been cognizant. Here and there a few have known about it and used it without realizing what they did or that they did

something which Man as a whole did not know could be done. This process is returning. Wide awake and without drugs an individual can return to any period of his entire life providing his passage is not blocked by engrams. Dianetics developed techniques for circumventing these blocks and reducing them from the status of Powerful Unknown to useful memory.

The technique of therapy is done in what is called a dianetic reverie. The individual undergoing this process sits or lies in a quiet room accompanied by a friend or professional therapist who acts as auditor. The auditor directs the attention of the patient to the patient's self and then begins to place the patient in various periods of the patient's life merely by telling him to go there rather than remember.

All therapy is done, not by remembering or associating, but by travel on the time track. Every human being has a time track. It begins with life and it ends with death. It is a sequence of events complete from portal to portal as recorded.

The conscious mind, in dianetics, is called by the somewhat more precise term of analytical mind. The analytical mind consists of the "I" (the center of awareness), all computational ability of the individual, and the standard memory banks which are filled with all past perceptions of the individual, awake or normally asleep (all material which is not engramic). No data are missing from these standard banks, all are there, barring physical organic defects, in full motion, color, sound, tactile, smell and all other senses. The "I" may not be able to reach his standard banks because of reactive data which bar portions of the standard banks from the view of "I."

Cleared, "I" is able to reach all moments of his lifetime without exertion or discomfort and perceive all he has ever sensed, recalling them in full motion, color, sound, tone and other senses. The completeness and profusion of data in the standard banks is a discovery of dianetics, and the significance of such recalls is yet another discovery.

The auditor directs the travel of "I" along the patient's time track. The patient knows everything which is taking place, is in full control of himself, and is able to bring himself to the present whenever he likes. No hypnotism or other means are used. Man may not have known he could do this but it is simple.

The auditor, with precision methods, recovers data from the earliest "unconscious" moments of the patient's life, such "unconsciousness" being understood to be caused by shock or pain, not mere unawareness. The patient thus contacts the cellular level engrams. Returned to them and progressed through them by the auditor, the patient re-experiences these moments a few times, when they are then erased and refiled automatically as standard memory. So far as the auditor and the patient can discover, the entire incident has now vanished and does not exist. If they searched carefully in the standard banks they would find it again but refiled as "Once aberrative, do not permit as such into computer." Late areas of "unconsciousness" are impenetrable until early ones are erased.

The amount of discomfort experienced by the patient is minor. He is repelled mainly by engramic commands which variously dictate emotion and reaction.

In a release, the case is not progressed to the point of complete recall. In a clear, full memory exists throughout the lifetime, with the additional bonus that he has photographic recall in color, motion, sound, etc., as well as optimum computational ability.

The psycho-somatic illnesses of the release are reduced, ordinarily, to a level where they do not thereafter trouble him. In a clear, psycho-somatic illness has become non-existent and will not return since its actual source is nullified permanently.

The dianetic release is comparable to a current normal or above. The dianetic clear is to a current normal individual as the current normal is to the severely insane.

Dianetics elucidates various problems with its many discoveries, its axioms, its organization and its technique. In the progress of its development many astonishing data were thrust upon it, for when one deals with natural laws and measurable actualities which produce specific and invariable results, one must accept what Nature holds, not what is pleasing or desired.

When one deals with facts rather than theories and gazes for the first time upon the mechanisms of human action several things confound him, much as the flutterings of the heart did

Harvey or the actions of yeasts did Pasteur. The blood did not circulate because Harvey said it could nor yet because he said it did. It circulated and had been circulating for eons; Harvey was clever and observant enough to find it; and this was much the case with Pasteur and other explorers of the hitherto unknown or unconfirmed. In dianetics the fact that the analytical mind was inherently perfect and remained structurally capable of restoration to full operation was not the least of the data found.

That man was good, as established by exacting research, was no great surprise, but that an unaberrated individual was vigorously repelled by evil and yet gained enormous strength was astonishing since aberration had been so long incorrectly supposed to be the root of strength and ambition according to authorities since the time of Plato.

That a man contained a mechanism which recorded with diabolical accuracy when the man was observably and by all presumable tests "unconscious" was newsworthy and surprising. To the layman the relationship of prenatal life to mental function has not entirely been disregarded since for centuries beyond count people were concerned with "prenatal influence." To the psychiatrist, the psychologist and psycho-analyst, prenatal memory had long been an accepted fact since "memories of the womb" were agreed to influence the adult mind. But the prenatal aspect of the mind came as an entire surprise to dianetics, an unwanted and at the time unwelcome observation.

Despite existing beliefs -- which are not scientific facts -- that the foetus had memory, the psychiatrist and other workers believed as well that memory could not exist in a human being until myelin sheathing was formed around the nerves. This was as confusing to dianetics as it was to psychiatry. After much work over some years the exact influence prenatal life had on the later mind was established by dianetics with accuracy. There will be those who, uninformed, will say that dianetics "accepts and believes in" prenatal memory.

Completely aside from the fact that an exact science does not "believe" but establishes and proves facts, dianetics emphatically does not believe in "prenatal memory." Dianetics had to invade cytology and biology and form many conclusions by research; it had to locate and establish both the reactive mind and the hidden engram banks never before known before it came upon "prenatal" problems. It had been discovered that the engram recording was probably done on the cellular level, that the engram bank was contained in the cells. It was then discovered that the cells, reproducing from one generation to the next, within the organism, apparently carried with them their own memory banks. The cells are the first echelon of structure, the basic building blocks. They built the analytical mind. They operate, as the whip, the reactive mind. Where one has human cells, one has potential engrams. Human cells begin with the zygote, proceed in development with the embryo, become the foetus and finally the infant.

Each stage of this growth is capable of reaction. Each stage in the growth of the colony of cells finds them fully cells, capable of recording engrams. In dianetics "prenatal memory" is not considered since the standard banks which will someday serve the completed analyzer in the infant, child and man are not themselves complete. There is neither "memory" or "experience" before the nerves are sheathed as far as dianetic therapy is concerned. But dianetic therapy is concerned with engrams, not memories, with recordings, not experience, and

wherever there are human cells, engrams are demonstrably possible and, when physical pain was present, engrams can be demonstrated to have been created.

The engram is a recording like the ripples in the groove of a phonograph record: it is a complete recording of everything which occurred during the period of pain. Dianetics can locate, with its techniques, any engram which the cells have hidden, and in therapy the patient will often discover himself to be upon the prenatal cellular time track. There he will locate engrams and he goes there only because engrams exist there.

Birth is an engram and is recovered by dianetics as a recording, not as a memory. By return and the cellular extension of the time track, zygote pain storage can be and is recovered. It is not memory. It impinged upon the analytical mind and it obstructed the standard banks where memory is stored. This is a very great difference from prenatal memory. Dianetics recovers prenatal engrams and finds them responsible for much aberration and discovers that any longing for the womb is not present in any patient but that engrams sometimes dictate a return to it, as in some regressive psychoses which then attempt to remake the body into a foetus.

This matter of prenatal life is discussed here at length in this synopsis to give the reader a perspective on the subject. We are dealing here with an exact science, precision axioms and new skills of application. By them we gain a command over aberration and psycho-somatic ills and with them we take an evolutionary step in the development of Man which places him yet another stage above his distant cousins of the animal kingdom.

INTRODUCTION

The progress of Mankind from the period of savagery to the present is marked with milestones. Conventional history books would have you believe that these milestones are battle monuments or the tombs of great men. Yet there are more important markers of Man's progress -- and these are New Ideas. Whenever a New Idea has been created, Man's chances for survival have been improved and the arduousness of his journey away from animalhood is lessened.

There have been numerous New Ideas in the past. To name a few of the more obvious, consider the invention of the wheel, the control of fire, the development of mathematics or even the newest one -- the discovery of the means of atomic fission. Every one of these ideas has altered the progress of Mankind -- sometimes temporarily for the worse, but ultimately for Man's betterment.

In my opinion DIANETICS is worthy of being called a New Idea, and is destined to take its place alongside of these other milestones of progress. It might even be considered to be more important than any of these, for it is a science which for the first time gives us an understanding of the tool with which these other inventions were created -- the human mind.

In the creation of any New Idea, there is one step which is highly important. It is so obvious as to be frequently overlooked. This step, the sine qua non of any idea, consists in examining the basic assumptions of the subject and determining whether or not they need to be revised. The creator of a New Idea asks, "What would happen if I assume that this belief which everyone has had for centuries isn't necessarily so?"

The primitive man who invented the wheel did just that. His fellows assumed that, when one wanted to transport an object, it had to be carried or dragged along the ground. The inventor changed the assumption -- and the wheel was born.

Again, so long as man assumed that fire was dangerous and should be avoided, he made no attempt to control it. When some brave soul re-examined this assumption and decided that fire, although it entailed some hazards, might offer certain advantages to the dwellers in his cave, he took the first step toward the creation of the science of chemistry and nuclear physics.

So it is with DIANETICS. In it there has been a reexamination and a re-evaluation of numerous basic assumptions regarding the functioning of the human mind.

The originator has had both the temerity and the wisdom to refuse to accept all of the old assumptions.

For example, we have all assumed that when a person is unconscious, he is unconscious -- that's all there is to it. The originator of dianetics was critical of that assumption and, as a result, was able to demonstrate that the mind is never totally unconscious. The assumption that nobody can remember anything which happened to him before the age of three or four also came in for consideration -- and the result of these and other reassessments was DIANETICS.

Yes, basic assumptions are important. They are especially important when they get such a strangle-hold on our ways of thinking that we can't get away from them. For hundreds of years it was assumed that the sun and the planets revolved around the earth; it was not until the assumption was tested and found to be faulty that modern astronomy was able to develop. For hundreds of years a certain group of philosophers and religionists have assumed that Man is fundamentally evil; now comes DIANETICS to test this assumption. It will be highly interesting to see if there will be any change in our interpersonal relationships as a result of a new, different basic assumption.

The basic assumption is also a long-lived brute, hard to kill. Perhaps one reason for his hardness is that he feeds upon Authority. There is a vast difference between Authority and an authority. An authority might be described as a man who propounds a basic assumption which is valid for his time and applicable to the state of knowledge at the time it was propounded and has had his ideas accepted. No doubt this man would not be at all averse to altering his assumptions if a change in knowledge warranted it. His protagonists and disciples don't seem to act this way, however; before very long they begin to treat his idea as if it were some sort of divine revelation -- and the man now becomes an Authority.

The words of an Authority carry much more weight than do those of a mere authority. They are sacrosanct, holy, not to be questioned; the words themselves are Authority. And, in time, another change occurs; Authority becomes confused with knowledge and is accepted blindly, unthinkingly. A man can even become an authority himself by knowing a great deal about the things Authority said.

Perhaps the epitome of this sort of foolishness is exemplified in the attitude of numerous doctors toward the work of Harvey, the man who first described the circulation of the blood. Harvey's views, even though they were well founded in observation and experimentation, ran counter to those held by his predecessor, Galen, who was the great medical Authority of that day. So great was the controversy that some men took the stand, "Male errare cum Galen quam veritatem Harveii amplecti." ("I would rather err with Galen than accept Harvey's truth.")

Now, respect for authority is all very well. There are certain brands of authority which we may tacitly agree to accept, such as customs and morals; there are other brands of authority which we may vote to accept, such as our laws. But we should be wary of self-constituted authority, especially the type I have called Authority. We should feel free to examine the basic assumptions of any body of knowledge we wish, without fear of committing lese majeste. If any system of thought is going to wither in the light of investigation, it does not deserve the title of Authority.

The originator of DIANETICS has, without the slightest effort towards being iconoclastic, succeeded in dislodging a good many of our false gods of Authority from their pedestals. perhaps the job wasn't too difficult -- so many of the idols who bear that name have feet of the poorest sort of clay. Those authorities whose work was sound and valid are still in their proper places in the temple of Knowledge, and will no doubt continue to remain.

In early 1948 I first heard about DIANETICS from a colleague. I studied it, getting reports from others who were familiar with aspects of the therapy. Shortly thereafter I corresponded with the originator of dianetics, which resulted in my traveling East to study with him, and finally, in my experiencing personal dianetic therapy under his supervision.

For the past year I have been practicing DIANETICS on my patients, on my friends, and on my family. For the first time in my life, I'm satisfied that there is a method by which many questions, hitherto unanswerable, can be answered with definiteness and proven correct. Correct, insofar as the improved health of the patient is concerned. Correct, insofar as his well-being has been implemented by a feeling of security. Correct, insofar as his approach to living has become more advanced, interesting, and productive of growth. To me this correctness is meaningful and worthy of acceptance.

Let me state that this is my opinion. I do not urge you to accept that opinion; I would much prefer that you make your own tests of DIANETICS, carefully, impartially, and arrive at your own opinion. This statement is directed towards doctors in general, psychiatrists, psychologists, psycho-analysts, etc., as well as the layman.

DIANETICS is a science. It has certain laws, and by following these laws we can predict the results which will be obtained under given circumstances. These laws have no exceptions -- or at least, no exceptions have been found. In this respect the laws of

DIANETICS are like the law of gravity: if you suspend a mass heavier than air above the ground and then remove the support, it will fall. It won't fall seventy per cent of the time or eighty per cent of the time; it will always fall. And if it doesn't fall, we are justified in re-examining the law.

The discovery that engrams (the ability of the cell to record a lasting trace of an event) are recorded on a cellular level when the higher sphere of the mind is "unconscious," insensitive, and not recording (as, for instance, in severe injury, delirium, or surgical anaesthesia) and that the recorded engrams then received are highly reactive, portends a new trend for psychological and psychiatric thought and practice. The engram recorded during a period of "unconsciousness" is susceptible to reactivation during future periods of mental anguish. This fact has been found to be a single, direct source of aberrated behavior. Its discovery and isolation with the mechanics of its operation within the psyche, bring new and brilliant light to hitherto obscure phenomena of the mind and its behavior. The engram, hidden beneath unexplored layers of "unconsciousness," possesses a power of command not unlike that of a hidden and unsuspected monitor upon the conscious mind; it produces effects which are comparable to those of a post-hypnotic suggestion, though in a far more insidious and involved manner and with greater and more tragic effect.

The technique of DIANETIC therapy is basically simple and can be understood and applied to each other by any two reasonably intelligent people after a brief study of this volume, which is the operating manual for therapy. (Dianetic psychiatric treatment of severe derangements is also delineated.) No previous background in psycho-analysis or psychology is necessary. The therapeutic technique offered in DIANETICS is independent of hypnotism or narco-synthesis.

1. DIANETICS will help you to eliminate any psychosomatic illness from which you may suffer.
2. DIANETICS will help you achieve at least one-third more than present capacity for work and happiness.
3. DIANETICS offers to the medical profession, to psychiatrists, to psycho-analysts, to all who are interested in the advancement of their fellow men, a new theory and technique which makes accessible for therapy diseases and symptoms which hitherto were unusually complex and obscure.
4. DIANETICS is the most advanced and most clearly presented method of psycho-therapy and self-improvement ever discovered.

At this point, I step out -- the job ahead is yours.

J. A. Winter, M. D.

HOW TO READ THIS BOOK

Dianetics is an adventure. It is an exploration into Terra Incognita, the human mind, that vast and hitherto unknown realm half an inch back of our foreheads.

The discoveries and developments which made the formulation of dianetics possible occupied many years of exact research and careful testing. This was exploration, it was also consolidation. The trail is blazed, the routes are sufficiently mapped for you to voyage in safety into your own mind and recover there your full inherent potential, which is not, we now know, low but very, very high. As you progress in therapy the adventure is yours to know why you did what you did when you did it, to know what caused those Dark and Unknown Fears which came in nightmares as a child, to know where your moments of pain and pleasure lay. There is much which an individual does not know about himself, about his parents, about his "motives." Some of the things you will find may astonish you, for the most important data of your life may be not memory but engrams in the hidden depths of your mind, not articulate but only destructive.

You will find many reasons why you "cannot get well" and you will know at length, when you find the dictating lines in the engrams, how amusing those reasons are, especially to you.

Dianetics is no solemn adventure. For all that it has to do with suffering and loss, its end is always laughter, so foolish, so misinterpreted were the things which caused the woe.

Your first voyage into your own Terra Incognita will be through the pages of this book. You will find as you read that many things "you always knew were so" are articulated here. You will be gratified to know that you held not opinions but scientific facts in many of your concepts of existence. You will find, too, many data that have long been known by all, and you will possibly consider them far from news and be prone to underevaluate them: be assured that underevaluation of these facts kept them from being valuable, no matter how long they were known, for a fact is never important without a proper evaluation of it and its precise relationship to other facts. You are following here a vast network of facts which, reaching out, can be seen to embrace the whole field of Man in all his works. Fortunately you do not have to concern yourself with following far any one of these lines until you are done. And then these horizons will stretch wide enough to satisfy anyone.

Dianetics is a large subject, but that is only because Man is himself a large subject. The science of his thought cannot but embrace all his actions. By careful compartmenting and relating of data, the field has been kept narrow enough to be easily followed. Mostly this handbook will tell you, without any specific mention, about yourself and your family and friends, for you will meet them here and know them.

This volume has made no effort to use resounding or thunderous phrases, frowning polysyllables or professorial detachment. When one is delivering answers which are simple, he need not make the communication any more difficult than is necessary to convey the ideas. "Basic language" has been used, much of the nomenclature is colloquial; the pedantic has not only not been employed, it has also been ignored. This volume communicates to several strata of life and professions; the favorite nomenclatures of none have been observed since such a usage would impede the understanding of others. And so bear with us, psychiatrist, when your structure is not used, for we have no need for structure here, and bear with us, doctor, when we call a cold a cold and not a catarrhal disorder of the respiratory tract. For this is, essentially, engineering and these engineers are liable to say anything. And "scholar," you would not enjoy being burdened with the summation signs and the Lorentz-Fitzgerald-Einstein equations, so we shall not burden the less puristic reader with scientifically impossible Hegelian grammar which insists that absolutes exist in fact.

The plan of the book might be represented as a cone which starts with simplicity and descends into wider application. This book follows, more or less, the actual steps of the development of dianetics. First there was the dynamic principle of existence, then its meaning, then the source of aberration, and finally the application of all as therapy and the techniques of therapy. You won't find any of this very difficult. It was the originator who had the difficulty. You should have seen the first equations and postulates of dianetics! As research progressed and as the field developed, dianetics began to simplify. That is a fair guarantee that one is on a straight trail of science. Only things which are poorly known become more complex the longer one works upon them.

It is suggested that you read straight on through. By the time you get into the appendix, you should have an excellent command of the subject. The book is arranged that way. Every fact related to dianetic therapy is stated in several ways and is introduced again and again. In this way, the important facts have been pointed up to your attention. When you have finished the book you can come back to the beginning and look through it and study what you think you need to know.

Almost all the basic philosophy and certainly all the derivations of the master subject of dianetics were excluded here, partly because this volume had to stay under half a million words and partly because they belong in a separate text where they can receive full justice. Nevertheless, you have the scope of the science with this volume in addition to therapy itself.

You are beginning an adventure. Treat it as an adventure. And may you never be the same again.

Book One

THE GOAL OF MAN

CHAPTER 1

The Scope of Dianetics

A science of mind is a goal which has engrossed thousands of generations of Man. Armies, dynasties and whole civilizations have perished for the lack of it. Rome went to dust for the want of it. China swims in blood for the need of it; and down in the arsenal is an atom bomb, its hopeful nose full-armed in ignorance of it.

No quest has been more relentlessly pursued or has been more violent. No primitive tribe, no matter how ignorant, has failed to recognize the problem as a problem, nor has it failed to bring forth at least an attempted formulation. Today one finds the aborigine of Australia substituting for a science of mind a "magic healing crystal." The Shaman of British Guiana makes shift for actual mental laws with his monotonous song and consecrated cigar. The throbbing drum of the Goldi medicine man serves in the stead of an adequate technique to alleviate the lack of serenity in patients.

The enlightened and golden age of Greece yet had but superstition in its principal sanatoria for mental ills, the Aesculapian temple. The most the Roman could do for peace of mind for the sick was to appeal to the penates, the household divinities, or sacrifice to Febris, goddess of fevers. And an English king, centuries after, could have been found in the hands of exorcists who sought to cure his deliriums by driving the demons from him.

From the most ancient times to the present, in the crudest primitive tribe or the most magnificently ornamented civilization, Man has found himself in a state of awed helplessness when confronted by the phenomena of strange illnesses or aberrations. His desperation, in his efforts to treat the individual, has been but slightly altered during his entire history, and until this twentieth century passed mid-term, the percentages of his alleviations, in terms of individual mental derangements, compared evenly with the successes of the shamans confronted with the same problems. According to a modern writer, the single advance of psycho-therapy was clean quarters for the madman. In terms of brutality in treatment of the insane, the methods of the shaman or Bedlam have been far exceeded by the "civilized" techniques of destroying nerve tissues with the violence of shock and surgery, treatments which were not warranted by the results obtained and which would not have been tolerated in the meanest primitive society, since they reduce the victim to mere zombie-ism, destroying most of his personality and ambition and leaving him nothing more than a manageable animal. Far from an indictment of the practices of the "neurosurgeon" and the ice-pick which he thrusts and twists into insane minds, they are brought forth only to demonstrate the depths of desperation man can reach when confronted with the seemingly unsolvable problem of deranged minds.

In the larger sphere of societies and nations, the lack of such a science of mind was never more evident; for the physical sciences, advancing thoughtlessly far in advance of man's ability to understand man, have armed him with terrible and thorough weapons which await only another outburst of the social insanity of war.

These problems are not mild ones; they lie across every man's path; they wait in company with his future. As long as Man has recognized that his chief superiority over the animal kingdom was a thinking mind, so long as he understood that his mind alone was his weapon, he has searched and pondered and postulated in efforts to find a solution.

Like a jig-saw puzzle spilled by a careless hand, the equations which would lead to a science of the mind and, above that, to a master science of the universe, were stirred round and round. Sometimes two fragments would be united; sometimes, as in the case of the golden age of Greece, a whole section would be built. Philosopher, shaman, medicine man, mathematician: each looked at the pieces. Some saw they must all belong to different puzzles. Some thought they all belonged to the same puzzle. Some said there were really six puzzles in

it, some said two. And the wars went on and the societies sickened or were dispersed, and learned tomes were written about ever-increasing hordes of madmen.

With the methods of Bacon, with the mathematics of Newton, the physical sciences went on, consolidating and advancing their frontiers. And, like a derelict battalion, careless of how many allied ranks it exposed to destruction by the enemy, studies of the mind lagged behind.

But after all, there are just so many pieces in any puzzle. Before and after Francis Bacon, Herbert Spencer and a very few more, many of the small sections had been put together, many honest facts had been observed.

To adventure into the thousands of variables of which that puzzle was composed, one had only to know right from wrong, true from false, and use all Man and Nature as his test tube.

Of what must a science of mind be composed?

1. An answer to the goal of thought.
2. A single source of all insanities, psychoses, neuroses, compulsions, repressions and social derangements.
3. Invariant scientific evidence as to the basic nature and functional background of the human mind.
4. Techniques, the art of application, by which the discovered single source could be invariably cured, ruling out, of course, the insanities of malformed, deleted or pathologically injured brains or nervous systems and, particularly, iatrogenic psychoses (those caused by doctors and involving the destruction of the living brain itself).
5. Methods of prevention of mental derangement.
6. The cause and cure of all psycho-somatic ills, which number, some say, 70% of Man's listed ailments.

Such a science would exceed the severest terms previously laid down for it in any age, but any computation on the subject should discover that a science of mind ought to be able to be and do just these things.

A science of the mind, if it were truly worthy of that name, would have to rank, in experimental precision, with physics and chemistry. There could be no "special cases" to its laws. There could be no recourse to Authority. The atom bomb bursts whether Einstein gives it permission or not. Laws native to Nature regulate the bursting of that bomb. Technicians, applying techniques derived from discovered natural laws, can make one or a million atom bombs, all alike.

After the body of axioms and technique was organized and working as a science of mind, in rank with the physical sciences, it would be found to have points of agreement with almost every school of thought about thought which had ever existed. This is again a virtue and not a fault.

Simple though it is, dianetics does and is these things:

1. It is an organized science of thought built on definite axioms: statements of natural laws on the order of those of the physical sciences.

2. It contains a therapeutic technique with which can be treated all inorganic mental ills and all organic psychosomatic ills, with assurance of complete cure in unselected cases.
3. It produces a condition of ability and rationality for Man well in advance of the current norm, enhancing rather than destroying his vigor and personality.
4. Dianetics gives a complete insight into the full potentialities of the mind, discovering them to be well in excess of past suppression.
5. The basic nature of man is discovered in dianetics rather than hazarded or postulated, since that basic nature can be brought into action in any individual completely. And that basic nature is discovered to be good.
6. The single source of mental derangement is discovered and demonstrated, on a clinical or laboratory basis, by dianetics.
7. The extent, storage capacity and recallability of the human memory is finally established by dianetics.
8. The full recording abilities of the mind are discovered by dianetics with the conclusion that they are quite dissimilar to former suppositions.
9. Dianetics brings forth the non-germ theory of disease, complementing bio-chemistry and Pasteur's work on the germ theory to embrace the field.
10. With dianetics ends the "necessity" of destroying the brain by shock or surgery to effect "tractability" in mental patients and "adjust" them.
11. A workable explanation of the physiological effects of drugs and endocrine substances exists in dianetics and many problems posed by endocrinology are answered.
12. Various educational, sociological, political, military, and other human studies are enhanced by dianetics.
13. The field of cytology is aided by dianetics, as well as other fields of research.

This, then, is a skeletal sketch of what would be the scope of a science of mind and of what is the scope of dianetics.

CHAPTER II

The Clear

Dianetically, the optimum individual is called the clear. One will hear much of that word, both as a noun and a verb, in this volume, so it is well to spend time here at the outset setting forth exactly what can be called a clear, the goal of dianetic therapy.

A clear can be tested for any and all psychoses, neuroses, compulsions and repressions (all aberrations) and can be examined for any autogenic (self-generated) diseases referred to as psycho-somatic ills. These tests confirm the clear to be entirely without such ills or aberrations. Additional tests of his intelligence indicate it to be high above the current norm. Observation of his activity demonstrates that he pursues existence with vigor and satisfaction.

Further, these results can be obtained on a comparative basis. A neurotic individual, possessed also of psychosomatic ills, can be tested for those aberrations and illnesses, demonstrating that they exist. He can then be given dianetic therapy to the end of clearing these neuroses and ills. Finally, he can be examined, with the above results. This, in passing, is an experiment which has been performed many times with invariable results. It is a matter of laboratory test that all individuals who have organically complete nervous systems respond in this fashion to dianetic clearing.

Further, the clear possesses attributes, fundamental and inherent but not always available in an uncleared state, which have not been suspected of Man and are not included in past discussions of his abilities and behavior.

First there is the matter of perceptions. Even so-called normal people do not always see in full color, hear in full tone, or sense at the optimum with their organs of smell, taste, tactile and organic sensation.

These are the main lines of communication to the finite world which most people recognize as reality. It is an interesting commentary that while past observers felt that the facing of reality was an absolute necessity if the aberrated individual wished to be sane, no definition of how this was to be done was set forth. To face reality in the present one would certainly have to be able to sense it along those channels of communication most commonly used by man in his affairs.

Any one of Man's perceptions can be aberrated by psychic derangements which refuse to permit the received sensations to be realized by the analytical portion of the individual's mind. In other words, while there may be nothing wrong with the mechanisms of color reception, circuits can exist in the mind which delete color before the consciousness is permitted to see the object. Color blindness can be discovered to be relative or in degrees in such a way that colors appear to be less brilliant, dull or, at the maximum, entirely absent. Anyone is acquainted with persons to whom "loud" colors are detestable and with persons who find them insufficiently "loud" to notice. This varying degree of color blindness has not been recognized as a psychic factor but has been nebulously assumed to be some sort of a condition of mind when it was noticed at all.

There are those persons to whom noises are quite disturbing, to whom, for instance, the insistent whine of a violin is very like having a brace and bit applied to the eardrum; and there are those to whom fifty violins, played loudly, would be soothing; and there are those who, in the presence of a violin, express disinterest and boredom; and, again, there are persons to whom the sound of a violin, no matter if it be playing the most intricate melody, is a monotone. These differences of sonic (hearing) perception have, like color and other visual errors, been attributed to inherent nature or organic deficiency or assigned no place at all.

In a like manner, from person to person, smells, tactile sensations, organic perceptions, pain and gravity, vary widely and wildly. A cursory check around amongst his friends will demonstrate to a man that there exist enormous differences of perception of identical stimuli. One smells a turkey in the oven as wonderful, one smells it with indifference, another may not smell it at all. And somebody else may maintain that roasting turkey smells exactly like hair oil -- to be extreme.

Until we obtain clears it remains obscure why such differences should exist. For in the largest measure, such wild quality and quantity of perception is due to aberration. Because of pleasurable experiences in the past and inherent sensitivity, there will be some difference amongst clears, and a clear response should not be assumed automatically to be a standardized, adjusted middle ground, that pallid and obnoxious goal of past doctrines. The clear gets a maximum response compatible with his own desire for the response. Burning cordite still smells dangerous to him, but it does not make him ill. Roasting turkey smells good to him if he is hungry and likes turkey, at which time it smells very, very good. Violins play melodies, not monotonous, bring no pain and are enjoyed to a fine full limit if the clear likes violins as a matter of taste -- if he doesn't, he likes kettledrums, saxophones or, indeed, suiting his mood, no music at all.

In other words, there are two variables at work. One, the wildest, is the variable caused by aberrations. The other, and quite rational and understandable, is caused by the personality.

Thus the perceptions of an aberree* (non-cleared individual) * Aberree is a neologism meaning an aberrated person vary greatly from those of the cleared (unaberrated) individual.

Now there are the differences of the actual organs of perception and the errors occasioned by these. Some of these errors, a minimum, are organic: punctured eardrums are not competent sound-recording mechanisms. The majority of perceptic (sense message) errors in the organic sphere are caused by psycho-somatic errors.

Glasses are seen on noses everywhere around, even on children. The majority of these spectacles are perched on the face in an effort to correct a condition which the body itself is fighting to uncorrect again. Eyesight, when the stage of glasses is entered (not because of glasses), is deteriorating on the psycho-somatic principle. And this observation is about as irresponsible as a statement that when apples fall out of trees they usually obey gravity. One of the incidental things which happen to a clear is that his eyesight, if it had been bad as an aberree, generally improves markedly, and with some slight attention will recover optimum perception in time. (Far from an optician's argument against dianetics, this assures rather good business, for clears have been known, at treatment's end, to have to buy, in rapid succession, five pairs of glasses to compensate adjusting eyesight; and many aberrees, cleared late in life, settle down ocularly at a maximum a little under optimum.)

The eyesight was reduced in the aberree on an organic basis by his aberrations so that the perceptic organ itself was reduced from optimum operating function. With the removal of aberrations, repeated tests have proven that the body makes a valiant effort to reconstruct back to optimum.

Hearing, in addition to other perceptics, varies organically over a wide range. Calcium deposits, for instance, can make the ears "ring" incessantly. The removal of aberrations permits the body to readjust toward its reachable optimum, the calcium deposit disappears, and the ears stop ringing. But far and beyond this very specific case, there are great differences in hearing on the organic basis. Organically as well as aberrationally, hearing can become remarkably extended or closely inhibited so that one person may hear footsteps a block away as a normal activity and another would not hear a bass drum thundering on the porch.

That the various perceptions differ widely from individual to individual on an aberrational and psycho-somatic basis is the least of the discoveries outlined here. Ability to recall is far more fantastic in its variation from person to person.

An entirely new recall process which was inherent in the mind but which had not been noticed came to light in the process of observing clears and aberrees. This recall process is possible in only a small proportion of aberrees in its fullest sense. It is standard, however, in a clear. Naturally, no intimation is made here that the scholars of past ages have been unobservant. We are dealing here with an entirely new and hitherto non-existent object of inspection, the clear. What a clear can do easily, quite a few people have, from time to time, been partially able to do in the past.

An inherent, not a taught, ability of the remembering mechanisms of the mind can be termed, as a technical word of dianetics, returning. It is used in its dictionary sense, with the addition of the fact that the mind has it as a normal remembering function, as follows: the person can "send" a portion of his mind to a past period on either a mental or combined mental and physical basis and can re-experience incidents which have taken place in his past in the same fashion and with the same sensations as before. Once upon a time an art known as hypnotism used what was called "regression" on hypnotized subjects, the hypnotist sending the subject back, in one of two ways, to incidents in his past. This was done with trance techniques, drugs and considerable technology.

The hypnotic subject could be sent back to a moment "entirely" so that he gave every appearance of being the age to which he was returned with only the apparent faculties and recollections he had at that moment: this was called "revivification" (re-living). "Regression" was a technique by which part of the individual's self remained in the present and part went back to the past. These abilities of the mind were supposed native only in hypnotism and were used only in hypnotic technique. The art is very old, tracing back some thousands of years and existing today in Asia as it has existed, apparently, from the dawn of time.

Returning is substituted for "regression" here because it is not a comparable thing and because "regression," as a word, has some bad meanings which would interrupt its use. Reliving is substituted for "revivification" in dianetics because, in dianetics, the principles of hypnotism can be found explained and hypnotism is not used in dianetic therapy, as will be explained later.

The mind, then, has another ability to remember. Part of the mind can "return" even when a person is wide awake and re-experience past incidents in full. If you want to test this, try it on several people until one is discovered who does it easily. Wide awake he can "return" to moments in his past. Until asked to do so he probably will not know he has such an ability. If he had it, he probably thought everybody could do it (the type of supposition which has kept so much of this data from coming to light before). He can go back to a time when he was swimming and swim with full recall of hearing, sight, taste, smell, organic sensation, tactile, etc.

A "learned" gentleman once spent some hours demonstrating to a gathering that the recall of a smell as a sensation, for instance, was quite impossible since "neurology had proven that the olfactory nerves were not connected to the thalamus." Two people in the gathering discovered this ability to return and despite this evidence, the learned gentleman continued the dispute that olfactory recall was impossible. A check amongst the gathering on this faculty, independent of returning, brought forth the fact that one-half of those present remembered smell by smelling it again.

Returning is the full performance of imagery recall. The entire memory is able to make the organ areas re-sense the stimuli in a past incident. Partial recall is common, not common enough to be normal, but certainly common enough to have merited considerable study. For it again is a wide variable.

Perception of the present would be one method of facing reality. But if one cannot face the reality of the past then, in some part, he is not facing some portion of reality. And if it is agreed that facing reality is desirable, then one would have to face yesterday's reality as well if he were to be considered entirely "sane" by contemporary definition. To "face yesterday"

requires a certain condition of recall to be available. One would have to be able to remember. But how many ways are there of remembering?

First there is the return. That is new. It gives the advantage of examining the moving pictures and other sense perceptions recorded at the time of the event with all senses present. He can also return to his past conclusions and imaginings. It is of considerable aid in learning, in research, in ordinary living to be able to be again at the place where the data desired was first inspected.

Then there are the more usual recalls. Optimum recall is by the return method of single or multiple senses, the individual himself remaining in present time. In other words, some people, when they think of a rose, see one, smell one, feel one. They see in full color, vividly -- with the "mind's eye" to use an old colloquialism. They smell it vividly. And they can feel it even to the thorns. They are thinking about roses by actually recalling a rose.

These people, thinking about a ship, would see a specific ship, feel the motion of her if they thought of being aboard her, smell the pine-tar or even less savory odors and hear whatever sounds there were about her. They would see the ship in full color motion and hear it in full tone audio.

These faculties vary widely in the aberree. Some, when told to think of a rose, can merely visualize one. Some can smell one but not see it. Some see it without color or in very pale color. When told to think of a ship some aberrees only see a flat, colorless, still picture such as a painting of a ship or the photograph of one. Some perceive a vessel in motion without color but with sound. Some hear the sound of a ship but fail to see any picture whatever. Some merely think of a ship as a concept that ships exist and that they know about them and fail to see, feel, hear, smell or otherwise sense anything on a recall basis.

Some past observers have called this "imagery" but the term is so inapplicable to sound and touch, organic sensation and pain that recall is used uniformly as the technical dianetic term. The value of recall in this business of living has occupied such scant attention that the entire concept has never been formulated previously. It is therefore detailed at some length here, as above.

It is quite simple to test recalls. If one will ask his fellows what their abilities are, he will gain a remarkable idea of how widely varied this ability is from individual to individual. Some have this recall, some have that, some have none, but operate on concepts of recall only. And remember, if you make a test on those around you, that any perception is filed in the memory and therefore has a recall which is to include pain, temperature, rhythm, taste and weight with the above mentioned sight, sound, tactile, and smell.

The dianetic names for these recalls are visio (sight), sonic (sound), tactile (touch), olfactory (smell), rhythmic, kinesthetic (weight and motion), somatic (pain), thermal (temperature) and organic (internal sensations and, by new definition, emotion).

Then there is another set of mental activities which can be summated under the headings of imagination and creative imagination. Here again is abundant material for testing.

Imagination is the recombination of things one has sensed, thought or intellectually computed into existence, which do not necessarily have existence. This is the mind's method of envisioning desirable goals or forecasting futures. Imagination is extremely valuable as a part of essential solutions in any mental problem and in everyday existence. That it is recombination in no sense deprives it of its vast and wonderful complexity.

A clear uses imagination in its entirety. There is an imagination impression for sight, smell, taste, sound -- in short, for each one of the possible perceptions. These are manufactured impressions on the basis of models in the memory banks combined by conceptual ideas and construction. New physical structures, tomorrow in terms of today, next

year in terms of last year, pleasure to be gained, deeds to be done, accidents to avoid, all these are imaginational functions.

The clear has full color-visio, tone-sonic, tactile, olfactory, rhythmic, kinesthetic, thermal and organic imagination in kind. Asked to envision himself riding in a gilded coach and four, he “sees” the equipage, moving, in full color, he “hears” all the noises which should be present, he “smells” the smells he thinks should be there, and he “feels” the upholstery, the motion, and the presence in the coach of himself.

In addition to standard imagination there is creative imagination. This is a very wide undimensional ability, quite variable from individual to individual, possessed in enormous quantity by some. It is included here, not as a portion of the operation of the mind treated as a usual part of dianetics, but to isolate it as an existing entity. In a clear who possessed creative imagination, even if inhibited, as an aberree, it is present and demonstrable. It is inherent. It can be aberrated only by prohibition of its general practice, which is to say, by aberrating the persistence in its application or encysting the whole mind. But creative imagination, that possession by which works of art are done, states builded and Man enriched, can be envisioned as a special function, independent in operation and in no way dependent for its existence upon an aberrated condition in the individual, since the examination of its activity in and use by a clear possessing adequately demonstrates its inherent character. It is rarely absent in any individual.

Finally, there is the last but most important activity of the mind. Man is to be regarded as a sentient being. His sentience depends upon his ability to resolve problems by perceiving or creating and understanding situations. This rationality is the primary, high echelon function of that part of the mind which makes him a Man, not just another animal. Remembering, perceiving, imagining, he has the signal ability of resolving conclusions and of using conclusions resolved to resolve further conclusions. This is rational Man.

Rationality, as divorced from aberration, can be studied in a cleared person only. The aberrations of the aberree give him the appearance of irrationality. Though such irrationality may be given the gentler names of “eccentricity” or “human error” or even “personal idiosyncrasy,” it is, nevertheless, irrationality. The personality does not depend upon how irrationally a man may act. It is not a personality trait, for instance, to drive while drunk and kill a child on a crosswalk -- or even to risk killing a child by driving while drunk. Irrationality is simply that -- the inability to get right answers from data.

Now it is a curious thing that although “everybody knows” (and what a horrible amount of misinformation that statement lets circulate) it is “human to err,” the sentient portion of the mind which computes the answers to problems and which makes man Man is utterly incapable of error.

This was a startling discovery when it was made, but it need not have been. It could have been deduced some time before. For it is quite simple and easy to understand. The actual computing ability of Man is never in error even in a very severely aberrated person. Observing the activity of such an aberrated person, one might thoughtlessly suppose that that person’s computations were wrong. But that would be an observer error. Any person, aberrated or clear, computes perfectly on the data stored and perceived.

Take any common calculating machine (and the mind is an exceptionally magnificent instrument far, far superior to any machine it will invent for ages to come) and put a problem on it for solution. Multiply seven times one. It will answer, properly, seven. Now multiply six times one but continue to hold down the seven. Six times one is six but the answer you will get is forty-two. Continue to hold down seven and put other problems on the machine. They are wrong, not as problems, but as answers. Now fix seven so that it stays down no matter what keys are touched and try to give the machine away. Nobody will want it because, obviously, the machine is crazy. It says ten times ten is seven hundred. But is the calculating portion of the machine really wrong or is it merely being fed the wrong data?

In the same way the human mind, being called upon to resolve problems of a magnitude and with enough variables to confound any mere calculating machine a thousand times an hour, is prey to incorrect data. Incorrect data gets into the machine. The machine gives wrong answers. Incorrect data enters the human memory banks, the person reacts in an "abnormal manner." Essentially, then, the problem of resolving aberration is the problem of finding a "held-down seven." But of that much, much more, later. Right now we have accomplished our immediate ends.

These are the various abilities and activities of the human mind in its constant task of resolving and putting into solution a multitude of problems. It perceives, it recalls or returns, it imagines, it conceives and then resolves. Served by its extensions -- the perceptics and the memory banks and the imaginations -- the mind brings forth answers which are invariably accurate, modified only by observation, education and viewpoint.

And the basic purposes of that mind and the basic nature of man, as discoverable in the clear, are constructive and good, uniformly constructive and uniformly good, the solutions modified only by observation, education and viewpoint.

Man is good.

Take away his basic aberrations and with them go the evil of which the Scholastic and the moralist were so fond. The only detachable portion of him is the "evil" portion. And when it is detached, his personality and vigor intensify. And he is glad to see the "evil" portion go because it was physical pain.

Later there are experiments and proofs for these things and they can be measured with the precision so dear to the heart of the physical scientist.

The clear, then, is not an "adjusted" person, driven to activity by his repressions now thoroughly encysted. He is an unrepressed person, operating on self-determinism. And his abilities to perceive, recall, return, imagine, create and compute are outlined as we have seen.

The clear is the goal in dianetic therapy, a goal which some patience and a little study and work can bring about. Any person can be cleared unless he has been so unfortunate as to have had a large portion of his brain removed or to have been born with a grossly malformed nervous structure.

We have seen the goal of dianetics here. Let us now inspect the goal of Man.

CHAPTER III

The Goal of Man

The goal of Man, the lowest common denominator of all his activities, the dynamic principle of his existence, has long been sought. Should such an answer be discovered, it is inevitable that from it many answers would flow. It would explain all phenomena of behavior; it would lead toward a solution of Man's major problems; and, most of all, it should be workable.

Consider all knowledge to fall above or below a line of demarcation. Everything above this line is not necessary to the solution of Man's aberrations and general shortcomings and is inexactly known. Such a field of thought could be considered to embrace such things as metaphysics and mysticism. Below this line of demarcation could be considered to lie the finite universe. All things in the finite universe, whether known or as yet unknown, can be sensed, experienced or measured. The known data in the finite universe can be classified as scientific truth when it has been sensed, experienced and measured. All factors necessary to the resolution of a science of the mind were found within the finite universe and were discovered, sensed, measured and experienced, and became scientific truth. The finite universe contains TIME, SPACE, ENERGY and LIFE. No other factors were found necessary in the equation.

TIME, SPACE, ENERGY and LIFE have a single denominator in common. As an analogy it could be considered that TIME, SPACE, ENERGY and LIFE began at some point of origin and were commanded to continue to some nearly infinite destination. They were told nothing but WHAT to do. They obey a single order and that order is "SURVIVE!"

THE DYNAMIC PRINCIPLE OF EXISTENCE IS SURVIVAL The goal of life can be considered to be infinite survival. Man, as a life form, can be demonstrated to obey in all his actions and purposes the one command: "SURVIVE!"

It is not a new thought that Man is surviving. It is a new thought that Man is motivated only by survival.

That his single goal is survival does not mean that he is the optimum survival mechanism which life has attained or will develop. The goal of the dinosaur was also survival and the dinosaur isn't extant any more.

Obedience to this command, "SURVIVE!" does not mean that every attempt to obey is uniformly successful. Changing environment, mutation, and many other things militate against any one organism attaining infallible survival techniques or form.

Life forms change and die as new life forms develop just as surely as one life organism, lacking immortality in itself, creates other life organisms, then dies as itself. An excellent method, should one wish to cause life to survive over a very long period, would be to establish means by which it could assume many forms, and death itself would be necessary in order to facilitate the survival of the life force itself, since only death and decay could clear away older forms when new changes in the environment necessitated new forms. Life, as a force, existing over a nearly infinite period, would need a cyclic aspect in its unit organisms and forms.

What would be the optimum survival characteristics of various life forms? They would have to have various fundamental characteristics, differing from one species to the next just as one environment differs from the next.

This is important, since it has been but poorly considered in the past that a set of survival characteristics in one species would not be survival characteristics in another.

The methods of survival can be summed under the headings of food, protection (defensive and offensive) and procreation. There are no existing life forms which lack solutions to these problems. Every life form errs one way or another, by holding a characteristic too long or developing characteristics which may lead to its extinction. But the developments which bring about successfulness of form are far more striking than their errors. The naturalist and biologist are continually resolving the characteristics of this or that life form by discovering that need rather than whim govern such developments. The hinges of the clam shell, the awesome face on the wing of the butterfly, have survival value.

Once survival was isolated as the only dynamic of a life form which would explain all its activities, it was necessary to study further the action of survival. In order to establish nomenclature in dianetics which would not be too complex for the purpose, words normally considered as adjectives or verbs have occasionally been pressed into service as nouns. This has been done on the valid principle that existing terminology, meaning so many different things, could not be used by dianetics without making it necessary to explain away an old meaning to bring forth a new. To remove the step of explaining the old meaning and saying then that one doesn't mean that, thus entangling our communications inextricably, and to obviate the ancient custom of compounding ponderous and thundering syllables from the Greek and Roman tongues, this principle and some others have been adopted for nomenclature. Dynamic is here used as a noun and will so continue to be used throughout this volume. Somatic, perceptic and some others will be noted, defined when used. It was discovered that when one considered pain and pleasure, he had at hand all the necessary ingredients with which to formulate the action life takes in its effort to survive.

As will be seen in the accompanying graph, a spectrum of life has been conceived to span from the zero of death or extinction toward the infinity of potential immortality. This spectrum was considered to contain an infinity of lines, extending ladderlike toward the potential of immortality. Each line as the ladder mounted was spaced a little wider than the last, in a geometric progression.

The thrust of survival is away from death and toward immortality. The ultimate pain could be conceived as existing just before death and the ultimate pleasure could be conceived as immortality.

Immortality could be said to have an attractive type of force and death a repelling force in the consideration of the unit organism or the species. But as survival rises higher and higher toward immortality wider and wider spaces are encountered until the gaps are finitely impossible to bridge. The urge is away from death, which has a repelling force, and toward immortality, which has an attracting force; the attracting force is pleasure, the repelling force is pain.

For the individual, the length of the arrow could be considered to be at a high potential within the fourth zone. Here the survival potential would be excellent and the individual would enjoy existence.

From left to right could be graphed the years.

The urge toward pleasure is dynamic. Pleasure is the reward; and the seeking of the reward -- survival goals -- would be a pleasurable act. And to ensure that survival is accomplished under the mandate, SURVIVE!, it seems to have been provided that reduction from a high potential would bring pain.

Pain is provided to repel the individual from death, pleasure is provided to call him toward optimum life. The search for and the attainment of pleasure is not less valid in survival than the avoidance of pain. In fact, on some observed evidence, pleasure seems to have a much greater value in the cosmic scheme than pain.

Now it would be well to define what is meant by pleasure, aside from its connection with immortality. The dictionary states that pleasure is “gratification; agreeable emotions, mental or physical; transient enjoyment; opposed to pain.” Pleasure can be found in so many things and activities that a catalogue of all the things and activities Man has, does and may consider pleasurable alone could round out the definition.

And what do we mean by pain? The dictionary states: “physical or mental suffering; penalty.”

These two definitions, in passing, are demonstrative of an intuitive type of thought which runs through the language. Once one has a thing which leads to the resolution of hitherto unsolved problems, even the dictionaries are found to have “always known it.”

If we wished to make this graph for a life-form cycle, it would be identical except that the value of the years would be increased to measure eons. For there is no difference, it seems, except magnitude, in the scope of the individual and the scope of the species. This inference could be drawn even without such remarkable evidence as the fact that a human being, growing from zygote to adult, evolves through all the forms which the whole species is supposed to have evolved through.

Now there is more in this graph than has been remarked as yet. The physical and mental state of the individual varies from hour to hour, day to day, year to year. Therefore the level of survival would form either a daily curve or the curve of a life on a measure of hourly or yearly position in the zones. And there would be two curves made possible by this, the physical curve and the mental curve. When we get toward the back of the book the relationships between these two curves will be found vital and it will also be seen that, ordinarily, a sag in the mental curve will precede a sag in the physical curve.

The zones, then, can apply to two things: the physical being and the mental being. Therefore these four zones can be called zones of the states of being. If a person is happy mentally, the survival level can be placed in Zone 4. If the person is extremely ill physically, he might be plotted, on estimation of his illness, in Zone 1 or close to death.

Very unprecise but nevertheless descriptive names have been assigned to these zones. Zone 3 is one of general happiness and well-being. Zone 2 is a level of bearable existence. Zone 1 is one of anger. Zone 0 is the zone of apathy. These zones can be used as a tone scale by which a state of mind can be graded. Just above death, which is 0, would be the lowest mental apathy or lowest level of physical life, 0.1. A Tone 1, where the body is fighting physical pain or illness or where the being is fighting in anger, could be graded from 1.0, which would be resentment or hostility, through Tone 1.5, which would be a screaming rage, to a 1.9 which would be merely a quarrelsome inclination. From Tone 2.0 to Tone 3.0 there would be an increasing interest in existence, and so forth.

It so happens that the state of physical being or mental being does not long remain static. Therefore, there are various fluctuations. In the course of a single day an aberree may run from 0.5 to 3.5, up and down, as a mental being. An accident or illness could cause a similar fluctuation in a day.

These are, then, figures which can be assigned to four things: the mental state on an acute basis and the mental state on a general, average basis, and the physical being on an acute basis and the physical being on a general basis. In dianetics we do not much employ the physical tone scale. The mental tone scale, however, is of vast and vital importance!

These values of happiness, bearable existence, anger and apathy are not arbitrary values. They are deduced from observation of the behavior of emotional states. A clear is usually found varying around Tone 4, plus or minus in an average day. He is a general Tone 4, which is one of the inherent conditions of being clear. A norm in current society, at a wild guess, is probably around a general Tone 2.8.

In this descriptive graph, which is two-dimensional, the vital data for the solution of the problem of the life dynamic are workably combined. The horizontal lines are in terms of geometric progression beginning with the zero line immediately above death. There are ten lines for each zone and each zone denotes a mental or physical state of being, as noted. Geometric progression, so used, leaves ever increasing spaces between the lines. The width of this space is the survival potential existing at the moment the top point of the survival dynamic arrow is within that space. The further away from death the top point of the survival dynamic arrow is, the better chance the individual has of survival. Geometric progression reaches up toward the impossible of infinity and cannot, of course, reach infinity. The organism is surviving through time from left to right. Survival optimum -- immortality -- lies in terms of time to the right. Potential only is measured vertically.

The survival dynamic actually resides within the organism as inherited from the species. The organism is part of the species as a railroad tie might be said to be part of a railroad as seen by an observer on a train, the observer being always in Now -- although this analogy is not perhaps the best.

Within itself the organism possesses a repulsive force toward pain sources. The source of the pain is not a driving force any more than the thorn bush which tears the hand was a driving force; the organism repulses the potential pain of a thorn.

At the same time the organism has at work a force which attracts it to the sources of pleasure. Pleasure does not magnetize the organism into drawing near. It is the organism which possesses the attraction force.

It is inherent.

The repulsion of pain sources adds to the attraction for pleasure sources to operate as a combined thrust away from death and toward immortality. The thrust away from death is no more powerful than the thrust toward immortality. In other words, in terms of the survival dynamic, pleasure has as much validity as pain.

It should not be read here that survival is always a matter of keeping an eye on the future. Contemplation of pleasure, pure enjoyment, contemplation of past pleasures, all combine into harmonies which, while they operate automatically as a rise toward the survival potential, by their action within the organism physically, do not demand the future as an active portion of the mental computation in such contemplation.

A pleasure which reacts to injure the body physically, as in the case of debauchery, discovers at work a ratio between the physical effect (which is depressed toward pain) and the mental effect of experienced pleasure. There is a consequent lowering of the survival dynamic. Averaging out, the future possibility of strain because of the act, added to the state of being at the moment the debauchery was experienced, again depresses the survival dynamic. Because of this, various kinds of debauchery have been in indifferent odor with Man throughout his history. This is the equation of "immoral pleasures." And any action which has brought about survival suppression or which can bring it about, when pursued as a pleasure, has been denounced at some time or another in Man's history. Immorality is originally hung as a label upon some act or class of actions because they depress the level of the survival dynamic. Future enforcement of moral stigma may depend largely upon prejudice and aberration and there is, consequently, a continuous quarrel over what is moral and what is immoral.

Because certain things practiced as pleasures are actually pains -- and how easy it will be to trace out why when you've finished this volume -- and because of the moral equation as above, pleasure itself, in any aberrated society can become decried. A certain kind of thinking, of which more later, permits poor differentiation between one object and another. Confusing a dishonest politician with all politicians would be an example of this. In ancient times the Roman was fond of his pleasures and some of the things he called pleasure were a trifle strenuous on other species such as Christians. When the Christian overthrew the pagan state, the ancient

order of Rome was in a villain's role. Anything, therefore, which was Roman was villainous. This went to such remarkable lengths that the Roman love of bathing made bathing so immoral that Europe went unwashed for some fifteen hundred years. The Roman had become a pain source so general that everything Roman was evil and it stayed evil long after Roman paganism perished. Immorality, in such a fashion, tends to become an involved subject. In this case it became so involved that pleasure itself was stigmatized.

When half the survival potential is struck from the list of lawful things, there is a considerable reduction in survival indeed. Considering this graph on a racial scale, the reduction of survival potential by one-half would forecast that direful things lay in wait for the race.

Actually, because Man is after all Man, no set of laws, however enforced, can completely wipe away the attraction of pleasure. But in this case enough was removed and banned to occasion precisely what happened: the Dark Ages and the recession of society. Society brightened only in those periods such as the Renaissance, in which pleasure became less unlawful.

When a race or an individual drops into the second zone, as marked on the chart, and the general tone ranges from the first zone barely into the third, a condition of insanity ensues. Insanity is irrationality. It is also a state in which non-survival has been so closely approached continually that the race or the organism engages in all manner of wild solutions.

In further interpretation of this descriptive graph there is the matter of the survival suppressor. This, it will be seen, is a thrust downward out of potential immortality at the race or organism represented as the survival dynamic. The survival suppressor is the combined and variable threats to the survival of the race or organism. These threats come from other species, from time, from other energies. These are also engaged in the contest of survival to potential immortality in terms of their own species or identities. Thus there is a conflict involved. Every other form of life or energy could be plotted in a descriptive as the survival dynamic. If we were to use a duck's survival dynamic in a descriptive graph, we would see the duck seeking a high survival level and Man would be a part of the duck's suppressor.

The balance and nature of things do not permit the infinity of the goal of immortality to be reached. In fluctuating balance and in almost unlimited complexity, life and energies ebb and flood, out of the nebulous, into forms and, through decay, into the nebulous once more.* Many equations could be drawn concerning this, but it is outside the sphere of our present interest.

In terms of the zones of the descriptive it is of relative concern what the extent of the force of the suppressor is against the survival dynamic. The dynamic is inherent in individuals, groups and races, evolved to resist the suppressor through the eons. In the case of Man, he carries with him another level of offensive and defensive techniques, his cultures. His primary technology of survival is mental activity governing physical action in the sentient echelon. But every life form has its own technology, formed to resolve the problems of food, protection and procreation. The degree of workability of the technology any life form develops (armor or brains, fleetness of foot or deceptive form) is a direct index of the survival potential, the relative immortality, of that form. There have been vast upsets in the past; Man, when he developed into the world's most dangerous animal (he can and does kill or enslave any life form, doesn't he?) overloaded the suppressor on many other life forms and they dwindled in number or vanished.

A great climatic change, such as the one which packed so many mammoths in Siberian ice, may overload the suppressor on a life form. A long drought in the American southwest in not too ancient times wiped out the better part of an Indian civilization.

A cataclysm such as an explosion of the core of the Earth, if that were possible, or the atom bomb or the sudden cessation of burning on the Sun would wipe out all life forms on Earth.

And a life form can even overload the suppressor on itself. A dinosaur destroys all his food and so destroys the dinosaur. A bubonic plague bacillus attacks its hosts with such thorough appetite that the whole generation of *Pasteurella pestis* vanishes. Such things are not intended by the suicide to be suicide; the life form has run up against an equation which has an unknown variable, and the unknown variable unfortunately contained enough value to overload the suppressor. This is the "didn't know the gun was loaded" equation.

And if the bubonic plague bacillus overloads its own suppressor in an area and then ceases to trouble its food and shelter, the animals, then the animals consider themselves benefited.

Reckless and clever and well-nigh indestructible, Man has led a course which is a far cry from "tooth and claw" in every sphere. And so have the redwood tree and the shark. Just as a life form, Man, like every life form, is "symbiotic." Life is a group effort. Lichens and plankton and algae may do very well on sunlight and minerals alone, but they are the building blocks. Above such existence, as the forms grow more complex, a tremendous interdependence exists.

It is very well for a forester to believe that certain trees willfully kill all other varieties of trees around them and then conclude a specious "attitude" of trees. Let him look again. What made the soil? What provides the means of keeping the oxygen balance? What makes it possible for rain to fall in other areas? These willful and murderous trees. And squirrels plant trees. And Man plants trees. And trees shelter trees of another kind. And animals fertilize trees. And trees shelter animals. And trees hold the soil so less well rooted plants can grow. Look anywhere and everywhere and we see life as an assist for life. The multitude of the complexities of life as affinities for life is not dramatic. But they are the steady, practical, important reason life can continue to exist at all.

A redwood tree may be first out for redwood trees and although it does an excellent job of seeming to exist as redwood alone, a closer glance will show it has dependencies and is depended upon.

Therefore the dynamic of any life form can be seen to be assisted by many other dynamics and combines with them against the suppressive factors. None survive alone.

Necessity has been declared to be a very wonderful thing. But necessity is a word which has been taken rather loosely for granted. Opportunism seems to have been read largely into necessity. What is necessity? Besides being the "mother of invention," is it a dramatic, sudden thing which excuses wars and murders, which touches a man only when he is about to starve? Or is necessity a much gentler and less dramatic quantity? "Everything," according to Leucippus, "is driven by necessity." This is a keynote of much theorizing down through the ages. Driven, that is the key to the error. Driven, things are driven. Necessity drives. Pain drives. Necessity and pain, pain and necessity.

Recalling the dramatic and overlooking the important, Man has conceived himself, from time to time, to be an object of chase by necessity and pain. These were two anthropomorphic (manlike) things which, in full costume, stuck spears at him. It can be said to be a wrong concept merely because it does not work to produce more answers.

Whatever there is of necessity is within him. Nothing is driving him except his original impetus to survive. And he carries that within himself or his group. Within him is the force with which he fends off pain. Within him is the force with which he attracts pleasure.

It chances to be a scientific fact that Man is a self-determined organism to the outermost limit that any form of life can be, for he still depends upon other forms of life and his general environment. But he is self-determined. This is a matter which will be covered later. But right here it is necessary to indicate that he is not inherently a determined organism in the sense that he is driven on this wonderful stimulus-response basis which looks so neat in certain text books, and works so completely unworkably in the world of Man. The happy little illustrations about rats do not serve when we are talking about Man. The more complex the organism, the less reliably these stimulus-response equation works. And when one reaches that highest complexity, Man, he has reached a fine degree of variability in terms of stimulus-response. The more sentient, the more rational an organism, the more that organism is self-determined. Self-determinism, like all things, is relative. Compared to a rat, however, Man is very self-determined indeed. This is only a scientific fact because it can easily be proven.

The more sentient the man, the less he is a “push-button” instrument. Aberrated and reduced he can, of course, in a limited degree, be made to perform like a marionette, but then it is understood that the more aberrated a person is, the closer he approaches the intelligence quotient of an animal.

Given this self-determinism, it is interesting to observe what a man does with it. While he can never escape the “didn’t know it was loaded” equation in terms of cataclysm or the unexpected gain of some other life form, he operates in a high zone level of survival potential. But here he is, self-determined, rational, his primary weapon, his mind, in excellent working order. What are his necessity instincts?

Necessity, according to that very sentient if rapidly subject-changing article, the dictionary, is “the state of being necessary; that which is unavoidable; compulsion.” It also adds that necessity is “extreme poverty,” but we don’t want that. We are talking about survival.

The compulsion mentioned can be re-evaluated in terms of the survival dynamic. That is interior in the organism and the race. And what is “necessary” to survival?

We have seen and can prove clinically that there are two factors at work. The necessity of avoiding pain is a factor because, degree by degree, little things, not much in themselves, can amount to large pains which, compounded in that rapid geometric progression, bring on death. Pain is the sadness of being bawled out for poor work, because that may lead to being fired, which may lead to starvation, which may lead to death. Run any equation into which pain has entered and it can be seen that it reduces down to possible non-survival. And if this were all there were to surviving and if necessity were a vicious little gnome with a pitch-fork, it seems rather obvious that there would be scant reason to go on living. But there is the other part of the equation, pleasure. That is a more stable part than pain, Stoics to the contrary, as clinical tests in dianetics prove.

There is therefore a necessity for pleasure, for working, as happiness can be defined, toward known goals over not unknowable obstacles. And the necessity for pleasure is such that a great deal of pain can be borne to attain it. Pleasure is the positive commodity. It is enjoyment of work, contemplation of deeds well done; it is a good book or a good friend; it is taking all the skin off one’s knees climbing the Matterhorn; it is hearing the kid first say daddy; it is a brawl on the Bund at Shanghai or the whistle of amour from a doorway; it’s adventure and hope and enthusiasm and “someday I’ll learn to paint”; it’s eating a good meal or kissing a pretty girl or playing a stiff game of bluff on the stock exchange. It’s what Man does that he enjoys doing; it’s what Man does that he enjoys contemplating; it’s what Man does that he enjoys remembering; and it may be just the talk of things he knows he’ll never do.

Man will endure a lot of pain to obtain a little pleasure. Out in the laboratory of the world, it takes very little time to confirm that.

And how does necessity fit this picture? There is a necessity for pleasure, a necessity as live and quivering and vital as the human heart itself. He who said that a man who had two

loaves of bread should sell one to buy white hyacinth, spoke sooth. The creative, the constructive, the beautiful, the harmonious, the adventurous, yes, and even escape from the maw of oblivion, these things are pleasure and these things are necessity. There was a man once who had walked a thousand miles just to see an orange tree and another who was a mass of scars and poor-set bones who was eager just to get a chance to “fan another bronc.”

It is very well to dwell in some Olympian height and write a book of penalties and very well to read to find what writers said that other writers said, but it is not very practical.

The pain-drive theory does not work. If some of these basics of dianetics were only poetry about the idyllic state of Man, they might be justified in that, but it happens that out in the laboratory of the world, they work.

Man, in affinity with Man, survives, and that survival is pleasure.

CHAPTER IV

The Four Dynamics

In the original equations of dianetics, when the research was young, it was believed that survival could be envisioned in personal terms alone and still answer all conditions. A theory is only as good as it works. And it works as well as it explains observed data and predicts new material which will be found, in fact, to exist.

Survival in personal terms was computed until the whole activity of Man could be theoretically explained in terms of self alone. The logic looked fairly valid. But then it was applied to the world. Something was wrong: it did not solve problems. In fact, the theory of survival in personal terms alone was so unworkable that it left a majority of behavior phenomena unexplained. But it could be computed and it still looked good.

Then it was that a nearly intuitive idea occurred. Man's understanding developed in ratio to his recognition of his brotherhood with the Universe. That was high flown but it yielded results.

Was Man himself a brotherhood of Man? He had evolved and become strong as a gregarious being, an animal that hunted in packs. It seemed possible that all his activities could be computed in terms of the survival of the group. That computation was made. It looked good. Man survived, it was postulated, solely in terms of the survival of his group. It looked good but it left a majority of observed phenomena unexplained.

It was attempted, then, to explain Man's behavior in terms of Mankind alone; which is to say, it was assumed that Mankind survived for Mankind in a highly altruistic way. This was straight down the sylvan path of Jean Jacques Rousseau. It could be computed that Man lived alone for the survival of all Mankind. But when addressed to the laboratory -- the world -- it did not work.

Finally, it was recalled that some had thought that Man's entire activity and all his behavior could be explained by assuming that he lived for sex alone. This was not an original assumption. But some original computations were made upon it and it is true that, by a few quick twists of the equation, his survival activity can be made to resolve on only the sexual basis. But when this was applied to observed data, again it failed to explain every phenomenon.

An examination was made of what had been attempted. It had been assumed that Man survived only for himself as an individual; it had been computed that he survived only for the group, the pack, for society; it had been postulated that he survived only for Mankind; and finally, it had been theorized that he lived only for sex. None worked alone.

A new computation was made on the survival dynamic. Exactly for what was man surviving? All four of these factors, self, sex, group and Mankind were entered into a new equation. And now it was found, a theory was in hand which worked. It explained all observed phenomena and it predicted new phenomena which were discovered to exist. It was a scientific equation, therefore!

From the survival dynamic, in this fashion, were evolved the four dynamics. By survival dynamic was meant the basic command, SURVIVE! which underlay all activity. By dynamic was meant one of the four purpose divisions of the entire dynamic principle. The four dynamics were not new forces; they were sub-divisions of the primary force.

DYNAMIC ONE is the urge toward ultimate survival on the part of the individual and for himself. It includes his immediate symbiotes*, the extension of culture for his own benefit, and name immortality.

DYNAMIC TWO is the urge of the individual toward ultimate survival via the sex act, the creation of and the rearing of children. It includes their symbiotes, the extension of culture for them, and their future provision.

DYNAMIC THREE is the urge of the individual toward ultimate survival for the group. It includes the symbiotes of the group and the extension of its culture.

DYNAMIC FOUR includes the urge of the individual toward ultimate survival for all Mankind. It includes the symbiotes of Mankind and the extension of its culture.

Life, the atom and the universe and energy itself are included under the symbiotic classification.

It will be seen immediately that these four dynamics are actually a spectrum without sharp division lines. The survival dynamic can be seen to sweep out from the individual to embrace the entire species and its symbiotes.

None of these dynamics is necessarily stronger than any of the others. Each is strong. They are the four roads a man takes to survival. And the four roads are actually one road. And the one road is actually a spectrum of thousands of roads contained within the four. They are all in terms of past, present and future in that the present may be a sum of the past and the future may be the product of the past and present.

All the purposes of Man can be considered to lie within this spectrum and all behavior becomes explained.

That Man is selfish is a valid statement when one means an aberrated Man. That Man is anti-social is an equally valid statement if one adds the modifier, aberration. And other such statements resolve equally. * The dianetic meaning of symbiote is extended beyond the dictionary definition to mean "any or all life or energy forms which are mutually dependent for survival." The atom depends on the Universe, the Universe on the atom.

Now it happens that these four dynamics can be seen to compete, one with another, in their operation within an individual or a society. There is a rational reason for this. The phrase "social competition" is a compound of aberrated behavior and sentient difficulties.

Any man, group or race may be in contest with any race, group or man and even in contest with sex on an entirely rational level.

The Equation of the Optimum Solution would be that a problem has been well resolved which portends the maximum good for the maximum number of dynamics. That is to say that any solution, modified by the time available to put the solution into effect, should be creative or constructive for the greatest possible number of dynamics. The optimum solution for any problem would be a solution which achieved the maximum benefit in all the dynamics. This means that a man, determining upon some project, would fare best if he benefited everything concerned in the four dynamics as his project touched them. He would then have to benefit himself as well for the solution to be optimum. In other words, the benefiting of the group and Mankind dynamic but the blocking of the sex dynamic and the self dynamic would be much poorer than the best solution. The conduct survival pattern is built upon this equation of the optimum solution. It is the basic equation of all rational behavior and is the equation on which a clear functions. It is inherent in Man.

In other words, the best solution to any problem is that which will bring the greatest good to the greatest number of beings, including self, progeny, family associates, political and racial groups, and at length to all mankind. The greatest good may require, as well, some destruction, but the solution deteriorates in a ratio to the destructiveness employed. Self-sacrifice and selfishness are alike reductive of the optimum action equation and alike have been suspected and should be.

This is entirely a matter of: does it work? Even on an unaberrated basis there are times when one or another of these dynamics have to be dropped from the computation of some activity or other and indeed, few problems are so entirely intense that they must take into account

the dynamics. But when a problem achieves such intensity and time is not an important factor, serious errors can follow the omission of one or another of the dynamics from the factors considered.

In the case of a Napoleon "saving France" at the expense of the remainder of Mankind in Europe, the equation of the optimum solution was so far neglected that all the revolutionary gains of the French people were lost. In the case of Caesar "saving Rome," the equation was so poorly done that the survival of Rome was impeded.

But there are special cases when the equation of the optimum solution becomes so involved with time that certain dynamics must be neglected to permit other dynamics to persist. The case of a sailor giving his own life to save his ship answers the group dynamic. Such an action is a valid solution to a problem. But it violates the optimum solution because it did not answer for Dynamic One: self.

Many examples of various kinds could be cited where one or another of the dynamics must, of necessity, receive priority, all on an entirely rational basis.

On an aberrated basis the equation is still valid but complicated by irrationalities which have no part of the situation. Many solutions are bad merely because of false educational data or no data at all. But these are still solutions. In the case of aberrated solutions, the dynamics are actually and actively impeded, as will later be outlined in full.

CHAPTER V

Summary

The dynamic principle of existence is survival.

This survival can be graduated into four zones, each one progressively portending a better opportunity of reaching the potential of immortality. Zone 0 borders from death and includes apathy; Zone 1 borders from apathy and includes violent effort; Zone 2 borders from violence into mediocre but not entirely satisfactory success; Zone 3 borders from the mediocre to the excellent chance. These zones are each occasioned by the ratio of the suppressor to the survival dynamic. In apathy, Zone 0, the suppressor appears too great to be overcome. In the area of violence, Zone I, the suppressor more or less overbalances the survival dynamic, requiring enormous effort which, when expended without result, drops the organism into the Zero Zone. In the area of mediocrity, Zone 2, the suppressor and the survival dynamic are more or less evenly balanced. In the area of Zone 3 the survival dynamic has overcome the suppressor and, the chances of survival being excellent, is the area of high response to problems. These four zones might be classed as the zone of no hope, the zone of violent action, the area of balance and the area of high hope. Clinical experiment is the basis of these zones since they follow a progress of mental or physical being as it rises from the death area into high existence.

The four dynamics are subdivisions of the survival dynamic and are, in Mankind, the thrust toward potential survival in terms of entities. They embrace all the purposes, activities and behavior of Mankind. They could be said to be a conduct survival pattern. The first of these, but not necessarily the most important nor yet the one which will receive priority in various efforts, is the individual dynamic, DYNAMIC ONE, which includes the personal survival of the individual as a living person and the survival of his personal symbiotes. DYNAMIC TWO is the thrust toward potential immortality through children and includes all sexual activity as well as the symbiotes of the children. DYNAMIC THREE is survival in terms of the group, which term may include such things as a club, a military company, a city, a state, a nation; this would include the symbiotes of the group. DYNAMIC FOUR is the thrust toward potential immortality of Mankind as a species and the symbiotes of Mankind. Embraced within these classifications are any part of existence, any form of matter and, indeed the Universe.

Any problem or situation discoverable within the activities or purposes of Mankind is embraced within these dynamics.

The equation of the optimum solution is inherent within the organism and, modified by education or viewpoint and modified further by time, is the operating method of unaberrated individuals, groups or Mankind. The equation of the optimum solution is always present even in severely aberrated individuals and is used as modified by their education, viewpoint and available time. The aberration does not remove activity from the dynamics of survival. Aberrated conduct is irrational survival conduct and is fully intended to lead to survival. That the intent is not the act does not eradicate the intent.

THESE ARE THE FUNDAMENTAL AXIOMS OF DIANETICS: The dynamic principle of existence -- SURVIVE!

Survival, considered as the single and sole Purpose, sub-divides into four dynamics.

DYNAMIC ONE is the urge of the individual toward survival for the individual and his symbiotes. (By symbiote is meant all entities and energies which aid survival.)

DYNAMIC TWO is the urge of the individual toward survival through procreation; it includes both the sex act and the raising of progeny, the care of children and their symbiotes.

DYNAMIC THREE is the urge of the individual toward survival for the group or the group for the group and includes the symbiotes of that group.

DYNAMIC FOUR is the urge of the individual toward survival for Mankind or the urge toward survival of Mankind for Mankind as well as the group for Mankind, etc., and includes the symbiotes of mankind.

The absolute goal of survival is immortality or infinite survival. This is sought by the individual in terms of himself as an organism, as a spirit or as a name or as his children, as a group of which he is a member or as Mankind and the progeny and symbiotes of others as well as his own. The reward of survival activity is pleasure.

The ultimate penalty of destructive activity is death or complete non-survival, and is pain. Successes raise the survival potential toward infinite survival. Failures lower the survival potential toward death.

The human mind is engaged upon perceiving and retaining data, composing or computing conclusions and posing and resolving problems related to organisms along all four dynamics and the purpose of perception, retention, concluding and resolving problems is to direct its own organism and symbiotes and other organisms and symbiotes along the four dynamics toward survival. Intelligence is the ability to perceive, pose and resolve problems.

The dynamic is the tenacity to life and vigor and persistence in survival. Both the dynamic and intelligence are necessary to persist and accomplish and neither is a constant quantity from individual to individual, group to group.

The dynamics are inhibited by engrams, which lie across them and disperse life force. Intelligence is inhibited by engrams which feed false or improperly graded data into the analyzer. Happiness is the overcoming of not unknown obstacles toward a known goal and, transiently, the contemplation of or indulgence in pleasure.

The analytical mind is that portion of the mind which perceives and retains experience data to compose and resolve problems and direct the organism along the four dynamics. It thinks in differences and similarities.

The reactive mind is that portion of the mind which files and retains physical pain and painful emotion and seeks to direct the organism solely on a stimulus-response basis. It thinks only in identities.

The somatic mind is that mind which, directed by the analytical or reactive mind, places solutions into effect on the physical level.

A training pattern is that stimulus-response mechanism resolved by the analytical mind to care for routine activity or emergency activity. It is held in the somatic mind and can be changed at will by the analytical mind.

Habit is that stimulus-response reaction dictated by the reactive mind from the content of engrams and put into effect by the somatic mind. It can be changed only by those things which change engrams.

Aberrations, under which is included all deranged or irrational behavior, are caused by engrams. They are stimulus-response pro- and contra-survival. Psycho-somatic ills are caused by engrams. The engram is the single source of aberrations and psycho-somatic ills. Moments of "unconsciousness" when the analytical mind is attenuated in greater or lesser degree are the only moments when engrams can be received. The engram is a moment of "unconsciousness" containing physical pain or painful emotion and all perceptions and is not available to the analytical mind as experience.

Emotion is three things: engramic response to situations, endocrine metering of the body to meet situations on an analytical level and the inhibition or the furtherance of life force.

The potential value of an individual or a group may be expressed by the equation:

($PV = ID$) where I is Intelligence and D is Dynamic.

The worth of an individual is computed in terms of the alignment, on any dynamic, of his potential value with optimum survival along that dynamic. A high PV may, by reversed vector, result in a negative worth as in some severely aberrated persons. A high PV on any dynamic assures a high worth only in the unaberrated person.

Book Two

THE SINGLE SOURCE OF ALL INORGANIC MENTAL AND ORGANIC PSYCHO-SOMATIC ILLS

CHAPTER I

The Analytical Mind and the Standard Memory Banks

This chapter begins the search for human error and tells where it is not.

The human mind can be considered to have three major divisions. First, there is the analytical mind, second, there is the reactive mind, and third, there is the somatic mind.

Consider the analytical mind as a computing machine. This is analogy, because the analytical mind, while it behaves like a computing machine, is yet more fantastically capable than any computing machine ever constructed and infinitely more elaborate. It could be called the "computational mind" or the "egsusheyftef." But for our purposes, the analytical mind, as a descriptive name, will do. This mind may live in the pre-frontal lobes -- there is some hint of that -- but this is a problem of structure, and nobody really knows about structure. So we shall call this computational part of the mind the "analytical mind" because it analyzes data.

The monitor can be considered part of the analytical mind. The monitor could be called the center of awareness of the person. It, inexactly speaking, is the person. It has been approximated by various names for thousands of years, each one reducing down to "I." The monitor is in control of the analytical mind. It is not in control because it has been told to be but only because it is, inherently. It is not a demon who lives in the skull nor a little man who vocalizes one's thoughts. It is "I." No matter how many aberrations a person may have, "I" is always "I." No matter how "clear" a person becomes, "I," is still "I." "I" may be submerged now and then in an aberree, but it is always present.

The analytical mind shows various evidences of being an organ, but as we know in this age so little of structure, the full structural knowledge of the analytical mind must come after we know what it does. And in dianetics we know precisely that for the first time. It is known and can be proven with ease that the analytical mind, be it one organ of the body or several, behaves as you would expect any good computing machine to behave.

What would you want in a computing machine? The action of the analytical mind -- or analyzer -- is everything anyone could want from the best computer available. It can and does do all the tricks of a computer. And over and above that, it directs the building of computers. And it is as thoroughly right as any computer ever was. The analytical mind is not just a good computer, it is a perfect computer. It never makes a mistake. It cannot err in any way so long as a human being is reasonably intact (unless something has carried away a piece of his mental equipment).

The analytical mind is incapable of error, and it is so certain that it is incapable of error that it works out everything on the basis that it cannot make an error. If a person says, "I cannot add," he either means that he has never been taught to add or that he has an aberration about adding. It does not mean that there is anything wrong with the analytical mind.

While the whole being is, in an aberrated state, grossly capable of error, still the analytical mind is not. For a computer is just as good as the data on which it operates and no better. Aberration, then, arises from the nature of the data offered to the analytical mind as a problem to be computed.

The analytical mind has its standard memory banks. Just where these are located structurally is again no concern of ours at this time. To operate, the analytical mind has to have percepts (data), memory (data), and imagination (data).

There are another data storage bank and another part of the human mind which contain aberrations and are the source of insanities. These will be fully covered later and should not be confused with either the analytical mind or the standard memory banks.

Whether or not the data contained in the standard memory banks is evaluated correctly or not, it is all there. The various senses receive information and this information files straight into the standard memory banks. It does not go through the analyzer first. It is filed and the analyzer then has it from the standard banks.

There are several of these standard banks and they may be duplicated in themselves so that there are several of each kind of bank. Nature seems generous in such things. There is a bank, or set of banks, for each perception. These can be considered racks of data filed in a cross-index system which would make an intelligence officer purple with envy. Any single percept is filed as a concept. The sight of a moving car, for instance, is filed in the visio-bank in color and motion, at the time seen, cross-indexed to the area in which seen, cross-indexed to all data about cars, cross-indexed to thoughts about cars, and so forth and so forth with the additional filing of conclusions (thought stream) of the moment and thought streams of the past with all their conclusions. The sound of that car is similarly filed from the ears, straight into the audio-bank, and cross-indexed multitudinously as before. The other sensations of that moment are also filed, in their own banks.

Now it may be that the whole filing is done in one bank. It would be simpler that way. But this is not a matter of structure but mental performance. Eventually somebody will discover just how they are filed. Right now the function of filing is all that interests us.

Every percept -- sight, sound, smell, feeling, taste, organic sensation, pain, rhythm, kinesthesia (weight and muscular motion) and emotion -- is each properly and neatly filed in the standard banks in full. It does not matter how many aberrations a physically intact person has or whether he thinks he can or cannot contain this data or recall it, the file is there and is complete.

This file begins at a very early period, of which more later. It then runs consecutively, whether the individual is asleep or awake, except in moments of "unconsciousness,"* for an entire lifetime. It apparently has an infinite capacity.

The numbers of these concepts (concept means that which is retained after something has been perceived) would stagger an astronomer's computer. The existence and profusion of memories retained were discovered and studied in a large number of cases, and they can be examined in anyone by certain processes.

Everything in this bank is correct in so far as the single action of perception is concerned. There may be organic errors in the organs of perception, such as blindness or deafness (when physical, not aberrational), which would leave blanks in the banks; and there may be organic impairment such as partial organic deafness which would leave partial blanks. But these things are not error in the standard memory banks; they are simply absence of data. Like the computer, the standard memory banks are perfect, recording faithfully and reliably.

Now part of the standard banks is audio-semantic, which is to say, the recordings of words heard. And part of the banks is visio-semantic, which is to say, the recordings of words read. These are special parts of the sound and sight files. A blind man who has to read with his fingers develops a tactile-semantic file. The content of the speech files is exactly as heard without alteration.

Another interesting part of the standard memory banks is that they apparently file the original and hand forward exact copies to the analyzer. They will hand out as many exact copies as are demanded without diminishing the actual file original. And they hand out these copies each in kind with color-motion sight, tone-audio, etc.

The amount of material which is retained in the average standard memory banks would fill several libraries. But the method of retention is invariable. And the potentiality of recall is perfect.

The primary source of error in “rational” computation comes under the headings of insufficient data and erroneous data. The individual, daily facing new situations, is not always in possession of all the material he requires to make a decision. And he may have been told something on Good Authority which was not true and yet which did not find counter-evidence in the banks.

Between the standard banks, which are perfect and reliable, and the computer, the analytical mind, which is perfect and reliable, there is no irrational concurrence. The answer is always as right as it can be made to be in the light of data at hand, and that is all anyone can ask of a computing device or a recording device.

The analytical mind goes even further in its efforts to be right than one would suppose. It constantly checks and weighs new experience in the light of old experience, forms new conclusions in the light of old conclusions, changes old conclusions and generally is very busy being right.

The analytical mind might be considered to have been given a sacred post of trust by the cells to safeguard the colony, and it does everything within its power to carry out that Mission. It has correct data, as correct as possible, and it does correct computations on them, as correct as they can be made. When one considers the enormous number of factors which one handles, for instance, in the action of driving a car ten blocks, he can appreciate how very, very busy on how very many levels that analytical mind can be.

Now before we introduce the villain of this piece, the reactive mind, it is necessary to understand something about the relation of the analytical mind to the organism itself.

The analytical mind, charged with full responsibility, is far from without authority to carry out its actions and desires. Through the mechanisms of the life function regulator (which handles all the mechanical functions of living), the analytical mind can effect any function of the body it desires to effect.

In excellent working order -- which is to say, when the organism is not aberrated -- the analytical mind can influence the heartbeat, the endocrines (such things as calcium and sugar in the blood, adrenalin, etc.), selective blood flow (stopping it in the limbs or starting it at will), urine, excreta, etc. All glandular, rhythm and fluid functions of the body can be at the command of the analytical mind. This is not to say that in a cleared person they always are. That would be very uncomfortable and bothersome. But it does say that the analytical mind can effect changes at desire when it skills itself to do so. This is a matter of laboratory proof, very easy to do.

People have long been intuitive about the “full power of the mind.” Well, the full power of the mind would be the analytical mind working with the standard memory banks, the life function regulator and one other thing.

The last and most important thing is, of course, the organism. It is in the charge of the analytical mind. And the analytical mind controls it in other ways than life function. All muscles and the remainder of the organism can be under the full command of the analytical mind.

In order to keep it and its circuits free of bric-a-brac and minor activities, the analytical mind is provided with a learned training pattern regulator. Into this, by education, it can place the stimulus-response patterns necessary for the performance of tasks like talking, walking, piano playing, etc. These learned patterns are not unchangeable. Because they are selected by the analytical mind after thought and effort, there is seldom any need to change them; if new situations arise, a new pattern is trained into the muscles. None of these are “conditionings”; they are simply training patterns which the organism can use without attention of any magnitude from the analyzer. An uncountable number of such patterns can be laid into the organism by this method. And they are not the source of any trouble since they file by time and situation, and a very little thought will serve to annul old ones in favor of new ones.

All muscles, voluntary and “involuntary,” can be at the command of the analytical mind.

Here, then, is the composite of a sentient being. There is no chance for error beyond the error incident to insufficient data and erroneous but accepted data (and the last will be used by the analyzer just once if that once proves the data to be wrong), Here is the realm of pleasure, emotion, creation and construction, and even destruction if the computation on the optimum solution says something has to be destroyed.

The dynamics underlie the activities of the analytical mind. The urge toward survival explains all its actions. That we can understand the fundamental simplicity of the functional mechanism does not, however, mean that a man operating this way alone is cold or calculating or intent on “tooth and claw.” The nearer Man approaches this optimum, in an individual or in a whole society, the quicker and warmer is that society, the more honest may be its moods and actions.

Sanity depends upon rationality. Here is optimum rationality and therefore optimum sanity. And here also are all the things Man likes to think Man should be like or, for that matter, what he has represented his better gods to be like. This is the clear.

This is sanity. This is happiness. This is survival.

Where is the error?

CHAPTER II

The Reactive Mind

It is fairly well accepted in these times that life in all forms evolved from the basic building blocks, the virus and the cell. Its only relevance to dianetics is that such a proposition works -- and actually that is all we ask of dianetics. There is no point to writing here a past tome on biology and evolution. We can add some chapters to those things, but Charles Darwin did his job well, and the fundamental principles of evolution can be found in his and other works.

The proposition on which dianetics was originally entered was evolution. It was postulated that the cells themselves had the urge to survive and that that urge was common to life. It was further postulated that organisms -- individuals -- were constructed of cells and were in fact aggregations of colonies of cells.

As went the building block, so went the organism. In the finite realms and for any of our purposes, Man could be considered to be a colonial aggregation of cells and it could be assumed that his purpose was identical with the purpose of his building blocks.

The cell is a unit of life which is seeking to survive and only to Survive.

Man is a structure of cells which are asking to survive, and only to survive.

Man's mind is the command post of operation and is constructed to resolve problems and pose problems related to survival and only to survival.

The action of survival, if optimum, would lead to survival.

The optimum survival conduct pattern was formulated and then studied for exceptions, and there were no exceptions found.

The survival conduct pattern was discovered to be far from sterile and barren but was full of rich and most pleasant activity.

None of these postulates outlawed any concept concerning the human soul or divine or creative imagination. It was understood perfectly that this was a study in the finite universe only and that spheres and realms of thought and action might very well exist above this finite sphere. But it was also discovered that none of these factors were needed to resolve the entire problem of aberration and irrational conduct.

The human mind was discovered to have been most grossly maligned, for it was found to be possessed of capabilities far in excess of any heretofore imagined much less tested.

Basic human character was found to have been pilloried because Man had not been able to distinguish between irrational conduct derived from poor data and irrational conduct derived from another, far more vicious source.

If there ever was a devil, he designed the reactive mind.

This functional mechanism managed to bury itself from view so thoroughly that only inductive philosophy, traveling from effect back to cause, served to uncover it. The detective work which was invested in the location of this arch criminal of the human psyche occupied many years. Its identity can now be certified by any technician in any clinic or in any group of men. Two hundred and seventy-three individuals have been examined and treated, representing all the various types of inorganic mental illness and the many varieties of psycho-somatic ills.

In each one this reactive mind was found operating, its principles unvaried. This is a long series of cases and will soon become longer.

The reactive mind is possessed by everyone. No human being examined anywhere was discovered to be without one or without aberrative content in his engram bank, the reservoir of data which serves the reactive mind.

What does this mind do? It shuts off hearing recall. It places vocal circuits in the mind. It makes people tone-deaf. It makes people stutter. It does anything and everything that can be found in any list of mental ills: psychoses, neuroses, compulsions, repressions...

What can it do? It can give a man arthritis, bursitis, asthma, allergies, sinusitis, coronary trouble, high blood pressure, and so on down the whole catalogue of psycho-somatic ills, adding a few more which were never specifically classified as psycho-somatic, such as the common cold.

And it is the only thing in the human being which can produce these effects. It is the thing which uniformly brings them about.

This is the mind which made Socrates think he had a "demon" that gave him answers. This is the mind that made Caligula appoint his horse to a government post. This is the mind which made Caesar cut the right hands from thousands of Gauls, which made Napoleon reduce the height of Frenchmen one inch.

This is the mind which keeps war a thing of alarm, which makes politics irrational, which makes superior officers snarl, which makes children cry in fear of the dark. This is the mind which makes a man suppress his hopes, which holds his apathies, which gives him irresolution when he should act, and kills him before he has begun to live.

If there ever was a devil, he invented it.

Discharge the content of this mind's bank and the arthritis vanishes, myopia gets better, heart illness decreases, asthma disappears, stomachs function properly, and the whole catalogue of ills goes away and stays away.

Discharge the reactive engram bank and the schizophrenic faces reality at last, the manic-depressive sets forth to accomplish things, the neurotic stops clinging to books which tell him how much he needs his neuroses and begins to live, the woman stops snapping at her children and the dipsomaniac can drink when he likes and stop.

These are scientific facts. They compare invariably with observed experience.

The reactive mind is the entire source of aberration. It can be proved and has been repeatedly proven that there is no other, for when that engram bank is discharged, all undesirable symptoms vanish and a man begins to operate on his optimum pattern.

If one were looking for something like demons in a human mind -- such as those one observes in some inmates of madhouses -- he could find them easily enough. Only they are not demons. They are by-pass circuits from the engram bank. What prayer and exhortations have been used against these by-pass circuits!

If one did not believe in demons, if one supposed that Man were good after all (as a postulate, of course), how would the evil get into him? What would be the source of these insane rages? What would be the source of his slips of the tongue? How would he come to know irrational fear?

Why is it that one does not like his boss although his boss has always been pleasant? Why is it that suicides smash their bodies to bits?

Why does Man behave destructively, irrationally, fighting wars, killing, ruining whole sections of Mankind?

What is the source of all neuroses, psychoses, insanities?

Let us return to a brief examination of the analytical mind. Let us examine its memory banks. Here we find all the sense concepts on file. Or so it appears at first glance. Let us take another look, a look at the time factor. There is a time sense about these analytical mind banks. It is very accurate, as though the organism were equipped with a fine watch. But there is something wrong here about time -- it has gaps in it! There are moments when nothing seems to be filed in these standard banks. These are gaps which take place during moments of "unconsciousness," that state of being caused by anaesthesia, drugs, injury or shock.

This is the only data missing from a standard bank. If in hypnotic trance you examine a patient's memory of an operation these incidents are the only periods in the banks you will not find. You can find these if you care to look and don't care what happens to your patient -- of which more later. But the point is that there is something missing which has always been considered by one and all in any age never to have been recorded.

One and all in every age have never been able to put a finger on insanity either. Are these two data in agreement and do they have relationship? They definitely do.

There are two things which appear to be -- but are not -- recorded in the standard banks: painful emotion and physical pain.

How would you go about the building of a sensitive machine upon which the life and death affairs of an organism depended, which was to be the chief tool of an individual? Would you leave its delicate circuits prey to every overload or would you install a fuse system? If a delicate instrument is in circuit with a power line, it is protected by several sets of fuses. Any computer would be so safeguarded.

It happens that there is some small evidence to support the electrical theory of the nervous system. In pain there are very heavy overcharges in the nerves. It may well have been -- and elsewhere some dianetic computations have been made about this -- that the brain is the absorber for overcharges of power resulting from injury, the power itself being generated by the injured cells in the area of injury. That is theory and has no place here save to serve as an example. We are dealing now only with scientific fact.

The action of the analytical mind during a moment of intense pain is suspended. In fact, the analytical mind behaves just as though it were an organ to which vital supply was shut off whenever shock is present.

As an example, a man struck in the side by a car is knocked "unconscious" and on regaining "consciousness" has no record of the period when he was "knocked out." This would be a non-survival circumstance. It means that there would be no volition on the part of anyone who was injured, and this is the time when the organism most requires volition. So this is non-survival, if the whole mind cuts out whenever pain appears. Would an organism with more than a billion years of biological engineering behind it leave a problem like this unsolved?

Indeed, the organism solved the problem. Maybe the problem is very difficult, biologically, and maybe the solution is not very good, but large provision has been made for those moments when the organism is "unconscious."

The answer to the problem of making the organism react in moments of "unconsciousness" or near "unconsciousness" is also the answer to insanity and psychosomatic illnesses and all the strange mental quirks to which people are liable and which gave rise to that fable "it is human to err."

Clinical tests prove these statements to be scientific facts:

1. The mind records on some level continuously during the entire life of the organism.
2. All recordings of the lifetime are available.
3. "Unconsciousness," in which the mind is oblivious of its surroundings, is possible only in death and does not exist as total amnesia in life.
4. All mental and physical derangements of a psychic nature come about from moments of "unconsciousness."
5. Such moments can be reached and drained of charge with the result of returning the mind to optimum operating condition.

"Unconsciousness" is the single source of aberration. There is no such action as "mental conditioning" except on a conscious training level (where it exists only with the consent of the person).

If you care to make the experiment you can take a man, render him "unconscious," hurt him and give him information. By dianetic technique, no matter what information you gave him, it can be recovered. This experiment should not be carelessly conducted because you might also render him insane.

A pale shade of this operation can be obtained by hypnosis, either by its usual techniques or drugs. By installing "positive suggestions" in a subject, he can be made to act like an insane person. This test is not a new one. It has been well known that compulsions or repressions can be so introduced into the psyche. The ancient Greek was quite familiar with it and used it to produce various delusions.

There is what is known as a "post-hypnotic suggestion." An understanding of this can assist an understanding of the basic mechanism of insanity. The actions under both circumstances are not identical, but they are similar enough in their essence.

A man is placed in a hypnotic trance by standard hypnotic technique or some hypnotic drug. The operator then may say to him, "When you awaken there is something you must do. Whenever I touch my tie you will remove your coat. When I let go my tie, you will put on your coat. Now you will forget that I have told you to do this."

The subject is then awakened. He is not consciously aware of the command. If told he had been given an order while "asleep," he would resist the idea or shrug but he would not know. The operator then touches his tie. The subject may make some remark about its being too warm and so take his coat off. The operator then releases his tie. The subject may remark that he is now cold and will put his coat back on. The operator then touches his tie. The subject may say that his coat has been to the tailor's and with much conversation finally explain why he is taking it off, perhaps to see if the back seam had been sewn properly. The operator then releases his tie and the subject says he is satisfied with the tailor and so replaces his coat. The operator may touch his tie many times and each time receive action on the part of the subject.

At last the subject may become aware, from the expressions on people's faces, that something is wrong. He will not know what is wrong. He will not even know that the touching of the tie is the signal which makes him take off his coat. He will begin to grow uncomfortable. He may find fault with the operator's appearance and begin to criticize his clothing. He still does not know the tie is a signal. He will still react and remain in ignorance that there is some strange reason he must take off his coat -- all he knows is that he is uncomfortable with his coat on whenever the tie is touched, uncomfortable with his coat off every time the tie is released.

These various actions are very important to an understanding of the reactive mind. Hypnotism is a laboratory tool. It is not used to any extent in dianetic therapy, but it has served as a means of examining minds and getting their reactions. Hypnotism is a wild variable. A few people can be hypnotized, many cannot be. Hypnotic suggestions will sometimes "take" and sometimes they won't.

Sometimes they make persons well and sometimes they make them ill -- the same suggestion reacting differently in different people. An engineer knows how to make use of a wild variable. There is something which makes it unpredictable. Finding out the basic reason hypnotism was a variable helped to discover the source of insanity. And understanding the mechanism of the post-hypnotic suggestion can aid an understanding of aberration.

No matter how foolish a suggestion is given to a subject under hypnosis, he will carry it out one way or another. He can be told to remove his shoes or call someone at ten the following day or to eat peas for breakfast and he will. These are direct orders and he will comply with them. He can be told that his hats do not fit him and he will believe that they do not. Any suggestion will operate within his mind unbeknownst to his higher levels of awareness.

Very complex suggestions can be given. One such would be to the effect that he was unable to utter the word "I." He would omit it from his conversation, using remarkable makeshifts without being "aware" that he was having to avoid the word. Or he could be told that he must never look at his hands and he will not. These are repressions. Given to the subject when drugged or in a hypnotic sleep, these suggestions operate when he is awake. And they will continue to operate until released by the hypnotic operator.

He can be told that he has an urge to sneeze every time he hears the word "rug" and that he will sneeze when it is spoken. He can be told that he must jump two feet in the air every time he sees a cat and he will jump. And he will do these things after he has been awakened. These are compulsions.

He can be told that he will think very sexual thoughts about a certain girl but that when he thinks them he will feel his nose itch. He can be told that he has a continual urge to lie down and sleep and that every time he lies down he will feel that he cannot sleep. He will experience these things. These are neuroses.

In further experiments he can be told, when he is in his hypnotic "sleep," that he is the president of the country and that the secret service agents are trying to murder him. Or he can be told that he is being fed poison in every restaurant in which he attempts to eat. These are psychoses.

He can be informed that he is really another person and that he owns a yacht and answers to the name of "Sir Reginald." Or he can be told that he is a thief, that he has a prison record, and that the police are looking for him. These would be schizophrenic and paranoid-schizophrenic insanities respectively.

The operator can inform the subject that the subject is the most wonderful person on earth and that everybody thinks so. Or that the subject is the object of adoration of all women. This would be a manic-type insanity.

He can be convinced, while hypnotized, that when he wakes he will feel so terrible that he will hope for nothing but death. This would be the depressive-type insanity.

He can be told that all he can think about is how sick he is and that every malady of which he reads becomes his. This would make him react like a hypochondriac.

Thus we could go down the catalogue of mental ills and by concocting positive suggestions to create the state of mind, we could bring about, in the awakened subject, a semblance to every insanity.

Understood that these are semblances. They are similar to insanity in that the subject would act like an insane person. He would not be an insane person. The moment the suggestion is relieved -- the subject being informed that it was a suggestion -- the aberration (and all these insanities, etc., are grouped under the heading of aberration) theoretically vanishes.* * An injunction here. These are tests. They have been made on people who could be hypnotized and people who could not be but who were drugged. They brought forth valuable data for dianetics. They can be duplicated only when you know dianetics unless you want to actually drive somebody insane by accident. For these suggestions do not always vanish. Hypnotism is a wild variable. It is dangerous and belongs in the parlor in the same way you would want an atom bomb there.

The duplication of aberrations of all classes and kinds in subjects who have been hypnotized or drugged has demonstrated that there is some portion of the mind which is not in contact with the consciousness but which contains data.

It was the search for this portion of the mind which led to the resolution of the problem of insanity, psycho-somatic ills and other aberrations. It was not approached through hypnotism, and hypnotism is just another tool, a tool which is of only occasional use in the practice of dianetics and is, indeed, not needed at all.

Here we have an individual who is acting sanely, who is given a positive suggestion and who then temporarily acts insanely. His sanity is restored by the release of the suggestion into his consciousness, at which moment it loses its force upon him. But this is only a semblance of the mechanism involved. The actual insanity, one not laid now by some hypnotist, does not need to emerge into the consciousness to be released. There is this difference and others between hypnotism and the actual source of aberration; but hypnotism is a demonstration of its working parts.

Review the first example of the positive suggestion. The subject was "unconscious," which is to say, he was not in possession of complete awareness or self-determinism. He was given something he must do and the something was hidden from his consciousness. The operator gave him a signal. When the signal occurred, the subject performed an act. The subject gave reasons for the act which were not the real reasons for it. The subject found fault with the operator and the operator's clothing but did not see that it was the tie which signaled the action. The suggestion was released and the subject no longer felt a compulsion to perform the act.

These are the parts of aberration. Once one knows exactly what parts of what are aberrations, the whole problem is very simple. It seems incredible at first glance that the source could have remained so thoroughly hidden for so many thousands of years of research. But at second glance, it becomes a wonder that the source was ever discovered. For it is hidden cunningly and well.

"Unconsciousness" of the non-hypnotic variety is a little more rugged. It takes more than a few passes of the hand to cause "unconsciousness" of the insanity-producing variety.

The shock of accidents, the anaesthetics used for operations, the pain of injuries and the deliriums of illness are the principal sources of what we call "unconsciousness."

The mechanism, in our analogue of the mind, is very simple. In comes a destructive wave of physical pain or a pervading poison such as ether and out go some or all of the fuses of the analytical mind. When it goes out, so go what we know as the standard memory banks.

The periods of "unconsciousness" are blanks in the standard memory banks. These missing periods make up what dianetics calls the reactive mind bank.

The times when the analytical mind is in full operation plus the times when the reactive mind is in operation are a continuous line of consecutive recording for the entire period of life.

During the periods when the analytical mind is cut out of circuit in full or in part, the reactive mind cuts in in full or in part. In other words, if the analytical mind is unfused so that it is half out of circuit, the reactive mind is half in circuit. No such sharp percentages are actually possible, but this is to give an approximation.

When the individual is "unconscious" in full or in part, the reactive mind is cut in in full or in part. When he is fully conscious, his analytical mind is fully in command of the organism. When his consciousness is reduced, the reactive mind is cut into the circuit just that much.

The moments which contain "unconsciousness" in the individual are contra-survival moments, by and large. Therefore it is vital that something take over so that the individual can go through motions to save the whole organism. The fighter who fights half out on his feet, the burned man who drags himself out of the fire -- these are cases when the reactive mind is valuable.

The reactive mind is very rugged. It would have to be in order to stand up to the pain waves which knock out other sentience in the body. It is not very refined. But it is most awesomely accurate. It possesses a low order of computing ability, an order which is sub-moron, but one would expect a low order of ability from a mind which stays in circuit when the body is being crushed or fried.

The reactive bank does not store memories as we think of them. It stores engrams. * These engrams are a complete recording, down to the last accurate detail, of every perception present in a moment of partial or full "unconsciousness." They are just as accurate as any other recording in the body. But they have their own force. They are like phonograph records or motion pictures, if these contained all perceptions of sight, sound, smell, taste, organic sensation, etc.

The difference between an engram and a memory, however, is quite distinct. An engram can be permanently fused into any and all body circuits and behaves like an entity.

In all laboratory tests on these engrams they were found to possess "inexhaustible" sources of power to command the body. No matter how many times one was reactivated in an individual, it was still powerful. Indeed, it became even more able to exert its power in proportion to its reactivation.

The only thing which could even begin to shake these engrams was the technique which developed into dianetic therapy, which will be covered in full in the third section of this volume.

This is an example of an engram: A woman is knocked down by a blow. She is rendered "unconscious." She is kicked and told she is a faker, that she is no good, that she is always changing her mind. A chair is overturned in the process. A faucet is running in the kitchen. A car is passing in the street outside. The engram contains a running record of all these perceptions: sight, sound, tactile, taste, smell, organic sensation, kinetic sense, joint position, thirst record, etc. The engram would consist of the whole statement made to her when she was "unconscious": the voice tones and emotion in the voice, the sound and feel of the original and later blows, the tactile of the floor, the feel and sound of the chair overturning, the organic sensation of the blow, perhaps the taste of blood in her mouth or any other taste present there, the smell of the person attacking her and the smells in the room, the sound of the passing car's motor and tires, etc.

These would all be considered something on the order of a "positive suggestion." But there is something else here which is new, something which is not in the standard banks except by context: pain and painful emotion.

These things are what make the difference between the standard banks and the reactive engram banks: physical pain and painful emotion. Physical pain and painful emotion are the difference between an engram, which is the cause of aberration, all aberration, and a memory.*
 * In dianetics, a memory is considered to be any concept of perceptions stored in the standard memory banks which is potentially recallable by the "I." A scene beheld by the eyes and perceived by the other senses becomes a record in the standard memory banks and later may be recalled by "I" for reference.

We all have heard that bad experience is helpful to living and that without bad experience, man never learns. This may be very, very true. But it doesn't embrace the engram. That isn't experience. That is commanded action.

Perhaps before Man had a large vocabulary, these engrams were of some use to him. They were survival in ways which will be developed later. But when Man acquired a fine, homonymic (words that sound the same but mean different things) language, and indeed, when he acquired any language, these engrams were much more a liability than a help. And now with Man well evolved, these engrams do not protect him at all but make him mad, inefficient and ill.

The proof of any assertion lies in its applicability. When these engrams are deleted from the reactive mind bank, rationality and efficiency are enormously heightened, health is greatly increased and the individual computes rationally on the survival conduct pattern, which is to say, he enjoys himself and the society of those around him and is constructive and creative. He is destructive only when something actually threatens the sphere of his dynamics.

These engrams, then, are entirely negative in value in this stage of Man's development. When he was nearer the level of his animal cousins (who have, all of them, reactive minds of this same kind), he might have had use for the data. But language and his changed existence make any engram a distinct liability, and no engram has any constructive value.

The reactive mind was provided to secure survival. It still pretends to act in that fashion. But its wild errors now lead only in the other direction.

There are actually three kinds of engrams, all of them aberrative: First is the contra-survival engram. This contains physical pain, painful emotion, all other perceptions and menace to the organism. A child knocked out by a rapist and abused receives this type of engram. The contra-survival engram contains apparent or actual antagonism to the organism.

The second engram type is the pro-survival engram. A child who has been abused is ill. He is told, while he is partially or wholly "unconscious," that he will be taken care of, that he is dearly loved, etc. This engram is not taken as contra-survival but pro-survival. It seems to be in favor of survival. Of the two this last is the most aberrative since it is reinforced by the law of affinity which is always more powerful than fear. Hypnotism preys on this characteristic of the reactive mind, being a sympathetic address to an artificially unconscious subject. Hypnotism is as limited as it is because it does not contain, as a factor, physical pain, and painful emotion: things which keep an engram out of sight and moored below the level of "consciousness."

The third is the painful emotion engram which is similar to the other engrams. It is caused by the shock of sudden loss such as the death of a loved one.

The reactive mind bank is composed exclusively of these engrams. The reactive mind thinks exclusively with these engrams. And it "thinks" with them in a way which would make Korzybski swear, for it thinks in terms of full identification, which is to say identities, one thing identical to another.

If the analytical mind did a computation on apples and worms, it could be stated, probably, as follows: some apples have worms in them, other don't; when biting an apple one

occasionally finds a worm unless the apple has been sprayed properly; worms in apples leaves holes.

The reactive mind, however, doing a computation on apples and worms as contained in its engram bank, would calculate as follows: apples are worms are bites are holes in apples are holes in anything are apples and always are worms are apples are bites, etc.

The analytical mind's computations might embrace the most staggering summations of calculus, the shifty turns of symbolic logic, the computations requisite to bridge-building or dress-making. Any mathematical equation ever seen came from the analytical mind and might be used by the analytical mind in resolving the most routine problems.

But not the reactive mind! That's so beautifully, wonderfully simple that it can be stated, in operation, to have just one equation: $A = A = A = A = A$.

Start any computation with the reactive mind. Start it with the data it contains, of course. Any datum is just the same to it as any other datum in the same experience.

An analytical computation done on the woman being kicked, as mentioned, would be that women get themselves into situations sometimes when they get kicked and hurt and men have been known to kick and hurt women.

A reactive mind computation about his engram, as an engram, would be: the pain of the kick equals the pain of the blow equals the overturning chair equals the passing car equals the faucet equals the fact that she is a faker equals the fact that she is no good equals the fact that she changes her mind equals the voice tones of the man equals the emotion equals a faker equals a faucet running equals the pain of the kick equals organic sensation in the area of the kick equals the overturning chair equals changing one's mind equals.... But why continue? Every single perception in this engram equals every other perception in this engram. What? That's crazy? Precisely!

Let us further examine our post-hypnotic positive suggestion of the touched tie and the removed coat. In this we have the visible factors of how the reactive mind operates.

This post-hypnotic suggestion needs only an emotional charge and physical pain to make it a dangerous engram. Actually it is an engram of a sort. It is laid in by sympathy between the operator and subject, which would make it a sympathy engram -- pro-survival.

Now we know that the operator had only to touch his tie to make the awakened subject remove his coat. The subject did not know what it was which caused him to remove his coat and found all manner of explanation for the action, none of which was the right one. The engram, the post-hypnotic suggestion in this case, was actually placed in the reactive mind bank. It was below the level of consciousness, it was compulsion springing from below the level of consciousness. And it worked upon the muscles to make the subject remove his coat. It was data fused into the circuits of the body below the command level of the analytical mind and operated not only upon the body but also upon the analytical mind itself.

If this subject took off his coat every time he saw somebody touch a necktie, society would account him slightly mad. And yet there was no power of consent about this. If he had attempted to thwart the operator by refusing to remove the coat, the subject would have experienced great discomfort of one sort or another.

Let us now take an example of the reactive mind's processes in a lower echelon of life: a fish swims into the shallows where the water is brackish, yellow, and tastes of iron. He has just taken a mouthful of shrimp when a bigger fish rushes at him and knocks against his tail.

The small fish manages to get away but he has been physically hurt. Having negligible analytical powers, the small fish depends upon reaction for much of his choice of activity.

Now he heals his tail and goes on about his affairs. But one day he is attacked by a larger fish and gets his tail bumped. This time he is not seriously hurt, merely bumped. But something has happened. Something within him considers that in his choice of action he is now being careless. Here is a second injury in the same area.

The computation on the fish reactive level was: shallows equals brackish equals yellow equals iron taste equals pain in tail equals shrimp in mouth, and any one of these equals any other.

The bump in the tail on the second occasion keyed-in the engram. It demonstrated to the organism that something like the first accident (identity thought) could happen again. Therefore, beware!

The small fish, after this, swims into brackish water. This makes him slightly "nervous." But he goes on swimming and finds himself in yellow and brackish water. And still he does not turn back. He begins to get a small pain in his tail. But he keeps on swimming. Suddenly he gets a taste of iron and the pain in his tail turns on heavily. And away he goes like a flash. No fish was after him. There were shrimp to be had there. But away he went anyway. Dangerous place! And if he had not turned away, he would have really gotten himself a pain in the tail.

The mechanism is survival activity of a sort. In a fish it may serve a purpose. But in a man, who takes off a coat every time somebody touches a tie, the survival mechanism has long outlived its time. But it is there!

Let us further investigate our young man and the coat. The signal for the coat removal was very precise. The operator touched his tie. This is equivalent to any or all of the perceptions the fish received and which made the fish turn back. The touch of the tie could have been a dozen things. Any one of the dozen might have signaled the removal of the coat.

In the case of the woman who was knocked out and kicked, any perception in the engram she received has some quality of restimulation. Running water from a faucet might not have affected her greatly. But water running from a faucet plus a passing car might have begun some slight reactivation of the engram, a vague discomfort in the areas where she was struck and kicked, not enough yet to cause her real pain but there all the same. To the running water and the passing car we add the sharp falling of a chair and she experiences a shock of mild proportion. Add now the smell and voice of the man who kicked her and the pain begins to grow. The mechanism is telling her that she is in dangerous quarters, that she should leave. But she is not a fish, she is a highly sentient being, to our knowledge the most complex mental structure so far evolved on Earth, organism of the species, Man. There are many other factors in the problem than this one engram. She stays. The pains in the areas where she was abused become a predisposition to illness or are chronic illness in themselves, minor it is true in the case of this one incident, but illness just the same. Her affinity with the man who beat her may be so high that the analytical level, being assisted by a normally high general tone, may counter against these pains. But if that level is low, without much to assist it, then the pains can become major.

The fish that was so struck and received an engram did not disavow shrimp. Shrimp might have made him a little less enthusiastic afterwards, but the survival potential of shrimp-eating made shrimp equal far more pleasure than it did pain.

A pleasant and hopeful life in general -- and never think we intimate that the woman stays for food alone whatever the wits say about women -- has a high survival potential, and that can overcome a very great deal of pain. As the survival potential diminishes, however, the level of pain (Zone 0 and Zone 1) is more closely approached and such an engram could begin to be reactivated severely.

There is another factor here, however, besides pain -- in fact, several more factors. If the young man with the detachable coat had been given one of the neurotic positive suggestions as listed a few pages back, he would have reacted to it on signal.

The engram this woman has received contains a neurotic positive suggestion quite in addition to the general restimulators such as the faucet and the car and the overturning chair. She has been told that she is a faker, that she is no good, and that she is always changing her mind. When the engram is restimulated in one of the great many ways possible, she has a "feeling" that she is no good, a faker, and she will change her mind.

There are several cases to hand which peculiarly illustrate the sadness of this. One case in particular which was cleared had been beaten severely many times and told a similar thing each time, all derogatory. The content inferred that she was very loose morally and would cohabit with anyone. She was brought in as a case by her father -- she had since been divorced -- who complained that she was very loose morally and had cohabited with several men in as many weeks. She herself admitted that she was, she could not see how it could be and it worried her, but she just "could not seem to help it." Examination of the engrams in her reactive mind bank brought forth a long series of beatings with this content. Because this was a matter of research, not treatment -- although that was given -- her former husband was contacted. An examination, independent of her knowledge, demonstrated his rage dramatization to contain these very words. He had beaten his wife into being a morally loose woman because he was afraid of morally loose women.

All cases examined in all this research were checked, the patient's engrams against the engrams in the donor. The contents of the incidents were verified wherever possible and were found uniformly to agree. Every safeguard was made to prevent any other method of communication between donor and patient. Everything found in the "unconscious" periods of every patient, when checked against other source, was found to be exact.

The analogy between hypnotism and aberration bears out well. Hypnotism plants by positive suggestion one or another form of insanity. It is usually a temporary planting, but sometimes the hypnotic suggestion will not "lift" or remove in a way desirable to the hypnotist. The danger of running experiments with hypnosis. on uncleared patients is found in another mechanism of the reactive kind.

When an engram such as our example above exists, the woman obviously was "unconscious" at the time she received the engram. She had no standard bank memory (record) of the incident beyond the knowledge that she had been knocked out by the man. The engram was not, then, an experience as we understand the word. It could work from below to aberrate her thinking processes, it could give her strange pains -- which she attributed to something else -- in the areas injured. But it was not known to her.

The key-in was necessary to activate the engram. But what, precisely, could key it in? At some later time when she was tired the man threatened to strike her again and called her names. This was conscious level experience. It was found to be "mentally painful" by her. And it was "mentally painful" only because there was real, live, physical pain unseen under it, which had been "keyed-in" by the conscious experience. The second experience was a lock. It was a memory but it had a new kind of action in the standard banks. It had too much power and it gained that power from a past physical blow. The reactive mind is not too careful about its time clock. It can't tell one year old from ninety, in fact, when a key-in begins. The actual engram moved up under the standard bank.

She thinks she is worried about what he said in the lock experience. She is actually worried about the engram. In this way memories become "painful." But pain doesn't store in the standard banks. There is no place in that bank for pain. None. There is a place for the concept of pain and these concepts of what is painful are good enough to keep the sentient organism called Man away from all the pain he believes is actually dangerous. In a clear there

are no pain-inducing memories because there is no physical pain record left to ruin the machinery from the reactive mind bank.

The young man with the detachable coat did not know what was worrying him or what made him do what he did. The person with an engram does not know what is worrying him. He thinks it is the lock and the lock may be a very long way removed from anything resembling the engram. The lock may have similar perceptive content. But it may be on another subject entirely.

It is not very complicated to understand what these engrams do. They are simply moments of physical pain strong enough to throw part or all the analytical machinery out of circuit; they are antagonism to the survival of the organism or pretended sympathy to the organism's survival. That is the entire definition. Great or little "unconsciousness," physical pain, perceptive content and contra-survival or pro-survival data. They are handled by the reactive mind, which thinks exclusively in identities of everything equals everything. And they enforce their commands upon the organism by wielding the whip of physical pain. If the organism does not do exactly as they say (and believe any clear, that's impossible!), the physical pain turns on. They steer a person like a keeper steers a tiger -- and they can make a tiger out of a man in the process without much trouble -- and give him mangle into the bargain.

If man had not invented language, or, as will be demonstrated, if his languages were a little less homonymic and more specific with their personal pronouns, engrams would still be survival data and the mechanism would work. But Man has outgrown their use. He chose between language and potential madness and for the vast benefits of the former he received the curse of the latter.

The engram is the single and sole source of aberration and psycho-somatic illness.

An enormous quantity of data has been sifted. Not one single exception has been found. In "normal people," in the neurotic and insane, the removal of these engrams wholly or in part, without other therapy, has uniformly brought about a state greatly superior to the current norm. No need was found for any theory or therapy other than those given in this book for the treatment of all psychic or psycho-somatic ills.

CHAPTER III

The Cell and the Organism

The reason the engram so long remained hidden as the single source of aberration and psycho-somatic ills is the wide and almost infinitely complex manifestations which can derive from simple engrams.

Several theories could be postulated as to why the human mind evolved exactly as it did, but these are theories, and dianetics is not concerned with structure. A comment or two as a stimulation to future workers in that field might be made, however, wholly as a postulate, that there is a definite connection between any electriclike energy in the body and the energy effusion of cells undergoing injury. A theory could be constructed along the lines that injured cells, further injuring their neighbors by a discharge of electric-like energy, forced the development of a special cell which would act as a conduit to "bleed off" this painful charge. The conduits of cells might have become neurons and the charge might have been better distributed so through the body with less likelihood of local incapacitation at the point of the injury impact. These conduits -- neurons -- might have been started in formation by impacts at the extremity of the body toward the direction of locomotion. This would make the skull the greatest mass of neurons. Man, walking upright, might have had another new point of impact, the forehead, and so gained his pre-frontal lobes. And maybe not. That is just theory, with only a few data to support it which have a scientific value. And it has not been subjected to experiment of any kind whatever.

This much, however, has to be advanced as theory on structure. The cell is one of the basic building blocks of the body. Cells, the better to survive, seem to have become colonies which, in turn, had the primary interest, survival. And the colonies developed or recruited into aggregations which in turn were organisms, also with the sole purpose of survival. And the organisms developed minds to coordinate the muscles and resolve the problems of survival. Again, this is still theory and even if it was the track of reasoning which led toward dianetics, it can be completely wrong. It works. It can be pulled away from dianetics and dianetics will remain a science and go on working. The concept of the electronic brain was not vital but only useful to dianetics and it could be swept away as well -- dianetics would still stand. A science is a changing affair as far as its internal theory goes. In dianetics we have our wedge into an enormous scope of research. As dianetics stands, it works and it works every time and without exception. The reasons why it works will undoubtedly be mulled over and changed here and there to its betterment -- if they aren't, an abiding faith in this generation of scientists and the future generations will not have been justified.

Why we talk about cells will become apparent as we progress. The reason we know that past concepts of structure are not correct is because they don't work as function. All our facts are functional and these facts are scientific facts, supported wholly and completely by laboratory evidence. Function precedes structure. James Clerk Maxwell's mathematics were postulated and electricity was widely and beneficially used long before anyone had any real idea about the structure of the atom. Function always comes before structure. The astounding lack of progress in the field of the human mind during the past thousands of years is partly attributable to its "organ of thought" lying within a field, medicine, which was and long may be an art, not a science. Basic philosophy to explain life will have to come before that art makes much further progress.

What the capabilities of the cell are, for instance, have been but poorly studied. Some work has been carried on in recent years to find out more, but basic philosophy was absent. The cell was being observed, not predicted.

The studies of cells in Man have been largely done from dead tissue. An unknown quality is missing from dead tissue, the important quality -- life.

In dianetics, on the level of laboratory observation, we discover much to our astonishment that cells are evidently sentient in some currently inexplicable way. Unless we postulate a human soul entering the sperm and ovum at conception, there are things which no other postulate will embrace than that these cells are in some way sentient. Entering a new field with postulates which work in all directions -- and the basic philosophy of survival is a pilot which leads us on and on into further and further realms, explaining and predicting phenomena on every hand -- it is inevitable that data will turn up which does not agree with past theory. When that data is as scientific as the observation that when an apple is dropped under usual conditions on Earth it falls, one cannot help but accept it. Abandoning past theories may do damage to treasured beliefs and one's nostalgic love of the old school tie, but a fact is a fact.

The cells as thought units evidently have an influence, as cells, upon the body as a thought unit and an organism. We do not have to untangle this structural problem to resolve our functional postulates. The cells evidently retain engrams of painful events. After all, they are the things which get injured. And they evidently retain a whip hand of punishment for every time the analyzer fails them. The story of the engram seems to be a story of a battle between the troops and the general every time the general gets some of the troops killed off. The less fortunate this general is in protecting these troops, the more power the troops assume. The cells evidently pushed the brain on an upward evolution toward higher sentience. Pain reversed the process as though the cells were sorry they had put so much power in the hands of a central commander.

The reactive mind may very well be the combined cellular intelligence. One need not assume that it is, but it is a handy structural theory in the lack of any real work done in this field of structure. The reactive engram bank may be material stored in the cells themselves. It does not matter whether this is credible or incredible just now. Something has to be said about it to give one a mental hold on what happens during moments of "unconsciousness."

The scientific fact, observed and tested, is that the organism, in the presence of physical pain, lets the analyzer get knocked out of circuit so that there is a limited quantity or no quantity at all of personal awareness as a unit organism. It does this either to protect the analyzer or to withdraw its power in the belief that an engram is best in an emergency -- with which the analyzer, by the way, on observed experience, does not agree.

Every percept present, including physical pain, is recorded during these non-analytical moments. Whenever pain is present -- physical pain -- that is, the analyzer gets shut down to a small or large extent. If the duration of the pain is only an instant, there is still an instant there of analytical reduction. This can be proven very easily -- just try to recall the last time you were seriously hurt and see if there isn't at least a momentary blank period. Going to sleep under anaesthetic and waking up some time later is a more complicated sort of shut-down in that it includes physical pain but is initially caused by a poison (and all anaesthetics are poisons, technically). Then there is the condition of suffocating, as in drowning, and this is a shut-down period to greater or lesser extent. And there is the condition caused by blood, for one cause or another, leaving the area or areas which contain analytical power -- wherever they are -- and this again causes a greater or lesser degree of analytical shutdown: such incidents include shock (in which the blood tends to lake in the center of the body), the loss of blood by surgery or injury or anemia and the closing of the arteries leading through the throat. Natural sleep causes a reduction of analytical activity but is actually not very deep or serious; by dianetic therapy any experience occurring during sleep can be recovered with ease.

It can now be seen that there are many ways in which analytical power can be shut down. And it can be seen that there is greater or lesser reduction. When one burns one's finger with a cigarette, there is a small instant of pain and a small amount of reduction. When one undergoes an operation, the duration may be in terms of hours and the amount of shut-down may be extreme. The duration and the amount of reduction are two different things, related but quite dissimilar. This is not so very important but it is mentioned.

We have seen, reading in dianetics this far, that the principle of the spectrum has been quite useful to us. And it can be seen that the amount of reduction in analytical power can be described in the same way that survival potential can be described. There can be a very little bit and there can be a very great deal. Going back and taking a look at the survival potential range, one can see that there would be death at the bottom and immortality at the top. There is "infinite" survival. Whether or not there can be infinite analytical power is a matter of mysticism. But that there is a definite relationship between individual tone and the amount of analytical shutdown is a scientific fact. Put it this way: with the individual well and happy and enthusiastic, analytical power can be considered to be high (Zones 3 and 4). With the individual under the wheels of a truck, "unconscious" and in agony, the analytical power may be considered to be ranging in Zone 0. There is a ratio between potential survival and analytical power. As one goes down, so does the other. There is more data to be concluded from this than one would think at first glance. It is a very important ratio.

All the percepts are included in an engram. Two of these percepts are physical pain and painful emotion. A third is organic sensation, which is to say, the condition of the organism during the moment of the engram. And how was the organism when the engram was received?

Greater or lesser "unconsciousness" was present. This meant that there was an organic sensation of reduced analytical power, since analytical power derives, evidently, from an organ or organs in the body. If an engram is reactivated by a restimulator or restimulators -- that is to say if the individual with an engram receives something in his environment similar to the perceptions in the engram -- the engram puts everything it contains -- its percepts such as faucets and words -- into greater or lesser operation.

There can be greater or lesser restimulation. An engram can be put into force just a little bit by restimulators in the environment of the individual or, with many restimulators present and the body in an already reduced state, the engram can go into a full force display (which is covered later). But whether the engram is slightly restimulated or greatly restimulated, everything in it goes into effect one way or another.

There is just one common denominator of all engrams, just one thing which every engram has and which is possessed by every other engram. Each contains the datum that the analyzer is more or less shut-down. There is a shut-down datum in every engram. Therefore, every time an engram is restimulated, even though physical pain has not been received by the body, some analytical power turns off, the organ or organs which are the analyzer are fused out of circuit in some degree.

This is highly important to an understanding of the mechanics of aberration. It is a scientific fact, susceptible of proof, and it never varies. This always happens: when an engram is received, the analyzer is shut down by the physical pain and emotion; when the engram is restimulated the analyzer shuts down as part of the commands of the engram. Actually this is a very mechanical thing. Engram is restimulated, part of the analytical power is shut down. This is as inevitable as turning on and off an electric light. Pull the cord and the light goes off. The reduction of the analyzer is not that sharp -- there are grades of light -- but it is just as mechanical.

Put a man under ether, hurt him in the chest. He has received an engram because his analytical power was turned off first by ether and then by a chest pain. While he was there on the operating table, the reactive mind recorded the click of instruments, everything said, all sounds and smells. Let us suppose that a nurse was holding one of his feet because he was kicking. This is a complete engram.

The engram will be keyed-in by something in the future, a similar incident. After this, in greater or lesser degree, whenever he hears clicks like instrument clicks he gets nervous. If he pays attention to what is happening in his body at that minute, he may find that his foot feels slightly as if it were being held. But he is not likely to give any attention to his foot because if

he had any attention to give, the chest pain would be found present in some degree. But his analytical ability has been turned off slightly. As the foot felt it was being held, so does the analyzer have the conception of being shut down by ether and pain. The restimulator (the clicking) tended to bring the whole engram slightly into being and part of the engram command is a reduced analytical power.

This is "push-button" in its precision. If one knew another's main restimulators (words, voice tones, music, whatever they are -- things which are filed in the reactive mind bank as parts of engrams) one could turn another's analytical power almost completely off, actually render him unconscious.

We all know people who make us feel stupid. There can be two causes for that but both of them are from engrams and one of them is the fact that no matter what engram is brought into restimulation, part of the analytical power is turned off.

Engrams can, if environment is uniform, be held in chronic restimulation. This means a chronic partial shutdown of analytical power. The recovery of intelligence by a clear and the rise of that intelligence to such fantastic heights results in part from the relief of word commands in engrams that he is stupid and in a larger part from the relief of this chronic shut-down condition.

This is not theory. This is scientific fact. It is strictly test-tube. The engram contains the percept of a shutdown analyzer; when it is restimulated the engram puts that datum back into force in some degree.

Engrams, then, being received in "unconsciousness" cause a partial "unconsciousness" to exist every time they are restimulated. The person who has an engram (any aberree) need not receive new physical pain to have a new moment of partial "unconsciousness" take place. Feeling "dopey" or "sleepy" or "dull" results in part from a partially shut-down analyzer. Being "nervous" or in a rage or frightened also carries with it partially shutoff analytical power.

The hypnotist has "success" where he does because he is able, by talking to people about "sleep," to put into restimulation some engram which contains the word sleep and shut-down analytical power. This is one of the reasons hypnotism "works."

The whole society, however, is liable to analytical shutdown in greater or lesser degree by the restimulation of engrams.

The number of engrams a person's reactive bank contains may not, however, establish the amount of analytical reduction to which he is subjected. A person may have engrams and they may not have been keyed-in. And if they have been keyed-in, he might not be in an environment which contains any great number of restimulators. Under these conditions his survival zone position may be high even though he is possessed of a great many engrams. And again, he might have educated himself over and above these engrams to some slight degree.

But a person who has keyed-in engrams and does exist in the area of many restimulators is liable to an enormous amount of restimulation and analytical shut-down. This is a normal condition. If a person has a large number of engrams and they are keyed-in and he lives around many restimulators his condition can vary from normal to insane. And in a single day -- as in the case of a man who experiences moments of rage or a woman who drops into apathies -- the condition of a person may vary from normal to insane and back to normal. We take here the word "insane" to mean utter irrationality. So there is temporary or chronic insanity.

The court of law which goes through the lugubrious process of having a man pronounced sane or insane after that man has murdered somebody is itself being irrational. Of course the man was insane when he committed the murder. What the court is asking now is whether or not the man is chronically insane. This has little bearing on the matter. If a man has

gone insane enough to murder once, he will go insane enough in the future to murder again. Chronic, then, means either a chronic cycle or a continuous condition. The law says sanity is the “ability to tell right from wrong.” When Man is subject to a mechanism (and all men are) which lets him be rational one minute and restimulated the next, none in the society, if uncleared, can be considered able to always tell right from wrong. This is completely aside from what the law means by “right” and what it means by “wrong.”

This is an example of the roller-coaster sanity curve of the aberree. All aberrees possess engrams (the normal number is probably in the hundreds per individual). Analytically people have a wide latitude of choice and they can deal even with philosophic rights and wrongs. But in aberrated persons the engram bank is always susceptible of restimulation. The “sanest” aberree of Tuesday may be a murderer on Wednesday if the exactly right situation occurs to trip the exact engram. A clear is not entirely predictable in any given situation -- he has such a wide power of choice. But an aberrated person transcends all predictability for the following reasons: (1) what engrams an aberree has in his reactive engram bank none know including himself; (2) what situation will contain what restimulators is a matter of chance; and (3) what his power of choice will be with the factors in the engrams on a reactive level cannot be established.

The variety of conduct which one can evolve out of these basic mechanics is so wide that it is no wonder that Man was considered to be a rather hopeless case by some philosophies.

The cells, if the engram bank is retained on a cellular level, might be theoretically supposed to have made sure that the analyzer did not get too adventurous in this life and death matter of living. They therefore could be considered to have copied down all data contained in every moment of physical pain and emotion resulting in or contained in “unconsciousness.” Then when any data similar to this appeared in the environment they could be wary and, with a large number of restimulators in sight, they could be considered to shut down the analyzer and proceed on reaction. This has a crude safety factor. Obviously, if the organism survived through one period of “unconsciousness,” it could be theorized by the cells that the placing of the data and action in effect under circumstances which threatened to be similar would result once more in survival. What’s good enough for grandpa is good enough for me. What was good enough in the bus accident is good enough in a bus.

This moronic “thinking” is typical of the reactive mind. It is just the sort of thinking it does. It is the ultimate in conservatism. It misses the point and important data at every turn, it overloads the body with pain, it is a whirlpool of confusion. If there were just one engram per situation, maybe it would get by. But there may be ten engrams with similar data in them (an engram lock chain) and yet the data may be so contradictory that when a new emergency arises which contains the restimulators of the chain, no proper past conduct can be put forth to meet it.

Obviously the x factor is language. The cells, if this is a problem in cells (for recall, this part is theory based on data in an effort to explain what happens and a theory can be altered without altering the scientific usefulness of the facts), probably do not understand languages very well. If they did they wouldn’t evolve such “solutions.”

Take two engrams about baseball bats. In the first, the individual is hit on the head and knocked out and somebody yells, “Run! Run! Run!” In the second the individual is knocked out by the bat in the same environment and somebody yells, “Stay there! You’re safe!” Now what does he do when he hears a baseball bat or smells one or sees one or hears these words? Run or stay there! He has a similar pain for each action. What actually happens? He gets a headache. This is that thing called conflict. This is anxiety. And anxiety can become very acute indeed on a purely mechanical level when one has ninety engrams pulling him south and eighty-nine pulling him north. Does he go north or south? Or does he have a “nervous breakdown?”

The level of brilliance of the reactive mind is about the same as a phonograph. The needle gets put on the record and the record plays. The reactive mind merely puts on the needle. When it tries to select several records out and play them all at once, things happen.

By intentional construction or accident in design or by-pass in evolution -- where the old, useless organ is still built -- the cells managed to hide this engram bank fairly well. Man is conscious in his analytical mind. When he is "unconscious," his analytical mind is unable to monitor the incoming data and the data is not to be found in the thing we call, by analogue, the standard banks. Therefore whatever came in passed by consciousness. And having passed by, consciousness cannot (without dianetic process) recall it, since there is no channel for recall.

The engram enters when consciousness is absent. It thereafter operates directly into the organism. Only by dianetic therapy can the analyzer come into possession of this data (and the removal of it does not depend upon the analyzer contacting it at all, despite an old belief that the "realization" of something cures it: "realize" an engram and one is in quick trouble, without dianetic technique). The engram is received by the cellular body. The reactive mind could be the very lowest level of analytical power, of course, but this does not alter the scientific fact that the engram acts as if it were a soldered-in connection to the life function regulator and the organic co-ordination and the basic level of the analytical mind itself. By "soldered-in" is meant "permanent connection." This keying-in is the hook-up of the engram as part of the operating machinery of the body. An analytical thought process is not permanently hooked in but can be thrown in and out of circuit at the will of the analyzer. This is not true of the engram, thus the term, "soldered-in."

The analytical mind lays down a training pattern; on a stimulus-response basis this training pattern will work smoothly and well whenever it will do the organism the most good. An engram is a training pattern, all complete in a package, "permanently" hooked into the circuits (without dianetic therapy) and it goes into operation like a training pattern without any consent whatever from the analyzer.

Influenced itself by the engram in the several ways of reduced analytical power and positive suggestion in the engram, the analytical mind is unable to discover any truly valid reason for the conduct of the organism. It therefore makes up a reason, for its job is to make sure the organism is always right. Just as the young man with the detachable coat gave forth a number of silly explanations as to why he was detaching his coat so does the analytical mind, observing the body engaged in irrational actions, including speech, for which there seems to be no accounting, justify the actions. The engram can dictate all the various processes incident to living; it can dictate beliefs, opinions, thought processes or lack of them and actions of all kinds, and can establish conditions remarkable for their complexity as well as their stupidity. An engram can dictate anything it contains and engrams can contain all the combinations of words in the entire language. And the analytical mind is forced, in the light of irrational behavior or conviction, to justify the acts and conditions of the organism, as well as its own strange blunders. This is justified thought.

There are three kinds of thought, then, of which the organism is capable: (a) analytical thought, which is rational as modified by education and viewpoint, (b) justified thought, analytical thought attempting to explain reactions, and (c) reactive thought, which is wholly in terms of everything in an engram equals everything in an engram equals all the restimulators in the environment and all things associated with those restimulators.

We have all seen somebody make a blunder and then give forth an explanation of just why that blunder had been made. This is justified thought. The blunder was made, unless out of education or viewpoint, by an engram. The analytical mind then had to justify the blunder to make sure that the body was right and that its computations were right.

Now there are two other conditions which can be caused by engrams. One is dramatization and the other is valence.

You have seen some child come forth with a tirade, a tantrum. You have seen some man go through a whole rage action. You have seen people go through a whole irrational set of actions. These are dramatizations. They come about when an engram is thoroughly restimulated, so thoroughly that its soldered-in aspect takes over the organism. It may come into circuit slightly or wholly, which is to say that there are degrees of dramatization. When it is in full parade, the engram is running off verbatim and the individual is like an actor, puppet-like, playing his dictated part. A person can be given new engrams which will make these old ones take secondary importance. (Society's punishment complex is aimed squarely at giving anti-engram education.)

Dramatization is survival conduct -- in the silly, reactive mind way of thinking -- based on the premise that the organism, in a "similar" situation lived through it because these actions were present.

The woman who was knocked down and kicked would dramatize her engram, possibly, by doing and saying exactly the same things done and said to her. Her victim may be her child or another woman. It could or would be the person who gave her the engram if she were strong enough to overcome him. Just because she has this engram does not mean she will use it. She may have a hundred other engrams she can use. But when she dramatizes one, it is as if the engram, soldered-in, were taking over a puppet. As much analytical power as she has left may be devoted to altering the pattern. Therefore she can make a similar or an identical dramatization.

This aspect of dramatization is strictly "tooth and claw" survival. This is the sort of thing which made observers think that "tooth and claw" was a primary rule.

In went the engram, by-passing rationality and the standard memory banks. Now it is in the organism but the organism does not know it in the level of consciousness. It is keyed-in by a conscious level experience. Then it can be dramatized. And far from becoming milder the more it is used, the more an engram is dramatized the more solid is its hold in the circuits. Muscles, nerves, all must comply.

"Tooth and claw" survival. The cells were making sure. And here we come to valence. Valens means "powerful" in Latin. It is a good term because it is the second half of ambivalent (power in two directions) and exists in any good dictionary. It is a good term because it describes (although the dictionary did not mean it to) the intent of the organism when dramatizing an engram. Multi-valence would mean "many powerfuls." It would embrace the phenomena of split personality, the strange differences of personality in people in one and then another situation. Valence in dianetics means the personality of one of the dramatic personnel in an engram.

In the case of the woman being knocked out and kicked, there were two valences present: herself and her husband. If another person had been present the engram would have contained three valences, providing he took any part: herself, her husband and the third person. In an engram, let us say, of a bus accident where ten people speak or act, there would be, in the "unconscious" person an engram containing eleven valences, the "unconscious" person and the ten who spoke or acted.

Now in the case of the woman beaten by her husband, the engram contains just two valences. Who won? Here is the law of "tooth and claw," the aspect of survival in engrams. Who won? The husband. Therefore it is the husband who will be dramatized. She didn't win. She got hurt. Aha! When these restimulators are present, the thing to do is to be the winner, the husband, to talk like him, to say what he did, to do what he did. He survived. "Be like him!" say the cells.

Hence, when the woman is restimulated into this engram by some action, let us say, on the part of her child, she dramatizes the winning valence. She knocks the child down and kicks him, tells him he is a faker, that he is no good, that he is always changing his mind.

What would happen if she dramatized herself? She would have to fall down, knocking over a chair, pass out and believe she was a faker, no good and was always changing her mind and she would have to feel the pain of all blows!

“Be yourself” is advice which falls on deaf reactive mind ears. Here is the scheme. Every time the organism gets punished by life, the analytical mind, according to the reactive mind, has erred. The reactive mind then cuts the analytical mind out of circuit in ratio to the amount of restimulation present (danger) and makes the body react as if it were the person who won in the earlier but similar situation where the organism was hurt.

Now what happens if “society” or the husband or some exterior force told this woman, who is dramatizing this engram, that she must face reality? That’s impossible. Reality equals being herself, and herself gets hurt. What if some exterior force breaks the dramatization? That is to say, if society objects to the dramatization and refuses to let her kick and yell and shout! The engram is still soldered-in. The reactive mind is forcing her to be the winning valence. Now she can’t be. As punishment, the reactive mind, the closer she slides in to being herself, approximates the conditions of the other valence in the engram. After all, that valence didn’t die. And the pain of the blows turns on and she thinks she is a faker, that she is no good and that she always changes her mind. In other words, she is in the losing valence. Consistent breaking of dramatization will make a person ill just as certainly as there are gloomy days.

A person accumulates, with the engrams, half a hundred valences before he is ten. Which were the winning valences? You will find him using them every time an engram is kicked into restimulation. Multiple personality? Two persons? Make it fifty to a hundred. In dianetics you can see valences turn on and off in people and change with a rapidity which would be awesome to a quick-change artist.

Observe these complexities of conduct, of behavior. If one set out to resolve the problem of aberration by a system of cataloguing everything he observed and were unaware of the basic source, he would end up with as many separate insanities, neuroses, psychoses, compulsions, repressions, obsessions and disabilities as there are combinations of words in the English language. Discovery of fundamentals by classification is never good research. And the unlimited complexities possible from the engrams (and the severest, most thoroughly controlled experiments discovered these engrams to be capable of just such behavior as is listed here) is the whole catalogue of aberrated human conduct.

There are a few other basic, fundamental things that engrams do. These will be covered under their own headings: parasite circuits, emotional impaction and psycho-somatic ills. With the few fundamentals listed here, the problem of aberration can be resolved. These fundamentals are simple, they have given rise to as much trouble as individuals and societies have experienced. The institutions for the insane, the prisons for the criminals, the armaments accumulated by nations, yes and even the dust which was a civilization of yesterday exist because these fundamentals were not understood.

The cells evolved into an organism and in the evolution created what was once a necessary condition of mind. Man has grown up to a point where he creates now the means of overcoming that evolutionary blunder. Examination of the clear proves he no longer needs it. He is now in a position where he can take an artificial evolutionary step on his own. The bridge has been built across the canyon.

CHAPTER IV

The “Demons”

For a moment let us leave such scientific things as cells and consider some further aspects of the problem of understanding the human mind.

People have been working on problems related to Man’s behavior for a good many millenia. Hindu, Egyptian, Greek, Roman and our own philosophers and researchers of the past few hundred years have been struggling against a superabundance of complexity.

Dianetics could be evolved only by the philosophic compartmentation of the problem into its elements and the invention of several dozen yardsticks such as The Introduction of an Arbitrary, The Law of Affinity, The Dynamic, The Equation of the Optimum Solution, The Laws of the Selection of Importances, The Science of Organizing Sciences, Nullification by Comparison of Authority to Authority and so forth and so forth. All this is fine matter for a tome on philosophy, but here is dianetics, which is a science. It should be mentioned, however, that one of the first steps taken was not invented but borrowed and modified: that was the Knowable and Unknowable of Herbert Spencer.

Absolutism is a fine road to stagnation and I do not think Spencer meant to be so entirely absolute about his Knowable and Unknowable. SURVIVE! is the demarcation point between those things which can be experienced by the senses (our old friends Hume and Locke) and those things which cannot necessarily be known through the senses but which possibly may be known but which one does not necessarily need to solve the problem.

Amongst those things which one did not necessarily need to know (the dianetic version of the Unknowable) were the realms of mysticism and metaphysics. Many things, in the evolution of dianetics, were by-passed solely because they had not yielded solution to anyone else. Therefore mysticism got short shrift despite the fact that the author studied it, not in the little understood, secondhand sources commonly used as authority by some western mental cults, but in Asia where a mystic who can’t make his “astral self” get out and run errands for him is strictly a second rate character indeed. Well aware that there were pieces in this jig-saw puzzle which were orange with yellow spots and purple with carmine stripes, one found it necessary to pick up only those pieces which were germane. Someday a large number of pieces -- about structure with the rest -- will come in and there will be answers to telepathy, prescience and so on and on. Understand that there are a lot of pieces in the construction of a philosophic universe. But none of the mystic pieces were found necessary to the creation of a uniformly applicable and aberration-resolving science of mind. No opinion will be delivered at this stage of dianetics about ghosts or the Indian rope trick beyond the fact they are seen to be multicolored pieces and the only ones we want are white. We have most of the white pieces and it makes a good, solid whiteness where there was blackness before.

Imagine, then, the consternation one must have felt when “demons” were discovered. Socrates had a demon, you’ll remember. It told him not what to do but whether or not he had made the right decision. Here we had been pursuing a course in the finite universe which would have pleased Hume himself for its tenacity to those things which could be sensed. And up popped “demons.”

A thorough examination of a number of subjects (14) revealed that every one apparently had a “demon” of some sort. They were randomly selected subjects in various conditions in society. Therefore the “demon” aspect was most alarming. However, unlike some of the cults (or schools as they call themselves), the temptation to sail off into romantic inexplicable and confounding labels was resisted. A bridge had to be built across a canyon and demons are darned bad girders.

Out in the Pacific islands -- Borneo, the Philippines -- I had seen quite a bit of demonology at work. Demonology is fascinating stuff. A demon gets into a person and makes him sick. Or it gets in and talks in lieu of him. Or he goes crazy because he has a demon in him and runs around with the demon shouting. This is demonology in a narrow sense. The shaman, the medicine man, these people deal pretty heavily in demonology (it pays well). But, while not skeptical particularly, it had always seemed to me that demons could be explained a little more easily than in terms of ectoplasm or some such unsensible material.

To find "demons" living in one's civilized fellow countrymen was disturbing. But there they were. At least there were the manifestations which the shaman and medicine man had said were caused by demons. It was found that these "demons" could be catalogued. There were "commanding demons," "critical demons," ordinary "tell-you-what-to-say demons" and "demons" which stood around and yelled or "demons" which simply occluded things and kept them out of sight. These are not all the classes, but they cover the general field of "demonology."

A few experiments with drugged subjects showed that it was possible to set these "demons" up at will. It was even possible to set up the whole analytical mind as a "demon." So there was something wrong with demonology. Without proper ritual, simply by word of mouth, one could make new demons appear in people. So there are no real demons in dianetics (that's underscored in case some mystic runs around telling people that a new science of mind believes in demons).

A dianetic demon is a parasitic circuit. It has an action in the mind which approximates another entity than self. And it is derived entirely from words contained in engrams.

How this demon gets there is not very hard to understand, once you've inspected one, close up, papa, while baby is unconscious, yells at Mama that she's got to listen to him and nobody else, by God. The baby gets an engram. It is keyed-in sometime between babyhood and death. And then there's the demon circuit at work.

An electronics engineer can set up demons in a radio circuit to his heart's content. In human terms it is as if one ran a line from the standard banks toward the analyzer but before it got there he put in a speaker and a microphone and then continued the line to the plane of consciousness. Between the speaker and the microphone would be a section of the analyzer which was an ordinary, working section but compartmented off from the remainder of the analyzer. "I" on a conscious plane wants data. It should come straight from the standard bank, compute on a sub-level and arrive just as data. Not spoken data. Just data.

With the portion of the analyzer compartmented off and the speaker-microphone installation and the engram containing the above words "got to listen to me, by God" in chronic restimulation, another thing happens. The "I" in the upper level attention units wants data. He starts to scan the standard banks with a sub-level. The data comes to him spoken. Like a voice inside his head.

A clear does not have any "mental voices!" He does not think vocally. He thinks without articulation of his thoughts and his thoughts are not in voice terms. This will come as a surprise to many people. The "listen to me" demon is common in the society, which is to say this engram circulates widely. "Stay right there and listen to me" fixes the engram in present time (and fixes the individual in the time of the engram to some extent). After it is keyed-in and from there on, the individual thinks "out loud," which is to say, he puts his thoughts into language. This is very slow. The mind thinks out solutions (in a clear) at such speed that the word stream of consciousness would be left at the post.

Proving this was very easy. In clearing every case without exception one or another of these demons was discovered. Some cases had three or four. Some had ten. Some had one. It is a safe assumption that almost every aberree contains a demon circuit.

The type of engram which makes a critical demon is, "You are always criticizing me." There are dozens of such statements contained in engrams, any one of which will make a critical demon, just as any combination of words resulting in a demand to listen and obey orders will make a commanding demon.

All these demons are parasitic. That is to say, they take a part of the analyzer and compartment it off. A demon can think only as well as the person's mind can think. There is no extra power. No benefit. All loss.

It is possible to set up the whole computer (analyzer) as a demon circuit and leave "I" on a tiny and forlorn shelf. This, on the surface, is a pretty good stunt. It makes it possible for the whole analytical mind to work out computations undisturbed and relay the answer to the "I." But in practice it is very bad, for "I" is the will, the determining force of the organism, the awareness. And very soon "I" becomes so dependent upon this circuit that the circuit begins to absorb him. Any such circuit, to last, would have to have pain and be chronic. It would have to be, in short, an engram. Therefore, it would have to be reductive of the intellect and would victimize the owner by eventually making him ill one way or another.

Of all the engram demon circuits found and removed, those which contained a seemingly all-powerful exterior entity which would solve all problems and answer every want were the most dangerous. As the engram keyed-in further and further and was constantly restimulated, it eventually made a spineless puppet out of "I"; because other engrams existed, the sum of the reduction tended toward insanity of a serious sort. If you want a sample, just imagine what you would have to say to a hypnotized person to make him think that he was in the hands of a powerful being who gave him orders and then imagine this as the phrase spoken when an individual had been knocked unconscious one way or another.

There is another full class of demons, the occlusion demons, the demons who shut things off. These are not properly demons because they don't talk. A bona-fide demon is one who gives thoughts voice or echoes the spoken word interiorly or who gives all sorts of complicated advice like a real, live voice exteriorly. (People who hear voices have exterior vocal demons -- circuits which have tied up their imagination circuits.) The occlusion demon doesn't have anything to say. It is what he doesn't permit to be said or done that makes the mental derangement.

An occlusion demon can exist for a single word. For instance, a child receives an engram by falling off her bicycle and losing consciousness; a policeman tries to assist her; she is still unconscious but moving and mutters that she can't move (an old engram at work); the officer says, cheerfully, "Never say can't!" Some time later she has a conscious level experience such as another fall but without injury. (We keep mentioning this second necessary step, the lock, because it is the thing old time mystics thought was causing all the trouble -- it is "mental anguish.") Now she has difficulty saying "can't." Dangerous in any event. What if she had that common engram expression, "Never say no!"?

Occlusion demons hide things from "I." It is as easy for one to mask many words. The individual having one will then omit these words or alter them or misspell them and make mistakes with them. The demon is not the only reason words get altered but he is a specific case. An occlusion demon can be of a much higher strength and breadth. He can be created with the phrase, "Don't talk!" or "Never talk back to your elders," or "You can't talk here. Who said you could talk?" Any of these phrases might produce a stammerer.

Other things besides speech can be occluded. Any ability of the mind can be inhibited by a demon specifically designed to obstruct that ability. "You can't see!" will occlude visual recall. "You can't hear!" will occlude audio recall. "You can't feel!" occludes pain and tactile recall (homonymic stuff, English).

Any perception can be occluded in recall. And whenever it is occluded in recall, it affects actual perception and the organ of perception as well. “You can’t see!” may reduce not only recall but the actual organic ability of the eyes, as in astigmatism or myopia.

One can imagine, with the entire English language (or in other lands with other tongues, any language) susceptible to inclusion within engrams just how many abilities of the mind’s operation can be occluded. An extremely common one is “You can’t think!”

So far now “you” has been used in illustrations and examples in order to keep the similarity to hypnotic or drug tests. Actually sentences which contain “I”, are more destructive. “I can’t feel anything,” “I can’t think,” “I can’t remember.” These and their thousands and thousands of variations, when spoken within the hearings of an “unconscious” person, are applicable to himself when he gets the engram keyed-in to circuit.

“You” has several effects. The statement, “You are no good,” to an awake person makes that person feel very angry perhaps when he has an engram to that effect.

Within him he feels, possibly, that people think he is no good. He may have a demon that tells him he is no good. And he will dramatize by telling other people that they are no good. It can be sprayed off by being dramatized. A person who has an engram to the effect that he is sexually sterile, for instance, will tell people that they are sexually sterile. (“Don’t do as I do, do as I say.”) If he has an engram that says, “You are no good, you have to eat with your knife,” he may eat with his knife but he gets excited about people eating with their knives, and he would grow very angry if somebody said he ate with his knife.

Thus, there are “compulsion demons” and “confusion demons” and so forth and so on.

The engram has a command value. There is a power of choice exercised in the reactive mind about which and what engrams will be used. But any engram, strongly enough restimulated, will come to the surface to be dramatized. And if dramatization is blocked, it will turn on the individual either temporarily or chronically.

The literalness of this reactive mind, in its interpretation of commands and the literalness of their action within the poor, harassed analytical mind is a strange thing in itself. “It is too horrible to be borne” might be interpreted to the effect that a baby was in such bad condition that it had better not be born. There are thousands of cliches in any language which, when literally taken, mean quite the opposite from what the speaker intends.

The reactive engram bank takes them, stores them with pain and emotion and “unconsciousness” and with moronic literalness, hands them forth to be LAW and COMMAND to the analytical mind. And when the happy little moron who runs the engram bank sees it possible to use up some analytical mind circuits with some of these confounded demons, it is done.

The analytical mind, then, can be seen to be subject to yet another form of attrition. Its circuits, ordinarily intended for smooth, rapid computation, become tied up and overloaded with demon lash-ups. The demons are parasites. They are pieces of analytical mind compartmented off and denied to larger computation.

Is it any wonder that, when these demons are deleted, I.Q. soars as it can be observed to do in a clear? Add the demon circuits to the shut-down aspect of restimulation, and truth can be seen in the observation that people run on about one-twentieth of their mental power. Research and scientific tabulation indicate that with the “unconsciousness” aspect and the demon circuits deleted from the engram bank and the data restored into the standard bank as experience where it should be, about forty-nine fiftieths of the mind have been placed at the service of “I” which he never could use as an aberree.

CHAPTER V

Psycho-somatic Illness

Psycho-somatic illnesses are those which have a mental origin but which are nevertheless organic. Despite the fact that there existed no precise scientific proof of this before dianetics, an opinion as to their existence has been strong since the days of Greece, and in recent times various drug preparations have been concocted and sold which were supposed to overcome these sicknesses. Some success was experienced, sufficient to warrant a great deal of work on the part of researchers. Peptic ulcers, for instance, have yielded to persuasion and environmental change. A recent drug called ACTH has had astonishing but wildly unpredictable results. Allergies have been found to yield more or less to things which depressed histamine in the body.

The problem of psycho-somatic illness is entirely embraced by dianetics, and by dianetic technique such illness has been eradicated entirely in every case.

About seventy per cent of the physician's current roster of diseases falls into the category of psycho-somatic illness. How many more can be so classified after dianetics has been in practice for a few years is difficult to predict, but it is certain that more illnesses are psycho-somatic than have been so classified to date. That all illnesses are psycho-somatic is, of course, absurd, for there exist, after all, life forms called germs which have survival as their goals.

The work of Louis Pasteur formulated the germ theory of disease. With dianetics is gained the non-germ theory of disease. These two, with bio-chemistry, complement each other to form the whole field of pathology so far as can be determined at this time, providing of course that the virus is included under the germ theory.

Dianetics adds an additional leaf to the germ theory in that it includes predisposition. There are three stages of pathology: predisposition, by which is meant the factors which prepared the body for sickness, precipitation, by which is meant the factors which cause the sickness to manifest itself, and perpetuation, by which is meant the factors which cause the sickness to continue.

There are two kinds of illness: the first could be called autogenetic, which means that it originated within the organism and was self-generated, and exogenetic, which means that the origin of the illness was exterior. Actually, although this is good medicine, it is not quite as precise as dianetics could desire. Mental illness itself is actually exterior in origin. But medically, we consider that the body can generate its own sicknesses (autogenetic) or that the sickness can come from an exterior source such as bacteria (exogenetic). The Pasteur germ theory would be the theory of exogenetic -- exteriorly generated -- illness. Psycho-somatic illness would be autogenetic, generated by the body itself.

Treatment for accidental injury, surgery for various things such as malformation inherent in the body on a genetic basis, and orthopedics, which actually can be classed under both, remain properly outside the field of dianetics, although it can be remarked in passing that almost all accidents are to be traced to dramatization of engrams and that clears rarely have accidents.

Psycho, of course, refers to mind and somatic refers to body; the term psycho-somatic means the mind making the body ill or illnesses which have been created physically within the body by derangement of the mind. Naturally such diseases, when one has resolved the problem of human aberration, become uniformly susceptible to cure.

Arthritis, dermatitis, allergies, asthma, some coronary difficulties, eye trouble, bursitis, ulcers, sinusitis, etc. form a very small section of the psycho-somatic catalogue. Bizarre aches

and pains in various portions of the body are generally psycho-somatic. Migraine headaches are psycho-somatic and, with the others, are uniformly cured by dianetic therapy. (And the word cured is used in its fullest sense.)

Just how many physical errors are psycho-somatic depends upon how many conditions the body can generate out of the factors in the engrams. For example, the common cold has been found to be psycho-somatic. Clears do not get colds. Just what, if any, part the virus plays in the common cold is not known, but it is known that when engrams about colds are lifted, no further colds appear -- which is a laboratory fact not so far contradicted by 270 cases. The common cold comes about, usually, from an engram which suggests it and which is confirmed by actual mucus present in another engram. A number of germ diseases are predisposed and perpetuated by engrams. Tuberculosis is one.

The engram itself, as has been covered, follows a cycle of action. The body is predisposed to the conduct and conditions contained in the engram when that engram is first received. Then a conscious-level experience keys-in the engram and other experience or the content of the engram itself may make it chronic. This is predisposition, precipitation and perpetuation in the mental plane.

Engrams and inherited disabilities and accidents and germs are the four ways an organism can be reduced physically from the optimum. Many conditions which have been called "inherited disabilities" are actually engramic. Engrams predispose people to accidents. Engrams predispose and perpetuate bacterial infections. Therefore the catalogue of ills affected by dianetics is very long. This is not a book listing effects but a book stating causes, and so the reader is asked to call upon his own knowledge or consult a medical text to understand just how many thousands and thousands of conditions result from engrams to disturb or derange the body.

At the present time dianetic research is scheduled to include cancer and diabetes. There are a number of reasons to suppose that these may be engramic in cause, particularly malignant cancer. This is remarked so that attention may be given to the possibility; no tests of any kind have been made on cancer or diabetic patients, and the thought is purely theory and is not to be taken as any kind of an avowal about a cancer cure. Those diseases which were catalogued above, however, have been thoroughly tested and have uniformly yielded to dianetic therapy.

The mechanism by which the mind is able to cause a physical disability or predispose the body to an illness and perpetuate sickness is, in its basic cause, a very simple thing. The complexity arrives when one begins to combine all the factors possible; then a staggering list of potential illnesses can be written.

A series of simple tests can be made on drugged or hypnotic patients which will prove clinically in other laboratories this basic mechanism. A series of these tests were run in the formulation of dianetics with uniform success.

Let us take first something -- which is only mildly psycho-somatic and scarcely an illness at all. A patient is hypnotized. He is given the positive suggestion that he will be able to hear much more acutely. This is "extended hearing." Controlling out other means of his gaining data (including safeguards against telepathy between operator and subject) the hearing can be found to be amplifiable many times over. In fact, there exist all around aberrees who have "extended hearing." By suggestion the power of the hearing can be tuned down or up so that a person is nearly deaf or can hear pins fall at a great distance. When the suggestion is removed, the subject's hearing returns to its previous normal state.

Similarly, experiments can be performed on the eyes, using light sensitivity. The patient's sight is tuned up or down so that his eyes are much more or much less sensitive to light than is normal for him. This is done entirely on the word suggestion basis such as "The light will appear very, very bright to you," or "The light will appear so dim it will be hard for you to see." With the former suggestion the patient can be made to see almost as well as a cat,

although other people around might think it impossible to see objects the patient can unerringly point out. In the latter suggestion the patient can be placed under light almost blinding and yet can read through a glare with apparent comfort.

The tactile sense can likewise be tuned up or down by verbal suggestion until touch becomes painfully acute or so dull it scarcely registers.

So with the various senses. Here we have simply the spoken word going into the mind and causing physical function to change.

Let us now address the heart. By deep hypnosis or drugs we take a patient into amnesia trance, a state of being wherein the "I" is not in control but the operator is the "I" (and that's all there is, really, to the function of hypnosis: the transfer of analytical power through the law of affinity from subject to operator, a thing which had a racial development and survival value in animals which ran in packs).

A caution should be observed that a patient who has a very sound heart and no heart-trouble history be chosen for this experiment, which, even above any other hypnotic experiment, can make a patient very ill if he has a heart history. And none of these hypnotic tests should be performed until one has finished this book and knows how to get rid of the suggestions; for hypnosis, as practiced, is strictly live fuse stuff and the hypnotist who is unacquainted with dianetics has no more idea how to get rid of a suggestion he has made than he has of how to peel an atom. He has thought he had the answer, but dianetics has treated many, many former hypnotic subjects who were thoroughly, as the engineers interested in dianetics say, "loused-up." This is no criticism of hypnosis or hypnotists, who are often very able people, but it is a comment that there is more to be known about it.

The heart, by positive suggestion alone, can be speeded up, slowed down or otherwise excited. Here are words spoken into the deep strata of the mind which cause physical action. Further, blood flow can be inhibited in some area of the body by suggestion alone. (This experiment, it is warned, particularly overloads the heart.) Blood can be denied to a hand, for instance, so that if you were to cut a vein in that hand it would bleed slightly if at all. A fine swami trick; which most amazed the author in India, was the inhibition of blood flow by the awake individual in himself. On command a cut would bleed or not bleed. It looked fantastic and made very good press agency that here was a swami who had so associated himself with Nirvana that he was in control of all material matters. Awe faded when the author learned that, via hypnosis, he could make his own body do the same thing and no Nirvana involved. The mechanism fades out rapidly and in a few days would have to be renewed: the body has its own optimum operation, and although such a function can be "analytically" handled, it is not an upper echelon analytical job to keep the blood going in the hand. The point here is that blood flow can be interrupted by verbal suggestion. Words connect up with the physical being.

How this can come about can be shown by an analogic explanation such as a schematic diagram, but we are not so much interested in structure as in function at this stage of the science of mind -- because by knowing function alone we can cure aberrations and psycho-somatic ills every time, predict new ills and conditions, and generally "work miracles," as such actions were once called before Man knew anything about the mind.

Excreta are among the easiest things to regulate by suggestion. Constipation can be caused or cured by positive suggestion with remarkable speed and facility. The urine can also be so controlled. And so can the endocrine system.

It is harder to make tests on some of the more poorly understood functions of the endocrines. Glandular research has not progressed very far at this time. But, by removing engrams and watching the endocrine system rebalance, it has been made obvious that the endocrine system is a part of the control mechanism with which the mind handles the body. The glands are easily influenced. These fluids and secretions -- testosterone, estrogen, adrenalin, thyroid, parathyroid, pituitrin, etc. -- are the substances the mind uses as one means

of controlling the body. They form relay circuits, so to speak. Each one has its own action within the body.

This experiment tends to prove the fallacy of an ancient assumption that the mind was controlled by the glands. An aberree is given a shot of 25 mg. of testosterone in oil twice a week. There may be some improvement in his physical status for a short time -- his voice may deepen and he may grow more hair on his chest. Now, without suggestion, we simply delete the engrams from his reactive bank so that they can re-form as experience in the standard bank. Before we have completed this task

his body begins to use more of the testosterone. The dose can be markedly reduced and still give more benefit than formerly. Finally the dose can be eliminated. This experiment has also been performed on people who had not been able to receive benefit from glandular substances such as testosterone and estrogen. And upon people who were made ill by the administration of these hormones. The deletion of the engrams from the reactive bank uniformly brought about a condition where they could receive benefit from the hormones but where such artificial administration was not necessary save in cases of extreme age. What this means to gerontology, the study of longevity in life, cannot at this time be estimated, but it can be predicted with confidence that the deletion of engrams from the reactive bank has a marked effect upon the extension of life. A hundred years or so from now this data will be available, but no clears have lived that long as yet.

Just now, to our purpose, it is easy to demonstrate the effect of positive suggestion upon the endocrine system and the lack of effect of artificial hormones upon aberrees.

This sort of an engram has a terribly reductive effect upon testosterone manufacture: "Sex is horrible; it is nasty; I hate it."

The autonomic nervous system, which has been supposed to run without much connection to the mind can be shown to be influenced in its parts by the mind. There is a dwindling spiral effect (note the lines on the survival potential chart) whereby the engram starts malfunction in the life function regulator; this produces malfunction in the mind, which in turn has further effect on the life function regulator; this again reduces physical activity, and the mind, being part of the organ and, so far as we can tell, organic itself, is further reduced in tone. Mental tone makes body tone go down. Body tone, then being down, makes mental tone go down. This is a matter of inverse geometric progression. A man starts to get sick and, having engrams, he gets sicker. Clears are not subject to this dwindling spiral. Indeed, so entirely superficial is this horrible stuff called psycho-somatic illness that it is the first thing which surrenders and can be alleviated without clearing.

Now the reason why various drug preparations which seek to change psycho-somatic illness meet with such uncertain success lies in the fact that the mind, containing these engrams which are "survival" (like a fellow needs a hole in his head), handles the life function regulator to actively produce illnesses. Something comes to take them away (they're "survival," you see, and these confounded cells moronically insist upon it) and the mind has to rapidly reverse the activity and put an illness back in place again. Try to influence the reactive mind by reason or needles and it is not any easier to convince than a drug-crazed man bent on murdering everybody in a bar. He's "surviving," too.

A concoction like ACTH has a slightly different effect. It is too exclusive to have any research done with it, but on reports about it, it seems to affect engrams in the time sense. That is to say, as will be covered under therapy, the individual's reactive location in time is shifted by it. ACTH and perhaps many others in its category move the individual from one chronic engram into another. This is about as reliable as changing dictators in Europe. The next one may be twice as bad. It may even be a manic and that's horrible despite its apparent "euphoria."

Electric shock treatment, the beatings of Bedlam and other things of their ilk, including surgical treatment of things psycho-somatic in origin, have another effect but one not dissimilar

to drugs like ACTH in that they give another shock which transfers the engram pattern to another part of the body (and switches around the aberrations; when these things work it is because the new aberration is less violent than the old one). Shocks, blows, surgery and maybe even things like cobra venom change the effect of the engram bank on the body, not necessarily for the worse, not necessarily for the better; they just change them. Like shooting dice: sometimes one gets a seven.

Then there is the deletion of tissue treatment of psycho-somatic ills. This simply removes the area which is busy dramatizing in the physical line. This can be the removal of a toe or the removal of a brain. These things are quite commonly used, as this is being written. The removal of the toe is addressed to one part of the engram content, the somatic, and the removal of parts of the brain (as in the trans-orbital leukotomy and the pre-frontal lobotomy or anything else more recent) is addressed mistakenly to "the removal of" the psycho-aberration. There is a surrender system at work in this as well: the surgeon or the patient has an aberration about "getting rid of it," and so bits of the body are cut up or removed.

Some patients surrender anatomy on advice or at their own insistence like old timers shed blood in a phlebotomy. There is a straight parallel between bleeding the patient to make him well and cutting away parts of him to make him well. Both are based on a surrender (get rid of) engram and neither are effective in any way. Barber basin medicine, it is hoped, will eventually die out as did its patients.

These are the five classes of psycho-somatic ills: (1) those ills resulting from mentally caused derangement in physical fluid flow, which class subdivides into (a) inhibition of fluid flow and (b) magnification of fluid flow; (2) those ills resulting from mentally caused derangement of physical growth, which class subdivides into (a) inhibition of growth and (b) magnification of growth; (3) those ills resulting from predisposition to disease resulting from a chronic psycho-somatic pain in an area; (4) those ills resulting from perpetuation of a disease on account of chronic pain in an area; and (5) these ills caused by the verbal command content of the engrams.

In Class 1 (a) fall such ordinary things as constipation and such extraordinary things as arthritis. Arthritis is a complex mechanism with a simple cause and a relatively simple cure. Remember that there are two things present in an engram: physical pain and verbal command.

In arthritis both must be present (as in the bulk of psycho-somatic ills). There must have been an accident to the joint or area affected, and there must have been a command during the "unconsciousness" which attended the injury which would make the engram susceptible to chronic restimulation. (Such commands as "It is always like this" or "It just goes right on hurting" or "I'm stuck" will produce similar results). Given this engram and given this engram keyed-in, there is a chronic pain in the area of the injury. It may be minor, but it is a pain just the same. (It can be a pain but not be felt if the engram contains a command which is anaesthetic such as "He'll never feel this," which produces a similar condition but makes one "unconscious" of the pain there.) This pain in the body probably tells the cells and the blood that this area is dangerous. It is therefore avoided.

The command permits the mind to influence, let us say, the parathyroid, which contains the secret of the calcium content in the blood stream. A mineral deposit then begins to be laid down in the area. The mineral deposit is not necessarily the cause of the pain, but it is an organic restimulator so that the more mineral, the more pain, the more the engram keys-in.

This is the dwindling spiral. And this is arthritis in action. Understand that the parathyroid and the blood avoidance are theoretical cause; the scientific fact is that when an engram is picked up and deleted about an area containing arthritis, that arthritis vanishes and does not return and this is X-ray plate evidence; it happens every time and does not happen because of any suggestion or medicine; it happens because an engram is picked up and refiled. As the engram goes away, so goes the pain, so vanishes the arthritis. This forms a whole class of ills, of which arthritis is only one.

The mechanisms involved vary slightly. All can be headed under "physical derangement caused by reduced body fluid flow."

Class 1 (b) of psycho-somatic ills, magnification of fluid flow, contains such things as high blood pressure, diarrhea, sinusitis, priapism (overactivity of the male sex glands), or any other physical condition resulting from a superabundance of fluid.

Class 2 (a) can cause such things as a withered arm, a foreshortened nose, underdeveloped genital organs or any other underdevelopment of a gland having to do with size (which cross-classes this with 1 [a]), hairlessness (which also like the rest can be part of the gene pattern and therefore inherent), and in short reduction in size of any part of the body.

Class 2 (b) causes such things as oversized hands, a lengthened nose, oversized ears, enlarged organs and other common physical malformations. (Cancer might possibly come under this heading as overhealing.)

Class 3 would include tuberculosis (some cases), liver trouble, kidney trouble, rashes, common colds, etc. (cross-classing with others, as do all of these in one way or another).

Class 4 would include those diseases which, arising without psycho-somatic influence, yet fix upon by accident a previously injured area and by restimulation, keep an engram keyed-in in that area so that a condition becomes chronic. Tuberculosis could be included here. Conjunctivitis, all running sores and any condition which refuses to heal, etc.

This fourth class would also include all bizarre pains and sicknesses which cannot be found to have actual pathology.

Class 5 includes an enormously wide catalogue of conditions, any one of which may cross-index to other classes or which arise solely out of engrams which dictate the presence or necessity of an illness. "You always have colds," "I have sore feet," etc. announce a psycho-somatic illness and the mechanisms of the body can furnish one.

Any disease whatever can be precipitated by engrams. The disease may be of germ origin; the individual possesses an engram to the effect that he may become sick and on this generalization, becomes sick with whatever is to hand. Further and even more general, the engram reduces the physical resistance of the body to disease, and when an engram goes into restimulation (perhaps because of a domestic quarrel, an accident or some such thing), the ability of the individual to resist sickness is automatically decreased.

Children, as will be explained, have many more engrams than has been supposed. Almost all childhood illnesses are preceded by psychic disturbance and if psychic disturbance is present -- keeping an engram restimulated -- such illnesses can be far more violent than they should be. Measles, for instance, can be just measles or it can be measles in company with engramic restimulation, in which case it can be nearly or entirely fatal. A check of many subjects on this matter of childhood illness being predisposed by, precipitated by and perpetuated by engrams causes one to wonder just how violent the diseases themselves really are: they have never been observed in a cleared child and there is reason to investigate the possibility that childhood illnesses are in themselves extremely mild and are complicated only by psychic disturbance -- which is to say, the restimulation of engrams.

In fact, one could ask this question of the entire field of pathology: what is the actual effect of disease minus the mental equation? How serious are bacteria?

The field of bacteriology has been without dynamic principles until now; the dynamic, survival, is applicable to all life forms and "life forms" include germs. The purpose of the germ is to survive. Its problems are those of food, protection (offense and defense) and procreation.

To accomplish these things the germ survives at its optimum efficiency. It mutates, alters with natural selection and changes dynamically from survival necessity (the missing step of the evolution theory, that last) in order to accomplish the maximum survival possible. It makes errors by killing the hosts, but to have a purpose to survive does not mean that a form necessarily survives.

In pathology, the germ, bent on its purpose, acts as a suppressor to the survival dynamic of the human species.

How serious this suppressor is in the absence of engram suppression in the human has not been determined; enough data exists to indicate that a human individual with his potential in the fourth zone is not, apparently, very subject to disease: the common cold, for instance, if it is a virus or not, passes him by; chronic infections are absent. What antibodies have to do with this or what this factor is, is yet another question. But it remains that a clear is not easily made ill. In the aberrant illness closely pursues mental depression (depression of the dynamic level).

The aberration of mind and body by engrams leads, then, not only to psycho-somatic ills but also to actual pathology, which has hitherto been considered more or less independent of the mental state. As has been proven by clinical research, clearing of engrams does more than remove psycho-somatic illness, potential, acute or chronic; the clearing also tends to proof the individual against the receipt of pathology: to what extent it is not yet known, for such a wide and long term view is required to establish the actual statistics that the project will require thousands of cases and the observations of medical doctors over a long term.

The amount of aberration which a person manifests, which is to say, the position he would occupy on a sanity scale, has little to do with psycho-somatic illness. Such illnesses require only one or two engrams of a specific nature to become manifest. These engrams may not be aberrative in any other way than to predispose the individual to illness. Having a psycho-somatic illness is not the same as being "crazy" or having hypochondriacal tendencies. The hypochondriac thinks he has illnesses, a special case of Class (5) above.

Derangement falls sharply into two categories: the first is the mental derangement, any irrational condition, which in dianetics we call aberration in order to avoid constant cataloguing of the thousands, the millions of manifestations irrationality can have. The other derangement of the individual is somatic: this applies entirely to his physical being and physical ability and health. Both these things are present in every engram: the aberration and the somatic. But the engram can manifest itself chronically as either a somatic (a noun has been made out of an adjective here and it is commonly employed in dianetics to avoid the use of the word pain, which is not embrative and which is restimulative) or as an aberration or as both together.

An engram must contain physical pain. When an engram is restimulated in everyday life, that physical pain may appear or it may not. If it does not appear as pain but as aberration, then the individual is in another valence than his own (the "necessity to manifest his hostilities"). If he is sane enough to be in his own valence, the physical pain will be present. In dianetics we say the somatic has appeared. When any somatic appears, unless the individual is a pre-clear in therapy, some of the aberration is also appearing. In short, the aberration can appear by itself or the somatic plus some of the aberration can appear. When a person dramatizes another valence than his own, the aberration is present; when the dramatization, running off the engram phonograph-record-wise in one or another valence, is suppressed by some other factor such as the police or a stronger person or even the individual himself (this has been called repression -- the term is not used here because it is loaded with other meanings), the somatic most certainly will come into view.

The individual is then apparently "better off," as the cells meant him to be, to occupy the survival role in the engram, the winning valence, for he is, at least, not ill. But how many people have been killed, how many banks have been robbed and how many marital partners have been driven mad by these dramatizations?

So the health of the individual would be considered by society, in its effort to protect its members to be a secondary affair. In fact, "society" has not known about this mechanical aspect. The individual who dramatizes the survival valence in his engrams may do violent things to other people. The individual who will not permit himself such a dramatization or who is forced by society away from such dramatization will most certainly become psychosomatically ill. "Heads I win, tails you lose." The answer is in the alleviation or deletion of the engram. For there are many additional aspects to the problem: the man who dramatizes his engrams, society or no society, is not apt to survive, and if he dramatizes them, he is subject to whatever slurs were leveled at the valence he is in by another valence in that same engram.

The combinations of the classes and aspects of psycho-somatic illness listed and described here lead to some highly complex situations. It is a scientific fact that no psychosomatic ill exists without an aberration. And it is true that no aberration exists without a potential or actual psycho-somatic ill. One of the psycho-somatic illnesses one would least expect to find as a psycho-somatic affair is the illness of sexual perversion.

The sexual pervert (and by this term dianetics, to be brief, includes any and all forms of deviation in Dynamic II such as homosexuality, lesbianism, sexual sadism, etc. and all down the catalogue of Ellis and Krafft-Ebing) is actually quite ill physically. Perversion as an illness has so many manifestations that it must be spread through the entire gamut of classes from (1) to (5) above. Over-development of sexual organs, underdevelopment, seminal inhibition or magnification, etc. are found some in one pervert, some in another. And the sum of it is that the pervert is always a very ill person in one way or another, whether he is conscious of it or not. He is very far from culpable for his condition, but he is also so far from normal and so extremely dangerous to society that the tolerance of perversion is as thoroughly bad for society as punishment for it.

Lacking proper means prior to this time, society has been caught between tolerance and punishment, and the problem of perversion has, of course, not been resolved. A bit off the subject here, but it can be remarked about perversion that the best previous explanation for it was something about girls becoming envious of Papa's penis or boys becoming upset about that terrible thing, the vulva, which Mama was incautious enough to show one day. It takes a great deal more than this utter tripe to make a pervert.

It is, rather, something on the order of kicking a baby's head in, running over him with a steam roller, cutting him in half with a rusty knife, boiling him in lysol and all the while with crazy people screaming the most horrifying and unprintable things at him. The human being is a very tough character. He is so confoundedly tough that he has whipped the whole animal kingdom and he can shake the stars. And when it comes to throwing his second dynamic out of balance, what that takes is straight out of Dante and Sax Rohmer combined. Hence the pervert, containing hundreds and hundreds of vicious engrams, has had little choice between being dead and being a pervert. But with an effective science to handle the problem, a society which would continue to endure perversion and all its sad and sordid effects doesn't deserve to survive.

Perversion can have other aspects. In one society examined, these aberrations had multiplied so far that a principal mystic cult had sprung up which contended that all mental illness came from sex; this, of course, gave further impetus to aberrations on the second dynamic (sex), as such a cultic belief must have been originated by an individual who had severe aberrations across the second dynamic; this belief that sex was the only source of human aberration and travail, naturally attracted as its practitioners individuals who had similar aberrative patterns. And so the cult further enforced existing aberrative factors in the society, since all their activity was leveled at making sex something ogreish and dreadful by labeling it the society's primary source of illness. The prophet of this god was Manichaeus, a Persian of the third century, who taught that all things about the body, especially sex, were evil; the cult of Manichaeus carried on well into the Dark Ages and then vanished, to trouble Man no more.

Any dynamic can be blocked, the personal dynamic, the sex dynamic, the group dynamic or the Mankind dynamic. Each one has been the target at some time of one cult or

another seeking to cure all Man's ills and save him. Dianetics is not interested in saving Man, but it can do much to prevent him from being "saved." As an organized body of scientific knowledge dianetics can draw only the conclusion which it observes in the laboratory.

It can be observed that the Church is entirely correct in doing all in its power to prevent blasphemy. Blasphemy can very often be uttered during the "unconsciousness" of a person who has been struck. This would enter sacred names and curses into engrams which, reacting within the individual, give him an unnatural terror and compulsion or repulsion toward God. It is not the religion which is at fault, it is the blaspheming of the religion. Such blasphemy makes the insane zealot and the murderous atheist, both of whom the Church would very gladly do without.

In the realm of psycho-somatic illness any combination of the language is as damaging a factor in an engram as any other factor. The moronic reasoning of the reactive mind, which considers everything in an engram equal to everything in an engram, also considers that everything similar to the engram in the exterior world (the restimulators) is sufficient cause to place an engram in effect. Hence aberration and illness can come about.

There is, however, a peculiarity in psycho-somatic illnesses which is chronic: the aberree's reactive mind exercises a power of choice to the extent that only pro-survival engrams become chronic. It could be said, on a reactive level, that the aberree will not permit himself to suffer illness from his engrams unless that illness has a "survival" value. This is very important in therapy. The chronic psycho-somatic illnesses which a patient displays are those which have a sympathy (pro-survival) background.

It is not possible to "spoil" a child with love and affection. Whoever postulated that it was possible was postulating out of bad data and no observation. A child needs all the love and affection it can possibly get. A test was run in one hospital which tended to show that babies, when left without attention, ran fevers. When given attention the fevers immediately abated. The test, while not observed personally by the author, seems to have been conducted with proper controls according to report. If this is true, it postulates a mechanism in the human being which uses illness for affection on a genetic basis. There is no reason why not; there have been enough years of engineering -- almost two billion -- to build anything into the blueprint. These babies, in several groups, were left in the hospital by their parents for the test; they uniformly became ill when not given affection. Here is the law of affinity at work, if these tests were accurately conducted, their purpose was not to help dianetics but to show that the leaving of a baby in the hospital after his birth because he has a slight illness invariably increases that illness.

A series of severely controlled dianetic experiments over a much longer period demonstrated that the law of affinity, as applicable to psycho-somatic illness, was more powerful than fear and antagonism by a very wide margin. So great is this margin that it could be compared as the strength of a steel girder to a straw. It was found, as above, that chronic psycho-somatic ills existed only when they had a sympathy engram behind them. The law of affinity might be interpreted as the law of cohesion; "affinity" might be defined as "love" in both its meanings. Deprivation of or absence of affection could be considered as a violation of the law of affinity. Man must be in affinity with man to survive. The suicide ordinarily commits the act on the computation that the removal of self will some way benefit other selves -- this, on the reactive mind level is a very ordinary computation, deriving exclusively from engrams. The violent industrial chieftain with his merciless mien, when he suffers from a psycho-somatic ill, ordinarily derives it out of a sympathy engram.

The sympathy engram pretends to be pro-survival. As one preclear said, a man is not victimized by his enemies but by his friends. An engram comes about always from a greater or lesser moment of "unconsciousness." There is no engram without "unconsciousness." It is only when the analyzer is out of circuit that the exterior world can come interior, unrationalized, and work from within. The second the analyzer identifies one of those engrams as such, that engram loses about twenty percent of its value to aberrate and usually a hundred percent of its

value to cause a psycho-somatic illness. Pain is extremely perishable. Pleasure is recorded in bronze. (Not poetry here, science. Physical pain will delete with brief attention, a pleasant or even a media-media experience is so solidly fixed in the mind that no treatment known to dianetics will shake it and a great deal of effort has been leveled at pleasure recordings just to test them for permanence. They are permanent; physical pain is perishable. Too bad, Schopenhauer, but you were a most mistaken man.)

Exposing a lock to the analyzer -- a moment of "mental anguish" -- once the engram which gave it power is gone causes that lock to blow away like chaff. The analyzer works on the Doctrine of the True Datum: it has no truck with anything which it once discovers to be false. Just exposing an engram without relieving it has some therapeutic value -- twenty percent -- and this gave rise to a belief that all one had to do was know about his ills and they would vanish. Nice if it were so.

The most aberrative engram, then, is one which is held down by the reactive mind's -- that moron's -- concept that it is needed in the survival of the individual. This sympathy engram is the one which comes forward and stays chronic as a psycho-somatic illness. There are two reasons for this: one is usually in one's own valence when a sympathy engram is received; and one's reactive mind, knowing well the value of affinity, puts forward the psycho-somatic illness to attract affinity. There is no volition here on the part of the individual's "I" analytical self. But there is every "volition" on the part of the reactive mind.

A sympathy engram would go something like this: a small boy, much victimized by his parents, is extremely ill. His grandmother attends him and while he is delirious soothes him and tells him she will take care of him, that she will stay right there until he is well. This puts a high "survival" value on being sick. He does not feel safe around his parents; he wants his grandmother present (she is a winning valence because she orders the parents around), and he now has an engram. Minus the engram there would be no psycho-somatic illness. Sickness, "unconsciousness" and physical pain are essential to the receipt of this engram. But it is not a contra-survival engram. It is a pro-survival engram. It can be dramatized in one's own valence.

The psycho-somatic illness, in such a case as this, would be a "precious possession." "I" doesn't even know the computation. The analyzer was out when the engram went in. The analyzer cannot recall that engram with anything short of dianetic therapy. And the engram will not clear away.

Now with this engram we have a patient with sinusitis and a predisposition to lung infections. It may be that he was luckless enough to marry a counterpart of his mother or his grandmother. The reactive mind cannot tell the difference between grandmother or mother and wife if they are even vaguely similar in speech, voice-tone or mannerisms. The wife is not sympathetic. In goes the engram to demand that sympathy. And even if the wife thinks that sinusitis and lung infection are repulsive enough to lead to divorce, the reactive mind keeps that engram keyed-in. The more hatred from the wife, the more that engram keys-in. You can kill a man that way.

The above is a standard sympathy engram. When a therapist tries to get that engram away from the patient, the reactive mind balks. The "I" doesn't balk. The analyzer doesn't balk. These are hopeful that this engram will spring. But the reactive mind keeps it nailed down until the dianeticist puts a crowbar under it. Then it is gone. (Enough locks may be lifted, by the way, to alleviate this condition. But the patient will dig up another engram!)

Resistance to past therapies has resulted from these sympathy engrams. Yet they lie right there on the surface, fully exposed as chronic psycho-somatic illness.

Feeding a patient with a psycho-somatic ill any number of drugs can result in only temporary relief. "I" doesn't want the illness. The analyzer doesn't want it. But the body has it and if anybody succeeds in curing it short of removing that engram, the body, at the command

of the reactive mind, will find something else to substitute for that ill or develop an “allergy” to the drug or annul the effect of the drug entirely.

Of course one can always rip living tissue out of the skull with knives, ice-picks or shock in wholesale quantities. This will cure a psycho-somatic ill. It also, unhappily, cures the personality, the intellect and all too often, life itself.

In dianetics the application of technique to relieve the engrams causing these ills has brought the uniform relief of all patients treated without relapse. In short and in brief, psycho-somatic ills can now be cured. All of them.

CHAPTER VI

Emotion and the Dynamics

Emotion is a theta quantity, which is to say that it is so involved with life forces that dianetics at this stage handles it with invariable success but does not attempt to give forth more than a descriptive theory. Much research must be done on emotion; but so long as the therapy embraces it and releases it with success, further data can be dispensed with up to a point.

Emotion would have to be divided sharply into minus emotions and plus emotions. The minus emotion would be non-survival in character, the plus emotion would be pro-survival. The pleasant and pleasurable emotions are not of any great concern to us here. It is believed that all emotion is the same thing but in its aspects above Zone 1 it can be by-passed as unnecessary to explain at this time for the purpose of this book.

In Zones 1 and 0, emotion becomes very important to therapy. As has been covered earlier, Zones 1 and 0 are the anger and apathy zones respectively. From death up to the border between anger and fear is Zone 0. From this borderline to the beginning of boredom is anger, Zone 1.

It is as if the survival dynamic, in becoming contracted into Zone 1, first began to display hostility, then, on further suppression toward death, anger. On further suppression, rage began to be displayed. Then fear as the next lower level, then terror and finally, just above death, apathy.

And as the dynamic is suppressed, the cells react forcefully to the menace, it could be said, by resisting the menace. The analyzer resists down to the top border of Zone 1, but in ever decreasing control. From here on down the cells, the actual organism, do the resisting in a last ditch effort. The reactive mind is thoroughly in command from the top border of Zone 1 straight on down to death, and it is in ever increasing command of the organism as the dynamic is suppressed.

Emotion seems to be inextricably connected up with the actual force of life. That there is a life force no engineer could doubt. Man and medicine usually look at the pitcher and forget that the pitcher is only there to hold milk and that the milk is the important quantity. Life force is the helium which fills the free balloon. Out goes the helium, down comes the balloon. When this type of energy is located and isolated as itself -- if it is just an energy type -- then medicine can start moving forward in strides which will make all former steps look like those of a man in a sack race. Medicine doesn't have any spare helium, for one thing.

How high this life force can go on the survival scale is not known. Above Zone 3 is the area of question marks. A clear goes up into a level of persistence, vigor, tenacity, rationality and happiness. Perhaps some day a clear will attain the nebulosity the author used to hear about in India which marked the man who was all soul.

How far down it can go is definitely known. A man dies. He doesn't move or think. He dies as an organism, then he dies as cells. There are different periods of "life after death" for the cells and biologists remark that the hair and nail cells do not die for months. So here is a spectrum of death, first the organism and then, colony by colony, the cells.

That is from the bottom of Zone 0 downward. But what we are interested in is the area from Zone 1 down to the bottom of Zone 0. It could be postulated that the analytical mind has its greatest bounce against the suppressor, its highest ability to care for the organism, when it is in the third zone. As the suppressor thrusts downward against it, the analyzer, within lower Zone 3 thrusts heavily back. This is necessity at work. The necessity level can rise, in this action, to a point which keys-out all engrams!

It must be realized that the analyzer considers future suppressors and is continually engaged upon computations which pose problems of the future which the analyzer resolves -- this is one of the functions of the imagination; it must further be realized that the analyzer is engaged upon a multitude of computations about the present: for the analytical mind is dealing continually with an enormous number of factors which comprise the suppressor of the present and the suppressor of the future. It computes for instance on the alliances with friends and symbiotes and its greatest victories are achieved by taking some of the suppressor and turning it into an alliance factor.

The individual can be visualized, on the survival spectrum, as being at the tip of the survival dynamic. The suppressor thrusts down, or future suppressors threaten a thrust and the analytical mind thrusts up with solutions. The level of the individual is determined by how well these suppressors are apparently met.

We speak now of the clear and until further mention we will continue to use the clear. The clear is an unaberrated person. He is rational in that he forms the best possible solutions he can on the data he has and from his viewpoint. He obtains the maximum pleasure for the organism, present and future, as well as for the subjects along the other dynamics. The clear has no engrams which can be restimulated to throw out the correctness of computation by entering hidden and false data into it. No aberration. Hence the reason we use him here as an example.

The survival dynamic is high, more than balancing the suppressor. Take this as a first condition. This would place the dynamic in Zone 3, Tone 3.9. Now increase the suppressor. The dynamic is pushed back to Tone 3.2. Necessity surges up. The suppressor is thrust back. The dynamic is once more at Tone 3.9. This action could be termed an enthusiastic resurgence. The individual has actually gotten "angry" -- that is to say, he has called upon his being to furnish power for thought and action.

Mentally he calls upon whatever constitutes mental energy. Physically, if the suppression was physical, he would call upon his adrenalin. This is proper use of the endocrines, to use them for regaining position in relation to the suppressor. Any and all body function is under analytical (but not necessarily monitored) command.

Now let us suppose that the suppressor surges down against the dynamic and drives the dynamic to 3.0. Necessity level comes up. Action is taken. The full force of the being is thrown against the suppressor. Now let us suppose that a new factor comes into the suppressor and makes it much, much stronger. The individual still attempts to resurge against it. But the suppressor weighs heavier and heavier against him. He is beginning to exhaust his supplies of mental or physical energy (and this suppressor can be on either a mental or physical level.) Wearing, the individual drops down to a 2.5. The suppressor again increases. Resurgence is attempted once more. The last supply of available energy or data is thrown out. And another factor comes into the suppressor, increasing its weight. The individual sags down to 2.0.

At exactly this point the analyzer, having failed, finally cuts out. Here is entered the top of Zone 1. Hostility sets in. The suppressor is down, pressing down against actual cellular survival. And it drops lower. The individual goes into anger, recruiting cellularly but not sentiently, the last forces. Again the suppressor gets new weight. The individual goes into rage. Once more the suppressor drops. The individual goes into fear, Tone 0.9. Again the suppressor lowers, recruiting new factors. The individual is thrust down to 0.6 and here is in terror. Once more the suppressor drops with new force. The individual slides into fear paralysis, 0.2.

Suppose we parallel this in a very simple, dramatic example so that we do not have to consider a thousand subtle factors.

A clear, inexperienced in hunting, determines to shoot a grizzly. He has a fine rifle. The grizzly appears to be easy game. The man is at 3.9 or above. He feels good. He is going to get

that grizzly as the grizzly has been threatening the man's stock. High enthusiasm carries him to the lair. He waits, he finally sees the grizzly. There is a cliff above the man which he could not ordinarily climb. But to get a good shot before the grizzly vanishes, the man has to climb the cliff. Seeing he was in danger of losing the game brought the man down to 3.2. Necessity sends him up the cliff. He fires but in firing falls back down the cliff. The grizzly is wounded. He starts toward the man. Necessity surges up. The man recovers the gun and shoots again. He is at 3.0 the moment he shoots. He misses. He fires again but the miss, with the grizzly charging, brought him down to 2.5. He shoots once more. The grizzly takes the ball and keeps on coming. The man shoots again but he has suddenly realized that his rifle is not going to stop this grizzly. His tone drops to 2.0. He begins to snarl and feverishly work his gun. His bullets go wild. He experiences rage at the gun, the grizzly, the world, and throws the gun away, ready to meet the grizzly, almost upon him, with bare hands. Suddenly the man knows fear. His tone is 1.2. It drops to 0.9 with a smell in his nostrils of the bear. He knows the bear will kill him. He turns and tries to claw up the cliff and get away but his efforts are frenzied. He is at Tone 0.6, stark terror. The bear strikes him and knocks him from the cliff-side. The man lies still, breathing almost halted, heart-beat slowed to nearly nothing. The bear hits him again and the man lies still. Then the bear decides he is dead and walks away. Shaken, the man eventually comes around, his tone gradually rising up to 2.0, the point where his analyzer shut off. He stirs more and gets up. His tone is back to 2.5: he is analytically afraid and cautious. He recovers his gun. He begins to leave the scene. He feels a great necessity to recoup his own self-esteem and his tone comes to 3.2. He walks away and reaches a safe area. Suddenly it occurs to him that he can borrow a friend's Mauser. He begins to make plans to get that bear. His enthusiasm mounts. But, completely aside from the engram received when the bear knocked him out, he acts on his experience. Three days later he kills the bear and his tone rises to 4.0 for the space of contemplation and telling the tale and then his mind occupies itself with new matters.

Life is much more complicated than the business of killing grizzlies, usually a lot less dramatic but always full of situations which cause a fluctuation of the suppressor. The gaining of all pleasurable goals -- a bear killed, a woman kissed, a seat in the front row at the opera, a friend won, an apple stolen -- are sweeps through various levels of tone. And the individual is generally carrying on three or three thousand computations at once and there are thirty or thirty thousand variables in his computations. Too many unknowns, too many entrances of "didn't know the gun was loaded" factors, all these can throw the analyzer from a direct alignment into the scattered dispersal of non-function. The analyzer can be considered to cut out when Tone 2.0 is reached. From 2.5 down the computations it makes are not very rational -- too many unknowns, too many unexpected factors, too many discoveries of miscalculations.

This is living on a "clear" basis. When our hunter was hit by the bear he received an engram. That engram, when it keyed-in, would give him a fear, an apathy attitude, in the presence of certain factors: every perceptic present -- the smell of that ground, twigs, bear-breath, etc. But he killed the bear. The chances of that engram keying-in are remote. Not because he killed the bear but because he was, after all, a grown man. And, if a clear, he could have thought back and cleared the whole thing himself.

This is a complete cycle of emotion. Enthusiasm and high pleasure are at the extreme top. Fear and paralysis are at the bottom. Feigned death, in Man, is very close to the actual thing on the tone scale. It is a valid mechanism. But it is complete apathy.

So long as the analyzer is operating, the receipt of an engram is impossible. Everything files in the standard banks. As soon as the border 2.0 is passed on the way down, "unconsciousness" can be judged to have set in and anything registered, in company with pain or painful emotion, is an engram. This is not a shift of definition. The analyzer cuts out, with surgical anaesthetic, at 2.0. The anaesthetic may depress the level of awareness further. Pain may depress it even more. But depressing the level of awareness is not necessarily depressing emotion.

How much conceived danger or sympathy is present in the environment? This is what depresses the tone scale. There can be a reactive engram which contains a Tone 4.0 or one that contains a 1.0 or another that contains a 0.1. This is not, then, quite two-dimensional, this emotion.

The level of depth of consciousness can be affected by painful emotion, poisons or other things which depress awareness. After that it is all engram and the engrams have their own tone scale which runs from 4.0 down to 0.1.

It can be seen now that two things are at work. First is the state of physical being. It is this which tunes down the analyzer. Then there is the mental state of being.

This is what tunes down the emotional tone scale.

But remember that in engrams there is another factor present: valence. Once its own analyzer is out the body will assume the evaluation or emotional condition of any other analyzer present. Here we have affinity at work in earnest. "Unconscious" in the presence of other beings, an individual picks up a valence for every other being present. Some of these valences are incidental. He will pick first that valence which is most sympathetic as a desirable future friend (or some similar person). And he will pick that valence which is the top valence (highest survival, the boss, the winner) for his dramatization. He will also take the valence of the winning entity (winning over himself or others) for emotional tone. If the winning valence is also the sympathetic valence, he has an engram which can be utilized to its fullest extent.

Let us make this an example: a man is under nitrous oxide (the most vicious anaesthetic ever invented as it is actually not anaesthetic but a hypnotic) undergoing exodontistry. As usual everybody present around the "unconscious" patient chatters and yaps about the patient, the weather, the most popular movie star, or baseball. The exodontist is a tough character, bossy to the nurse, apt to be angry about trifles; he is also very sympathetic toward the patient. The nurse is a blue-eyed blonde who is sexually aberrated. The patient, actually in agony, receiving an engram amongst engrams which may ruin his life (terrible stuff, nitrous oxide; really hands out a fancy engram as any dianeticist can attest) is unanalytical. Everything said to him or around him is taken literally. He takes the valence of the exodontist as both the top valence present and the sympathetic valence. But every phrase uttered is aberrative and will be interpreted by that happy little moron, the reactive mind, on the order of Simple Simon who was told he had to be careful how he stepped in the pies, so he stepped in them carefully. These people may be talking about somebody else but every "I" or "he" or "you" uttered is engramic and will be applied to others and himself by the patient in the most literal sense. "He can't remember anything" says the exodontist. All right, when the engram keys-in, this patient will have an occlusion on memory in greater or lesser degree. "He can't see or feel it": this means an occlusion on sight, pain and tactile. If the patient has his eyes watering in agony at the moment (though completely "under") he may get actual bad vision as well as poor visual recall from this experience.

Now they put him in the hands of this blonde nurse to let him sleep off the drug and recover. She is an aberree amongst aberrees.

She knows patients do weird things when they are still "out" so she pumps him for information about his life. And she knows they are hypnotic (yes, she sure does) so she gives him some positive suggestions. Amusing herself. She says he'll like her. That she'll be good to him. And stay there now for the present.

So the poor patient, who has had two wisdom teeth, impacted, taken out, has a full anger-sympathy dramatization. The general tone he takes is the tone the exodontist showed to the others in the room. The exodontist was angry at the nurse. With his recalls all messed up, the patient a few years later meets a woman similar to this nurse. The nurse has given him compulsions toward her.

The silly little moron, the reactive mind, sees in this entirely different person enough similarity to create an identity between the nurse and this new woman. So the patient divorces his wife and marries the pseudo-nurse.

Only now that he has married the pseudo-nurse the dental engram begins to key-in in earnest. Physically he gets ill: the two molars adjacent to where the wisdom teeth came out develop large cavities and begin to rot (circulation shut down, pain in the area but can't be felt because there's a pain recall shut-off). His memory goes to pieces. His recalls become worse. He begins to develop eye trouble and a strange conjunctivitis. Further (because the dentist leaned on his chest and stomach with a sharp elbow from time to time) he has chest and stomach pains. The nitrous oxide hurt his lungs and this pain is also in chronic restimulation. But most horrible: he believes that this pseudo-nurse will take care of him and he stops to some degree taking care of himself in any way; his energy dissipates; and analytically he knows it is all wrong and that he is not himself. For he is now fixed in the valence of the exodontist who is angry with this nurse and so he beats the pseudo-nurse because he senses that from her all evil flows. The girl he married is not and was not the nurse: she sounds something like her and is a blonde. She has her own engrams and reacts. She attempts suicide.

Then, one day, since this is one engram among many, the mental hospital gets our patient and the doctors there decide that all he needs is a good solid series of electric shocks to tear his brain up, and if that doesn't work, a nice ice-pick into each eyeball after and during electric shock, the ice-pick sweeping a wide arc to tear the analytical mind to pieces. His wife agrees. Our patient can't defend himself: he's insane and the insane have no rights, you know.

Only the cavalry, in this one case, arrived in the form of dianetics and cleared the patient and the wife and they are happy today. This is an actual engram and an actual case history. It is a sympathy engram, pro-survival on the moronic reactive mind level.

This is to show the ebb and flow of emotion within this one engram. The physical being is out and in agony. The mental being is given a variety of emotional tones on a contagion principle. The actual emotional tone of the patient, his own, is beaten apathy; hence he can no longer "be himself."

In passing it should be mentioned that only absolute silence, utter silence and tomb-like silence, should attend an operation or injury of any kind. There is nothing which can be said or given as a percept in any moment of "unconsciousness" which is beneficial to a patient.

Nothing! In the light of these researches and scientific findings (which can be proven in any other laboratory or group of people in very short order), speech or sound in the vicinity of an "unconscious" person should be punished criminally as, to anyone who knows these facts, such an act would be a willful effort to destroy the intellect or mental balance of an individual. If the patient is complimented, as in hypnosis or during an injury or operation, a manic is formed which will give him temporary euphoria and eventually plunge him into the depressive stage of the cycle.

The golden rule could be altered to read: If you love your brother, keep your mouth shut when he is unconscious.

Emotion can be seen then to exist in two planes, the personal plane and the extra-valence plane. It is communicable in terms of identical thinking. Rage present when a man is "unconscious" will give him a Tone 1 engram: it will contain rage. Apathy present in the vicinity of an "unconscious" person will give him a Tone 0 engram. Happiness present during an engram is not very aberrative but will give a Tone 4 engram. And so forth. In other words, the emotion of those present around an "unconscious" person is communicated into the person as part of his engram. Any mood can be so communicated.

In dramatizing an engram, the aberree always takes the winning valence and that valence is not, of course, himself. If only one other person is present and the other is talking in

terms of apathy, then the apathy is the tone value of the engram. When an apathy engram is restimulated, the individual, unless he wants to be hurt severely, is apathetic and this tone, being the nearest to death, is the most dangerous one to the individual. The rage emotion communicated to an “unconscious” person gives him a rage engram he can dramatize. This is most harmful to the society. A merely hostile tone present around an “unconscious” person gives him a merely hostile engram (covert hostility). With two people present, each having a different mood, the “unconscious” person receives an engram with two valences other than his own. When this happens he will first dramatize the winning valence with its mood and, if forced from this, will dramatize the second valence with its mood. Driven from this in a chronic engram, he goes insane.

Nothing here should be construed to mean that a person only uses or dramatizes sympathy engrams. This is very far from the case. The sympathy engram gives him the chronic psycho-somatic illness. He can dramatize any engram he has when it is restimulated.

Emotion, then, is communication and a personal condition. The cellular level evaluation of a situation depends upon any other analyzer present, even if that analyzer is thoroughly hostile to it. Lacking such evaluation, the individual takes his own tone for the moment.

There is another condition of emotion which is of extreme and useful interest to the therapist since it is the first thing with which he will have to deal in opening a case. We do not mean here to start discussing therapy but to describe a necessary part of emotion.

Great loss and other swift and severe suppressor action dams up emotion in an engram. Loss itself can be a shock to reduce analytical power. And an engram is received. If it is the loss of a sympathetic person on whom an individual has depended, it seems to the individual as if death itself stalks him. When such a suppressor effect occurs, it is as if a strong steel spring had been compressed within the engram. When it releases it comes with a terrible rush of emotion (if this discharge is, indeed, emotion, though we hardly know what other name to call it).

Life force apparently gets dammed up at these points in life. There may be enormous quantities of that life force available but some of it becomes suppressed into a loss engram. After that the person does not seem to possess as much fluid vitality as before. This may be not emotion but life force itself. The mind then has below it, as in a cyst, a great quantity of sorrow or despair. The more of these charges exist in such an encysted state, the less free are the emotions of the individual. This may be on a basis of suppression to a point from which there is no swift rising. Nothing in the person’s future seems to bring him up to any plane like those he occupied before.

The glory and color of childhood vanishes as one progresses into later years. But the strange part of it is that this glamor and beauty and sensitivity to life are not gone. They are encysted. One of the most remarkable experiences a clear has is to find, in the process of therapy, that he is recovering appreciation of the beauty in the world.

Persons, as they live forward from childhood, suffer loss after loss, and each loss takes from them a little more of this ; Ø quantity which may be, indeed, life force itself. Bound up within them, that force is denied them and indeed, reacts against them.

Only this emotional encysting can, for instance, compartment the mind of a person who is multi-valent or who cannot see or hear his past. The analytical mind, worked upon by the reactive bank, compartments and divides with loss after loss until there is no free flow left. Then a man dies.

Thus we could say that emotion, or what has been called emotion, is really in two sections: first, there is the endocrine system which, handled either by the analytical mind in the upper two zones or the reactive mind in the lower two zones, brings emotional responses of

fear, enthusiasm, apathy, etc.; second, there would be life force itself becoming compartmented by engrams and being sealed up, little by little, in the reactive bank.

It is possible that a therapy could be formulated which would spring out these various life force charges only and create thereby a full clear. Unfortunately, to date, this has not been possible.

The odd part of emotion is that it is so ordinarily based on the word content of engrams. If an engram says, "I am afraid," then the aberree is afraid. If an engram says, "I am calm," even if the rest of the engram gives him chattering shakes, the aberree still has to be "calm."

The problem of emotion as endocrine balance and life force has another complication in that the physical pain in an engram is often mistaken for a particular emotion named in the engram. For instance, the engram can say with verbal content that the individual is "sexually excited" and have as a pain content an ache in the legs and have as an actual emotional content (the valence that says "I'm sexually excited") anger. This, to the aberree dramatizing it is a complex affair. When he is "sexually excited" -- he has an idea what that means as just language -- he is also angry and has an ache in the legs. This is actually very amusing in many cases and has led to a standard set of clinical jokes, all of which begin with, "You know, I feel like everybody else."

Dianeticists, having discovered that people evaluate the emotions, beliefs, intelligence and somatics of the world in terms of their own engramic reactions, delight in discovering new concepts of "emotion." "You know how people feel when they're happy. Their ears burn." "I feel just like anybody else when I'm happy; my feet and eyes ache." "Of course I know how people feel when they're happy; just pin prickles going all over them." "I wonder how people can stand to be passionate when it makes their noses hurt so." "Of course I know how people feel when they're excited: they have to go to the toilet."

Probably every person on earth has his own peculiar definition for every emotional state in terms of engram command. The command plus the somatics and perceptics make what they call an "emotional state."

Actually the problem, then, should be defined in terms of the clear, who can function without engramic orders from the reactive mind. So defined it breaks down in terms of the endocrine system and the varying level of life force free to resurge against the suppressor.

Laughter, it should be added, is not, strictly speaking, an emotion but a relief from emotion. The early Italians had a very definite idea, as represented by their folk tales, that laughter was of therapeutic value. Melancholy was the only mental illness these tales consider and laughter was its only cure. In dianetics we have a great deal to do with laughter. In therapy patients vary, in their laughter reaction, from the slight chuckle to hilarious mirth. Any engram which really releases may be expected to begin somewhere between tears and boredom and end with laughter; the nearer the engram's tone is to tears at the first contact, the more certainly laughter will appear as it is relieved.

There is a stage of therapy often reached by the pre-clear when his entire past life seems to be a subject of uncontrollable mirth. This does not mean he is clear but it means that a large proportion of the encysted charges have been tapped. A pre-clear has laughed for two days almost without ceasing. Hebephrenia is not the same thing as this laughter for the relief of the pre-clear on realizing the shadowy aspect and completely knowable character of his past fears and terrors is hearty.

Laughter plays a definite role in therapy. It is quite amusing to see a pre-clear, who has been haunted by an engram which contained great emotional charge, suddenly relieve it, for the situation, no matter how gruesome it was, when relieved, is in all its aspects a subject of great mirth. The laughter fades away as he becomes disinterested in it and he can be said to be "Tone 3" about it.

Laughter is definitely the relief of painful emotion.

[The complete Tone Scale, its use in predicting the behavior of others as well as assisting in auditing, is given in the book **SCIENCE OF SURVIVAL** by L. Ron Hubbard, 1951, 580 pages.]

CHAPTER VII

Prenatal Experience and Birth

Old women less than a hundred years ago talked wisely about "prenatal influence" and how a woman marked her child. Many such intuitive thoughts are based, actually, on observed data. It can be observed that the child born out of wedlock is often a luckless creature (in a society which frowns upon such bearings). These tenets have been held in the market place for a great many millenia. Just because they have been held is no reason they are true, but they make an excellent beginning for a chapter on prenatal experience and birth.

If dianetics had worked on obscure theories such as those of the old women or those of the mystics who believe that "childish delusions" are capable of aberrating a child, dianetics would not be a science of mind. But it was no obscure theory which brought about the discovery of the exact role prenatal experience and birth play in aberration and psycho-somatic ills.

Many schools of mental healing from the Aesculapian to the modern hypnotist were studied after the basic philosophy of dianetics had been postulated. Much data was accumulated, many experiments were made. The fundamentals about engrams had been formulated and "unconsciousness" had been discovered as being a period of actual recording when the theory began to predict new phenomena not hitherto observed.

There has been, in recent years, a practice called "narco-synthesis." This was actually a branch of "hypno-analysis" and "deep analysis." It did not produce clears and it did not even produce alleviation in the majority of its cases. But it was discovered to be an aberrative factor in itself. A thing which aberrates may well lead to something which removes aberrations if it is studied scientifically. Narco-synthesis was so studied. Several cases were examined on which narco-synthesis had been employed. Some of these cases had experienced relief from narcosynthesis. Others had become a great deal worse.

Working with hypno-analysis it was discovered that the technique could be varied until it would actually remove the aberrative charge contained in locks. In treating schizophrenics with narco-synthesis it was found that the locks (periods of mental anguish not including physical pain or "unconsciousness") would sometimes spring (clear) and sometimes not.

Narco-synthesis is a complicated name for a very ancient process quite well known in Greece and India. It is drug hypnotism. And it is generally employed either by those practitioners who do not know hypnosis or on those patients who will not succumb to ordinary hypnosis. A shot of sodium pentothal is given intravenously to the patient and he is asked to count backwards. Shortly he stops counting at which the injection is also stopped. The patient is now in a state of "deep sleep." That this is not sleep seems to have missed both narco-synthesists and hypnotists. It is actually a depressant on the awareness of an individual so that those attention units which remain behind the curtain of his reactive bank can be reached directly. These attention units are up against the standard banks. The by-pass circuits (demon circuits) which lie between these banks and "I" have themselves been by-passed. In other words, a section of the analytical mind has been exposed which is not aberrated. It is not very powerful and it is not highly intelligent, but it has the advantage of being hard up against the standard banks. This is basic personality. The intent and purpose and persistence of these few attention units have the same quality and direction as the whole analytical mind would have if it were clear. It is a very nice, co-operative group of attention units and it is very useful; for basic personality has all recalls -- sonic, audio, tactile, smell, pain, etc. It can get at anything that is in the banks -- which is everything perceived or thought in a lifetime, minute by minute. These qualities of basic personality have been very poorly described in hypnosis, and it is doubtful even if it was generally known that sonic was part of the recall system disclosed by deep hypnosis or the drug hypnosis called narco-synthesis.

A study of basic personality in a multi-valent subject who had poor memory, no good recalls and scant imagination disclosed the information that BP (the attention units called basic personality) was more able to select out data than AP (aberrated personality as represented by the awake subject). It was further discovered that AP could ordinarily return better than BP so far as time-distance went but that when AP arrived at the earliest place it was unable to manage recall. But if AP had gone back and established a vague contact with an incident, drug hypnotism or standard hypnotism used on him when he was in present time (no longer returned would then permit BP to return. Drug hypnotism has seldom been able to force back very early into a patient's life. But by making the strength of AP go back and then using BP for the recall, some very early incidents could be reached. This trick was invented to overcome some of the difficulties which had made drug hypnosis relatively uncertain in results.

Then another factor was discovered. All those patients who had been treated by narco-synthesis had become worse every time the people doing the work had crossed over but left (because "everybody knew" an "unconscious" person didn't record) a period of "unconsciousness." When one of these "unconscious" periods was so probed -- by the drug hypnosis called narco-synthesis -- the patient usually became worse, not better. Doing a little more probing than had been done by the usual practitioners, dianetic research entered some of the late life "unconscious" periods and, with much labor, laid them bare.

Now all drug hypnosis, whether it is called narco-synthesis or a visit from the god Aesculapius, is still hypnosis. Whatever is said to a hypnotized subject remains as a positive suggestion, and these positive suggestions are simply engrams with a somewhat lighter effect and a shorter duration. When a drug is present the hypnotism is complicated by the fact that hypnotic drugs are, after all, poisons; the body is then possessed of a permanent (at least until dianetics was discovered) somatic to go along with the suggestion. Drug hypnotism invariably creates an engram. Whatever a practitioner says to a drugged subject becomes engramic in some degree. In the course of dianetic research it first was supposed, playing back the careless chatter of practitioners out of the minds of patients they had placed under drug hypnosis, that this carelessness in saying so many aberrative things was responsible for some of the failure. But this was found to be true in a very limited sense. Then it was discovered that when the "unconscious" periods were reached by drug hypnosis they refused to lift even when the patient recounted them scores of times. This was blamed on the drug character of the hypnosis.

Straight hypnotism was then used to reach these late "unconscious" periods and these periods still failed to lift. Therefore it was adjudged safe to continue drug use on those patients who refused hypnosis. And the AP-BP alternate trick began to be employed.

It was discovered by drug hypnosis where it was necessary and straight hypnosis where that was possible that the "schizophrenic" (the multi-valent aberree) could be made to reach very early periods in every case. And it was further found that an early period of "unconsciousness" would often lift. Experimentation brought about a scientific axiom: The earlier the period of "unconsciousness" the more likely it is to lift. That is a fundamental axiom of dianetic therapy.

Manic-depressives who had sonic recall were worked upon, most of them by straight hypnosis, and it was discovered that they also followed this rule. But it was most dramatic in the multi-valent aberree: for when the engram did not lift it impinged against his analytical mind when he was awakened and created a variation in his psychoses and brought with it psychosomatic illnesses as well.

This brought about an understanding of why the multi-valent aberree, under narco-synthesis, was made worse whenever some practitioner had glided over (but not entered, of course) a late-life period of "unconsciousness." Now came the problem of applying the axiom. It was postulated that the primary engram must in some way suppress later engrams. In view of other data and postulates, this was an entirely reasonable assumption. The earlier a person went in the life of a multi-valent aberree the less likelihood there was of restimulating him

artificially. Often an engram at around two or three years of age would lift entirely and give him a great deal of relief.

The problem of this research was very far from the same problem of those who, not knowing about the reactive mind and “unconsciousness,” tried merely to find computing factors on a rational level or incidents of everyday life as aberrative factors in a patient.

When an engram is touched, it is very resistive, particularly above the age of two years. Further, the whole reactive bank was buried deeply under foggy layers of “unconsciousness” and was further safeguarded by a mechanism of the analytical mind which tended to prohibit it from touching pain or painful emotion. The reactive bank was protecting itself all the way through the research but it was obviously the answer. The problem was how to achieve its relief, if it could be relieved.

Having made several multi-valent personalities intensely uncomfortable, a new necessity level was reached whereby something had to be done about the problem. But there was this shining hope, the above axiom. A bridge between insanity and sanity had to be built and there, in the axiom, one had at least a glimmer of a plan. The earlier one had experienced this fog and pain, the lighter these engrams seemed to be.

Then, one day, a multi-valent patient, under drugs, went back to his birth. He suffered the pain -- and it was very painful with this crude technique, for dianetics had not yet smoothed down to a well-oiled piece of machinery -- and he floundered through the “unconsciousness” of the period and he fought the doctor who had tried to put drops in his eyes and he generally resented the entire proceedings. AP had been sent down first, then later, under drugs, BP had contacted the incident.

This seemed a remarkable day for dianetics. After twenty runs through birth the patient experienced a recession of all somatics and “unconsciousness” and aberrative content. He had had asthma. It seemed that this asthma had been caused by the doctor’s enthusiasm in yanking him off the table just when he was fighting for his first breath. He had had conjunctivitis. That came from the eye-drops. He had had sinusitis. That had come from the nose swabs used by the pretty nurse.

Rejoicing was held for he seemed to be a new man. A primary psychosis about being “pushed around” had vanished. The subjective reality of this incident was intense. Objective reality did not matter but this patient had a mother near at hand and objective reality was established simply by returning her in therapy to his birth. They had not communicated about it in detail. The recording of her sequence compared word for word with his sequence, detail for detail, name for name. Possibility, even if they had communicated, of such duplication, outside the dianetic situation, was mathematically impossible. And she had been “unconscious” during his birth and had always supposed that the affair had been quite different and the return data collapsed her awake description of it as being so much fable.

In order to make sure that this was no freak (for it is a very poor research man who will base conclusions on a series of one) two manic-depressives were returned to their births and both completed the experience. But one of these two birth engrams would not lift!

The postulated axiom was called into play again. If one could find the earliest engram, then the others would lift each in turn. That was the hope.

The manic-depressive whose birth had not lifted was returned to a period before birth in an effort to find an earlier engram.

Structural theories, as fondly held for ages, had thoroughly collapsed already when “unconscious” fog and pain had been penetrated to discover the engram as an aberrative unit. Tests had held up the discovery that all data, awake, asleep and “unconscious,” from the moment of conception on was always recorded somewhere in the mind or body. The little

matter of myelin sheathing, since it had already been disproven by laboratory research which included the reaching of birth, was discarded. The theory that no recordings can take place in the mind until the nerves are sheathed depends upon a theoretical postulate, has never been subjected to scientific research, and depends for its existence upon Authority alone -- and a "science" which depends on Authority alone is a breath in the wind of truth and is therefore no science at all. That babies cannot record until the myelin sheathing is formed has about as much truth, on investigation, as the fact that penis-envy is the cause of female homosexuality. Neither theory, when applied, works. For the baby, after all, is composed of cells and it is evidenced now by much research that the cell, not an organ, records the engram.

Thus there was no inhibition about looking earlier than birth for what dianetics had begun to call basic-basic (the first engram of the first chain of engrams). And an earlier engram was reached.

It has since been discovered that a great deal of recording is done by the child in the womb which is not engramic. For a time it was thought that the child in the womb records on the proposition of "extended hearing," where hearing tunes up in the presence of danger and particularly during "unconsciousness." But the first research discovered prenatal engrams to be most easily reached when they contained a great deal of pain. Cells, not the individual, are evidenced to record pain. And the reactive engram bank is composed only of cells.

Recourse to nature rather than recourse to Authority is the very building block of modern science. So long as Galen remained an Authority on blood, none but "madmen" like Da Vinci, Shakespeare and William Harvey even thought to experiment to find out what truly was the action of blood! So long as Aristotle remained the Authority for All, the Dark Ages reigned. Advance comes from asking free-minded questions of nature, not from quoting the works and thinking the thoughts of by-gone years. Recourse to precedent is an assertion that yesterday's mentors were better informed than today's: an assertion which fades before the truth that knowledge is compounded of the experience of yesterdays, of which we have more, most certainly, than the best-informed mentor of yesterday itself.

In that dianetics was based on a philosophy that used the cell as the basic building block, the fact that recording of engrams was done by cells came with less surprise than it otherwise might have. The engram is not a memory; it is a cellular trace of recordings impinged deeply into the very structure of the body itself.

The experience of which cells themselves were capable had already been tested. It had been found that a monocyte divided not only its substance but gave its total experience, as a master disc will make duplicates, to its offspring. Now this is a peculiarity of monocytes: they survive as identities. Each is personally its fore-bearer.

Cell A divides to a first generation; this generation is also Cell A; the second generation, the second division, creates an entity which is still Cell A. Lacking the necessity of such laborious processes as construction and birth and growth before reproduction, the monocyte simply splits. And everything it has learned could be postulated to be contained in the new generation. Cell A dies but through generations from it, the latest generation is still Cell A. Man's belief that he is to live in his progeny might possibly derive from this cellular identity of procreation. Another interesting possibility lies in the fact that even neurons exist in embryo in the zygote and neurons do not themselves divide but are like organisms (and may have the virus as their basic building block).

Dianetics, as a study of function and the science of mind, does not need any postulate concerning structure, however. The only test is whether or not a fact works. If it does work and can be used, it is a scientific fact. And the prenatal engram is a scientific fact. Tested and checked for objective reality, it still stands firm. And as for subjective reality, the acceptance of the prenatal engram as a working fact alone makes possible the clear.

At the end of a series of 270 clears and alleviations a short series of five cases was taken to finally settle the argument. These five cases were not permitted to admit anything before birth. They were treated with everything dianetics, hypnotism and other therapeutics could offer, and no clear was obtained. This ruled out the "personality of the operator" or "suggestion" or "faith" as factors in dianetics. These five cases had never been informed of prenatal engrams. Each swerved in toward them but was restrained without informing him that engrams existed that early. The five were alleviated as to some variety of psycho-somatic ills but the ills were only alleviated, not completely cured. The aberrations remained but little changed. They are extremely disappointed since each had heard something of "the miracles dianetics could perform." Before then 270 cases had been worked and 270 cases had reached prenatal engrams. And 270 cases had been cleared or alleviated as the dianeticist chose and time permitted. All could have been cleared with an additional average of 100 or so hours for each of the persons who were alleviated. In short, on random cases -- and selected cases so that at least two of each classification of neurosis or psychosis was included in the clearing -- when prenatal engrams and birth were taken into account and used in therapy, results were obtained. When these factors were not taken into account, results were no more favorable than those attained in the best successes of past schools -- which is not nearly good enough for a science of mind.

Dianetics had prenatal and birth engrams wished off on it as facts existing in the nature of things. That past schools have been passing over these engrams and into the prenatal area without success does not mean that prenatals could not be found any more than it means that these past schools found much value in prenatal experience when they considered it at all. The problem is slightly more complex: the difficulty lay in finding the reactive bank which was occluded by "unconsciousness" which had never before been penetrated wittingly as "unconsciousness." The discovery of this reactive bank led to the discovery of prenatal engrams, which are quite different from "prenatal memory."

After a few cases had been examined as to objective and subjective reality dianetics was forced to accept, if it wished a clear, the fact that the cells of the foetus record. A few more cases and a little more experience discovered that the embryo cells record. And suddenly it was discovered that recording begins in the cells of the zygote -- which is to say, with conception. That the body recalls conception, which is a high level survival activity, has little to do with engrams. Most patients to date sooner or later startle themselves by finding themselves swimming up a channel or waiting to be connected with. The recording is there. And there's little use arguing with a pre-clear that he cannot recall being a sperm, engramic or not as the case may be. It must be remarked because any dianeticist will encounter this.

Anyone postulating that "return to the womb" was an ambition should have examined life in the womb a little more carefully. Even a poor scientist would have at least tried to find out if anybody could recall it before he made a statement that there was a memory of it. But life in the womb does not seem to be the Paradise it has been poetically, if not scientifically, represented. Actuality discloses that three men and a horse in a telephone booth would have but little less room than an unborn baby. The womb is wet, uncomfortable and unprotected.

Mama sneezes, baby gets knocked "unconscious." Mama runs lightly and blithely into a table and baby gets its head stoved in. Mama has constipation and baby, in the anxious effort, gets squashed. Papa becomes passionate and baby has the sensation of being put into a running washing machine. Mama gets hysterical, baby gets an engram. Papa hits Mama, baby gets an engram. Junior bounces on Mama's lap, baby gets an engram. And so it goes.

People have scores of prenatal engrams when they are normal. They can have more than two hundred. And each one is aberrative. Each contains pain and "unconsciousness."

Engrams received as a zygote are potentially the most aberrative, being wholly reactive. Those received as an embryo are intensely aberrative. Those received as the foetus are enough to send people to institutions all by themselves.

Zygote, embryo, foetus, infant, child, adult: these are all the same person. Time has been considered the Great Healer. That can be filed with the things “everybody knew.” On a conscious level it may be true. But on a reactive level Time is nothing. The engram, whenever received, is strong in proportion to the degree it is restimulated.

The mechanism of an engram has an interesting feature. It is not “reasoned” or analyzed nor does it have any meaning until it has been keyed-in. A baby before speech could have an engram in restimulation but that engram must have been keyed-in by the analytical data the baby has.

The reactive mind steals meaning from the analytical mind. An engram is just so many wave-recordings until it is keyed-in, and those recordings, by such restimulation, become effective upon the analytical mind. It may be that the engram never has any reason or meaning in itself but only thrusts its waves forward as unreasoned things at the body and analyzer, and the body and analyzer, through mechanisms, give them meaning. In other words, the engram is not a sentient recording containing meanings. It is merely a series of impressions such as a needle might make on wax. These impressions are meaningless to the body until the engram keys-in, at which time aberrations and psycho-somatics occur.

Thus it can be understood that the prenatal child has no remotest idea of what is being said in terms of words, It does learn, being an organism, that certain things may mean certain dangers. But this is every bit as far as it goes with recording. The mind must become more or less fully formed before the engram can impinge into the analytical level.

The prenatal child can, of course, experience terror. When the parents or the professional abortionist start after it and thrust it full of holes, it knows fear and pain. It has, however, this prenatal child, an advantage in its situation. Being surrounded by amniotic fluid and dependent for nutrition on its mother, being in a state of growth and easily reformed physically, it can repair an enormous amount of damage and does. The recovery qualities of the human body are never higher than before birth. Damage which would maim an infant for life or would kill a grown man can be taken in stride by the prenatal child. Not that this damage does not make an engram -- it certainly does, complete with all data and speech and emotion -- but that this damage does not easily kill it is the point here.

Why people try to abort children is a problem which has its answer only in aberration, for it is very difficult to abort a child. One can say that in the attempt the mother herself is in more danger of dying than the child, no matter what method is used.

A society which suppresses sex as evil and which is so aberrated that any member of it will attempt an abortion is a society which is dooming itself to ever-rising insanity. For it is a scientific fact that abortion attempts are the most important factor in aberration. The child on whom the abortion is attempted is condemned to live with murderers whom he reactively knows to be murderers through all his weak and helpless youth! He forms unreasonable attachments to grandparents, has terrified reactions to all punishments, grows ill easily and suffers long. And there is no such thing as a guaranteed way to abort a child. Use contraceptives, not a knitting needle or the douche bag, to hold down population. Once the child is conceived, no matter how “shameful” the circumstances, no matter the mores, no matter the income, that man or woman who would attempt an abortion on an unborn child is attempting a murder which will seldom succeed and is laying the foundation of a childhood of illness and heartache. Anyone attempting an abortion is committing an act against the whole society and the future; any judge or doctor recommending an abortion should be instantly deprived of position and practice, whatever his “reason.”

If a person knows he has committed this crime against a child who has been born, he should do all possible to have that child “cleared” as soon as possible after the age of eight and in the meantime should treat that child with all the decency and courtesy possible in order to keep the engram out of restimulation. Otherwise he may send that child to an institution for the insane.

A large proportion of allegedly feeble-minded children are actually attempted abortion cases, whose engrams place them in fear paralysis or regressive palsy and which command them not to grow but to be where they are forever.

However many billions America spends yearly on institutions for the insane and jails for the criminals are spent primarily because of attempted abortions done by some sex-blocked mother to whom children are a curse, not a blessing of God.

Antipathy toward children means a blocked second dynamic. Physiological examination of anyone with such blockage will demonstrate a physical derangement of the genitalia or glands. Dianetic therapy would demonstrate attempted abortion or an equally foul prenatal existence and would clear the individual.

The case of the child who, as this is read, is not yet born but upon whom abortion has been attempted, is not hopeless. If he is treated with decency after he is born and if he is not restimulated by witnessing quarrels, he will wax and grow fat until he is eight and can be cleared, at which time he will probably be much startled to learn the truth. But that startlement and any antagonism included in it will vanish with the finishing of the clear and his love of his parents will be greater than before.

All these things are scientific facts, tested and rechecked and tested again. And with them can be produced a clear on whom our racial future depends.

CHAPTER VIII

Contagion of Aberration

Disease is contagious. Germs, traveling from one individual to another, wander through an entire society, respecting none until stopped by such things as sulfa or penicillin.

Aberrations are contagious. Like germs they respect none and carry forward from individual to individual, from parents to child, respecting none until they are stopped by dianetics.

The people of yesterday supposed that genetic insanity must exist, for it could be observed that the children of aberrated parents were often themselves aberrated. There is genetic insanity but it is limited to the case of actually missing parts. A very small percentage of insanity falls into such a category and its manifestation is mental dullness or failure to coordinate and beyond these has no aberrative quality whatever (such people receive engrams which complicate their cases).

The contagion of aberration is too simple in principle to be much labored here. In dianetics we learn that only moments of "unconsciousness," short or long and of greater or lesser depth, can contain engrams. When a person is rendered "unconscious," people in his vicinity react more or less at the dictates of their engrams: in fact, the "unconsciousness" is quite ordinarily caused by somebody's dramatization. A clear, then, could be rendered unconscious by an aberrer who is dramatizing and the aberrer's dramatization of his engram would enter as an engram into the clear.

The mechanics are simple.

People under stress, if aberrated, dramatize engrams. Such dramatization may involve the injury of another person and render him more or less "unconscious." The "unconscious" person then receives as an engram the dramatization.

This is not the only way contagion of aberration gets about. People on operating tables, under anaesthetic, are subjected to the more or less aberrated conversation of those present. This conversation enters into the "unconscious" person as an engram. Similarly, at the scene of accidents, the emergency nature of the experience may excite people into dramatizations, and if a person is "unconscious" because of the accident, an engram is received.

Aberrated parents are certain to infect their children with engrams. The father and mother, in dramatizing their own engrams around sick or injured children, pass them along just as certainly as if those engrams were bacteria. This does not mean that the total reactive bank of a child is composed solely of the parents' engrams, for there are many exterior influences to the home which can enter into the child when it is "unconscious." And it does not mean that the child is going to react to the same engrams the way either parent might react, for the child, after all, is an individual with an inherent personality, a power of choice and a different experience pattern. But it does mean that it is utterly inevitable that aberrated parents will in some way aberrate their children.

Misconceptions and poor data in a society's culture become engrams because not all the conduct around an "unconscious" person is dramatization. If some society believed that fish-eating brought on leprosy, it is quite certain that this false datum would find its way into engrams and sooner or later some one would develop a leprosy-like disease after having eaten fish.

Primitive societies, being subject to much mauling by the elements, have many more occasions for injury than civilized societies. Further, such primitive societies are alive with false data. Further, their practice of medicine and mental healing is on a very aberrative level by

itself. The number of engrams in a Zulu would be astonishing. Moved out of his restimulative area and taught English he would escape the penalty of much of his reactive data; but in his native habitat the Zulu is only outside the bars of a madhouse because there are no madhouses provided by his tribe. It is a safe estimate and one based on better experience than is generally available to those who base conclusions on "modern man" by studying primitive races that primitives are far more aberrated than civilized peoples. Their savageness, their unprogressiveness, their incidence of illness all stem from their reactive patterns, not from their inherent personalities. Measuring one set of aberrations by another set of aberrations is not likely to lead to much data. And the contagion of aberration, being much greater in a primitive tribe, and the falsity of the superstitious data in the engrams of such a tribe both lead to a conclusion which, observed on the scene, is carried out by actuality.

Contagion of aberration is very easily studied in the process of clearing any aberration whose parents fought. Mother, for instance, might be relatively unaberrated at the beginning of the marriage. If she is beaten by her husband who is, after all, dramatizing, she will begin to pick up his aberrations as part of her own reactive pattern. This is particularly noticeable when one is clearing a person who was conceived shortly after his parents' marriage or before it. Papa may begin with a certain dramatization which includes beating a wife. Whatever he says in such a dramatization will sooner or later begin to affect the wife and she may -- unless extraordinarily well balanced -- begin to dramatize these things on her own. Eventually, when the child is born, she will begin to dramatize on the child, thus putting him into a continual state of restimulation.

Birth is one of the most remarkable engrams in terms of contagion. Here the mother and child both receive the same engram which differs only in the location of pain and the depths of "unconsciousness." Whatever the doctors, nurses and other people associated with the delivery say to the mother during labor and birth and immediately afterwards before the child is taken away is recorded in the reactive bank, making an identical engram in both mother and child.

This engram is remarkably destructive in several ways. The mother's voice can restimulate the birth engram in the child and the presence of the child can restimulate the giving-birth engram in the mother. Thus they are mutually restimulative. In view of the fact that they have all the other restimulators also in common a later life situation can cause them each to suffer simultaneously from the engram. If birth included a slammed window, a slammed window may trigger birth dramatization in both, simultaneously, with resultant hostilities or apathies.

Should a doctor become angry or despairing, the emotional tone of birth can be severe. And if the doctor talks at all, the conversation takes on its full reactive literal meaning to both mother and child.

Many cases were cleared where both mother and child were available. One such case found the mother (as heard by the child in dianetic clearing) moaning, "I'm so ashamed, I'm so ashamed," over and over. The child had a neurosis about shame. When the mother was cleared, it was found that her mother at birth was moaning, "I'm so ashamed, I'm so ashamed." One can presume that this has been going along, by contagion, since Cheops built his tomb.

In the larger sphere of society contagion of aberration is extremely dangerous and cannot but be considered as a vital factor in undermining the health of that society.

The social body behaves similarly to an organism in that there are social aberrations which exist within the society. The society grows and may fade like an organism which has people, not cells, for its parts. Where pain is leveled by the head of the society at any member in that society, a source of aberration is begun which will be contagious. The reasons against corporal punishment are not "humanitarian," they are practical. A society which practices punishment of any kind against any of its members is carrying on a contagion of aberration. The society has a social engram, society size, which says punishment is necessary. Punishment

is meted. The jails and institutions fill. And then one day some portion of the society, depressed into Zone 1 by a government's freedom with government engrams, jumps up and wipes the government out. And a new set of aberrations is formed from the violence attending the destruction. Violent revolutions never win because they begin this cycle of aberration.

A society filled with aberrations may feel it necessary to punish. There has been no remedy other than punishment. The provision of a remedy for unsocial conduct by members of the group is of more than passing interest to a government for a continuance of its own corporal practices; adding these to the continuing aberrations of the past seriously depresses the survival potential of that government and will some day cause that government to fall. After many governments so fall, its people too perish from this earth.

Contagion of aberration is never more apparent than in that social insanity called war. Wars never solve the need of wars. Fight to save the world for democracy or save it from Confucianism and the fight is inevitably lost by all. War has become associated in the past with competition, and it has been believed, therefore, by shifty logic, that wars were necessary. A society which advances into a war as a solution of its problems cannot but depress its own survival potential. No government was ever permitted to enter a war without costing its people some of their liberties. The end product is the apathy of a ruling priesthood, where mystery and superstition alone can band the insane remnants of a people together. This is too easily observed in past histories to need much amplification. A democracy engaging in war has always lost some of its democratic rights. As it engages in more and more wars, it eventually comes under the command of a dictator (rule by a single engram). The dictator, forcing his rule, increases the aberrations by his activity against minorities. Revolt begins to follow revolt. Priesthoods flourish. Apathy awaits. And after apathy comes death. So went Greece, so went Rome. So goes England. So goes Russia. And so goes the United States and with it goes Mankind.

Rule by force is a violation of the law of affinity for force begets force. Rule by force reduces the self-determinism of the individuals in a society and therefore the self-determinism of the society itself. Contagion of aberration sweeps along like a forest fire. Engrams beget engrams. And unless the dwindling spiral is interrupted by new lands and mongrel races which escape their aberrative environments, or by the arrival of a means to break the contagion of aberration by clearing individuals, a race will reach downward to the end of the cycle -- Zone 0.

A race is as great as its individual members are self-determined.

In the smaller sphere of the family, as in the national scenes, contagion of aberration produces an interruption of optimum survival.

Self-determinism is the only possible way a computer can be built to give rational answers. Holding down seven in an adding machine causes it to give wrong answers.

Entering fixed and not-to-be-rationalized answers into any human being will cause him to compute wrong answers. Survival depends on right answers. Engrams enter from the exterior world into the hidden recesses below rational thinking and prevent rational answers being reached. This is exterior-determinism. Any interference with self-determinism cannot but lead to wrong computations.

In that a clear is cooperative, a society of clears would cooperate. This may be an idyllic, Utopian dream and it may not be. In a family of clears there is observable harmony and cooperation. A clear can recognize a superior computation when he sees one. He does not have to be slugged and held down and made to obey to make him put a shoulder to the wheel. If he is made to obey, independent of his thinking, his self-determinism is interrupted to a point where he cannot get right answers; the society which holds him has penalized itself his ability to think and act rationally. The only way a clear could so be forced would be to give him engrams or turn a neuro-surgeon loose upon his brain. But a clear does not need to be forced for if the job is important enough to do in terms of general need, he will most certainly do it according to his intelligence and do it as well as possible. One never observes the forced

individual doing a job well, just as one never observes a forced society winning against an equally prosperous free society.

A family which runs on the godhead plan, where somebody must be obeyed without question, is never a happy family. Its prosperity may be present in some material aspects but its apparent survival as a unit is superficial.

Forced groups are invariably less efficient than free groups working for the common good. But any group which contains aberrated members is likely to become entirely aberrated as a group through contagion. The effort to restrain aberrated members of a group inevitably restrains the group as a whole and leads to further and further restraint.

Clearing one member of a family of aberrations is seldom enough to resolve the problems of that family. If the husband has been aberrated, he will have aberrated or restimulated his wife and children in one way or another, even when he used no physical violence upon them. The parents implant their mutual aberrations in the children and the children, being potentially self-determined units, revolt back to stir up the aberrations of the parents. In that so many of these aberrations, by contagion, have become mutual and held in common with the whole family, the happiness of the family is severely undermined.

The corporal punishment of children is just another facet of the problem of the forced group. If any one cares to argue over the necessity of punishing children, let him examine the source of the misbehavior of the children.

The child who is aberrated may not have his engrams entirely keyed-in. He may have to wait until he himself is married and has children or a pregnant wife to have restimulators enough to cause him to become, suddenly, one of these things they call a "mature adult" blind to the beauty of the world and burdened by all its griefs. But the child is nevertheless aberrated and has many dramatizations. The child is in a very unlucky situation in that he has with him his two most powerful restimulators -- his mother and father. These assume the power of physical punishment over him. And they are giants to him. He is a pygmy. And he has to depend upon them for food, clothing and shelter. One can speak very grandly about the "delusions of childhood" until he knows the engram background of most children.

The child is on the unkind receiving end of all the dramatizations of his parents. A cleared child is a most remarkable thing to observe: he is human! Affinity alone can pull him through. The spoiled child is the child whose decisions have been interrupted continuously and who is robbed of his independence. Affection could no more spoil a child than the sun could be put out by a bucket of gasoline.

The beginning and end of "child psychology" is that a child is a human being, that he is entitled to his dignity and self-determinism. The child of aberrated parents is a problem because of the contagion of aberration and because he is denied any right to dramatize or counter. The wonder is not that children are a problem but that they are sane in any action for, by contagion, punishment, and denial of self-determinism the children of today have been denied all the things required to make a rational life. And these are the future family and the future race.

This is not a dissertation on children or politics, however, but a chapter on contagion of aberration. Dianetics covers human thought, and human thought is wide ground. When one gazes at the potentialities inherent in the mechanism of contagion, respect for the inherent stability of Man cannot but arise. No "wild animal" reacting with inherent "asocial tendencies" could have built Nineveh or Boulder Dam. Carrying the contagion mechanism like some Old Man of the Sea, we have yet come far. Now that we know it, perhaps we shall truly reach the stars.

CHAPTER IX

Keying-in the Engram

The single source of inorganic mental illness and organic psycho-somatic illness is the reactive engram bank. The reactive mind impinges these engrams upon the analytical mind and the organism whenever they are restimulated after being keyed-in.

There are many known incidents in a lifetime which apparently have a profound influence upon the happiness and mental condition of the individual. The individual remembers these and to them attributes his troubles. In a measure he is right: he is at least looking back at incidents which are held in place by engrams. He does not see the engrams. In fact, unless he is acquainted with dianetics, he does not know the engrams are there. And even then he will not know their contents until he has undergone therapy.

It can be demonstrated with ease that any moment of "conscious level" unhappiness which contained great stress or emotion was not guilty of the charge of causing aberration and psycho-somatic illness. These moments, of course, played a role in the matter: they were the key-ins.

The process of keying-in an engram is not very complex. Engram 105, let us say, was a moment of "unconsciousness" when the prenatal child was struck via Mother, by Father. The father, aware or not of the child, uttered the words, "God damn you, you filthy whore: you're no good!" This engram lay where it was impressed, in the reactive bank. Now it could lie there for seventy years and never become keyed-in. It contains a headache and a falling body and the grating of teeth and the intestinal sounds of the mother. And any of these sounds, post-birth, may be present in large quantities without keying-in this engram.

One day, however, the father becomes exasperated at the child. The child is tired and feverish, which is to say that his analytical mind may not be at its highest level of activity. And the father has a certain set of engrams which he dramatizes and one of these engrams is the above incident. And the father reaches out and slaps the child and says, "God damn you: you're no good!" The child cries. That night he has a headache and is much worse physically. And he feels both an intense hatred and a fear of his father. The engram has keyed-in. Now the sound of a falling body or grating teeth or any trace of anger of any kind in the father's voice will make the child nervous. His physical health will suffer. He will begin to have headaches.

If we take this child who has now become an adult and rake back over his past, we shall discover (though it may be occluded) a lock like the above key-in. And now not only the key-in; we may discover half a hundred, half a thousand, such locks just on this one subject. One would say, unless he knew dianetics, that this child was ruined post-natally by being beaten by the father, and one might attempt to bring the patient's mind back into better condition by removing these locks.

There are literally thousands, tens of thousands of locks in the average life. To take all of these locks away would be a task for Hercules. Every engram a person has, if it has been keyed-in, may have its hundreds of locks.

If conditioning existed as a mechanism of pain and stress, Mankind would be in very bad condition. Fortunately conditioning does not so exist. It appears to exist but the appearance is not the fact. One would think that if a child were daily thrust around and reviled he would eventually become conditioned into a belief that this was the way life was and that he had better turn against it.

Conditioning does not, however, exist. Pavlov may have been able to drive dogs mad by repeated experiments: this was simply bad observation on the part of the observer. The dogs might be trained to do this or that.

But it was not conditioning. The dogs went mad because they were given engrams if and when they did go mad. A series of such experiments, properly conducted and observed, proves this contention.

The boy who was daily told he was no good and who apparently went into a decline solely because of that declined only because of the engram. This is a happy fact. The engram may take a while to locate -- a few hours -- but when it is alleviated or refiled in the standard memory banks, everything which had locked on to it also refiles.

People trying to help others with their aberrations who did not know about engrams were, of course, operating with 2.9 strikes against any success. In the first place, the locks themselves may vanish down into the reactive bank. Thus we get a patient who says, "Oh, my father wasn't so bad. He was a pretty good guy." And we discovered, and the patient discovers, when an engram is sprung, that father was customarily to be found dramatizing. What the patient knows about his past before engrams are sprung is not worth cataloguing. In another case we may find a patient saying, "Oh, I had a terrible childhood, a terrible childhood. I was beaten seriously." And we discover, when we get the engrams refiled, that the parents of this patient never laid a hand on him in punishment or wrath in his entire life.

An engram may coast along without being keyed-in for decades. One of the most remarkable types of case is one which spent an entire youth without displaying any aberration. Then suddenly, at the age of twenty-six, we discover him to be so aberrated, so suddenly, that it appears he must have been hexed. Perhaps most of his engrams were concerned with the action of getting married and having children. He has never been married before. The first time he is weary or ill and realizes he has a wife on his hands, the first engram keys-in. Then the dwindling spiral begins to go to work. This one shuts down the analyzer enough so that others can be keyed-in. And finally we may discover him in an institution.

The young girl who has been happy and carefree to the age of thirteen and then suddenly goes into a decline has not, that moment, received an engram. She has had an engram key-in which let another key-in. Fission reaction. This key-in may have required nothing more than the discovery that she was bleeding from the vagina. She has an emotional engram about this; she becomes frantic. The other engrams, as the days follow, may swing into position to impinge upon her. And so she becomes ill.

The first sexual experience may be one which keys-in an engram. This is so standard that sex has gotten a rather bad name for itself here and there as being an aberrative factor all by itself. Sex is not and never has been aberrative. Physical pain and emotion which incidentally contain sex as a subject are the aberrative factors.

It may be that a patient is urgent in her insistence that her father raped her when she was nine and that this is the cause of all her misery. Large numbers of insane patients claim this. And it is perfectly true. Father did rape her, but it happened she was only nine days beyond conception at the time. The pressure and upset of coitus is very uncomfortable to the child and normally can be expected to give the child an engram which will have as its content the sexual act and everything that was said.

Drug hypnosis is dangerous when one is trying to treat psychotics as has been mentioned. And there are other reasons it is dangerous. Any operation under anaesthetic or any drugging of a patient may bring about the keying-in of engrams. Here is the analyzer shut down, there is the reactive bank open to be stirred by any comment made by the people around the drugged subject.

Hypnotism itself is a condition in which engrams may be keyed-in which have never before been restimulated: the glassy-eyed stare of the person who has been "too often hypnotized," the lack of will seen in people too often hypnotized, the dependence of the subject upon the hypnotic operator, all these things stem from the keying-in of engrams. Any time the body is rendered "unconscious" without physical pain, no matter how light the degree of

“unconsciousness” is, even if it is only the lightness of weariness, an engram may be keyed-in. And when “unconsciousness” is complicated by new physical pain, a new engram is formed which may gather up with it an entire bundle of old engrams not hitherto keyed-in. Such a late engram would be a “cross-engram” in that it crosses chains of engrams. And if such an engram resulted in a loss of sanity, it would be called a “break-engram.”

There are some aspects to various drug “unconsciousnesses” which have been very perplexing in the past. Psychotic women often maintain, after they are awakened from a drugged sleep (and sometimes a hypnotic sleep), that they have been raped. Men occasionally maintain that the operator has tried to perform a homosexual act upon them while they were drugged. Although it occasionally occurs that people are raped after being drugged, the largest number of such assertions are merely an aspect of the key-in mechanism. Almost any child has been put through the prenatal discomfort of coitus. Often there was violent emotion other than passion present. Such an engram may stay out of circuit for years until drugged “unconsciousness” or some such thing keys it in. The patient goes to sleep without a keyed-in engram; he wakes up with one. He tries to justify the strange sensations he has (and engrams are timeless things unless they are arranged properly on the time track) and comes out with the “solution” that he must have been raped.

Childhood rapes are very seldom the responsible cause in sexual aberration. They are the key-in.

One looks at the conscious-level locks and sees sadness, mental anguish and misfortune. Some of the experience there seems to be so terrible that it must certainly cause aberration. But it does not. Man is a tough, resilient creature. These conscious-level experiences are at best only guide-posts leading toward the actual seat of trouble, and that is not known in any detailed way to the individual.

The engram is never “computed.” An example of this, on a lightly aberrative level, can be found in a child’s punishment. If one examines a childhood where punishment has been corporal and frequent, he begins to understand the utter futility of the pain-drive theory. Punishment actually and literally and emphatically does no good of any kind whatsoever but accomplishes quite the reverse, since it occasions a reactive revolt against the punishment source and is likely to cause not only a disintegration of a mind but also a continual bedevilment of the punishment source. Man reacts to fight sources of pain. When he stops fighting them he is mentally broken and of little use to anyone, much less himself.

We take a case of a boy who was beaten with a hair-brush every time he was “bad.” In researching this case the most searching inquiry fails to reveal any vivid recall of why he was punished but only that he was punished. The progress of the event would go something like this: activity more or less rational, fright at threatened punishment, punishment, sorrow over punishment, renewed activity. The mechanics of the case showed the person to have been engaged on some activity which, whether others would consider it so or not, was nevertheless survival activity to him, giving him either pleasure or actual gains or even the assertion that he could and would survive; the moment punishment is threatened old punishments go into restimulation as minor engrams, resting usually on major engrams: this shuts down the analytical power to some extent and the recording is now being done on a reactive level; the punishment takes place, submerging analytical awareness so that the punishment records in the engram bank only; the sorrow following is still in the period of analytical shut-down; the analyzer gradually turns on; full awareness returns, and then activity on an analytical plane can be resumed. All corporal punishment runs this gamut and all other punishments are, at best, locks, following this same pattern with only the complete shut-down resulting from pain missing.

If the analyzer wants this data for computation, it is not available. There is a reaction in the reactive mind when the matter is approached. But there are five courses the reactive mind can take with this data! And there is no guarantee and no method between land and sky of knowing what course the reactive mind will take with the data except knowing the full engram

bank -- and if that is known, the person could be cleared with a few more hours work and would need no punishment.

These five ways of handling data make corporal punishment an unstable and unreliable thing. A ratio exists which can be tested and proven in any man's experience: A man is evil in the direct ratio that destructiveness has been leveled against him. An individual (including those individuals society is liable to forget as individuals: children) reacts against the punishment source whether that source be parents or government. Anything which sets itself forward against an individual as a punishment source will be considered in greater or lesser degree (as it is in proportion to benefits) as a target for the reactions of the individual.

The little accidental milk glass upsets of children, that noise which just accidentally occurs on the porch where the children are playing, that little accidental ruination of Papa's hat or Mama's rug, these are often cold, calculated reactive mind actions against pain sources. The analytical mind may temporize about love and affection and the need of three square meals. The reactive mind runs off the lessons it has learned and devil take the meals.

If one turned an idiot loose on an adding machine to let him audit the company books and let him prevent the auditor from touching equipment and data which has to be his if any answers will be right, one would get very little in the way of correct answers. And if one kept feeding the idiot and made him fat and powerful, the firm would sooner or later go to ruin. The reactive mind is the idiot, the auditor is "I" and the firm is the organism. Punishment feeds the idiot.

The helpless amazement of police about the "confirmed criminal" (and the police belief in the "criminal type" and the "criminal mind") comes about through this cycle. Police, for some reason or other, like governments, have become identified with society. Take any one of these "criminals" and clear him and the society regains a rational being of which it can use all it can get. Keep up the punishment cycle and the prisons will get more numerous and more full.

The problem of the child lashing back at his parents by "negation" and the problem of Jimmie the Cob blowing a bank guard apart in an armed robbery stem both from the same mechanism. The child, examined on the "conscious-level," is not aware of his causes but will put forth various justifications for his conduct. Jimmie the Cob, waiting for this oh so very sentient society to tie him down with straps in an electric chair and give him an electric shock therapy which will cause him to cease and desist forever, examined for his causes, will pour forth justifications to explain his life and conduct. The human mind is a pretty wonderful computing machine. The reasons it can evolve for unreasonable acts have staggered one and all and particularly social workers. Without knowing the cause and the mechanism, the chances of drawing a correct conclusion by comparing all conducts available are as remote as winning at fantan from a Chinese. Hence, the punishments have continued as the muddled answer to a very muddled society.

There are five ways in which a human being reacts toward a source of danger. These are also the five courses he can take on any given problem. And it might be said that this is five-valued action.

The parable of the black panther* is appropriate here. Let us suppose that a particularly black-tempered black panther is sitting on the stairs and that a man named Gus is sitting in the living room. Gus wants to go to bed. But there is the black panther. The problem is to get upstairs. There are five things that Gus can do about this panther: (1) he can go attack the black panther; (2) he can run out of the house and flee the black panther; (3) he can use the back stairs and avoid the black panther; (4) he can neglect the black panther; and (5) he can succumb to the black panther.

These are the five mechanisms: attack, flee, avoid, neglect or succumb.

All actions can be seen to fall within these courses. And all actions are visible in life. In the case of a punishment course, the reactive mind can succumb, neglect, avoid, flee or attack it. The action is dictated by a complexity of engrams and depends upon which one comes into restimulation. This maelstrom of reaction generally resolves itself, however, in one of the five courses. * In dianetics considerable slang has been developed by patients and dianeticists and they call the "black panther mechanism" a neglect of the problem. One supposes this stems from the ridiculousness of biting black panthers.

If a child is punished and thereafter obeys, he can be considered to have succumbed. And the value of a child who will succumb to punishment is so slight that the Spartans would long since have drowned him, for it means he has sunk into an apathy unless it so happens that he himself has computed the idea, by-passing all reaction, that the thing for which he was punished was not bright (he can't be assisted in this computation if punishment is entered into the reactive mind by the source trying to assist him). He can flee the punishment source, which at least is not apathy but merely cowardice by popular judgment. He can neglect the matter entirely and ignore the punishment source -- and would have been called a Stoic by the ancients, but might be called merely dull-witted by his friends. He can avoid the punishment source, which might give him the doubtful compliment of being sly or cunning or pandering. Or he can attack the punishment source either by direct action or by upsetting or fouling the person or the possessions of the source -- in which instance he would be called, on direct action, a valiant fool, taking parental size into account, or in a less direct fashion he could be called "covertly hostile" or could be said to be "negating"; as long as a human being will attack as a response to a valid threat, he can be said to be in fair mental condition -- "normal" -- and a child is said to be "just acting like any normal child."

Enter punishment into the computation and it no longer computes. It is entirely different in the case of "experience." Life has plenty of painful experience waiting for any human being without other human beings complicating the score. A person who is still unblocked in his dynamics or who has been unblocked by dianetics can absorb the most amazing amount of hammering in the business of living. Here, even when the reactive receives engrams as a result of some of this experience, the analytical mind can continue to cope with the situation without becoming aberrated in any way. Man is a tough, resilient, competent character. But when the law of affinity begins to be broken and such a breaking of affinity gets into the reactive bank, human beings, as antagonistic sources of non-survival, become a punishment source. If no contra-survival engrams involving human beings are in the earlier (before 5 years) content of the engram bank, pro-survival engrams are taken as a matter of course and are not severely aberrative. In other words, it is the breaking of affinity with his fellows on an engramic level which most solidly blocks the dynamics. Man's affinity with Man is far more a scientific fact than it is a poetic and idyllic idea.

The cycle, then, of life which will be "normal" (current average state) or psychotic is an easy thing to draw. It begins with a large number of engrams before birth, it gathers more in the dependent and rather helpless condition post-birth. Punishment of various kinds entering now as locks key-in the engrams. New engrams which will involve the earlier ones enter. New locks accumulate. Illness and aberrated action set in most certainly by the age of forty or fifty. And death ensues sometimes afterwards.

Short of the optimum solution of clearing the engrams, there are several things which can be done about aberration and psycho-somatic ills. That these methods are uncertain and of only limited value does not mean that they will not occasionally meet with some astonishingly beneficial responses.

Such methods can be classified under the headings of environmental change, education and physical treatment. Taking factors out of the environment of an aberree or taking the aberree out of the environment in which he is unhappy or ineffective can bring about some astonishingly swift recoveries: this is valid therapy; it removes the restimulators from the individual or takes the individual away from the restimulators. It is ordinarily quite hit-or-miss and more miss than hit, and it will not remove all the restimulators by nine-tenths since the

individual himself carries the bulk of these around with him or is compelled to contact them. One is reminded of a case which had severe asthma. He had received it in a very severe birth engram; his frantic parents carried him to every mountain asthma resort suggested and spent tens of thousands of dollars in these jauntings. When this patient was cleared and the engram refilled, it was discovered that the restimulator for his asthma was clean, cold air! The only certainty in the environment approach is that a sickly child will recover when removed from restimulative parents and taken where he is loved and feels safe -- for his sickness is the inevitable result of restimulation of prenatal engrams by one or the other or both his parents. Somewhere along the line there is probably a husband or a wife who has descended chronically into the first two zones after marriage after having married pseudo-mother or pseudo-father or pseudo-abortionist.

In the educational field, new data or enthusiasms may very well key-out engrams by overbalancing the reactive mind in the light of a new analytical surge. If a man can simply be convinced he has been fighting shadows or if he can be persuaded to hang his fears on some indicated cause, whether that cause is true or not, he can be benefited. Sometimes he can be "educated" into a strong faith in some deity or cult which will cause him to feel so invulnerable that he rises above his engrams. Raising his survival potential in any way will raise his general tone to a point where it is no longer on a par with the reactive bank. Giving him an education in engineering or music, where he can receive a higher level of respect, will often defend him from his restimulators. A rise to a position of esteem is actually a change of environment, but it is also educational since he is now taught he is valuable. If a man can be made busy at a hobby or work by personal or exterior education that it is good for him, another mechanism comes into being -- the analytical mind becomes so engrossed that it takes to itself more and more energy for its activity and begins to align with a new purpose.

Physical treatment resulting in improved physical condition will bring about hope or change a man's reactions by shifting him on his time track. It may key-out engrams.

These methods are valid therapy: they are also, in reverse, the things which cause aberrations to manifest themselves. There are wrong ways to act and wrong things to do and wrong ways to treat men which, in the light of what we know now, are criminal.

Thrusting a man into an environment which restimulates him and making him stay there is a slice of murder. Making him keep an associate who is restimulative is bad: making a man or a woman stay with a marriage partner who is restimulative is unworkable mores unless dianetic therapy is used; making a child stay in a home where he is restimulated is most certainly inhibitive, not only of his happiness but of his mental and physical development -- a child should have many more rights about such things, more places to go.

On the physical therapy level anything as violent as surgery or exodontistry in the psycho-somatic plane is utter barbarism in the light of dianetics. "Toothache" is normally psycho-somatic. Organic illnesses enough to fill several catalogues are psycho-somatic. No recourse to surgery of any kind should be had until it is certain that the ailment is not psycho-somatic or that the illness will not diminish by itself if the potency of the reactive mind is reduced. Mental-physical therapy is too ridiculous, with the source of aberration now a science, to be seriously mentioned. For no thinking doctor or psychiatrist possessed of this information would touch another electrode for electric shock therapy or even glance at a scalpel or ice-pick to perform an operation on the pre-frontal lobes of the brain unless that doctor or psychiatrist is himself so thoroughly aberrated that the act springs, not from any desire to heal but from the most utter and craven sadism to which engrams can bring a man.*

* Many persons investigating the treatment of the mentally ill by psychiatrists and others in charge of mental institutions are prompted, when they discover just what the pre-frontal lobotomy, the trans-orbital leukotomy and electric shock actually do to patients, to revile the psychiatrist as unworthy of trust and accuse him of using it to conduct vivisection experiments on human beings. That any possible hope of recovery via dianetics may be gone for these unfortunate patients in the majority of cases should not be blamed upon the psychiatrist and

neuro-surgeon. These people have only followed their teachings in various universities and have practiced such actions merely because they believed the problem of the mind could not be solved by anyone. A witch-burning attitude toward these people is very far from the one adopted by dianetics. Pointing to the fact that they have murdered minds which would otherwise have recovered, labeling them "mind snatchers" and making a horror story out of their actions is far from rational conduct. On the whole these people have been entirely sincere in their efforts to help the insane. By contagion of aberration such people have been subjected to enormous stresses in this work, having had their own engrams in continual restimulation. They can be cleared and their experience is valuable. Legislation against them such as that recently mentioned by a senator who was familiar with dianetics, horror stories about them in newspapers and a general public antipathy as well as the medical doctor's traditional distrust of them cannot but bring about a disorderly condition. Dianetics is a newly discovered science and is nonpartisan.

CHAPTER X

Preventive Dianetics

There are many branches in dianetics. It is actually a family of sciences covered by a single set of axioms. There is, for instance, Educational Dianetics, which contains the body of organized knowledge necessary to train minds to their optimum efficiency and to an optimum of skill and knowledge in the various branches of the works of Man. And there is Political Dianetics, which embraces the field of group activity and organization to establish the optimum conditions and processes of leadership and inter-group relations. And again there is Medical Dianetics. And there is Social Dianetics. There are many such subdivisions which are sciences within themselves guided by their own axioms.

We are dealing in this volume, actually, with basic dianetics and dianetic therapy as applied to the individual. This is the most immediately important and the most valuable to the individual.

But no book on dianetic therapy would be complete without a mention of a branch of dianetics which, some say, is even more important to the race than the therapy. This is Preventive Dianetics.

If one knows the cause of something, he can usually prevent the cause from going into effect. The discovery and proof of Ronald Ross that the malaria germ was carried by the mosquito makes it possible to prevent the disease from committing the ravages it once enjoyed at the expense of Mankind. Similarly, when one knows the cause of aberration and psychosomatic illness, he can do a great deal toward preventing them.

While Preventive Dianetics is a large subject, infiltrating the fields of industry and agriculture and other specialized activities of Man, its basic principle is the scientific fact that engrams can be held to minimal content or prevented entirely with large gains in favor of mental health and physical well-being as well as social adjustment.

The engram is actually a very simple thing: it is a moment when the analytical mind is shut down by physical pain, drugs or other means, and the reactive bank is open to the receipt of a recording. When that recording has verbal content, it becomes most severely aberrative. When it contains antagonism on an emotional level, it becomes very destructive. When it is intensely pro-survival in content it is most certainly capable of thoroughly deranging a life.

The engram, amongst other things, determines fate. The engram says that a man has to fail to survive and so he contrives numerous ways to fail. The engram commands that he can only experience pleasure amongst the members of another race and so he goes amongst them and abandons his own. It commands that he must kill to live and so he kills. And far more subtly, the engram weaves its way from incident to incident to cause the catastrophe which it dictates.

A recent case was plotted out to have actually gone to enormous lengths to break his arm, for with a broken arm he received the sympathy without which the engram said he could not live. The plot covered three years and half a hundred apparently innocent incidents which, when netted together, told the story.

The accident prone person is a case where the reactive mind commands accidents. He is a serious menace in any society for his accidents are reactively intentional and they include the destruction of other people who are innocent.

Drivers with several accidents on their records are generally accident prone. They have engrams which command them to have accidents. When you have run a case, just one, you will see how thoroughly and maliciously disposed this moronic thing, the reactive mind, can be

about such things. Cleared drivers could have accidents only through two sources: (a) mechanical failure and, more important, (b) because of accident prone people. The terrible and awesome death toll taken by our automotive transport is almost all attributable to reactive mind driving rather than learned response driving. The apathy of this society is measured by the fact that it does not act severely to prevent all automotive accidents; just one broken windshield is one too many: now that an answer is to hand action can take place.

The aberree in thousands of ways complicates the lives of others. Preventive Dianetics makes it possible to sort out the aberree who is accident prone and bar him from activities which will menace others. This is one general aspect of Preventive Dianetics. That the aberrees so isolated can be cleared is another type of problem.

The other general aspect of Preventive Dianetics, and the more important, is the prevention of engrams and modification of content both on the social and the individual scale. On the social scale one would delete from the society the causes of aberration in that society as if he were deleting engrams from the individual. In the same way, one can prevent the social causes from occurring in the first place.

In the individual, the prevention of engrams is a very easy matter. Once the source of aberration and illness is known, one can prevent the source from entering a life. If the source has been known to enter, one can prevent the next step, in key-in. Of course, the final answer in all this is therapy to a clearing, but there is one aspect of the source which is not so answered.

The child cannot be safely cleared until he is at least five years of age and current practice is to place this figure at about eight years. Improved address to the problem may reduce this figure, but it cannot be reduced below the age of speech unless some one in the future invents a catalyst which simply clears out the reactive mind without further treatment (not as wild as it may sound). But just now and probably for a long time to come the child will remain a problem to dianetics.

Childhood illness is chiefly derived from engrams. It is most likely to be severe before the age of speech and the number of deaths within the first year of life, while medicine may reduce them, is yet a serious thing.

Preventive Dianetics addresses this problem in two phases: first the prevention of engrams, and second, the prevention of the key-in.

Taking the key-in first, there are two things which can be done to prevent it. The child can be given a calm and harmonious atmosphere which is not restimulative or, if the child appears to be restimulated despite kindly treatment, he can be removed to another environment which will be minus the two most certain sources: his father and mother, and which will contain a source of affection. The test of whether or not a child is restimulated, pre-speech or post-speech, is very simple. Is he susceptible to illness? Does he eat well? Is he nervous? There can be actual physical things wrong with the child, of course, but these are quickly established by a doctor and they lie in the category of physical derangement.

Quarrels within the hearing of a child, loud noises, frantic conduct, drooling sympathy when he is sick or hurt, these things are some of the key-in catalogue. These make a child ill physically and aberrated mentally by keying-in his engrams. And nobody can say how many he has!

The primary source of prevention lies in the field, oddly enough, of the regard in which another person is held -- his mother.

It is not "biological love" which makes mother play such an enormous role in the life of a human being. It is the simple mechanical truth that Mother is a common denominator to all the child's prenatals. The prenatal engram is far more serious than the post-natal. Any such engram

a person has contains his mother or his mother and another person, but always his mother. Therefore her voice, the things she says, the things she does, have an enormous and vast effect upon the unborn child.

It is not true that emotion gets into a child through the umbilical cord as people always suppose the moment they hear of prenatales. Emotion comes on another (more electrical than physical) type of wave -- what type is a problem for structure. Therefore, anyone who is emotional around a pregnant woman is communicating that emotion straight into the child. And mother's emotion is, in the same manner, so conducted to his reactive mind.

Whether or not the unborn child is "unanalytical" has no bearing on his susceptibility to engrams. The prenatal engram is just another engram. Only when the child is actually struck or hurt by high-blood pressure or orgasms or other sources of injury does he become "unconscious." When he becomes "unconscious" he receives all the percepts and words in the area of the mother as engrams. Analytical power has nothing to do with engrams. If the child is "unanalytical," this does not predispose him to engrams. If the child is "unconscious" or hurt it does.

The presence or absence of "analytical power" has nothing to do with whether or not engrams are received.

Morning sickness, coughing, all monologuing (mother talking to herself), street noises, household noises, etc., are all communicated to the "unconscious" child when he is injured. And the child is very easily injured. He is not protected by formed bones and he has no mobility. He is there: when something strikes him or presses him, his cells and organs are injured. A simple experiment to demonstrate how mobility influences this is to lie down in bed and place one's head on a pillow. Then have somebody lean a hand on one's forehead. As there is no mobility, the pressure of the hand is far stronger than it would be if a hand were laid on the forehead when one was standing. The tissue and the water around the child form very slight buffers. In an injury amniotic fluid, as an incompressible medium, presses him, for it cannot compress itself. The child's situation is far from armored.

Mother's act of tying her shoes, in the later stages of pregnancy, even may be severe on the child. Mother's strain when lifting heavy objects is particularly injurious. And mother's collision with objects like a table edge might well crush a baby's head. The repair facilities of the unborn child, as mentioned elsewhere, are far above anything ever before discovered. The child may have its head crushed but the blueprint is still there and the building materials and repair can be made. So it is not a case of the child being "all right" just because it can live through almost anything. It is a case of whether or not these injuries are going to have high aberrative value as engrams.

Attempted abortion is very common. And remarkably lacking in success. The mother, every time she injures the child in such a fiendish fashion, is actually penalizing herself. Morning sickness is entirely engramic, so far as can be discovered, since clears have not so far experienced it during their own pregnancies. And the act of vomiting because of pregnancy is via contagion of aberration. Actual illness generally results only when mother has been interfering with the child either by douches or knitting needles or some such thing. Such interference causes the mother to become ill and, from an actual physical standpoint, is much harder on the mother than on the child. Morning sickness evidently gets into a society because of these interferences such as attempted abortion and, of course, injury.

The cells know when pregnancy occurs. The reactive mind is acquainted with the fact before the analyzer by process of organic sensation, since the endocrine system is altered. Hence, the mother's discovery of pregnancy has little to do with whether or not she was sick before the discovery.

This entire field has been a subject of considerable research in dianetics. Much more research must be done. These conclusions are tentative. But the conclusion that the engram is

received and that it is as violent as its content, rather than its actual pain, is a scientific fact and not in any way a theory. It is as real a discovery as gravity.

Preventing these engrams is the first consideration. Preventing them from having any content is the second. Women who lead peasant lives, doing heavy labor, are subject to all manner of accident. Perhaps such accidents cannot be prevented because of the purpose these women serve in the society. But when it is known that any injury to the mother can create an engram in the unborn child, it should be the concern of all those present during such an injury, including the mother, to maintain a complete and utter silence. Any remark is aberrative in an engram. Even such a statement as "You can remember this when in dianetic therapy," made toward an unborn child, installs an engram so that every word in this statement means a physical pain just where he received it at the time, and in the future "dianetic therapy" will be restimulative to him.

The doctor, punching around to find out if mother is pregnant, may say, "Well, it's hard to tell this early." The patient in dianetic therapy years later will return into the vicinity of this incident only to draw a blank until the dianeticist suddenly guesses the content from how the patient describes his reactions. If the doctor is very tough and says, "You had better take good care of yourself, Mrs. Jones. If you don't, you'll be mighty sick!" the child, "unconscious" from the examination no matter how mild it is, will get a mild hypochondria when the engram keys-in and be very concerned over his health.

If the husband uses language during coitus, every word of it is going to be engramic. If the mother is beaten by him, that beating and everything he says and that she says will become part of the engram.

If she does not want the child and he does, the child will later react toward him as an ally and perhaps have a nervous breakdown when the father dies. If she wants the child and he doesn't, the ally computation is reversed.

This is true when abortion is threatened or attempted providing the threat is contained in an engram.

Should the mother be injured and the father be highly solicitous, the engram has this for content and the child has a sympathy engram. The way to survive, then, is to be pathetic when injured, and even see to it that one is injured.

A woman who is pregnant should be given every consideration by a society which has any feeling for its future generations. If she falls, she should be helped -- but silently. She must not be expected to carry heavy things. And she should not have coitus forced upon her. For every coital experience is an engram in the child during pregnancy.

An astonishing number of pregnancies must take place which are never realized. The violence of coitus, the use of douches and jellies (used because the woman is still contracepting and does not know she is already pregnant), straining bowel movements, falls and accidents must account for a large number of miscarriages which come about sometime around the first period after conception. For the zygote and embryo forms of the child have a rather frail grip on existence and are very severely injured by things the mother would consider nothing. Once past the first missed period, the chances of miscarriage rapidly grow less and only when the child is a genetic monstrosity or when abortion attempts are made can a miscarriage be expected to take place. The monstrosities are so small a percentage that they are negligible as a possibility.

The amniotic sac can be pierced many times and repeatedly and emptied of all water after the first missed period and the child can still survive. Twenty or thirty abortion attempts are not uncommon in the aberree and in every attempt the child could have been pierced through the body or brain.

The child before birth does not depend upon the standard senses for its perceptions. Engrams are not memories but cellular level recordings. Therefore, the child needs no eardrums to record an engram. Cases are on hand where whatever hearing mechanism the unborn child had must have been temporarily destroyed by an abortion attempt. And the engram was still recorded. The cells rebuilt the apparatus which was to be the source of sound in the standard banks and stored their own data in the reactive bank.

Release of such engrams means a restoration of rationality to the individual far above the current norm and a stability and well-being greater than Man ever thought Man possessed. These engrams have been confirmed by taking the data from a child, from the mother and the father, and all data checked. So we are dealing here with scientific facts which, no matter how startling, are nevertheless true.

The mother, then, should be extremely gentle on herself during pregnancy and those around her should be entirely informed of the necessity for silence after any jar or injury. And in view of the fact that it is not possible to tell when a woman has become pregnant and in view also of the high potentiality of aberration in the zygote and embryo engrams, it is obvious that society must better its ways toward women if the future health of the child is to be preserved.

The woman has to some degree become considered less valuable in this society than in other societies and times. She is expected to be in competition with men. Such a thing is nonsense. A woman has as high a plane of activity as man. He cannot compete with her any more than she can compete with him in the fields of structure and vigorous activity. Much of the social maelstrom now in existence has as its hub the failure to recognize the important role of the woman as a woman and the separation of the fields of women and men.

The changes which will come about in the next twenty years need no urging here. But with the recent discoveries in photosynthesis which should secure enough food to feed Man better and at less cost, the importance of birth control dwindles. The morality standards have already changed, no matter what moralists do to try to block the change. And woman, therefore, can be freed of many of her undesirable chains.

In the custody of Man is the current world and its activity and structure. In the charge of woman is the care of the person of the human being and his children. Almost sole custodian of tomorrow's generation, she is entitled to much more respect than her chattel-period of the past gave her.

It is not, then, any wild Utopian thought that woman can be placed above the level hitherto occupied. And so she must be placed if the childhood of tomorrow's generation is to reach any high standard, if homes are to be peaceful and unharassed and if society is to advance.

Preventive Dianetics, in the sphere of the home, must place emphasis on the woman in order to safeguard the child.

As any first step, a mother should be cleared, for any mother who attempts an abortion is blocked across the second dynamic and any block menaces her health as well as her happiness. An antipathy for children has been found to accompany sexual aberration.

Preventive Dianetics, then, on the level of the individual, asks for cleared parents and then precaution against the aberrating of the child, and further precaution against the keying-in of any aberration the child might have received.

To do this is very easy. Maintain silence in the presence of injury. Do what has to be done for the injure ill and do it in silence. Maintain silence in the presence of birth to save both the sanity of the mother and the child and safeguard the home to which they will go. And the maintaining of silence does not mean a volley of "Sh's," for those make stammerers.

In a wider field, the maintenance of silence around any “unconscious” or injured person is second in importance only to preventing the “unconsciousness” in the first place.

Say nothing and make no sound around an “unconscious” or injured person. To speak, no matter what is said, is to threaten his sanity. Say nothing while a person is being operated upon. Say nothing when there is a street accident. Don’t talk!

Say nothing around a sick child or an injured child. Smile, appear calm, but say nothing. Actions do not speak louder than words but actions are all that can be done around the sick and injured unless one has an active desire to drive them into neurosis or insanity or, at best, to give them a future illness.

And above all, say nothing around a woman who has been struck or jarred in any way. Help her. If she speaks, don’t answer. Just help her. You have no idea of whether she is pregnant or not.

And it is a remarkable fact, a scientific fact, that the healthiest children come from the happiest mothers. Birth, for one thing, in a cleared mother, is a very mild affair. Only birth engrams in the mother made it hard. A cleared mother needs no anaesthetic. And that is well because the anaesthetic makes a dazed child and the engram, when it reacts, makes him appear a dull child. A happy woman has very little trouble. And even a few engrams, which arrive despite all precautions, are nothing if the general tone of the mother is happy.

Woman, you have a right and a reason to demand good treatment.

Book Three
THERAPY

CHAPTER I

The Mind's Protection

The mind is a self-protecting mechanism. Short of the use of drugs as in narco-synthesis, shock, hypnotism or surgery, no mistake can be made by an auditor* which cannot be remedied either by himself or by another auditor. Those things which are stressed, then, in this book, are ways to accomplish therapy as swiftly as possible with minimal errors; for errors take time. Auditors are going to make errors, that is inevitable. If they make the same error repeatedly, they had better get some one to guide them through therapy.

There are probably thousands of ways to get into trouble with mental healing, but all these ways can be classed in these groups: (1) use of shock or surgery on the brain; (2) use of strong drugs; (3) use of hypnosis as such; and (4) trying to cross-breed dianetics with older forms of therapy.

The mind will not permit itself to be seriously overloaded so long as it can retain partial awareness of itself; it can only be overloaded when its awareness is reduced to a point where it cannot evaluate anything: it can then be thoroughly upset. Dianetic reverie leaves a patient fully aware of everything which is taking place and with full recall of everything which has happened. Types of therapy which do not do this are possible and useful but they must be approached with the full knowledge that they are not foolproof. Dianetics, then, uses the reverie for the majority of its work and using the reverie an auditor cannot possibly get himself into any trouble from which he cannot extricate himself and the patient. He is working with an almost foolproof mechanism as long as the mind retains some awareness: a radio or a clock or an electric motor are far more susceptible to injury in the hands of a workman than the human mind. The mind was built to be as tough as possible. It will be found that it is difficult to get it into situations which make it uncomfortable and impossible, with the reverie, to embroil it enough to cause neurosis or insanity.

In the U.S. infantry manual there is a line about decision: "Any plan, no matter how poorly conceived, if boldly executed is better than inaction."

In dianetics, any case, no matter how serious, no matter how unskilled the auditor, is better opened than left closed. It is better to start therapy if it is to be interrupted after two hours of work than not to start therapy at all. It is better to contact an engram than to leave an engram uncontacted even if the result is physical discomfort for the patient -- for that engram will not thereafter possess as much power and the discomfort will gradually abate.

This is scientific fact. The mechanism dianetics uses is an ability of the brain which Man as a whole did not know he had. It is a process of thought which everyone possesses inherently and which was evidently meant to be used in the overall process of thinking but which, by some strange oversight, Man has never before discovered. Once a person has learned that he possesses just this one new faculty, he is better able to think than he was before, and he can learn this faculty in ten minutes.

Further, when one approaches an engram with this faculty (which, when intensified, is the reverie) some of that engram's sub-level connections are broken and the aberrative factors no longer have as much force either in the physical or mental spheres. Further, the knowledge that there is a solution to mental ills is a stabilizing factor.

Approaching an engram with the reverie is very far from the same as restimulating the engram exteriorly as is done in life. The engram is a powerful and vicious character only so long as it is untapped. In place and active it can be restimulated to cause innumerable mental and physical ills. But approaching it with reverie is approaching it on a new circuit, one that disarms it. The power of the engram is partly the fear of the unknown -- knowing brings stability by itself.

Do not think that you will not make patients uncomfortable. That is not true. The auditor's work, when it taps engrams which cannot be lifted, may cause the patient to have headaches, various aches and pains and even mild physical illness, even when the work is carefully done. But life has been doing this to the patient on a much grander scale for years and no matter how badly the case is mauled around, no matter how many aberrations spring into view to plague the patient for a day or two, none are as serious as those which can be occasioned by the environment acting upon the untapped engram.

The auditor can do everything backwards, upside down and utterly wrong and the patient will still be better, provided only that he does not try to use drugs before he has worked a few cases, that he does not use hypnotism as hypnotism and he does not try to cross dianetics with some older therapy. He can use drugs in dianetics if he knows his dianetics and if he has medical concurrence. He can use all the techniques of hypnotism so long as he is thoroughly experienced with dianetics.

And once he has used dianetics, he will not fall back to mystic efforts to heal minds. In short, the point which is offered here is that so long as the auditor takes a relatively simple case at first to see how the mechanisms of the mind work and uses only the reverie he cannot get into trouble. There will be those, certainly, who believe they are so vastly experienced in tomtom beating or gourd rattling that they won't give dianetics a chance to work as dianetics but will sail in and begin to plague the patient about "penis-envy" or make him repent his sins, but the patient who starts to get this will be smart to simply change positions from the couch to the auditor's chair and clear up some of the aberrations of the auditor before work proceeds.

Anybody who has read this book once through and procured a patient with sonic recall for a trial effort will know more about the mind, in those actions, than he has ever known before, and he will be more skilled and able to treat the mind than anyone attempting to do so, regardless of reputation, a very short while ago. This does not mean that men who have had experience with mental patients will not, knowing dianetics (knowing dianetics) have an edge on those who do not realize some of the foibles of which Man in an aberrated state is capable. And on the other hand it does not mean that some engineer or lawyer or cook with a few dianetic cases under his belt, will not be more skilled than all other practitioners of whatever background or kind. In this case, the sky is no limit.

One could not say, offhand, that an able hypnotist or an able psychologist, ready and willing to jettison and unlearn yesterday's mistakes, is not better prepared to practice dianetics. In the field of psycho-somatic medicine the medical doctor, with a vast fund of experience in healing, might very well be far and above other auditors in dianetic work. But it is not necessarily the case, for in research it has been proven that men and women with most unlikely professional backgrounds have suddenly become auditors superior in skill to those in fields you might suspect were more closely allied. Engineers particularly are excellent material and make excellent auditors. Again, dianetics is not being released to a profession, for no profession could encompass it. It is insufficiently complicated to warrant years of study in some university. It belongs to Man and it is doubtful if anyone could manage to gain a corner on it for it does not fall within any legislation of any kind in any place and if dianetics were legislated into a licensed profession, then it is to be feared that listening to stories and jokes and personal experience would also have to be legislated into a profession. Such laws would put all men of good will who lend a sympathetic ear to a friend's troubles inside the barbed wire. Dianetics is not psychiatry. It is not psycho-analysis. It is not psychology. It is not personal relations. It is not hypnotism. It is a science of mind and needs about as much licensing and regulation as the application of the science of physics. Those things which are legislated against are a matter of law because they may in some way injure individuals or society.

Legislation exists about psycho-analysis in some three states in the Union, legislation against or about psychiatry exists everywhere. If an auditor wishes to constitute himself a psychiatrist with the power of vivisectioning human brains, if he wants to constitute himself a doctor and administer drugs and medicines, if he wants to practice hypnotism and pour suggestions into a patient, then he must square it with psychiatry, medicine and the local laws

about hypnotism, for he has entered other fields than dianetics. In dianetics hypnotism is not used, no brains are operated upon and no drugs are given unless the local medico is part of the staff. Dianetics is not in any way covered by legislation anywhere for no law can prevent one man sitting down and telling another man his troubles, and if anyone wants a monopoly on dianetics, be assured that he wants it for reasons which have to do not with dianetics but with prof it. There are not enough psychiatrists in the country to begin to staff the mental institutions.

Surely this generation, particularly with all the iatrogenic field is the treatment of the insane by definition and that has nothing to do with thee and me. In psychology, dianetics drops into line without disturbing anything concerned with staffs or research or teaching posts, for psychology is simply the study of the psyche and now that there exists a science of the psyche it can go ahead with a will.

Thus dianetics is the enemy of none and dianetics falls utterly outside all existing legislation, none of which anticipated or made any provision for a science of mind.

CHAPTER II

Release or Clear

The object of dianetic therapy is to bring about a release or a clear.

A release (noun) is an individual from whom major stress and anxiety have been removed by dianetic therapy.

A clear (noun) is an individual who, as a result of dianetic therapy, has neither active nor potential psycho-somatic illness or aberration.

To clear (verb) is to release all the physical pain and painful emotion from the life of an individual or, as in Political Dianetics -- a society. The result of this will bring about persistence in the four dynamics, optimum analytical ability for the individual and, with that, all recall. The experience of his entire life is available to the clear and he has all his inherent mental ability and imagination free to use it. His physical vitality and health are markedly improved and all psycho-somatic illnesses have vanished and will not return. He has greater resistance to actual disease. And he is adaptable to and able to change his environment. He is not "adjusted"; he is dynamic. His ethical and moral standards are high, his ability to seek and experience pleasure is great. His personality is heightened and he is creative and constructive. It is not yet known how much longevity is added to a life in the process of clearing, but in view of the automatic rebalancing of the endocrine system, the lowered incidence of accident and the improvement of general physical tone, it is most certainly raised.

A release is an individual from whom have been released the current or chronic mental and physical difficulties and painful emotion. The value of a release, when compared to a clear, may not at first thought be considered great, but when one understands that a release is usually in excess of the contemporary norm in mental stability, it can be seen that the condition is not without great value.

As a standard of comparison, a clear is to the contemporary norm as the contemporary norm is to a contemporary institutional case. The margin is wide and it would be difficult to exaggerate it. A clear, for instance, has complete recall of everything which has ever happened to him or anything he has ever studied. He does mental computations, such as those of chess, for example, which a normal would do in a half an hour, in ten or fifteen seconds. He does not think "vocally" but spontaneously. There are no demon circuits in his mind except those which it might amuse him to set up -- and break down again -- to care for various approaches to living. He is entirely self-determined. And his creative imagination is high. He can do a swift study of anything within his intellectual capacity, which is inherent, and the study would be the equivalent to him of a year or two of training when he was "normal." His vigor, persistence and tenacity to life are very much higher than anyone has thought possible.

The objection that it is dangerous to create too many clears in a society is a thoughtless one. The clear is rational. The acts which damage a society are irrational. That a handful of clears could probably handle any number of "normals" is within reason, but that the clear would handle them to their detriment is unreasonable. The more clears a society possessed the more chance that society would have to prosper. That a clear is unambitious is not proven out by scientific observation, for the curve of dwindling ambition follows the curve of reducing rationality; and those who have been cleared have proven the matter by reactivating all their skills toward goals they had once desired but had begun to consider unattainable when "norms."* That a clear is in some degree separated from the "norm" is attributable to the gulf between their respective mental abilities, for he has achieved solutions and conclusions before the "norm" has begun to form an idea of what to conclude; this does not make a clear intolerable to the "norm," for the clear has none of that superiority attitude which is actually a product of engrams. This is a quick glance at the state of being clear, but the state cannot be described; it has to be experienced to be appreciated.

A release is a somewhat variable quantity. Anyone well advanced on the road to clear is a release. There is no comparison between a clear and anything Man has before believed obtainable and there is no comparison between clearing and any therapy hitherto practiced. In the case of the release only is there a basis of comparison between dianetics and past therapies such as "psycho-analysis" and any other. A release can be effected in a few weeks. The resulting condition will be at least equivalent to that following two years of "psycho-analysis" with the difference that the release has a guarantee of permanent results and no guarantee of success has ever been made by "psycho-analysis." A release does not relapse into any pattern which has been relieved.

These are the two goals of the dianetic auditor: clear and release. It is not known at this writing how long is the average time to raise the institutionally insane into the neurotic level: it has been done in two hours, it has been done in ten and in some cases it has required two hundred.*

The dianetic auditor should determine beforehand in any case whether he wishes to attempt a release or a clear. He can achieve either with anyone not organically insane (missing or seared portions of the brain bringing about insanity, mainly genetic or iatrogenic and relatively rare except in institutions). But he should make an estimate of the amount of time he can invest in any one person and regulate his intention accordingly and announce it to his patient. The two goals are slightly different. In a release one does not attempt entrance into phases of the case which will or may bring about a necessity of long work and gives his attention to the location and release of emotional charge. In clearing the auditor gives his attention to the location of the basic-basic engram, the discharge of emotion and the entire engram bank.

There is a third goal which could be considered a sub-head of a release.

This is an assist: it is done after injury, or illness following the injury, or illness just sustained, in order to promote more rapid recovery: to assist the body in its rehabilitation after injury or illness. This is specialized therapy which will probably be practiced commonly enough but is of primary benefit to the medical doctor who, with it, can save lives and speed healing by releasing the engram of that particular illness or injury, thus removing the various engram conceptions which the furtherance of the injury restimulates. Any dianetic auditor can practice this. The assist has about the same level of usefulness as a faith healing miracle which would work every time.

Estimations of the amount of time the case will require are difficult to attain with any accuracy greater than 50% and it should be understood by the patient that the time in therapy is variable. It depends in a measure upon the skill of the auditor, the number of unsuspected engrams never hitherto reactivated, and the amount of restimulation to which the patient is subject during therapy. Therefore the auditor should not be optimistic in estimating time but should make his patient understand that greater or lesser time may be consumed in the therapy.

Any person who is intelligent and possessed of average persistency and who is willing to read this book thoroughly should be able to become a dianetic auditor. When he has cleared two or three cases he will have learned far more and understood far more than is contained in this book, for there is nothing which develops an understanding of a machine like handling it in action. This is the instruction book, the machine in question is ready to hand wherever there are men. Contrary to superstition about the mind, it is almost impossible to permanently injure the mechanism. It can be done with an electric shock or a scalpel or an ice-pick, but it is almost impossible to do it with dianetic therapy.

CHAPTER III

The Auditor's Role

The purpose of therapy and its sole target is the removal of the content of the reactive engram bank. In a release, the majority of emotional stress is deleted from this bank. In a clear, the entire content is removed.

The application of a science is an art. That is true of any science. The efficacy of its application depends upon the understanding, skill and ability of whomever applies it. The chemist has a science of chemistry and yet the profession of being a chemist is an art. The engineer may have behind him the precision of all the physical sciences and yet the practice of engineering is an art.

Certain rules of procedure can be laid down after the basic axioms of a science are understood. Beyond those rules of procedure is the understanding, skill and ability necessary to application.

Dianetics is extremely simple. This does not mean that cases cannot be extremely complicated. To cover one case for each kind of case in this book would necessitate two billion cases and that would only encompass the current population. For each man is a great deal different from every other man. His inherent personality is different. His composite of experience is different. And his dynamics are of different strengths. The only constant is the mechanism of the reactive engram bank and that alone does not vary. The content of that bank is different from man to man both in quantity and intensity but the mechanism of operation of the bank and therefore the basic mechanisms of dianetics are constant from man to man, and were in every age and will be in every future age until Man evolves into another organism.

The target is the engram. It is also the target of the patient's analytical mind and the patient's dynamics as he tries to live his life: it is the target of the auditor's analytical mind and the auditor's dynamics. So bracketed and salvoed it gives up its store of engrams.

This should be extremely plain to any auditor: the amount he relaxes from the position of auditor and forgets the target, he garners trouble which will consume his time. The moment he makes the error of thinking that the person, the analytical mind or the dynamics of the patient are resisting, trying to stop therapy, or giving up, the auditor has made the fundamental and primary error in the practice of dianetics. Almost anything that goes wrong can be traced back to this error. It cannot be too emphatically stated that the analytical mind and the dynamics of the patient never, never, never resist the auditor. The auditor is not there to be resisted. He has no concern with resistance from anything except the patient's (and sometimes his own) engrams.

The auditor is not there as the patient's driver or adviser. He is not there to be intimidated by the patient's engrams or be frightened by their aspects. He is there to audit and only to audit. If he feels that he is called upon to be lordly to the patient, then the auditor had better change chair for couch because he has a case of authoritarianism coming into view. The word auditor is used, not "operator" or "therapist," because it is a cooperative effort between the auditor and the patient, and the law of affinity is at work.

The patient cannot see his own aberrations. That is one of the reasons why the auditor is there. The patient needs to be bolstered to face the unknowns of his life. That is another reason the auditor is there. The patient would not dare address the world which has gotten inside him and turn his back upon the world that is outside him unless he has a sentry. That is another reason the auditor is there.

The auditor's job is to safeguard the person of the patient during therapy, to compute the reasons why the patient's mind cannot reach into the engram bank, to strengthen the patient's nerve and to get those engrams.

There is a three-way case of affinity at work this moment. I am in affinity with the auditor: I am telling him all that has been discovered and is in practice in dianetics and I want him to succeed. The auditor is in affinity with the patient: he wants the patient to attack engrams. The patient is in affinity with the auditor because, with minimal work, that patient is going to get better and with persistence lent him by the auditor, plus his own, will become a release or a clear. There are even more affinities at work, a vast network of them. This is a cooperative endeavor.

The engram bank is the target, not the patient. If the patient swears and moans and weeps and pleads, those are engrams talking. After a while the engrams that make him swear and moan and weep and plead will be discharged and refiled. The patient, in whatever state, knows full well that the action taken is necessary. If the auditor is short of rationality that he mistakes this swearing or moaning as something directed at him personally, that auditor had better change places with the patient and undergo therapy.

The only thing which resists is the engram! When it is being restimulated it impinges against the patient's analyzer, tends to reduce analytical power, and the patient exhibits a modified dramatization. Any auditor with two brain cells to click together will never be in any slightest danger of his person at the hands of the pre-release or pre-clear. If the auditor wants to use hypnotism and try to run late physically painful engrams such as operations when early ones are available, he may find himself targeted. But then he has done something very wrong. If the auditor suddenly gets supermoral and lectures the patient, he may get involved, but again he has done something very wrong. If the auditor snarls and snaps at the patient, he may get targeted, but once more a fundamental error has been made.

The target is the engram bank. It is the auditor's job to attack the pre-clear's engram bank. It is the pre-clear's job to attack that bank. To attack the pre-clear is to permit his engram bank to attack the pre-clear.

We know that there are five methods of handling an engram. Four of them are wrong. To succumb to an engram is apathy, to neglect one is carelessness, but to avoid or flee from one is cowardice. Attack and only attack resolves the problem. It is the duty of the auditor to make very sure that the pre-clear keeps attacking engrams, not the auditor or the exterior world. If the auditor attacks the pre-clear, that's bad gunnery and very poor logic.

The engram bank is best attacked primarily by discharging its emotional charge anywhere it can be contacted. After that it is best attacked by finding out what the pre-clear, in reverie, thinks would happen to him if he got well, got better, found out, etc. And then it is most and always most important, in any way possible, to contact the primary moment of pain or unconsciousness in the patient's life. This is basic-basic. Once an auditor has basic-basic, the case will swiftly resolve. If the pre-clear's reactive mind is suppressing basic-basic, then the auditor should discharge more reactive emotion, discover the computation now in force, and try again. He will eventually get basic-basic. That's important. And that is all that is important in a pre-clear.

In the pre-release (patient working toward release only) the task is to discharge emotion and as many early engrams as will present themselves easily. The reduction of locks may be included in pre-release; but only when they lead to basic-basic should locks be touched in a pre-clear.

There are three levels of healing. The first is getting the job done efficiently. Below that is making the patient comfortable. Below that is sympathy. In short, if you can do nothing for a man with a broken back, you can make him comfortable. If you can't even make him comfortable, you can sympathize with him.

The second and third echelons above are entirely unwarranted in dianetics. The job can be done efficiently. Making the patient comfortable is a waste of time. Giving him sympathy may snarl up the entire case, for his worst engrams will be sympathy engrams and sympathy may restimulate them out of place. The auditor who indulges in “hand-patting,” no matter how much it seems to be indicated, is wasting time and slowing down the case. Undue roughness is not indicated. A friendly, cheerful, optimistic attitude will take care of everything. A pre-clear sometimes needs a grin. But he has already had more “hand-patting” than the analyzer has been able to compute. His chronic psycho-somatic illness contains sympathy in its engram.

The next thing the auditor should know and live is the AUDITOR’S CODE. This may sound like something from “When Knighthood Was in Flower” or the “Thirteen Rituals for Heavenly Bliss and Nirvana,” but unless it is employed by the auditor on his patients, the auditor will have some heavy slogging. This code is not for the comfort of the pre-clear; it is exclusively for the protection of the auditor. The AUDITOR’S CODE should never be violated. Practice in dianetics has demonstrated that violation of the AUDITOR’S CODE alone can interrupt cases.

The auditor should be courteous in his treatment of all pre-clears.

The auditor should be kind, not giving way to any indulgence of cruelty toward pre-clears, nor surrendering to any desire to punish.

The auditor should be quiet during therapy, not given to talk beyond the absolute essentials of dianetics during an actual session.

The auditor should be trustworthy, keeping his word when given, keeping his appointments in schedules and his commitments to work and never giving forth any commitment of any kind which he has any slightest reason to believe he cannot keep.

The auditor should be courageous, never giving ground or violating the fundamentals of therapy because a pre-clear thinks he should. The auditor should be patient in his working, never becoming restless or annoyed by the pre-clear, no matter what the pre-clear is doing or saying.

The auditor should be thorough, never permitting his plan of work to be swayed or a charge to be avoided.

The auditor should be persistent, never giving up until he has achieved results.

The auditor should be uncommunicative, never giving the patient any information whatsoever about his case, operates more or less automatically on this code. Dianetics is a parallel to thought, since it follows the natural laws of thought. What works in dianetics works as well in life.

Various conditions ensue when any of the above are violated. All violations slow therapy and cause the auditor more work. All violations come back to the detriment of the auditor.

For instance, in the last, it is not part of the auditor’s work to inform the pre-clear of anything. As soon as he starts doing so, the pre-clear promptly hooks the auditor into the circuit as the source of information and so avoids engrams.

The auditor will see in progress the most violent and disturbing human emotions. He may be moved to sympathy, but if he is, he has overlooked something and hindered therapy: whenever an emotion shows, it is an emotion which will shortly be history. Whatever gyrations the pre-clear may go through, however much he may move or wrestle around, the auditor must keep firmly in mind that every moan or gyration is one step closer to the goal. For

why be frightened or waste sympathy about something which, when it has been recounted a few times will leave a pre-clear happier?

If the auditor becomes frightened and pulls that error of all errors when a pre-clear begins to shake, "Come up to present time!" he can be sure that the pre-clear will have a couple of bad days and that the next time the auditor wants to enter that engram it will be blocked.

If an auditor assumes the state of mind that he can sit and whistle while Rome burns before him and be prepared to grin about it, then he will do an optimum job. The things at which he gazes, no matter how they look, no matter how they sound, are solid gains. It's the quiet, orderly patient who is making few gains. This does not mean that the auditor is trying for nothing but violence, but it does mean that when he gets it he can be cheerful and content that one more engram has lost its charge.

The task of auditing is rather much a shepherd's task, herding the little sheep, the engrams, into the pen for slaughter. The pre-clear isn't under the auditor's orders but the pre-clear, if the case runs well, will do whatever the auditor wants with these engrams because the analytical mind and the dynamics of the pre-clear want that job done. The mind knows how the mind operates.

CHAPTER IV

Diagnosis

One of the most important contributions of dianetics is the resolution of the problem of diagnosis in the field of aberration. Hitherto there have been almost unlimited classifications; further there has been no optimum standard. As one researches in the field of psychiatric texts, he finds wide disagreement in classification and continual complaint that classification is very complex and lacking in usefulness. Without an optimum goal of conduct or mental state and without knowledge of the cause of aberration, catalogues of descriptions alone were possible and these were so involved and contradictory that it was nearly impossible to sharply assign to a psychotic or neurotic any classification which will lead to an understanding of his case.** The main disability in this classification system was that the classification did not lead to a cure, for there was no standard treatment and there was no optimum state to indicate when treatment was at end; and as there was no cure for aberration or psycho-somatic illness, there could be no classification which would indicate the direction which was to be taken or what could uniformly be expected of a case.

This is no criticism of past efforts surely, but it is a source of relief to know that the classification of aberration is unnecessary along such complicated lines as have been used and that the cataloguing of psycho-somatic ills, while necessary to the physician, is unimportant to the auditor. In the evolution of the science of dianetics there were several stages of classification until it finally became clear that the label on a pathological condition should only be whatever the auditor had to overcome to achieve cure. This system, as now evolved through practice, makes it possible for the auditor to “diagnose” without any more knowledge than is contained in this chapter and his own future experience.

The number of aberrations possible is the number of combinations of words possible in a language as contained in engrams. In other words, if a psychotic thinks he is God, he has an engram which says he is God. If he is worried about poison in his hash, he has an engram which tells him he may get poison in his hash. If he is certain he may be “fired” from his job any moment even though he is competent and well-liked, he has an engram which tells him he is about to be “fired.” If he thinks he is ugly, he has an engram about being ugly. If he is afraid of snakes or cats, he has engrams which tell him to fear snakes and cats. If he is sure he has to buy everything he sees, despite his income, he has an engram which tells him to buy everything he sees. And in view of the fact that anyone not released or cleared has upwards of two or three hundred engrams and as these engrams contain a most remarkable assortment of language and as he may choose one of five ways of handling any one of these engrams, the problem of aberration is of no importance to the auditor except where it slows therapy.

Most aberrated people talk in a large measure out of their engrams. Whatever the chronic patter of the individual may be, his rage patter, his apathy patter, his general attitude toward life, this patter is contained in engrams wherever it departs even in the slightest degree from complete rationality. The man who “cannot be sure,” who “does not know” and who is skeptical of everything, is talking out of engrams. The man who is certain “it cannot be true” that “it isn’t possible,” that “Authority must be contacted” is talking out of engrams. The woman who is so certain she needs a divorce or that her husband is going to murder her some night is talking out of either her own or his engrams. The man who comes in and says he has a bad pain in his stomach that feels “just like a #12 gauge copper wire going straight through me” has quite possibly had a #12 gauge copper wire through him in an attempted abortion or talk of such a thing while he was in pain. The man who says it “has to be cut out” is talking straight out of an engram either from some operation of his own or his mother’s or from an attempted abortion. The man who “has to get rid of it” is again possibly talking out of an attempted abortion engram. The man who “can’t get rid of it” may be talking from the same source but from another valence. People, in short, especially when talking about dianetics and engrams, give forth with engram talk in steady streams. They have no awareness, ordinarily, that the things they are saying are minor dramatizations of their engrams and suppose that they have

concluded these things themselves or think these things: the supposition and explanation is only justified thought -- the analyzer performing its duty in guaranteeing that the organism is right no matter how foolishly it is acting.

The auditor can be assured, particularly when he is talking about dianetics, that he is going to hear in return a lot of engram content; for discussion of the reactive mind generally takes place in language which it itself holds.

Recall that the reactive mind can think only on this equation -- $A = A = A$, when the three A's may be respectively a horse, a swear-word and the verb "to spit." Spitting is the same as horses is the same as God. The reactive mind is a very zealous Simple Simon, carefully stepping in each pie. Thus when a man is told he has to delete the content of the reactive bank, he may say that if he did, he is sure he would lose all his ambition. Be assured -- and how easily this proves up on therapy and how red-eared some pre-clears become -- that he has an engram which may run something like this:

(Blow or bump, prenatal)

FATHER: Damn it, Agnes, you've got to get rid of that God-Damned baby.

If you don't, we'll starve to death. I can't afford it.

MOTHER: Oh, no, no, no, I can't get rid of it, I can't, I can't, I can't! Honest I will take care of it. I'll work and slave and support it.

Please don't make me get rid of it. If I did I'd just die. I'd lose my mind! I wouldn't have anything to hope for. I'd lose all my interest in life. I'd lose my ambition. Please let me keep it!

What a common one that engram is: and how sincerely and "rationally" and earnestly an aberree can be in supporting his conclusion that he has just "thought up" the "computation" that if he "gets rid of it," he'll lose his mind and ambition, maybe even die!

As this work is written, most of the engrams that will be found in adults come from the first quarter of the 20th century. This was the period of "Aha, Jack Dalton, at last I have you in my possession!" It was the period of "Blood and Sand" and Theda Bara. It was the period of bootleg whiskey and woman suffrage. It covered the days of "flaming youth" and the "The Yanks are Coming," and bits of such color will be demanding action in the engram banks. Dianetic auditors have picked up whole passages of the Great Play "The Drunkard" out of prenatal engrams, not as a piece of funny "corn" but as Mama's sincere and passionate effort to reform Papa. Super-drama, Mellerdrammer. And not only that but also tragedy. The hangover of the Gay Nineties, when the "business girl" had just begun to be "free" and Carrie Nation was saving the world at the expense of bartenders will be common fare in engrams found in today's adults.

Yesterday's cliches and absurdities become, tragically enough, today's engramic commands. One very, very morose young man, for instance, was found to have as the central motif of his reactive mind Hamlet's historic vacillations about whether "to be or not to be, that is the question." Mama (who was what these colloquially-minded auditors call a "loop") had gotten it by contagion from an actor-father whose failure to be a Barrymore had driven him to drink and wife beating; and our young man would sit for hours in a morose apathy wondering about life. To classify his psychosis required nothing more than "apathetic young fellow."

Most of engram content is merely cliches and commonplaces and emotional crash drives by Mama or Papa. But the auditor will have his moments. And when he suddenly learns about them, the pre-clear will have his laughs.

In other words, aberration can be any combination of words contained in an engram. Thus, to classify by aberration is not only utterly impossible but completely unnecessary. After an auditor has run one case, he will be far more able to appreciate this.

As for psycho-somatic ills, as classified in an earlier chapter, these depend also upon accidental or intentional word combinations and all the variety of injury and unbalanced fluid and growth possible. It is very well to call an obscure pain "tendonitis" but more probably and more accurately, it is a fall or injury before birth. Asthma comes fairly constantly from birth, as do conjunctivitis and sinusitis, but when these can occur in birth, there is generally prenatal background. Thus it can be said that wherever a man or woman aches is of minor importance to the auditor beyond using the patient's chronic illness to locate the chain of sympathy engrams, and all the auditor needs to know of that illness is that some area of the body hurts the patient. That, for the auditor, is enough for psycho-somatic diagnosis.

It happens that the extent of aberration and the extent of psycho-somatic illness are not the regulating factors which establish how long a case may take. A patient may be a screaming lunatic and yet require only a hundred hours to clear. Another may be a "well-balanced" and moderately successful person and yet take five hundred hours to clear. Therefore, in the light of the fact that the extent of aberration and illness has only a minor influence on what the auditor is interested in -- therapy -- classification by these is so much wasted time.

Oh, there are such things as a man being too sick from heart trouble to be worked very hard and such things as a patient worrying so continuously as a manifestation of his usual life that the auditor finds his work difficult, but these are rarities and again have little bearing on the classification of a case.

The rule in diagnosis is that whatever the individual offers the auditor as a detrimental reaction to therapy is engramic and will prove so in the process. Whatever impedes the auditor in his work is identical to whatever is impeding the patient in his thinking and living. Think of it this way: the auditor is an analytical mind (his own) confronted with a reactive mind (the pre-clear's). Therapy is a process of thinking. Whatever troubles the patient will also trouble the auditor; whatever troubles the auditor has also troubled the patient's analytical mind.

The patient is not a whole analytical mind: the auditor will find himself occasionally with a patient who does nothing but swear at him and yet when the appointment time arrives, there that patient is, anxious to continue therapy; or the auditor may find a patient who tells him how useless the entire procedure is and how she hates to be worked upon and yet if he were to tell her, "All right, we'll stop work," she would go into a prompt decline.

The analytical mind of the patient wants to do the same thing the auditor is trying to do, fight down into the reactive bank; therefore, the auditor, when he encounters opposition, adverse theory about dianetics, personal criticism, etc., is not listening to analytical data but reactive engrams and he should calmly proceed, secure in that knowledge, for the patient's dynamics, all that can be brought to bear, will help him so long as the auditor is an ally against the pre-clear's reactive mind, rather than a critic or attacker of the pre-clear's analytical mind.

This is an example:

(In reverie -- pre-natal basic area)

PRE-CLEAR: (Believing he means dianetics) I don't know. I don't know. I just can't remember. It won't work. I know it won't work.

AUDITOR: (repeater technique, described later) Go over that. Say, "It won't work."

PRE-CLEAR: "It won't work. It won't work. It won't work... etc. etc." Ouch, my stomach hurts! "It won't work. It won't work. It won't work ..." (Laughter of relief.) That's my mother. Talking to herself.

AUDITOR: All right, let's pick up the entire engram. Begin at the beginning.

PRE-CLEAR: (Quoting recall with somatics [pains]) "I don't know how to do it. I just can't remember what Becky told me. I just can't remember it. Oh, I am so discouraged. It won't work this way. It just won't work. I wish I knew what Becky told me but I can't remember. Oh I wish..." Hey, what's she got in here? Why, God damn her, that's beginning to burn! It's a douche. Say! Let me out of here! Bring me up to present time! That really burns!

AUDITOR: Go back to the beginning and go over it again. Pick up whatever additional data you can contact.

PRE-CLEAR: Repeats engram, finding all the old phrases and some new ones plus some sounds. Recounts four more times, "re-experiencing" everything. Begins to yawn, almost falls asleep ("unconsciousness" coming off), revives and repeats engram twice more. Then begins to chuckle over it. Somatic is gone. Suddenly engram is "gone" (refiled and he cannot discover it again. He is much pleased.)

AUDITOR: Go to the next earliest moment of pain or discomfort.

PRE-CLEAR: Uh. Mmmmm. I can't get in there. Say, I can't get in there! I mean it. I wonder where...

AUDITOR: Go over the line, "Can't get in there."

PRE-CLEAR: "Can't get in there. Can't..." My legs feel funny. There's a sharp pain. Say, what the hell is she doing? Why damn her! Boy, I'd like to get my hands on her just once. Just once!

AUDITOR: Begin at the beginning and recount it.

PRE-CLEAR: (Recounts engram several times, yawns off "unconsciousness," chuckles when he can't find the engram any more. Feels better.) Oh, well, I guess she had her troubles.

AUDITOR: (Carefully refraining from agreeing that Mama had her troubles, since that would make him an ally of Mama) Go to the next moment of pain or discomfort.

PRE-CLEAR: (Uncomfortable) I can't. I'm not moving on the time track. I'm stuck. Oh, all right. "I'm stuck, I'm stuck." No. "It's stuck. It's stuck that time." No. "I stuck it that time." Why damn her! That's my coronary trouble! That's it! That's the sharp pain I get!

AUDITOR: Begin at the beginning of the engram and recount, etc.

Each time, it can be seen in this example, that the patient in reverie encountered analytically the engram in near proximity, the engram command impinged itself upon the patient himself, who gave it forth as an analytical opinion to the auditor. A pre-clear in reverie is close up against the source material of his aberrations. An aberree wide awake may be giving forth highly complex opinions which he will battle to the death to defend as his own but which are, in reality, only his aberrations impinging against his analytical mind. Patients will go right on declaring that they know the auditor is dangerous, that he shouldn't ever have started them in therapy, etc., and still keep working well and efficiently. That's one of the reasons why the auditor's code is so important: the patient is just as eager to relieve himself of his engrams as could be wished, but the engrams give the appearance of being a long way from anxious to be relieved.

It will also be seen in the above example that the auditor is not making any positive suggestion. If the phrase is not engramic, the patient will very rapidly tell him so in no uncertain terms and although it still may be, the auditor has no great influence over the pre-clear in reverie beyond helping him to attack engrams. If the pre-clear contradicted any of the above,

it means that the engram containing the words suggested is not ready to be relieved and another paraphrase is in order.

Diagnosis, then, is something which takes care of itself on the aberration and psycho-somatic plane. The auditor could have guessed -- and kept it to himself -- that a series of attempted abortions were coming up in the above example before he entered the area. He might have guessed that the indecisiveness of the patient was from his mother. The auditor, however, does not communicate his guesses. This would be suggestion and might be seized upon by the patient. It is up to the pre-clear to find out. The auditor, for instance, could not have known where on the time track the pre-clear's "coronary pain" was nor the nature of the injury. Chasing up and down looking for a specific pain would be just so much wasted time. All such things will surrender in the course of therapy. The only interest in them is whether or not the aberrations and illnesses go to return no more. At the end of therapy they will be gone. At the beginning they are only complication.

Diagnosis of aberration and psycho-somatic illness, then, is not an essential part of dianetic diagnosis.

What we are interested in is the mechanical operation of the mind. That is the sphere of diagnosis. What are the working mechanics of the analytical mind?

1. Perception. Sight, hearing, tactile and pain, etc.
2. Recall. Visio-color, tone-sonic, tactile, etc.
3. Imagination. Visio-color, tone-sonic, tactile, etc.

These are the mechanical processes. Diagnosis deals primarily with these factors and with these factors can establish the length of time a case should take, how difficult the case will be, etc. And we need only a few of these.

This further simplifies into a code:

1. Perception, over or under optimum.

(a) Sight

(b) Sound

2. Recall: Under

(a) Sonic

(b) Visio

3. Imagination: Over

(a) Sonic

(b) Visio

In other words, when we examine a patient before we make him a pre-clear (by starting him into therapy) we are interested in three things only: too much or too little perception, too little recall, too much imagination.

In Perception we mean how well or how poorly he can hear, see and feel.

In Recall, we want to know if he can recall by sonic (hearing), visio (seeing) and somatic (feeling).

In Imagination we want to know if he (recalls) sonics, visions or somatics too much.

Let us make this extremely clear: it is very simple, it is not complex, and it requires no great examination. But it is important and establishes the length of time in therapy.

There is nothing wrong with an active imagination so long as the person knows he is imagining. The kind of imagination we are interested in is that used for unknowing “dub-in” and in that kind only. An active imagination which the patient knows to be imagination is an extremely valuable asset to him. An imagination which substitutes itself for recall is very trying in therapy.

“Hysterical” blindness and deafness or extended sight or hearing are useful in diagnosis. The first, “hysterical” blindness, means the patient is afraid to see; “hysterical” deafness means he is afraid to hear. These will require considerable therapy. Likewise, extended sight and extended hearing, while not as bad as blindness and deafness, are an index of how frightened the patient really is and is often a straight index of the prenatal content in terms of violence.

If the patient is afraid to see with his eyes or hear with his ears in present time, be assured there is much in his background to make him afraid, for these actual perceptions do not “turn-off” easily.

If the patient jumps at sounds and is startled by sights or is very disturbed by these things, his perceptions can be said to be extended, which means the reactive bank has a great deal in it labeled “death.”

The recalls in which we are interested in diagnosis are those which are less than optimum only. When they are “over optimum” they are actually imagination “dubbed in” for recall. Recall (under) and imagination (over) are actually, then, one group, but for simplicity and clarity we keep them apart.

If the patient cannot “hear” sounds or voices in past incidents he does not have sonic. If he does not “see” scenes of past experiences in motion color pictures, he does not have visio.

If the patient hears voices which have not existed or sees scenes which have not existed and yet supposes that these voices really spoke and these scenes were real, we have “over imagination.” In dianetics imaginary sound recall would be hyper-sonic, sight recall -- hyper-visio (hyper= over).

Let us take specific examples of each one of these three classes and demonstrate how they become fundamental in therapy and how their presence or absence can make a case difficult.

A patient with a mild case of “hysterical” deafness is one who has difficulty in hearing. The deafness can be organic but if organic it will not vary from time to time.

This patient has something he is afraid to hear. He plays the radio very loudly, makes people repeat continually and misses pieces of the conversation. Do not go to an institution to find this degree of “hysterical” deafness. Men and women are “hysterically” deaf without any conscious knowledge of it. Their “hearing just isn’t so good.” In dianetics this is being called hypo-hearing (hypo = under).

The patient who is always losing something when it lies in fair view before him, who misses signposts, theater bills and people who are in plain sight is “hysterically” blind to some degree. He is afraid he will see something. In dianetics this is being called, since the word “hysterical” is a very inadequate and overly dramatic one, hypo-sight.

Then there is the case of over-perception. This is not necessarily imagination, but it can go to the length of seeing and hearing things which are not there at all, which happens to be a common insanity. We are interested in a less dramatic grade in standard operation.

A girl, for instance, who sees something or thinks she sees something but knows she doesn't and is very startled, who jumps in fright when anyone silently comes into a room and can be so startled rather habitually, is suffering from extended sight. She is afraid she will encounter something, but instead of being blind to it she is too alive to it. This is hyper-sight.

A person who is much alarmed by noises, by sounds in general, by certain voices, who gets a headache or gets angry when the people around are “noisy” or the door slams or the dishes rattle, is a victim of extended hearing. She hears sounds far louder than they actually are. This is hyper-hearing.

The actual quality of the seeing and hearing does not need to be good. The actual organs of sight and sound can be in poor condition. The only fact of importance is the “nervousness” about reception.

This disposes of the two perceptions in which we are interested in dianetics. As the auditor talks to people around him and gets their reactions to sights and sounds, he will find wide variety in quality of response.

Recall is the most directly important to therapy, for it is not a symptom, it is an actual tool of work. There are many ways to use recall. The clear has vivid and accurate recall for every one of the senses. Few aberrees have. The auditor is not interested in other senses than sight and sound because the others will be cared for in the usual course of therapy. But if he has a patient who has no sonic, watch out. And if he has a patient with neither sonic nor visio, beware! This is the multi-valent personality, the schizophrenic, the paranoid of psychiatry with symptoms not acute enough to be so classified in normal life. This does not mean, emphatically does not mean, that people without sight and sound recall are insane, but it does mean an above average case and it means a case which will take some time. It does not mean the case is “incurable” for nothing can be further from the truth: but such cases sometimes take five hundred hours. It simply means that such a case isn't any stroll through the park: there is drammer back there in that reactive mind, drammer which says, “Don't see! Don't hear!” Some of the engrams in this case demand reduced or no recall. The organs of sight and sound may be highly extended in their reception. This does not mean that anything need be wrong with the way this person perceives sound or light waves and records them. But it does mean that after he has recorded them, he cannot easily get them back out of the standard bank because the reactive engram bank has set up circuits (occlusion demon circuits) to keep him from finding out about his past. There are, of course, greater or lesser degrees of recall.

The test is simple. Tell the patient wide awake to go back to the time he was entering the room. Ask him what was being said. If he can “hear” it wide awake, he has sonic recall. The auditor knows very well what was said, for if he means to use this test, he utters a certain set of words and notes the actual sounds present. Therefore, if the patient falls into the following category, the “dub-in,” the auditor will be apprised of that.

The sight recall test is equally simple. Show the patient a book with an illustration. After a time interval, ask him to “go back” while he is wide awake and look at that book “in his mind” and see if he can see it. If he can't, this is hypo-visio.

More tests similar to this will clearly establish whether or not our patient is recall blind and deaf or whether he falls into the next group:

The over-active imagination which enthusiastically “dubs-in” sight and sound for the patient without knowledge is something which is definitely a hindrance to fast therapy. There are many demon circuits which snarl up thinking, but these particular “dub-in” demons mean that the operator is going to get a most awful cargo of what the auditors colloquially call “garbage.” There is, as they further use some of the doubtlessly disgraceful terminology which, despite anything one can do, keeps rising up in this field, something at work in the brain which is a “lie factory.”

The patient asked to recount the conversation as he entered the door by “hearing it” again may confidently start in to give forth all manner of speech which was entirely paraphrase or utterly fictitious. Asked to tell about the picture and page he is shown, he will “see” vividly a lot more than was there or something entirely different. If he is doubtful about it, that is a healthy sign.

If he is certain, beware, for it is a demon circuit “dubbing in” without his analytical knowledge and the auditor will have to listen to more incidents which never happened than he could begin to catalogue and will have to sort out and pick his way through this “garbage” continually to get his pre-clear to a point where the data is reliable. (And it isn’t a matter of grading “garbage” by its improbability -- truth is always stranger than fiction; it is a matter of trying to reduce engrams which are not present or by-pass engrams which are present and so on in a tangled hash.)

The optimum pre-clear would be one who had average response to noises and sights, who had accurate sonic and visio and who could imagine and know that he was imagining, in color-visio and tone-sonic. This person, understand clearly, may have aberrations which make him climb every chimney in town, drink every drop in every bar every night (or try it anyway), beat his wife, drown his children and suppose himself to be a jub-jub bird. In the psycho-somatic line he may have arthritis, gall-bladder trouble, dermatitis, migraine headaches and flat feet. Or he may have that much more horrible aberration -- pride in being average and “adjusted.” He is still a relatively easy case to clear.

In the case which has sonic and visio shut-off without “dub-in” we are dealing with engrams which have shut down some of the primary working mechanisms of the mind. The auditor will have to slog through hours and hours and hours of trying to contact engrams when the patient cannot hear them or see them. A case which merely has a shut-down sonic recall still means that the auditor is going to do a lot more work than on an average case. This case is very, very far from impossible to resolve. That is not the idea here, to frighten off any attempt on such a case. But this case will only be resolved after a great deal of persistent effort. Such a person may be apparently very successful. He may be enormously intelligent. He may have few or no psycho-somatic ills. Yet he will prove to have a crammed engram bank, any part of which may come into restimulation at any time and swamp him. Usually, however, this type of case is quite worried and anxious about many things, and such worry and anxiety may put a little more time on the worksheet.

In the case of the “dub-in” who doesn’t know it, where circuits are giving him back altered recall, we have a case which may very likely prove to be very long and require artful treatment. For there is a “lie factory” somewhere in that engram bank. This case may be the soul of truthfulness in his everyday life. But when he starts tackling his engrams, they have content which makes him give out material which is not there.

Sharply and clearly, then, without further reservation or condition, this is dianetic diagnosis: The aberration is the engram content; the psycho-somatic illness is the former injury. The perceptions of sight and sound, under-optimum recall, over-optimum imagination regulate the length of the case.

If the auditor wants to be fancy, he can list the general tone scale position of the individual mentally and physically. The woman who is dull and apathetic is, of course, around Tone 0.5, in the Zone Zero part of the dynamic scale earlier in the book. If the man is angry or

hostile, the auditor can mark him down as a 1.5 or somewhere generally in the Zone One range of the survival scale. These markings would apply to the probable average tone of the aggregate engrams in the reactive mind. This is interesting because it means that a Zone Zero person is far more likely to be ill and is a slightly harder case than a Zone One person: And, as therapy raises tone to Zone Four, the 1.5 is closer to the goal.

It is difficult to estimate time in therapy. As mentioned before, it has several variables such as auditor skill, restimulative elements in the patient's environment and sheer volume of engrams.

The auditor is advised, in his first case, to seek out some member of the family or a friend who is as close as possible to the optimum pre-clear, which is to say, a person with visio and sonic recall and average perceptions. In clearing this one case he will learn at first hand much of what can be expected in the engram banks of any mind; and he will see clearly how engrams behave. If the auditor himself falls into one of the harder brackets and if he means to work with somebody in one of these brackets, that poses no great difficulty, either case can be released in a hundredth the time of any former mental healing technique and they can be cleared, if any skill at all is used, in five hundred hours of work per case. But if two cases are particularly difficult, before they work on each other each would be wise to find and clear a nearly optimum pre-clear. That way each will be a competent operator when the rougher cases are approached.

Thus, diagnosis. The other perceptions, recalls and imaginations are interesting but not vital in measuring case time. I.Q., unless it falls down into the feeble-minded level, is no great factor. And even then the I.Q. of any patient goes up like a skyrocket with clearing and rises all the while during the work.

There are organic insanities. Iatrogenic psychoses (caused by doctors) are equivocal in dianetics, for a part of the machinery may have been wrecked. Nevertheless, with many organic psychoses a case can be improved by dianetics even if an optimum cannot be reached. And so all an auditor can do is try. Insanities caused by missing parts of the nervous system have not been extensively investigated by auditors at this time: the reviving of corpses is not the end of dianetics: the bringing about an optimum mind in the normal or merely neurotic person has had the main emphasis. Dianetics can be otherwise used, is being and will be. But with so many potentially valuable people who can be made highly valuable to themselves and society, emphasis has been placed on inorganic aberrations and organic psycho-somatic illnesses.

Cases which have been subjected to pre-frontal lobotomy (which saws a section out of the analytical mind), the topectomy (which removes pieces of brain somewhat as an apple corer cores apples), the trans-orbital leukotomy which, while the patient is being electrically shocked, thrusts an ordinary dime store ice-pick into each eye and reaches up to rip the analyzer apart), and electric shock "therapy" which sears the brain with 110 volts, as well as insulin shock and other treatments, are considered by dianetics to be equivocal. There are ordinary organic insanities such as paresis, but most of these, even so, can be benefited by dianetics.

CHAPTER V

Returning, the File Clerk, and the Time Track

There is a method of “thinking” which Man did not know he had.

If you would like an illustration of this, ask a small child if she would like to go sleigh riding in memory. She will try to remember the last time she rode her sleigh. She will frown and pucker her brows perhaps. Now tell her to go back to the last time she was sleigh riding. Coaxed she will suddenly come forth with a complete experience and, unless she is badly aberrated, will be able to tell you about the snow getting down her collar and so forth. She is right back there sleigh riding, swimming or whatever you choose.

Man, when and if he thought about this at all, must have mistaken it for imagination. But it is not imagination. Anyone, unless he is very severely aberrated indeed, can be “sent back” wide awake to an experience of the past. In initial tests one should use experiences not long gone and experiences which are pleasant.

This is not memory in the way one “remembers something.” It is returning. Remembering is a far more complicated process than returning. Just why people go around seeking to remember some specific or complex datum when they can return is something of a mystery when one considers lost articles, things read, conversations had and so forth. Remembering, of course, has a very definite role and is an automatic process which provides “I” with conclusions and data in a never-ending stream. But when one wishes a very precise, specific bit of information or when one seeks a past pleasure to contemplate it, returning is more to the point.

The hypnotist, with much mumbo-jumbo and hand passes et al., has something which he calls “regression.” This is a very complicated business which requires being hypnotized. True enough, regression has research value since, by hypnosis, it by-passes occlusions which are not otherwise easy to get around. And regression served dianetics well when the author was checking his data on memory banks. But it evidently had occurred to none that regression is an artificial use of a natural process.

Undoubtedly some people use returning for some of their mental work, and these people probably think that “everybody else” does likewise, which is far from true. But even those people who return naturally seldom understand that this is a distinct process, much different from remembering.

People also relive without being hypnotized or drugged; this is a rarer thing. If a person sits in contemplation of some past glory for a while he will begin to relive instead of simply return.

In dianetics we have had much to do with “spectrums.” The spectrum of gradations is a much better mechanism for philosophy than Aristotle’s pendulum which swung from one extreme to the other. We have the spectrum of the dynamics. We call them four dynamics, through which the command: SURVIVE! is expressed, and the four are actually a great number of gradations from the cells of “I” through “I,” through family and children, through club and city and state, through nation and race and hemisphere and finally all Mankind. That is a spectrum: gradations of something which are really the same thing but which have wider and wider scope or range.

In much the same way as the spectrum of SURVIVE! we have a spectrum of memory at work. First there is memory in its most precise, present time sense. Then there is memory of the past. Then there is more memory of the past. And so we move into a part of the spectrum which has been overlooked: part of the “I” returns into the past, then a greater part of “I” returns into the past (at which point we have return) and finally, at the extreme all of “I” is back

in the past. First there is remembering. This is the furthest from exact data (except in a clear). Then there is returning in which part of the "I" is actually in the past and records appear to be perceptions he is actually experiencing. Then there is reliving where a man is so thoroughly in the past for the moment that, while he was recalling an infant experience, if startled he would react just as he would have when a baby.

There is a lot of aberrated notion in this present society about the evils of living in the past. These stem partially from an unwillingness of aberrated people to face and understand yesterday.

One of the prime sources of "bad memory" is Mother. Often enough Mother has been sufficiently panic-stricken at the thought of Junior's recalling just what she did to Junior that a Mankind-wide aberration seems to have sprung up. The standard attempted abortion case nearly always has an infancy and childhood full of Mama assuring him that he cannot remember anything when he was a baby. She doesn't want him to recall how handy she was, if unsuccessful, in her efforts with various instruments. Possibly prenatal memory itself would be just ordinary memory and in full recall to the whole race if this guilty conscience in Mother had not been rolling along lo! these millennia. In the normal course of work the auditor will have his hands full of Mama screaming objections about her grown son's or daughter's entering into therapy because of what they might find out: Mama has been known, by auditors, to go into a complete nervous collapse at the thought of her child's recalling prenatal incidents. Not all of this, by the way, is based on attempted abortion. Mama often has had a couple of more men than Papa that Papa never knew about; and Mama would very often rather condemn her child to illness or insanity or merely unhappiness than let a child pursue the course of the pre-clear even though Mother avowedly has no recollection whatever of anything bad ever happening to the child. Under therapy herself, she usually volunteers the truth.

Here is the source of why good memory is discouraged in a society and infant and prenatal memory overlooked, to say nothing of the ability to return and relive.

The index system of the standard bank is a wonderful thing to behold. Everything is there, filed by subject, filed by time and filed by conclusions. All perceptions are present.

With the time file system we have what is called in dianetics a time track. Going back along this track with part of "I" is returning. It is definitely present for both conscious and "unconscious" data. The time track is of vast and interesting concern to the auditor.

The mind is a well-built computer and it has various services. Auditors, backing off from Latin and complexity, call the source of one of these services, the file clerk. This is not a very dignified name and it is certainly anthropomorphic. There is no small man or woman in there with a green eye-shade. But the action which takes place is a close approximation to what would happen if such an entity did dwell within the mind.

The file clerk is the bank monitor. "He" monitors for both the reactive engram bank and the standard banks. When he is asked for a datum by the auditor or "I," he will hand out a datum to the auditor via "I." He is a trifle moronic when he handles the reactive engram bank, a contagion from the reactive mind, and he will at times hand out puns and crazy dreams when he should be delivering serious data.

The file clerk, if the auditor asks the pre-clear for the last time he saw a movie, will hand out the movie, the date it was seen, the age and physical being of the person, all perceptics, the plot of the movie, the weather -- in short, he hands out everything that was present and connected with the movie.

In ordinary living the file clerk feeds memory to "I" at a rapid rate. A good memory gets its data in split seconds. If the file clerk has to shove the memory around various reactive occlusions, it may take minutes or days for the data to arrive.

If we had a big computing machine of the most modern design, it would have a "memory bank" of punched cards or some such thing and it would have to have a selector and feeder device to thrust out the data the machine wants. The brain has one of these -- it could not operate without it. This is the bank monitor -- the file clerk.

Keep in mind these two parts of the mind: the time track and the file clerk and keep in memory this mechanism of returning. These are the three things we use, with the reactive and standard banks, in the dianetic reverie.

The file clerk is a very obliging fellow. If he has been having trouble getting to the "I" around the reactive occlusions and circuits in general, he is particularly obliging. He cooperates with the auditor.

The monitor system could be considered on the basis of attention units where a man could be supposed to have a thousand. Thus a thousand possible attention units would be available to a clear's "I." In the aberree, probably fifty are available to "I," five or six hundred absorbed in the reactive engrams, and the remainder variously used besides composing this mechanism we call the bank monitor, the file clerk.

It seems as if the file clerk in an aberree would rather work with the auditor than with the aberree. That may appear an astonishing fact, but it is a scientific fact. The file clerk works best, then, when he is selecting data out of a pre-clear's banks to present to the auditor. This is an aspect of the law affinity. "I's" file clerk and the auditor are a team: and they work very often in close harmony without enough consent from the pre-clear's analyzer to notice.

The return is most easily effected, in the aberree, by the auditor's addressing the file clerk, not the patient. This can actually be done with the patient wide awake. The auditor asks him for information, tells him to go back to it. "I" is suddenly in possession of the whole file. Something inside the mind, then, works in close harmony with the auditor and works better for the auditor than it does for the person in whose mind it is. That is the file clerk.

The object of the auditor is to take what the file clerk hands forth and to keep the file clerk from getting swamped by reactive data. Once the data has been given out by the file clerk, it is the business of the auditor to see that the pre-clear goes over it enough times to take the charge out of it. The mechanism of doing this is extremely simple. In order to help matters and keep the pre-clear from being distracted, the auditor goes through a routine with every session which disposes the patient to let the file clerk work.

The patient sits in a comfortable chair, with arms, or lies on a couch in a quiet room where perceptic distractions are minimal. The auditor tells him to look at the ceiling. The auditor says: "When I count from one to seven your eyes will close." The auditor then counts from one to seven and keeps counting quietly and pleasantly until the patient closes his eyes. A tremble of the lashes will be noticed in optimum reverie.

This is the entire routine. Consider it more a signal that proceedings are to begin and a means of concentrating the patient on his own concerns and the auditor than anything else. This is not hypnotism. It is vastly different. In the first place the patient knows everything which is going on around him. He is not "asleep," and can bring himself out of it any time he likes. He is free to move about, but, because it distracts the patient, the auditor does not usually permit him to smoke.

The auditor makes very sure that the patient is not hypnotized by telling him, before he begins to count, "You will know everything which goes on. You will be able to remember everything that happens. You can exercise your own control. If you do not like what is happening, you can instantly pull out of it. Now, one, two, three, four," etc.

To make doubly sure, for we want no hypnotism, even by accident, the auditor installs a canceller. This is an extremely important step and should not be omitted even when you may

be entirely certain that he is in no way influenced by your words. The auditor may inadvertently use restimulative language which will key-in an engram: he may, when he is especially new in dianetics, use such a thing as a holder or a denier, telling the pre-clear to "stay there" when he is returned on the track or telling him, worst of all things, to "forget it," one of a class of phrases of the forgetter mechanism which is most severe in its aberrative effect, denying the data entirely to the analyzer. To prevent such things from happening, the canceller is vital. It is a contract with the patient that whatever the auditor says will not become literally interpreted by the patient or used by him in any way. It is installed immediately after the condition of reverie is established. A canceller is worded more or less as follows: "In the future, when I utter the word Cancelled, everything which I have said to you while you are in a therapy session will be cancelled and will have no force with you. Any suggestion I have made to you will be without force when I say the word Cancelled. Do you understand?"

The word cancelled is then said to the patient immediately before he is permitted to open his eyes at the end of the session. It is not further amplified. The single word is used.

The canceller is vital. It prevents accidental positive suggestion. The patient may be suggestible or even in a permanent light hypnotic trance (many people go through life in such a trance). An engram is actually a hypnotic suggestion. It could be said that the purpose of therapy is to awaken a person in every period of his life when he has been forced into "unconsciousness." Dianetics wakes people up. It is not hypnotism, which puts people to sleep. Dianetic therapy wakes them up. Hypnotism puts them to sleep. Can you ask for a wider difference in polarity? Dianetic therapy removes engrams. Hypnotism installs engrams. Further, dianetics is a science, an organized body of knowledge -- hypnotism is a tool and an art and is such a wild variable that Man has suspected it as a dangerous thing for centuries and centuries, use it though he did.

The auditor will inevitably get cases into his hands which will drop into a hypnotic sleep for all he can do to prevent it. Such cases have engrams which make them do this, just as others have engrams which make them stay awake. The auditor then mentions neither "sleep" nor "wake." He takes his cases wherever they drop into their own inversion level and works them from there. Patients will plead to be drugged or put into a trance. Let them plead! The reverie has a clear at its end -- drugs and hypnotism have dependency on the auditor and many other undesirable aspects. A case takes longer in amnesia trance than in reverie. The gains in reverie are certain. The patient gets more and more well. When amnesia trance or hypnotism are used instead of reverie, no matter how easily the data seems to come up, the usual run of cases so treated experience little relief until the case is nearly completed, when the patient so long uncomfortable gets suddenly well. Hypnotism carries with it transference, enormous operator responsibility, and other impedimenta with which dianetics, in long practice, has done without. Hypnotism was used for research, then abandoned.

Hence, install the canceller every time. Never neglect to install it in every session. The patient may be trancing, which is something we don't want, but something which we cannot always avoid, and which we cannot always detect. Just install the canceller at the beginning of the session, then before you bring the patient to present time, use the canceller word.

This is a rehearsal, then, of the entire routine:

Auditor: Look at the ceiling. When I count from one to seven your eyes will close. You will remain aware of everything which goes on. You will be able to remember everything that happens here. You can pull yourself out of anything which you get into if you don't like it. All right (slowly, soothingly): One, two, three, four, five, six, seven*. One, two, three, four, five, six, seven. One, two, three (patient's eyes close and eyelids flicker), four, five, six, seven. (Auditor pauses; installs canceller.) All right, let us go back to your fifth birthday... (work continues until the auditor has worked the patient enough for the period)... Come to present time. Are you in present time? (Yes.) (Use canceller word.) When I count from five to one and snap my fingers you will feel alert. Five, four, three, two, one. (Snap.)

As it can be seen in this example, when work for the day is concluded, the pre-clear, who may have been returned into his past for two hours, must be brought back to present time and startled with a finger snap to restore his awareness of his age and condition. Sometimes he is unable easily to come back to present, for which there is quick remedy, which we will cover later, so the auditor must always assure himself that the patient feels he actually is in present time.

This is the reverie. This is all one needs to know about its actual mechanics. Experience will show him a great deal. But these are the basic processes:

1. Assure patient he will know everything that happens.
2. Count until he closes his eyes.
3. Install canceller.
4. Return him to a period in the past.
5. Work with file clerk to get data.
6. Reduce all engrams contacted so that no charge remains.
7. Bring patient to present time.
8. Be sure he is in present time.
9. Give him canceller word.
10. Restore full awareness of his surroundings.

The patient's time track, in the lowest level of attention units, is always in excellent condition. It can be depended upon to reach any date and hour of his life and all the data in it. In the higher levels of awareness, this time track may appear to be in very foul condition. The reactive mind engram circuits stand between these lower levels -- right up against the banks -- and the higher levels which contain "I." The lower levels contain only a shadow of the force of "I" and appear to be another "I" in a case of multi-valent personality.

You can draw this on a piece of scratch paper and it would be helpful if you would do so. Draw a tall rectangle (the standard banks) to the left of the page. Draw half a dozen circles up against the right side of this rectangle for a representation of the file clerk -- the bank monitor units. Now draw, about the center of the sheet, a large rectangle. Black it in. This is the area of the reactive engram circuits. It is not the reactive bank. It is the circuit pattern from the reactive engram bank, which borrows from the analyzer to make demons, vocal thinking, etc. Now, to the right of the page, draw a white rectangle. This is the portion of the analyzer which is "consciousness" and "I."

The whole task of therapy is to get that black rectangle, the reactive engram bank circuits, deleted so that from the standard bank to the left of the sheet to the analyzer portion to the right of the sheet is all analyzer. It can't be done with a knife as some people have supposed, evaluating the situation from their own engrams, for that black area you have drawn is all analyzer rendered useless by engrams and when therapy is done, it will all be available for thinking. This increases I.Q. to an enormous extent.

Now suppose that the bottom of your picture is conception and the top is present time. The vertical route up and down, then, is the time track. In this graph it can be supposed that present time just keeps adding up higher and higher, further and further from conception in the form of new construction (an analogy). For "I" to get data from the standard banks to the left, "I" would have to work through this black rectangle, the reactive mind circuits. To a large

extent "I" manages to get data from around this black area. But to a much larger extent it doesn't.

Now suppose that we draw a vertical line at the right of the picture. This line is "awareness." Consider that it can be moved, still vertical, to the left. As the line passes toward the left, we get deeper and deeper "trance." As the line moves into the reactive mind area, it becomes hypnotic trance. Now as it moves even further left and into the circles we are calling "file clerk," it becomes the amnesia trance of hypnotism. Thus, anywhere we place this line we establish a "depth of trance." We want to work over to the right of the reactive bank, nearest the awake level, so that we can keep "I" in contact with his surroundings and keep unwanted data from coming through which will make the patient chronically uncomfortable. If the patient instantly slides from the right all the way to the left so that the attention units, the circles, of the file clerk itself are present, and does so the instant you count from one to seven, he is a hypnotic subject. He may not be aware, when he awakens, of what has taken place, for "I" was out of contact. Work him there, for he will have full sonic, etc., but be very, very careful to work very early in his prenatal area. He might not be able to recall what has taken place and a late engram which, if tapped, will not reduce, may have its full force opened up on "I" when the patient regains possession of himself. Further, you might give him positive suggestion by accident. Work by preference with trance depth well to the right of the reactive bank.

The characteristics of the units we label "file clerk" are similar in desires to those of the basic individual when he is cleared. Thus, in any patient, the basic personality can be reached for here is a sample of it. But the auditor should be content to know it is there; as the clearing goes forward, he will see more and more of it. The individual is himself, his personality does not alter, it simply becomes what he wanted it to be all the time at his optimum moments.

The units up against the standard banks can be considered the file clerk. But the file clerk has more than just the standard bank which he can tap. He also has the entire engram bank from which he can pull forth data.

The time track may have several aspects to the preclear. There is actually no track there except time and time is invisible: but the awareness, the "I," can return along it. The track is always there, stretched out. But ideas of it continually occur and recur in the same patient. It may get all bunched up. It may be very long. It may be that he cannot get on it at all (here's the schizophrenic -- he is off his time track). But it is there. It is the filing system by time and "I" can be returned back along time by the simple request that he do so. If he does not, he is stuck in the present or an engram, which is easy to resolve. And so forth.

Now let us consider the engram bank. It was drawn as a black rectangle in the above sketch. Let us alter that a trifle and draw all this again, with the rectangles represented as triangles with all their points downwards and together but all else as before -- the standard banks, the analyzer (consciousness), and "I." This is a working model now, an analogy, of what the auditor is trying to contact. It is as if the engram bank itself existed in that black triangle. Actually it doesn't, only its circuits, but all we need to visualize is that it does. Therefore, there is a thin point at the bottom. "I" and the file clerk can get together here. This is the bottom of the time track. This is immediately after conception. A little higher up, let's say two-and-one-half months after conception, it is a little harder for "I" and the file clerk to achieve contact. There is more reactive circuit between them. At seven months after conception it is more difficult. And at twenty years of age it has approached impossibility in most cases without dianetic technique.

Hence, the auditor will find it expedient to work in the prenatal area and as early in that as possible. If he can clear the time from conception to birth, including birth, his task is nine-tenths complete. To clear the entire reactive bank is his goal.

The reactive bank is like a pyramid which is fairly well armored everywhere but just under the point, and which becomes unarmored when the point is contacted. This is taking the reactive bank in an exposed sector. The effort is to get into the basic area, contact early

engrams, erase the basic-basic engram by recountings and then progress upwards, erasing engrams. These engrams apparently vanish. Actually it takes a hard search to discover once they are really gone. They exist as memory in the standard bank, but that memory is so unimportant, having been integrated now as experience, that it cannot aberrate. Nothing in the standard bank can aberrate. Only the contents of the reactive bank can aberrate -- moments of "unconsciousness" and what was recorded within them -- and locks. The auditor, in his work, considers an engram erased when it vanishes, when the pre-clear can no longer contact any part of it, but only after the pre-clear has thoroughly re-experienced it, complete with somatics.*

This inverted pyramid, in its upper reaches, is affect. In the lower reaches, it is the primary cause of aberration. The cement that holds this inverted pyramid together is physical pain and painful emotion. All the physical pain ever recorded by the organism and all the painful emotion are parts of this inverted pyramid.

The auditor first discharges the painful emotion from later life as it was displayed in "conscious moments." He runs these periods as true engrams until the pre-clear is no longer affected by them. Then he tries to contact basic-basic, that first engram. He reduces all engrams he contacts en route to that primary goal. In every session he tries to reach basic-basic until he is certain he has it.

Basic-basic is the bottom point. Once it has been gained, an erasure is begun during which engram after engram is "re-experienced" with all somatics until it is gone. Before basic-basic had been reached, the auditor may have had to run engrams twenty times before they reduced. Later he may have found they reduced in five runs. Then he contacts and erases basic-basic. If the patient has sonic by this time -- or if he has had it all along -- the engrams start erasing with one or two recountings.

The file clerk is smart. The auditor who does not credit the ability of these attention units will involve the case beyond necessity and will lengthen it. The file clerk may hand things out by phrases, by somatics, by time. Whatever he hands out ordinarily will reduce on recountings. By working with, not trying to command, the file clerk, the auditor will find his case steadily improving until it is released or fully cleared. The only time the auditor disregards this is when he uses the repeater system, which will be described.

We have "I" in a reverie; we return him to a period in his life along his time track; the file clerk gives incidents forth which the pre-clear re-experiences; the auditor makes the pre-clear recount the engram until it is relieved or has "vanished"* (all engrams will eventually "vanish" after basic-basic is erased); anything new the file clerk offers, even during the recounting, is addressed by the auditor to make the pre-clear re-experience it. That is the total sum of activity in dianetics. There are, as accessories, the repeater technique and a few short-cuts. This is therapy. Amplification is needed, of course, and will be found in the ensuing pages to give the auditor all the data he needs. But this is the entire outline of dianetic therapy. * The words "vanished" or "erased," when applied to an engram which has been treated mean that the engram has disappeared from the engram bank. It cannot be found afterwards except by search of the standard memory.

CHAPTER VI

The Laws of Returning

The engram has the aspect of -- and is not -- a live entity which protects itself in various ways. Any and all phrases in it can be considered commands. These commands react on the analytical mind in such a way as to cause the analytical mind to behave erratically.

Dianetic therapy is parallel to the methods of thought and thinking itself. Anything which reacts against dianetics and the auditor can uniformly and without exception be found to react in just that way on the patient's analytical mind. Conversely, the patient's problems of thinking in his usual activities are the auditor's problems in therapy.

The bulk of these "commands" the engrams contain are not computable in any way, since they are contradictory or demand unreasonable acts. It is the impossibility of computing them and reconciling them to thought and existence which makes the patient aberrated. Let us take an engram which comes from one of Mother's bowel movements. She is straining, which causes compression, which brings about "unconsciousness" in the unborn child. Then, if she habitually talks to herself (a monologist) as an enormous number of aberrated women do, she may say, "Oh, this is hell. I am all jammed up inside. I feel so stuffy I can't think. This is too terrible to be borne."

This may be in the basic area. The dream mechanism of the mind (which thinks in puns mostly, symbologists to the contrary) may bring forth a dream about hell-fire as the engram is approached. The pre-clear may be sure that he is going to descend into fire if he goes on his time track toward this engram. Further, he may think his time track is all jammed up. This will mean, perhaps, that the incidents are all in one place on it. So much for "This is hell," and "all jammed up inside." Now let us take a look at what happens with "I'm so stuffy, I can't think." The pre-clear snuffles because he thinks this means a cold in his nose. And as for "This is too terrible to be borne," he is filled with an emotion of terror at the thought of touching the engram, for this command says it is too painful to bear. Additionally, engrams being literal in their action, he may think that he was too terrible to be born.

The emotional reaction to hell, from some other place on the track -- as contained in some other engram -- may say that "going to hell" is loud sobbing. Hence he does not "want" to recount this engram. Further, he is terrified of it because it is "too terrible to be borne." That Mother was only discussing with her ambivalent self the necessity of laxatives is never entered into the computation. For the reactive mind does not reason, it thinks in identities, seeking to command the analytical mind.

There is only as much data as is in the engram and the analytical reaction to this unthinking thing is utterly literal.

Let us look at another. This is a coitus experience. It has, as its somatic, varying pressure. It is not painful and, by the way, no matter how painful these engrams may be in present time when restimulated, no matter how forceful, when they are actually contacted, their reexperienced pain is very mild, no matter what it was when received. So this is a shaking up of the unborn child, that is all. But it says, "Oh, darling, I'm afraid you'll come in me. I'll just die if you come in me. Oh please don't come in me!"

What does the analytical mind do with this? Does it think about coitus? Does it worry about pregnancy? No, emphatically not. The engram that would make one think about coitus would say, "Think about coitus!" and the engram that contained a worry about pregnancy would say, "I am worried about pregnancy." The pain is not severe in this coitus experience but it specifically states that the engram is not to be entered. "Do not come in me!" He would die if he did, wouldn't he? It says so right there. And the patient finds himself wandering around the track until the auditor uses repeater technique (as will be covered).

How about another type of engram? Let us suppose that our poor patient has been unlucky enough to get a Junior tagged on him. Let us suppose his name is Ralph and his father's name is Ralph. (Be careful of these Junior cases, they are unusually complex sometimes.) Mother (see the Kinsey report, if you've any doubts) is having a quiet affair on the side with Jim. This coitus somatic is no more painful than being gently sat upon, but the patient has a terrible time with it. Mother: "Oh, honey, you are so wonderful. I wish Ralph were more like you but he isn't. He just doesn't seem to be able to excite a girl at all." Lover: "Oh, Ralph isn't so bad. I like him." Mother: "You don't know his pride. If Ralph found out about this, it would kill him. He would just die, I know." Lover: "Don't worry, Ralph'll never hear."

This little gem of an engram is more common than one would suppose before he begins to get an embryo-eye view of Mother. This won't compute in the analyzer as data. Therefore it is a worry. (A worry is contradictory engram commands which cannot be computed.) Ralph, Junior, finds that he is very shy sexually. That is the aberrative pattern. Approaching it in therapy we find we have a sympathy computation with the lover. After all, he said Ralph wasn't so bad, that he liked Ralph. Well, the only Ralph is, of course, to the reactive mind, Junior. This keeps our patient from approaching this engram because he thinks he will lose a friend if he touches it.

Further, on the aberrative side, Junior has always worried about people's pride. As we contact this in therapy, he shies violently from it. After all, if he found out about it it would "kill him dead right where he lies." And there is another thing here, a sonic shut-off. It says right there that Ralph will never hear. This is survival stuff. That is what the cells believe. Therefore Ralph never hears in recall. There will be more sonic shut-offs; Mother is promiscuous and that generally means blockage on the second dynamic. Blockage on the second dynamic often means she dislikes children. In short, this would be an attempted abortion case which stabbed Junior full of enough holes to supply a cheese factory for some time.

Junior, now a man, may have extended hearing because he is frightened in general of "life." But his sonic recall is zero. This engram, then, would have to be sorted out through the demon circuits as "impressions" which come to the mind. The auditor, taking what the patient says about this, may very soon guess its content and explode it by repeater technique.

Now take the case of the mother who, a soul of propriety if a little on the whiny side, discovers she is pregnant and goes to the doctor. Mother: "I think I'm pregnant. I'm afraid I am." Doctor punches her around for a while, knocking the unborn child, who is our pre-clear thirty years later, into an "unconscious" state. Doctor: "I don't think so." Mother: "I'm really afraid I am. I'm sure I'm caught. I just know it." Doctor (more punching): "Well, it's hard to tell this early."

It says right there that this man patient of ours is pregnant. If we look, we'll see he has a paunch. That's good survival, that is. And in therapy we find he is afraid he exists: I am afraid I am. And suddenly he isn't moving on the time track. Why? He's caught. That doesn't mean he's pregnant, that means he is caught. Further, he won't be able to recount it. Why? Because it is hard to tell this early. Consequently he doesn't speak about it. We free him on the track with repeater technique.

Oh, this language of ours which says everything it doesn't mean! Put into the hands of the moronic reactive mind, what havoc it wreaks! Literal interpretation of everything! Part of the aberrative pattern of the person who had the above engram was great cautiousness about advancing any opinion. After all, it was hard to tell, this early.

Now let us take an engram from a girl patient whose father was badly aberrated. He strikes Mother because he is afraid Mother is pregnant and Father is blocked on Dynamics One, Two, Three and Four. Father: "Get out! Get out! I know you haven't been true to me! You were no virgin when I married you. I should have killed you long ago! Now you're pregnant. Get out!"

The girl, some five weeks after conception, is knocked “unconscious” by the blow to Mother’s abdomen. She has a severe engram here because it has painful emotional value which she will never be able to dramatize satisfactorily. The aberrative pattern here demonstrates itself in hysterics whenever a man might accuse her of not being true. She was a virgin when she was married twenty-one years after this engram was received, but she was sure she was not. She has had a “childhood delusion” that her father was likely to kill her. And she is always afraid of being pregnant because it says now she is pregnant, which means always, since time is a march of “nows.” In therapy we try to get near this engram. We return the patient to basic area and suddenly find her talking about something which happened when she was five years of age. We return her again and now she is talking about something which happened when she was ten years of age. The auditor, observing any such reaction as this, knows he is handling a bouncer. It says, “Get out!” and the patient gets out. The auditor recognizes what is wrong, uses repeater technique, and reduces or erases the engram.

Always and invariably, the analytical mind reacts to these engrams as though commanded. It performs on the track as these engrams state. And it computes about the case or about life as these engrams dictate. Healthy things to have around, engrams! Real, good survival! Survival good enough to lay any man in his grave.

The auditor is not much worried by the phrases which assist therapy. An engram received from Father beating Mother which says: “Take that! Take it, I tell you. You’ve got to take it!” means that our patient has possibly had tendencies as a kleptomaniac. (Such things are the whole source of the impulses of a thief, the test being that when an auditor erases all such engrams in a patient, the patient no longer steals.) The auditor will find it eagerly recounted because its content offers it to the analytical mind.

The whole species of engrams which say, “Come back here! Now stay here!” as Fathers are so fond of saying, account for a snap back to an engram when therapy is entered. The patient goes straight back to it the moment it is exposed. When recounted the command is no longer effective. But while that engram existed, unentered, it was fully capable of sending people to an institution to lie in a foetal position. Anyone left in institutions who has not been given shocks or pre-frontal lobotomy and who suffers from this type of insanity can be released from such an engram and restored to present time simply by use of repeater technique. It sometimes takes only half an hour.

Traveling on the track, then, and wandering through the computations the analyzer is compelled by these engrams to attempt is something like playing a child’s game which has a number of squares and along which one is supposed to move a “man.” A game could actually be composed on the basis of this time track and engram commands. It would be similar to parchesi. Move so many squares, land on one which says, “Get out!” which means one would go back to present time or toward it. Move so many squares and then lose a move because this square on which we now land says, “Stay here!” and the “man” would stay until the auditor let him out by technique (but because this is struck by therapy, it would have no power to hold long). Then move so many squares to one which said, “Go to sleep,” at which the “man” would have to go to sleep. Move so many squares until one was hit which said, “Nobody must find out,” and so there would be no square. Move so many until one was reached which said, “I’m afraid,” at which the “man” would be afraid. Move again to a square which said, “I must go away,” so the “man” would go away. Move once more to a square which says, “I’m not here,” and the square would be missing. And so forth and so forth.

The classes of commands which particularly trouble the auditor are only a few. Because the mind actually does some part of its thinking, especially when remembering, by return, even when the individual is not returning, all these commands also impede the thought processes of the mind. In therapy they are particularly irksome and are the constant target of attention of the auditor.

First is the patient-ejector species of command. These are colloquially called “bouncers.” They include such things as “Get out!” “Don’t ever come back,” “I’ve got to stay away,” etc. etc., including any combination of words which literally mean ejection.

Second is the patient-holder species of command. These include such things as “Stay here,” “Sit right there and think about it,” “Come back and sit down,” “I can’t go,” “I mustn’t leave,” etc.

Third is the engram-denyer species of command which, literally translated, means that the engram doesn’t exist: “I’m not here,” “This is getting nowhere,” “I must not talk about it,” “I can’t remember,” etc.

Fourth is the engram-grouper species of command which, literally translated, means that all incidents are in one place on the time track: “I’m jammed up,” “Everything happens at once,” “Everything comes in on me at once,” “I’ll get even with you,” etc.

Fifth is the patient-misdirector which sends the pre-clear in the wrong direction, makes him go earlier when he should be going later, go later when he should go earlier, etc. “You can’t go back at this point,” “You’re turned around,” etc.

The bouncer sends the pre-clear soaring back toward present time. The holder keeps him right where he is. The denyer makes him feel that there is no incident present. The fourth, the grouper, foreshortens his time track so that there is no time track. The misdirector reverses the necessary direction of travel.

Contacting any engram causes the pre-clear to react “analytically.” Just as in the case of an engram being restimulated, the commands are impinged upon his analyzer, and although the analyzer may firmly believe it has just computed the reaction all of its own accord, it is actually speaking straight out of the content of an engram or engrams.

This is the method of repeater technique.

As he goes back along the track contacting engrams, the pre-clear runs into areas of “unconsciousness” which are occluded by “unconsciousness” or emotion. In most early engrams the pre-clear can be expected to yawn and yawn. It is not the command “to sleep” which is responsible for this: the “unconsciousness” is releasing (boiling off, the auditors call it). A pre-clear may, for a space of two hours, fumble around, drop off into “unconsciousness,” appear doped, start to go to sleep, without any such command being present.

Part of the engram bundle of data is the analyzer shut-off. When he is returned and an engram is contacted, the pre-clear then experiences an analyzer attenuation, which means he is much less able to think in the area.

Boiling-off “unconsciousness” is a process very necessary to therapy, for this “unconsciousness” could be restimulated in the everyday life of the individual and, when restimulated, make his wits shut off just a little or a very great deal, slowing down his thought processes.

The aspect of “unconsciousness,” then, reduces the pre-clear’s awareness whenever it is contacted. He has dreams, he mumbles foolish things, he flounders. His analyzer is penetrating the veil which kept him from the engram. But it is also highly susceptible, when in this state, to an engram command.

When urged by the auditor to go through the engram and recount it (although the auditor knows it may take minutes for this “unconsciousness” to boil off enough to let the patient through) the pre-clear may complain that “I can’t go back at this point.” The auditor promptly takes note of this. It is an engram command coming through. He does not apprise the

patient of this knowledge; the patient usually doesn't know what he's saying. If the patient then continues to have trouble, the auditor tells him, "Say, 'I can't go back at this point.'" The patient then repeats this, the auditor making him go over it and over it. Suddenly the somatic turns on and the engram is contacted.

In interviewing a patient, the auditor notes carefully without appearing to do so, what phrases the patient chooses and repeats about his ills or about dianetics. After he has placed the patient in reverie, if he discovers the patient, for instance, insists he "can't go any place," the auditor makes him repeat the phrase.

Repetition of such a phrase, over and over, sucks the patient back down the track and into contact with an engram which contains it. It may happen that this engram will not release -- having too many before it -- but it will not release only in case it has that same phrase in an earlier engram. So the repeater technique is continued with the auditor making the patient go earlier and earlier for it. If all goes on schedule the patient will very often let out a chuckle or a laugh of relief. The phrase has been sprung. The engram has not been erased, but that much of it will not thereafter influence therapy.

Anything the patient does about engrams and any words he uses to describe the action are contained, usually, in those engrams. Repeater technique takes the charge off the phrases so that the engrams can be approached.

This technique, of course, can very occasionally land the patient in trouble, but the kind of trouble into which one can get in dianetics is not very severe. The engram, restimulated in everyday life, can be and is violent. Murders, rapes and arsons, attempted abortions, backwardness in school, -- any aberrated aspect of life -- stems from these engrams. But the act of approaching them in dianetic therapy goes on another channel, a channel closer to the source of the engram. Ordinarily, acting on an unsuspecting individual, the engram has enormous motor and speech power, ties up great numbers of circuits in the mind which should be used for rationality, and generally effects havoc: its contacts are "soldered-in" and cannot be thrown out by the analyzer. In therapy the patient is headed toward the engram: that act alone begins to disconnect some of its "permanent leads." A patient can be gotten into an engram which, unless approached on the therapy route, might have made him curl up like a foetus and get shipped off to the nearest institution. On the therapy route, which is a return down the time track, the most powerful holder has its force limited: a patient can get into a holder which in normal life might be a psychosis: his only manifestation, perhaps, is that when he is told to "Come up to present time," he simply opens his eyes without actually traversing the interval up the track to present time. He does not suspect he is in a holder until the auditor, watchful for such a manifestation, feeds him repeater technique.

AUDITOR: Are you in present time?

PRE-CLEAR: Sure.

AUDITOR: How do you feel?

PRE-CLEAR: Oh, I've got a slight headache.

AUDITOR: Close your eyes. Now say: "Stay here."

PRE-CLEAR: All right. Stay here. Stay here. Stay here. (Several times)

AUDITOR: Are you moving?

PRE-CLEAR: No.

AUDITOR: Say "I'm caught. I'm caught."

PRE-CLEAR: I'm caught. (Several times)

AUDITOR: Are you moving on the track?

PRE-CLEAR: Nope.

AUDITOR: Say, "I'm trapped."

PRE-CLEAR: I'm trapped. I -- Ouch, my head!

AUDITOR: Keep going over it.

PRE-CLEAR: I'm trapped. I'm trapped. I'm trapped, Ouch! That's worse! (His somatic is getting stronger as he approaches the engram holding him on the other side of the "unconsciousness" veil)

AUDITOR: Keep going over it.

PRE-CLEAR: I'm trapped -- "Oh, God, I'm trapped. I'll never get out of this place. I'll never get out. I'm trapped!"

AUDITOR: Contact it closely. Make sure there is nothing more in it. (A trick to keep the pre-clear from replaying what he himself has just said and keep running the engram)

PRE-CLEAR: My head hurts! Let me come up to present time!

AUDITOR: Go through it again. (If the pre-clear comes up with this much charge, he'll be unhappy and the incident may be hard to enter next time)

PRE-CLEAR: "Oh, God, I'm trapped. I'm afraid I'm trapped (new word showed up). I'll never get out of this place as long as I live. I'm trapped. I'll never get out. I'm trapped." (aside) She's crying. "Oh, why did I ever have to marry such a man!"

AUDITOR: How's your head?

PRE-CLEAR: Hurts less. Say, that's a dirty trick. She's pounding herself on the stomach. That's mean! Why, confound her!

AUDITOR: Re-experience it. again. Let's make sure there isn't more in it. (Same mechanism to keep the pre-clear from replaying what he said before rather than what he now gets from the engram. If he replays rather than re-experiences, the engram won't lift)

PRE-CLEAR: (Does so, getting some new words and several sounds including the thud of the blows on her abdomen and an auto horn (bulb type) in the street outside) Don't tell me I have to run this thing again.

AUDITOR: Recount it, please.

PRE-CLEAR: Well, so this dame tries to bust my head in and get rid of me. And so I jumped out and beat hell out of her.

AUDITOR: Please re-experience the engram.

PRE-CLEAR: (Starts to do so, suddenly finds out that like a piece of string with a loop in it, this engram has straightened out and contains more data where the loops were). "I've got to think of something to tell Harry. He'll jump all over me." (This was the source of his joking -- "jumped out, etc.")

AUDITOR: Please go over it again. There may be more in it.

PRE-CLEAR: (Does so, old parts of it reduce, two new sounds appear, her footsteps and running water. Then he is happy laughs at it. This engram is released because it may not have entirely vanished. Such an engram is in this shape only when it is contacted prior to basic-basic.)

This is both repeater technique and an engram talked into recession. This engram may appear again with a very faint additional charge after basic-basic is contacted, but it has lost all power to aberrate or give out a psycho-somatic headache or other illness. Yet this engram, not contacted by therapy, was quite enough to make this patient, when a boy, scream with terror every time he found he could not get out of some closed space (claustrophobia).

The repeater technique is the one particular phase of dianetics which requires cleverness from the auditor. Given persistency and patience, any auditor can succeed in the other phases of the science with minimal intelligence. In the repeater technique he must learn how to think -- for therapy purposes -- like an engram. And he will have to observe how the subject is conducting himself along the time track. And he will have to observe the type of reaction the subject has and draw from this the conclusion as to what sort of command is troubling the subject when the subject himself either does not cooperate or does not know.

This is not to say that the repeater technique is hard: it is not. But the ability of the auditor to use it is the principal reason why a case takes longer with one auditor than another. It is a definite ability. It is playing the game mentioned earlier with cleverness. Where is the pre-clear stuck and with what command? Why has the pre-clear suddenly stopped cooperating? Where is the emotional charge which is holding up the case? With the repeater technique the auditor can resolve all these problems and a clever auditor resolves them much faster than an unclever one.

How does one think like an engram? Ronald Ross, discovering that insects carried germs, considered it necessary to think like a mosquito. Here is a similar menace, the engram. One has to learn to think, for therapy purposes, like an engram.

The auditor could not and does not have to be able to look into a patient's eyes and guess why the patient won't eat anything but cauliflower on Wednesdays. That is an aberration and the auditor does not have to guess at either aberrations or psycho-somatic illness sources; they all come out in time and he will learn much about them as he goes. But the auditor must be able to keep his patient straightened out on the track, moving earlier into the basic area, moving upwards from there for a reduction. The current answer to this is the repeater technique. Understand that a whole new art of practice, or many arts of practice, could be evolved for dianetics: one would be unhappy with his fellow man if such evolution and betterment did not take place. Just now the best that has come forward -- and the criterion of best is that it works uniformly in all cases -- is the repeater technique. The auditor must be able to use it if he expects anything like results from a case at this time. When the auditor -- or some auditor -- has run a few cases and knows the nature of this beast, the engram, he may -- and better had -- come forward with improved techniques of his own. The real drawback which repeater technique has is that it requires the auditor to be clever.

Being clever does not mean talking a lot. In dianetics, when one is auditing, that is being very unclever. Indeed auditors, when they begin to work cases, almost invariably so love the sound of their own voices and the feel of their skill that the poor pre-clear hardly gets a chance to get a word in reactive-wise -- and it is the pre-clear who is to be cleared, who has the only accurate information, who can make the only evaluations.

Being clever in the sense of the repeater technique is being able to pick out, from the subject's conversation or action, just what the engrams contain which will prevent his reaching them, progressing through them and so forth. The repeater technique is addressed only to action, not to aberration.

Here is a case, for instance, which was so “sealed-in” that thirty hours of almost continual repeater technique were necessary to break the walls between the analytical mind and the engrams. It is important to know that an engram would not be an engram if the pre-clear could contact it easily. Any engram which can be easily contacted and has no emotional charge is about as aberrative as a glass of soda water.

A young girl, with sonic recall, but with extended hearing and such a complete imbalance of the endocrine system that she had become an old woman at twenty-two, was worked for seventy-five hours before she contacted anything in the basic area. This is almost incredible but it happened. In a patient with sonic shut-off and off his time track, seventy-five hours of work would just about get the wheels greased. But this girl, having sonic recall, should have been well on the road to being clear and she had yet to touch basic-basic.

By repeater technique and repeater alone the case was finally resolved. It contained practically no holders or bouncers. It simply appeared that the whole prenatal area was a blank.

Now it happens that an engram, being not a memory with reason in it, is just a set of waves or some other type of recording which impinges itself on the analytical mind and the somatic mind and runs the voice and muscles and other parts of the body. The analytical mind, to justify what it finds going forward, and cut down by the engram in dramatization, may be interjecting data to make this action seem reasonable -- to justify it. But this does not make an engram sentient. When an engram is first approached in therapy it appears to be absent entirely. It may be that three sessions will be required to “develop” this engram. As many are worked, this does not mean three blank sessions, but it means that the “I,” in returning, must pass over an engram a few times for the engram to “develop.” This is important to know. Just as you ask the mind for a datum one week and don’t find it (in an aberree) and ask it again the next week and find it, so with engrams. A cardinal principle in therapy is that if you keep asking for it, you will eventually get the engram. Returning over and over the prenatal area will, of itself alone, eventually develop the engrams in it so that the analytical mind can attack them and reduce them. This is slow freight. The repeater technique -- although the engram is still in need of development by several sessions -- speeds the process immensely.

In the case of this young girl it probably would have taken another fifty or sixty hours of work to contact the engrams unless a technique like repeater had been used.

Repeater technique resolved it when the auditor noted that she kept saying, “I’m sure there’s a good reason why I feel bad up in my childhood. After all, my brother raped me when I was five. I’m sure it’s up in my childhood, much later. My mother was terribly jealous of me. I’m sure it’s later.”

This young lady, as might be imagined, had studied some school of mental healing in college which thought sex or eating vitamins caused aberrations of the mind and she had often held forth on the fact that while she was not averse to what she called “analysis” she did think it dull to expect a foetus to hear anything. She would go into the area before birth and declare she was quite comfortable. But birth was not in sight. That is important. The basic engram or engrams in the basic area -- around the embryo period -- cannot vanish and will not vanish short of therapy, and when birth cannot even be contacted by so much as one somatic, it is certain that something lies before it. If birth were the first engram, everybody could be cleared in five hours. Birth can even be in sight and there may still remain half a hundred severe prenatal experiences. In her case, nothing was in sight. Her educational pattern had slowed the case: she was always trying to sit in present time and “remember” with a memory so full of occlusions that she couldn’t have recalled her mother’s right name. (She had acquired this from being in the hands of mental practitioners for ten years who had asked her to do nothing but “remember.”) As has been said, she was quite comfortable before birth, sensed the amniotic fluid and was certain that life in the womb was a joyous life for all. The incongruity that she could experience the sensations of this amniotic fluid and floating comfort and warmth and a continued belief that there was no prenatal memory escaped her utterly. The auditor made no

slightest effort to convince her. Knowing his business, he merely kept sending her back and forth, trying this mechanism or that.

She finally wanted to know if there had to be prenatal experience and was told that what was there was there, that if there was no prenatal memory then she wouldn't recall any but that if there was, she might. This is a good, equivocal attitude for an auditor. Dianetics, after all, as one auditor put it, "just shows the yard goods" and makes no sales effort at all.

The auditor had been using repeater technique on varieties of phrases. She was moving on the track so there must be a denyer present. And he had utterly run out of ideas when he realized, suddenly, that she was very handy with that phrase, "much later."

AUDITOR: Say "Much later" and return into the prenatal area.

GIRL: "Much later. Much later," etc. (very bored and uncooperative).

AUDITOR: Continue please. (Never say "Go ahead" for that means to do just that. Say "Continue" when you want them to keep on progressing along an engram or repeating and "Return over it" when re-running an engram already run once.)

GIRL: "Much later. Much..." I have a somatic in my face! It feels like I am being pushed. (This was good news for the auditor knew she had a mid-prenatal pain shut-off which prevented later somatics from appearing.)

AUDITOR: Contact it more closely and continue to repeat.

GIRL: "Much later. Much later." It's getting stronger. (Naturally. On repeater technique, the somatic gets stronger until the phrase appears, exactly right. On a non-sonic case it impinges itself indirectly on "T"; in a sonic, the sound comes through as sound.)

AUDITOR: Continue.

GIRL: "Much..." I hear a voice! There. That's it. Why, that's my father's voice!

AUDITOR: Listen to the words and repeat them, please.

GIRL: He's talking to my mother. Say, this face pressure is uncomfortable. It keeps going up and down on me. It hurts!

AUDITOR: Repeat his words please.

GIRL: He's saying: "Oh honey, I won't come in you now. It's better to wait until much later to have one." And there's my mother's voice. Say, this pressure is hurting me. No, it's eased up considerably. Funny, the minute I contacted his voice, it got less.

AUDITOR: What is your mother saying, please, if you hear her?

GIRL: She's saying: "I don't want you in there at all then!" She's mad! Say, the somatic stopped. (Coitus had ended at this point.)

AUDITOR: Please return to the start of this and recount.

GIRL: (Regains the beginning, somatic returns) I wonder what they're doing? (then a pause) I hear a squishing sound! (then a pause and embarrassment) Oh!

AUDITOR: Recount the engram please.

GIRL: There's a sort of a faint rhythm at first and then it gets faster. I can hear breathing. Now it's beginning to bear down harder but a lot less than it did the first time. Then it eases up and I hear my father's voice: "Oh, honey I won't come in you now. It's better to wait until much later to have one. I'm not too sure I like children that well. Besides, my job ..." And my mother must shove at him because there's a sharper somatic here. "I don't want you in there at all then. You cold fish!"

AUDITOR: Return to the beginning and recount it again, please.

GIRL: (Recounts it several times, somatic finally vanishes. She feels quite cheerful about it but doesn't think to mention that she doubted prenatals existed.)

This is repeater technique at work. This particular case had had about two hundred phrases thrown at her for repeater technique without finding one of them that would fit. In the first place, there were only a few lower engrams which the file clerk was willing to give out and the auditor was guessing at the whole gamut of deniers. A later incident might have contained -- and did but no somatic appeared -- numbers of the phrases he used. But the file clerk was willing to settle for this one for it was early and could be erased.

The file clerk rarely hands out something in a badly occluded case which cannot be reduced to recession. And an auditor never leaves an engram so offered until he has made every effort with many recountings to reduce it. The file clerk, in this case, by the bye, would have let down the auditor by putting forth such an engram as birth, which would not have lifted and which would have caused a lot of lost work and given the patient a headache for a few days. The auditor would have let the file clerk down if he had not reduced the engram offered by making the girl go over it several times until the somatic was gone and the voice faded out.

The reason this engram stayed hidden was because its content said so. Actually it was a coitus. As an engram it seemed to say that the incidents would be found later on in life. Further, as an engram, it said that it was not to be entered.

Repeater technique will sometimes embroil a patient in trouble of a minor sort by getting him "sucked into" incidents which will not lift. This is not common but the file clerk occasionally hands out a late incident, rather than an early one. However, this is not an error on the part of the file clerk. Remember, he has these engrams filed by subject, somatic and time, and the auditor can use any one of these. When the file clerk responds and hands out a somatic on a repeater phrase the auditor has gleaned from the pre-clear's chatter or has guessed himself and yet that somatic will not lift or no voice appears with it (in a sonic case, or merely won't lift with a non-sonic), the file clerk had to unstack a pile of material. Therefore, the auditor, realizing this, finding that a voice does not appear or that the somatic will not lift, has the pre-clear repeat the same phrase and tells him to go earlier and earlier. Another somatic may turn up in a different place in the body. The file clerk has gotten an even earlier one loose, now that a small amount of trouble has been taken from what he could first get. Now this earlier one is addressed similarly. It may get mediumly strong as a somatic, the pre-clear repeating the phrase all the while, and still no voice may appear. The auditor then sends the pre-clear earlier. The file clerk again has managed to get out an even earlier one, now that something has been taken from the second. This time again, an even earlier somatic turns on, probably down around the basic area in a case which has not previously contacted this area, and this time a voice can be heard. The engram reduces. The file clerk, in short, was willing to risk trouble in order to get several somatics unstacked and let the auditor get a basic incident.

There are variations on this sort of thing. As the filing system is by subject, somatic and time, the auditor can use other things than phrases. He can send a pre-clear to the "highest intensity of a somatic," and often results may be obtained, though this is not as reliable as by subject nor as foolproof. The pre-clear, incidentally, does not mind going to any "highest intensity" of somatic because somatics are about a thousandth part as strong as the original agony, though they are quite strong enough. In present time with the pre-clear not in therapy, the intensity of one of these somatics can be a drastic affair as witness the migraine headache.

Taking the migraine, a pre-clear can be returned to the very moment of its reception when one would think its intensity would be the highest and yet find a mild, dull ache such as one would get with a hangover. This is part of the principle that any entrance of a case is better than a case not entered at all. For by return with standard reverie technique the source is approached, and if the source is contacted at all, the power of the engram to aberrate has become reduced in strength no matter how many mistakes the auditor makes.

Returning to “maximum intensity” of a somatic, then, is nothing very painful. Actual maximum intensity is when the pre-clear is awake before the contact with the incident is made. But in returning to “maximum intensity” the incident may often be contacted and reduced. If “maximum intensity” however, contains in its engram the phrases, “I can’t stand it!” “It’s killing me,” or “I’m terrified,” then expect our pre-clear to respond to it in some such way. If he does not respond, then he has an emotional shut-off, which is another problem which will be taken up later.

Similarly, the auditor can handle his pre-clear in time. There exists a very accurate clock in the mind. The file clerk is very well acquainted with this clock and wherever possible will comply. The auditor who wants the patient to go “six minutes before this phrase is uttered” will generally find that his pre-clear is now six minutes before it, even though the incident is prenatal. The auditor can bring his pre-clear forward, then, minute by minute as he desires. He can take a pre-clear straight through an incident by announcing, “It is one minute later, it is two minutes later. Three minutes have gone by,” and so forth. The auditor does not have to wait for those minutes to elapse; he just announces them. He can make a pre-clear go through time at five minute intervals or hour intervals or day intervals, and unless there is engramic material which holds him or otherwise affects the operation, the auditor can move the pre-clear on the time track at will. It would be very nice if the auditor could send the pre-clear to conception and then tell him it is one hour later, two hours later and so forth to pick up the first engram. However, there are more factors involved than time, and the plan, though pretty, is not feasible. The time shift is generally used when the auditor is trying to get the pre-clear ahead of an incident to make sure that he really has a beginning. By returning the pre-clear by five or ten minute intervals, the auditor may sometimes discover that he is running backwards into a very long and complicated incident and that the headache he has been seeking to alleviate on the pre-clear was received, actually, hours before the period in which he thought it had initially been received. In such a case there is a second engram appended to an earlier engram and the auditor cannot lift the second one until he has the first one.

Actually time shift is of limited use. The auditor who tries to go chasing backwards through time will find that he will have on his hands an artificially restimulated case and that the work is much impeded. Repeater technique works best and is most easily handled by the file clerk. The auditor uses a time shift to get the pre-clear as close to basic area (early prenatal) as possible and then generally, if the file clerk doesn’t simply go to work handing out engrams which can be washed, one after the other, the auditor uses repeater technique. Time shift and “running down a somatic” have some limited use. Some experimentation will show about how much use they have.

The laws of regression are these:

- (1) A returned patient reacts more, theoretically, to those commands which are earlier than he is on the time track and less to those commands which are later than his point in time.
- (2) A pre-clear reacts to those engramic commands which are: (a) in chronic restimulation, or (b) to which he is nearest on the time track. Thus, if an engram says, “I’m afraid,” he is. If it says, “I’d rather die than face this,” he would. If the command to which he is near says, “I’m sleepy,” he will be. If it says, “Forget it,” he will. Commands in chronic restimulation give a false color to the personality: “I can never be sure of anything,” “I don’t know,” “I can’t hear anything” are all possibly in chronic

restimulation. If the file clerk won't give them up, then keep working the case anyway around these. They will give up after a while.

- (3) The action of the pre-clear on the time track and the condition of the track are regulated exclusively by engramic commands classifiable as bouncers, holders, deniers and groupers and misdirectors. (These conditions, it is repeated, are quite variable, as variable as language: "I don't know whether I am coming or going," for instance in an engram makes it very confusing. "I can't go back at this point" makes the pre-clear keep progressing later and later.)
- (4) The engramic command manifests itself either in the awake speech of the pre-clear after a session of therapy or is inadvertently announced as a supposedly "analytical" thought when he nears the vicinity of the command.
- (5) The engram is not a sentient, rationalized memory but a collection of unanalyzed perceptions, and it will develop into contact simply by the process of returning through it, to it, over it or asking for it.
- (6) The file clerk will give the auditor whatever can be extracted from the engram bank. The auditor must aid the file clerk by reducing in charge or severity everything the file clerk offers. This is done by making the patient recount it. (Otherwise the file clerk gets so much material piled around that, with this in restimulation, he can no longer get at the files. The auditor who bucks the file clerk is not rare. The file clerk who will buck an auditor except by withholding data which will not reduce has yet to be found.)

The techniques available to the auditor are as follows:

1. Returning, in which the pre-clear is sent as early as possible on his track before therapy itself is engaged upon.
2. Repeater technique, by which the file clerk is asked for data on certain subjects, particularly those affecting the return and travel on the time track, and which aid the ability of the pre-clear to contact engrams.
3. Time shift, by which a pre-clear can be moved short or long distances on the track by specific announcement of the amount of time forward the pre-clear is to go or time backwards, or return or progression through intervals of time. (It is also useful to find out if the pre-clear is moving or which direction he is moving on the time track in order to discover the action some engram may be having upon him.)
4. Somatic location, by which the moment of reception of the somatic is located, in an effort to discover whether it is received in this engram or to find an engram containing it.

CHAPTER VII

Emotion and the Life Force

One of the largest roles in therapy is played by Emotion. In the second book we covered this subject and divided it tentatively as a theory only into three divisions: (a) the emotions contained in the command of engrams whereby physical pain became confused with emotions; (b) the emotions contained as endocrine reactions subject to the analytical mind of the clear and the analytical mind and reactive mind of the aberree; and (c) the emotions contained in engrams which bound up free units of Life force.

Further work and research on emotion will undoubtedly bring about an even closer understanding of it. But we have a workable knowledge of emotion now. We can use what we know and produce results with it. When we know more, we shall be able to produce much better results but just now we can produce the release and the clear. If we treat emotion as bound up life force and if we follow these general precepts to release it, we shall obtain a very large gain in any pre-clear; indeed, we shall produce our largest single gains by so releasing emotion.

In an engineering science like dianetics, we can work on a push-button basis. We know that throwing a switch will stop a motor, that closing it again will start it and that no matter how many times we open or close that switch our motor will stop or start. We are using here a force which is still as mysterious to us as electricity was to James Clerk Maxwell. Much earlier Benjamin Franklin had observed that electricity existed and had done some interesting things with it: but he had not used it much and he could not control it. A philosopher like Bergson selected out a thing he called *elan vital*, a life force. Man is alive, there must be a force or flow of something which keeps him alive; when Man is dead there is no force or flow. This is life force in the Benjamin Franklin stage. As he considered electricity, so did Bergson consider life force. Now we are up, in dianetics, to the James Clerk Maxwell stage, or very nearly. We know that certain equations can be made about life force and we can use those equations. And we can theorize that "life force" and what has been called a certain kind of "emotion" are either similar or the same thing. We may have the wrong theory, but so might James Clerk Maxwell. Indeed, Maxwell's theories may still be wrong: at least we have electric lights. In dianetics we are pretty certain that the majority of tenets are parallels of natural law: these are the big computations. We are not certain that we have emotion properly bracketed, but then we shall not be sure until we have actually taken a dead man and pumped him up with life force again. Short of this extreme, we are on solid ground with emotion as life force.

We can, for instance, take a girl, examine something of her background with, let us say, an electro-encephalograph (an instrument for measuring nervous impulses and reactions) and then proceed on the basis of the information so obtained to do one or two things. The first is inhuman and would not be done, of course, but she could be made sick or insane merely by using this data, so obtained. (If the data is obtained in therapy, it is obtained by actual contact with engrams and an engram contacted in reverie has lost its power to aberrate: dianetic therapy thus makes such an eventuality utterly impossible.) The second and far more important fact to us is that she can be made to recover, with this same data, all the force, interest, persistence and tenacity to life and all the physical and mental well-being possible. If it could not be made to work both ways, we would not have the answer, at least in workable form. (Some fiction writer, by the way, if tempted to horrify on the first fact, must please recall that the data was obtained with apparatus which would have staggered Doctor Frankenstein for intricacy and skill in use and that dianetic therapy contacts the data at source: the apparatus is necessary to keep from touching the source for the instant the source is touched by therapy its power vanishes like yesterday's headlines: so let's have no "Gaslight" plays about dianetics, please: they'd be technically inaccurate.)

This is not as simple as electricity in that the switch cannot be turned off and on. So far as dianetics is concerned, it can only be turned on. We have a rheostat, then, which will not

drop back but which, when pressed forward, releases more and more dynamic force into the individual and gives him more and more control over its use.

Man is intended to be a self-determined organism. That is to say that as long as he can make evaluations of his data without artificial compulsions or repressions (held down 7's in an adding machine) he can operate to maximum efficiency. When man becomes exteriorly-determined, which is to say compelled to do or repressed from doing without his own rational consent, he becomes a push-button animal. This push-button factor is so sharply defined that an auditor, in therapy, who discovers a key phrase in an engram (and does not release it) can use that phrase for a little while to make a patient cough or laugh or stop coughing or stop laughing at the auditor's will. In the case of the auditor, because he got the data at source -- contacted the engram itself, which robbed it of some power, the push-button will not last very long, certainly less than two or three hundred pushes. The whole pain-drive effort at handling human beings and most of the data accumulated in the past by various schools has been, unwittingly, this push-button material. If the engram is not touched at source it is good for endless use, its power never diminishing. Touched at source, however, the original recording has been reached and so it loses its power. The "handling of human beings" and what people have been calling, roughly, "psychology" have been actually push-button handling of a person's aberrational phrases and sounds. Children discover them in their parents and use them with a vengeance. The clerk discovers that his boss can't stand a full waste basket and so always has one full. The bosun on a ship finds out one of his sailors cringes every time he hears the phrase, "fancy-pants" and so uses the word to intimidate the man. This is push-button warfare amongst aberrees. Wives may find that certain words make the husband wince or make him angry or make him refrain from doing something and so they use these "push-buttons." And husbands find their wives' push-buttons and keep them from buying clothes or using the car. This defensive and offensive dueling amongst aberrees is occasioned by push-button reacting against push-buttons.

Whole populaces are handled by their push-button responses. Advertising learns about push-buttons and uses them in such things as "body-odor" or constipation. And in the entertainment field and the song-writing field push-buttons are pushed in whole racks and batteries to produce aberrated responses. Pornography appeals to people who have pornographic push-buttons. Corn-and-games government appeals to people who have "care for me" push-buttons and others. It might be said that there is no necessity to appeal to reason when there are so many push-buttons around.

These same push-buttons, because they are 7's held down by pain and emotion (false data forced into the computer by engrams -- and every society has its own special patterns of engrams), also happen to drive people insane, make them ill and generally raise havoc. The only push-button the clear has is whatever his own computer, evaluating on his experience which itself has been evaluated by the computer, tells him is survival conduct along his four dynamics. And so, being no marionette in the hands of careless or designing people, he remains well and sane.

It is not true, however, that a clear is not emotional, that his reason is cold, and that he is a self-conscious puppet to his own computations. His computer works so rapidly and on so many levels with so many of his computations going on simultaneously but out of the sight of "I" (though "I" can examine any one of them he chooses) that his inversion or acute awareness of self is minimal. Inversion is the condition of the aberree whose poor computer is wrestling with heavy imponderables and held down 7's in his engrams such as "I must do it. I just have to do it. But no, I'd better change my mind."

The computational difference between the clear and the aberree is very wide. But there is a much grander difference: life force. The dynamics have, evidently, so much potential force. This force manifests itself as tenacity to life, persistence in endeavor, vigor of thought and act and ability to experience pleasure. The dynamics in a man's cells may be no stronger than those in a cat's cells. But the dynamics in the whole man are easily greater than those in any other animal. Assign this as one will, the man is basically more alive in that he has a more volatile

response. By more alive is meant that his sentient-emotional urge to live is greater than those found in other life forms. If this were not true, he would not now command the other kingdoms. Regardless of what a shark or a beaver does when threatened with final extinction, the shark and the beaver get short shrift when they encounter the dynamics of Man: the shark gets worn as leather or eaten as vitamins and the beaver decks a lady's back.

The fundamental aspect of this is seen in a single reaction. Animals are content to survive in their environments and seek to adjust themselves to those environments. That very dangerous animal -- or god -- Man has a slightly different idea. Ancient schools were fond of telling the poor demented aberree that he must face reality. This was optimum conduct: facing reality. Only it isn't Man's optimum conduct. Just as these schools made the fundamental error of supposing that the aberree was unwilling to face his environment when he was actually, because of engrams, unable to face it, they supposed that the mere facing of reality would lead to sanity. Perhaps it does, but it does not lead to a victory of Man over the elements and other forms. Man has something more: some people call it creative imagination, some call it this or some call it that: but whatever it is called, it adds up to the interesting fact that Man is not content merely to "face reality" as most other life forms are. Man makes reality face him. Propaganda about "the necessity of facing reality," like propaganda to the effect that a man could be driven mad by a "childhood delusion" (whatever that is) does not face the reality that where the beaver down his ages of evolution built mud dams and keeps on building mud dams Man graduates in half a century from a stone and wood dam to make a mill wheel pond to structures like Grand Coulee Dam, and changes the whole and entire aspect of a respectable portion of Nature's real estate from a desert to productive soil, from a flow of water to lightning bolts. It may not be as poetic as Rousseau desired, it may not be as pretty as some "nature lover" would desire, but it's a new reality. Two thousand years ago the Chinese built a wall which would have been visible from the Moon had anybody been up there to look; three thousand years ago he had North Africa green and fertile; ten thousand years ago he was engaged upon some other project; but always he has been shaping things up pretty well to suit Man.

There's an extra quality at work or perhaps just more of it, so much more of it that it looks like a new thing entirely.

Now all this is not any great digression from therapy; it is stated here as an aspect of life force. Where the individual finds himself "possessed of less and less life force," he is losing some of the free units somewhere.

And the free units of this life force, in a society or an individual, are the extra surge that is needed to tame North Africa, divide an atom, or reach the stars.

The mechanical theory here -- and recall it is but theory and dianetics can stand without it -- is that there are so many units of force per individual. These units may be held in common by a group and may build to higher and higher numbers as "enthusiasm" increases; but for our purposes, we can consider that Man, as an individual or a society -- both are organisms -- has a ready number to hand for use in any given hour or day. He may manufacture these life units as required and he may simply have a given supply: that is beside the point.

What is to the point is that he can be considered, at any hour or day, as just so much alive. Consider this as his dynamic potential as we can see on our descriptic earlier.

What happens, then, to this dynamic potential in the aberree? He has a large quantity of engrams in his bank. We know that these engrams can sleep for his entire life without being "keyed-in," and we know that any or all of them can be keyed-in and thereafter wait for restimulators in the environment to set them into action. We know that his necessity level can suddenly rise and surmount all these keyed-in engrams, and we know that a high survival activity can bring him such a chance of pleasure that the engrams can stay unrestimulated, though keyed-in. And we can suppose that these engrams, from one period of life to another,

can actually key-out again and stay out because of some vast change of environment or survival chances.

The usual case, however, is that a few engrams stay keyed-in continually and are restimulated rather chronically by the environment of the individual, and that if he changes environment the old may key out but eventually new ones will key-in.

Most aberrees are in a state of chronic restimulation which, on the average, starts the spiral dwindling down rather rapidly.

As this pertains to life force, the mechanical action of an engram on being keyed-in, is to capture so many of these units of life force. Sudden and sweeping restimulation of the engram permits it to capture a great many more units of life force. In the average case, every restimulation captures a greater residue of life force and holds it. When enthusiasm or impetus aligns the purpose of the individual toward a true survival goal (as opposed to a pseudo-goal in the engrams) he recaptures some of these units. But the spiral is dwindling: he cannot capture back, except in very unusual circumstances, as many as he has lost into the engram bank.

Thus it can be said, for purposes of this theory of life force action, that more and more life force units out of an individual's supply are captured and held in the engram bank. Here they are perverted in use to counterfeit themselves as dynamic (as in the manic and the high euphoria case) and force action upon the somatic and analytical mind. In this engram bank, the life force units are not available as free feeling or for free action but are used against the individual from within.

An observation here tends to demonstrate this action: the more restimulated an aberree is, the less free feeling he may possess. If caught in a manic (highly complimentary pro-survival engram), his life force is channeling straight through the engram and his behavior, no matter how enthusiastic or euphoric, is actually very aberrated: if he has this much life force to be so channeled, then he can be shown to have even more life force, sentiently directed, when clear. (This has been done.)

We have demonstrated the parasitic quality of the "demon circuits" which use pieces of the analytical mind and its processes. This parasitic quality is common to engrams in other ways. If a man has, arbitrarily, a thousand units of life force, he has an ability to channel them, when clear, into highly zestful existence: in a manic state, with a pro-survival engram in full restimulation, the life force is directed through an aberrated command and gives him, let us say, five hundred units of pseudo-dynamic thrust.

In other words, the power is out of the same battery: such an engram has at best less power than the whole organism, cleared, would have. (This aspect of the manic or super-personality neurotic has misled some of the old schools of mental healing into the thoroughly aberrated and poorly observed belief that insanities alone were responsible for Man's ability to survive, a concept which can be disproven in the laboratory simply by clearing one of these manics or any other aberree.)

The engram uses the same current but perverts it just as it uses the same analytical mind but usurps it. Not only does the engram have no life of its own, but it is wasteful as are so many parasites, of the life force of the host. It is thoroughly inefficient. If a comparable device were fitted into an electronic circuit it would merely lead off and make "unalterable" some of the functions of the equipment which should be left variable and would, in addition, consume, simply by lengthened leads and bad condensers and tubes, power supply vital to the machine.

In the human mind, the engram assumes its most forceful "assist" aspect in the manic, channeling and commanding the organism into some activity of wild violence and monomaniac concentration.

The “super-salesman,” the violently buoyant “glad-hander,” the fanatical and apparently unkillable religious zealot are classifiable as manics. The abundance of “power” in these people, even when it is as grim as Torquemada’s or as destructive as Genghis Khan’s, is an object of admiration in many quarters. The manic, as will be later covered, is a “pro-survival,” “assist” command in an engram which yet fixes the individual on some certain course. But an engram is capable only of as much “power” as is present in the host, just as it is capable of tying up only as much analyzer as is present.

Let us take a forceful manic who is displaying and functioning on 500 arbitrary units of life force. Let us assume that the entire being is possessed of 1000 arbitrary units of life force. Suppose we have here an Alexander. The dynamics of the average person are unassisted by manics in most cases but are dispersed as a stream of electrons might be dispersed by a block before them.

Here are scattered activity, scattered thoughts, uncomputable problems, lack of alignment. In such a person, with 1000 units present, 950 of those units could be so captured in the engram banks and yet so thoroughly counteractive that the person displays a functioning capacity of only 50 units. In the case of Alexander, it could be assumed, the manic must have been an alignment in a general direction of his own basic purposes. His basic purpose is a strong regulator: the manic happens to align with it: a person of great ability and personal prowess becomes possessed of 500 units via a manic engram, believes he is a god and goes out and conquers the known world. He was educated to believe he was a god, his manic engram said he was a god and had a holder in it.

Alexander conquered the world and died at 33. He could hold in his manic only so long as it could be obeyed: when it could no longer be obeyed, it changed his valence, became no more a manic and drove him, with pain, into dispersed activities. The engram, received from his mother, Olympia, can almost be read even at this late date. It must have said he would be a joyous god who would conquer all the world and must keep on conquering, that he must always strive to rise higher and higher. It was probably a ritual chant of some sort from his mother, who was a high priestess of Lesbos and who must have received some injury just before the ritual. She hated her husband, Phillip. A son who would conquer all was the answer. Alexander may well have had fifty or a hundred such “assist” engrams, the violent praying of a woman aberrated enough to murder. Thus he could be assumed to have conquered until he could no longer stretch a line of supply for conquering, at which time he, of course, would no longer be able to obey the engram and its force of pain would turn on him. The engrams dictated attack to conquer, and they enforced the command with pain: once conquering could no longer be accomplished, the pain attacked Alexander. He realized one day he was dying: within the week he was dead: and at the height of his power. Such, on a very large scale, is a manic phrase in an engram at work.

Now let us suppose that Alexander, with only education to turn him against his father, with only prayers to ask him to conquer the world, not engrams, had been cleared. Answer: given a sufficient and rational reason, he would most certainly have been able to conquer the world and at eighty might well have been alive to enjoy it.

How can we assume this?

The manic with 500 units of directed purpose has been cleared. He now has 1000 units of sentiently directed purpose. He is exactly twice as forceful as he was when he was in a forceful manic and his basic purpose may be similar but now can be realized and will not turn on him the moment he has reached a goal or failed.

This is clinical, the theory behind life force. It was formulated in an effort to explain observed phenomena.

The theory may be wrong, the observed data is not. But the theory must be somewhere close to right because with it could be predicted considerable phenomena which had not been

known to exist before: in other words, it is a profitable theory. It followed after dianetics was well formulated, for a strange fact, vital to the therapist, turned up: the pre-clear advanced in therapy in exact ratio to the amount of emotional charge released from his reactive bank.

The purpose and persistency of the aberree was hindered in ratio to the amount of emotional charge within his engram bank. His recovery of survival potential increased in ratio to the amount of energy freed from the engram bank.

His health increased in ratio to the amount of energy feed from the engram bank.

The engrams which contained the greatest discharge were those which centered around loss of imagined survival factors.

Hence, this theory of life force was formulated. Any manic cleared seemed to demonstrate far more actual power and energy than before he was cleared. And any "normal" cleared increased in accessible life force units to compare with any manic cleared.

Undoubtedly further work and observation will refine this theory. At the present moment, however, it serves. It is one of those "scientific theories" thrown in to explain an operation or a long series of observations. In this case it happens to be squarely aligned with the basic tenets of dianetics, for it predicts data which can then be found and does not throw out former data predicted by the basic mathematics and philosophy of dianetics.

Here we are speaking, actually, not of this slippery term, emotion, but, we believe, life force. This life force is considerably enhanced by success and pleasure in general and is, according to this theory, augmented in terms of arbitrary units, by pleasure. In other words, pleasure is a thing which recharges the batteries or permits them to be recharged and in a clear, far from leading to softness, leads to renewed activity since indolence is engramic.

Pleasure is a vitally important factor: creative and constructive endeavor, the overcoming of not unknowable obstacles toward some goal, the contemplation of past goals reached all combine to recharge life force. The person, for instance, who has been an enormous success and then loses that success and so becomes ill is following no rational cycle but an engramic command cycle. In a way he has disobeyed an engramic command and having disobeyed, suffers pain. The "child wonder" who early "burns out" is actually, via therapy, about as burned out as a banked furnace. Any "child wonder" is a forced affair: think of the dreams mama must have poured through his engrams. She's hurt: "Oh, I'll never forgive myself! If I have ruined my child, I will never forgive myself. My child, that's to be the world's greatest violinist!" or "Oh, you brute! You have struck me! You have injured our child. I'll show you. I'll make him the greatest child pianist in all Brooklyn! He's to be a beautiful child, a wonder child! And you've struck him, you brute. Oh, I am going to sit right here until you go away!" (Actual engrams.) The last computes that the way to get even with papa is to be the greatest pianist in all Brooklyn. The child is a great success -- musical ear, practice and great "purpose." He gets this engram restimulated constantly by his mother. But then, one day he loses a contest, he knows suddenly he is no longer a child, that he has failed. His purpose wavers. He gets headaches (papa's blow) and is at last "neurotic" and "burned out." Cleared he went back to being a pianist, not as an "adjusted" person but one of the best paid concert pianists in Hollywood. Music aligned with basic purpose.

Again, in another manic example, a patient who had been some time in therapy -- not the first to do this by far -- raved that he had been "turned-on" by dianetics. He was walking about a foot off the earth, chest punched out and so forth. His glasses suddenly would not fit him, his eyes were too good. He was a beaming, powerful case of euphoria.

Artificial restimulation had touched a manic engram, had brought it into key for the first time in his life. He felt wonderful. The auditor knew that he was due for a complete come down within thirty-six hours to three days (the usual time) because an artificial restimulation, by therapy, had tapped the engram. It happened that his grandmother had told her daughter that

she must not abort the child because someday it might become a “fine upstanding man or beautiful woman.” He was upstanding all right: it almost strained his back muscles. Another glance at the engram in therapy and the manic phase was gone.

This manic, then, as in the case of the boy wonder, can be assumed to have gathered up available life force and suddenly channeled it along basic purpose lines, making a high level of concentration of life force. In the case of the pianist his cleared force was well above the manic force. In the other case, currently in process, a level has been reached which is approaching the former level and will surpass it by far.

In the same way an enthusiasm for a project will channel life force along some purpose line and necessity will suddenly rob back from engrams enough power to carry an individual far, although he has no active manics whatever.

Now we come to the heart of this matter: the pro-survival engram. It is pseudo-survival like all engramic “assist,” a mirage which dissolves and leaves burning sands.

Formerly we spoke mainly of contra-survival engrams. These lie across the dynamics of the individual and his basic purpose.

The contra-survival engram is, to the dynamics, like a log jam which dams a necessary river. The dynamic is blocked in some degree. Any blockage to any one of the four dynamics (or any section of that spectrum) causes a dispersal of the flow. It does not make less dynamic, particularly, but it does misdirect it in the same order that the river, blocked in its natural flow, might become five streams going in various directions or flood a fertile pasture it should merely have watered.

The pro-survival engram alleges to assist (but does not actually assist) the dynamic on its way. It pretends it is the dynamic. In the analogy of the river, the pro-survival engram would be a canal which took the river’s force and sent it off in some unintended direction. The pro-survival engram is not a manic; it can and does contain at times manic phrases.

A contra-survival engram says, “He’s worthless, damn him, let’s kill him.”

The pro-survival engram says: “I am saving him.” If it added: “He is a darling and a very wonder with the ladies,” it would then be a pro-survival with a manic.

In terms of the descriptive which defines the survival dynamic and the suppressor earlier in this book, the contra-survival engram would be part of the suppressor (an aberrated part) and the pro-survival engram would be part of the dynamic thrust (an aberrated part).

Neither one of these things is actually a sentient and computable portion of survival dynamic or suppressor.

The engram (delirium from illness, perhaps) which says, “I will stay with you, darling, so long as you are sick” is an apparent but wholly shadow-stuff part of the survival dynamic. But the reactive mind has no sense of time when restimulated and this engram, keyed-in and constantly restimulated by some concept in it such as an odor or a person’s voice who may or may not be the original person, demands that the person who has it be ill just as he was ill when it was said. This way, according to our moron, the reactive mind, lies survival: “I had some one taking care of me when I was ill. I need some one to take care of me. I must be ill.” Here is the basic pattern of all sympathy engrams. Here is the basic pattern of the engram which will contain the chronic psycho-somatic illness in any patient. The variety is, of course, very large but all insist that the individual who has them be ill in order to survive.

The suppressor-type engram, always contra-survival, can be cut into restimulation in exactly the same way as the pro-survival engram. An engram is an engram and all the mechanics are the same. The fact that the analytical mind cannot time the engram can make any engram seem omnipresent. Time can “heal” the experiences of the analytical mind, perhaps, but

not the reactive mind which has no time, a fact which makes time not the Great Healer but the Great Charlatan. There may be no actuality at all in this suppressor data. It is false data. Such engrams let an individual, for instance, see a butterfly and then tell him it is dangerous: he then comes to detest spring because that is the time he sees butterflies. This engram may say: "You're all against me. You're against everything I do," which was actually Mama making a stand against her husband and mother-in-law. It contains a concept, a recording of the sound of a sewing machine as well. The individual possessing this engram hears a sewing machine (if this engram has at some time been keyed-in) at a moment when he is weary and dull and, looking toward the machine (he never identifies the actual sound: these engrams protect themselves), sees his wife. She is the associative restimulator, something his analytical mind, told to scent danger, picks up as the cause. So he searches around and finds something he is angry about (something almost "rational") and begins to tell her she is against him. Or it can be an engram of such low emotional tone that it is an apathy, and so he sits down and weeps and moans that she is against him. If, during "unconsciousness" at birth, the doctor said he'd have to spank him, the individual possessing this engram howls and gets headaches when he is spanked and when grown spansks his children as the strongest suppressor he can think of.

There is a difference, then, between the pro- and contra-engrams, particularly the real sympathy pro-engram and the contra-engram. And it is a difference, even if we have been long on the road in this chapter, which is of vital interest to the auditor.

All the real reluctance he will see in pre-clears during therapy will come from these sympathy pro-survival engrams. These add up into some very weird computations. They tell the patient that he had better not "get rid of it" and so the patient struggles to retain his engrams. Such an engram is very common. A typical case is Mama pushing off Papa, who insists he cannot afford a child: the struggle injures the child and in the "unconsciousness" he receives, of course, an engram: Mama is refusing to get rid of it. Mama is on baby's side, therefore baby had better do exactly as Mama says and "not get rid of it." This aligns with purpose, the deepest purpose, to survive. If he gets rid of his engrams, he will die because getting rid of it means death, for Mama said she would die if she got rid of it. Further, on up through life, Mama may have the nasty habit of telling him when he is ill that she will "take care of her baby and protect him from his father," and this makes a new force in the old computation.

Thus we come to the ally computation. This will be the chief and number one struggle of the auditor, the thing which will most elusively resist him, the thing which lies down close to the core of a person.

The ally computation is severe enough that an auditor once said that a man is not victimized by his enemies, he is murdered by his friends. Engrammatically speaking, that is quite true.

The only aberration and psycho-somatic ill the patient will continually hold to is a pro-survival engram which is part of an ally computation. That could be written fifty times here without being stressed enough. It is most important, it is the first thing which the auditor is going to buck when he enters a case, the first thing he must discharge if he wishes therapy to go swiftly. He may have to touch and reduce many contra-survival engrams, for they come swiftly enough when called, before he can even get an idea of what the ally computation is. But when he gets an ally computation he had better run it out and discharge all its emotion or the case will hang fire.

The ally computation is the reactive mind level moronism that survival depends on Grandma or Aunt Sue or some serving maid thirty years dead. The attendants of the individual when he was ill, the people who begged his pregnant mother to stop trying to abort him, or fed him or otherwise tried to keep him from being hurt: these are the allies.

The reactive mind operates wholly on two-valued logic. Things are life or they are death, they are right or they are wrong, just as the engram wording states. And the personnel of engrams are friends or enemies. The friends, the allies, mean Life! The enemies mean Death!

There is no middle ground. Any restimulator or associated restimulator for the pro-survival engram means Life: and any restimulator or associated restimulator for a contra-survival engram means Death!

The auditor, of course, may be a really restimulative person (one who is a pseudo-father, a pseudo-lover of mother before birth, etc.) but he is always an associative restimulator, the person who may take away these terribly, horribly vital things, the pro-survival engrams. The contra-survival engrams outbalance this factor and, of course, the analytical mind of the pre-clear is always all for the auditor and the therapy.

The trouble comes when the analytical mind is shut down by restimulation and the auditor is seeking the ally computation. Then the pre-clear's reactive mind dodges and avoids.

The ally computation, however, is simple to trace. And it is very vital to trace it, for this computation may contain the bulk of all the emotional discharge of the case. Freeing the complete ally computation wholly before basic-basic is reached is wholly impossible. But as much life force as possible must be restored to the pre-clear to make the case work well.

For the ally computation, above all things, encysts the life force of the individual. Here is caught and held the free feeling, the very heartbeat of life itself. A pre-clear is only placed in apathy by ally computations. The body can be almost dead in the presence of antagonism and still rally and fight. But it cannot fight its friends. The law of affinity has been aberrated into an entrance into the reactive engram bank. And that law, even when twisted with the murky shadows of unreason in the reactive mind, still works. It is a good law. It is too good when the auditor is trying to find and reduce engrams which are making the pre-clear ache with arthritis or bleed internally with stomach ulcers.

Why can't he "get rid of" his arthritis? Mama said, when she gracefully fell over a pig, "Oh, I can't get up! Oh, my poor, poor baby. Oh, my baby! I wonder if I hurt my poor, poor baby. Oh, I hope my baby is still alive! Please God let him live. Please God let me keep my baby. Please!"

Only the God to which she prayed was the Reactive Mind, which makes one of its idiot computations on the basis of everything is equal to everything. A holder, a prayer for life, a thoroughly bruised baby's spine, Mama's sympathy, a pig grunt, a prayer to God, all these things are equal to the reactive mind and so we have a fine case of arthritis, particularly since our patient sought "survival" by marrying a girl with a voice just like Mama's sounded when he was in the womb. Ask him to get rid of his arthritis? The reactive mind says "NO!" Arthritis is a baby is a pig grunt is a prayer to God is wife's sympathy is being poor is Mama's voice and all these things are desirable.

He's kept himself poor and he's kept his arthritis and he married a wife who would make a harlot blush and this is pro-survival: wonderful stuff, survival, when the reactive mind computes it! And in the case of the ulcers, here was baby poked full of holes (Mama is having a terrible time trying to abort him so she can pretend a miscarriage, and she uses assorted household instruments thrust into the cervix to do it) and some of the holes are through and through his baby's abdomen and stomach: he will live because he is surrounded by protein and has a food supply and because the sac is like one of these puncture-proof inner tubes that seals up every hole. (Nature has been smart about attempted abortion for a long, long time.)

It so happens that Mama in this case was not a monologist, although most of Mama's activity on this line is a dramatization and has conversation with it; but it also so happens that Grandma lives next door and she comes over unexpectedly, shortly after the latest effort to make baby meet oblivion.

Grandma may have been an attempted abortionist in her day but now she is old and highly moral and besides, this baby is not giving her any morning sickness: she therefore finds much to censure when she sees a bloody orangewood stick in the bathroom. Baby is still

“unconscious.” Grandma berates Mama: “Any daughter of mine who would do such a horrible thing should be punished by the vengeance of God (the principle of, don’t do as I do, do as I say, for who gave Mama this dramatization in the first place?) and driven through the streets. Your baby has a perfect right to live: if you don’t think you can take care of him, I certainly will. Now you go right on through with your pregnancy, Eloisia, and when that baby is born, if you don’t want him, you bring him to me! The idea of trying to hurt that poor thing!” And so, when our bleeding ulcer case gets born, there is Grandma and there is security and safety. Grandma is here the ally (and she can become an ally in a thousand different ways, any of them based on the principle that she talks sympathetically to baby when he is out like a flounder, and fights Mama in his favor when he is “unconscious”), and when he grows to boyhood he can be found placing a large dependency on Grandma, much to the parental wonder (for they never did anything to little Roger, not they). And Roger will, when Grandma is dead, develop bleeding ulcers to get her back.

Whoever is a friend is to be clasped to the bosom with bonds of steel, says this great genius, the reactive mind, even though it kills the organism.

The ally computation is a little more than the mere idiot calculation that anyone who is a friend can be kept a friend only by approximating the conditions wherein the friendship was realized. It is a computation on the basis that one can only be safe in the vicinity of certain people and that one can only be in the vicinity of certain people by being sick or crazy or poor and generally disabled.

Show an auditor a child who was easily frightened by punishment, who was not at ease around home and who had allies who seemed more important to him than the parents (grandparents, aunts, boarders, doctors, nurses, etc.) and who was sickly, and the auditor can usually spring into view an attempted abortion background because, more often than not, it is there. Show an auditor a child who showed enormous attachment for one parent and detestation for the other and the auditor can bring out a background wherein one person wanted to get rid of or hurt the child and the other parent did not.

The ally computation, then, is important. And it is also very secret. Trying to get the real allies in a case is often a great struggle. It may be that a patient had eight or ten of these allies in some cases and tried desperately to hold to them, and when he could not, searched and found mates and friends who were approximations of his allies. A wife, around whom A is continually ill but whom he will not leave under any circumstances, is usually a pseudo-ally, which is to say she approximates some mannerism of the actual ally, has a similar voice or even a similar first name. B, who will not leave a job and yet who is working far below his ability level in life, may be there because his boss is a pseudo-ally; further, he may be working at this job because an ally had a similar station in life and he is being the ally.

Anything which can so far corrupt a person’s life is naturally going to be difficult to some degree in therapy, for when he is asked to get rid of his ally computation, it is as likely that he will give any clue to it as it is that he would have spit in his ally’s face.

These pro-survival engrams containing the ally computation can be described as those which contain personnel who defended the patient’s existence in moments when the patient conceived that his existence was under attack. This need not be an actual, rational defense: it may only be that the content of the engram seems to indictate it; but it can safely be assumed that the worst ally computations are those when the life of the patient was defended against attackers by the ally. Most ally computations have their genesis in the prenatal area.

The ally computation is sought as the first action in any case and new ally computations are sought throughout a case.

These sympathy pro-survival engrams, which make up the ally computations, vary only in intensity from the standard pro-survival engram. A standard pro-survival engram is bad only because someone has expressed friendship for the patient or another person when he was “unconscious”: it is difficult to discover and clear even when it actually has been entirely

misread -- which is to say that the pro-survival content was intended for another person than the patient but is only misconstrued by the patient. If the patient is "unconscious" and somebody says "he is a good guy," actually meaning another person entirely, the egocentric reactive mind takes the phrase to have been meant for oneself.

In the sympathy pro-survival engram (the ally computation is composed only of these) there is an actual defense of the person from danger by some ally: this can vary from a dramatic scene wherein somebody has been bent on killing the patient and the ally has arrived, like the cavalry, in the nick of time, to the incident wherein the patient was simply saved (or assumed he was being saved) from destruction such as drowning, being run over, etc. And the sympathy pro-survival engram is only as good as its content in words, for it does not rationalize the action. Engrams have been discovered where the patient was actually being murdered but the content was such that he was convinced he was being saved: such a case would include what auditors call a "mutual AA" -- a father and mother together attempting an abortion, AA meaning "attempted abortion" -- wherein Mama was in utter agreement and disposed herself for the operation but became frightened and began to scream about "her precious baby" in an effort to save herself from being injured: patients with this sort of sympathy pro-survival engram can get pretty confused about mother.

The insidious aspects of the sympathy pro-survival engrams are several. (1) They are aligned with the fundamental dynamic of survival in the most literal sense and are therefore aligned with the purpose of the individual; (2) they are like cysts round which contra-survival engrams serve as the outer shell; (3) they most sharply affect the health of the individual and are always the basic factor beneath the psycho-somatic illness which the individual displays; (4) they cause the reactive mind (but not the analytical mind) to resist therapy; and (5) they are the largest drain upon the life force units.

In (3) above, the pro-survival sympathy engram does more than just carry forward the injury which becomes the psycho-somatic illness. Any engram is a bundle of data which includes not only all perceptics and speech present but also metering for emotion and state of physical being. The last, the state of physical being, would be serious enough. This metering says that structure was so and such at the moment this sympathy pro-survival engram was received: in the case of an embryo engram, then, the reactive mind, in forcing the engram back into action, may also force the structural pattern back upon the body: this occasionally results in retarded development, embryo-like skin, embryo-type back curvature, and so forth. The glands themselves, being physical organs, are also sometimes so suppressed in the reactive mind's effort to approximate all conditions. The underdeveloped gonads, the sub-level thyroid, the wasted limb, all these things often come from sympathy pro-survival engrams. This is so observably the case that when an individual is being cleared, growth process begins to bring the body up to genetic blueprint even before the case is completed: the change which takes place in the physical being of the patient is sometimes so remarkable and so marked that it is far more startling than the mere disappearance of a catalogue of psycho-somatic ills such as coronary, ulcers, arthritis, allergies, and so on.

It would be supposed that anything powerful enough to twist the physical blueprint and keep the body from developing or make it keep on growing where it should have stopped would resist any therapy. This is true only in a most limited sense. Once one is aware of what suppresses a case, one can go about vanquishing the suppressors because a pro-survival engram, unlike a contra-survival engram, has an Achilles heel.

The most workable answer now known to dianetics lies in the principle of life force units and a technique for throwing them back into circulation. The pro-survival engram collects and holds such units, according to this theory, and collapses when its power to hold units is broken.

Entering a case, then, where one has a chronic psycho-somatic illness (and what case doesn't have, even though it is as slight as an occasional fit of sneezing or hiccoughs), the auditor first scouts it, going through a returning routine to find out how early he can get for

material, how the state of the sonic recall is, how occluded is the youth of the person, and so forth. When he has made this survey, he begins to make his computation on the case: first, was the child happy with both father and mother, and if not, where was the child happiest (there will be where the allies live). Was either parent an unreasonably powerful factor in shaping the thinking powers of the child: here again may be an ally, even if a poor one. Did the patient have grandparents or other relatives; how did he feel toward them? All this data will be more or less occluded and warped by demon circuits and is about as reliable as the data this patient will inevitably try to get from “loopy” parents or relatives, who not only do not know what happened to him but might be most anxious not to have anything discovered.

What really did happen? Don't let patients ask relatives or parents anything if you can help it, for these are restimulators in the extreme and never have any data you can use; the patient is just trying to use them as by-pass circuits to avoid the pain of recalling things himself. When the case is finished he will no longer want to hound these people and if you want a check for research reasons, get one of the relatives and put him through therapy.

The auditor now has some slight idea of who the allies may be. And here comes the Achilles heel of the ally computation:

Any ally computation may have included the loss of the ally. And the loss of the ally may be the trigger which will start chain fission. For what we are going to try to do is blow off or discharge as many life force units as possible from the reactive engram bank and weaken it. Every charge we get from the bank will reinforce the ability of the patient to carry on in existence and will aid his analytical mind to get into the engram bank. Hence, discharging these frozen units is a vital and important part of therapy and the condition of the case will improve in direct ratio to the number of these units so discharged.

Consider these life units as free life energy: an engram capturing them can set itself up, for all intent, as a life force. It is then an entity and only then. The demon circuits, the valence walls (which compartment the analyzer, so to speak, and bring about multi-valence), the force and power of the engram itself are all dependent, according to theory and as observed in practice, upon usurped life units.

To free these units is the primary task of therapy: to relieve pain from the engrams is the secondary task; to make the patient comfortable during therapy does not even rank, though there is no need he should be uncomfortable. The dual character of therapy, then, is actually two sections of the same thing: relieving engrams. There is this dual nature in engrams, however, that they have painful emotion (where that means usurped life force) and physical pain (where that means pain of injury, illness, etc.).

To get as early as possible as fast as possible and find basic-basic is the direction and intent of therapy in its first stages: to accomplish this (when it cannot be done immediately merely by returning and finding basic-basic which can and always should be tried) one relieves the case and robs the engram bank by releasing life units (painful emotion captured them) from the ally computations.

In brief, the entire intent and act of therapy is to find the earliest engram and erase it and then proceed to erase all other engrams as engrams so they can no longer be discovered (they refile in the standard bank but it takes a genius to find them there and a search of hours and hours: hence, to the auditor they can be said to have “erased” for they are no longer engrams and are now experience). The first, last and only job of the auditor is to find the earliest engrams available and erase them. That cannot be said too often or too strongly.

The various ways to accomplish this are the techniques and arts of therapy. Anything which brings about this erasure of engrams in place and their refiling as experience is useful and legitimate whatever it includes. An engineer intends to remove a mountain which is in the way of a river: his intent and all his effort is directed toward moving that mountain; the ways

and means employed by him to move that mountain, by steam shovel, hydraulic rams or dynamite are the art and techniques applied to do the job.

There are three degrees of knowledge in our task: (1) In dianetics we know the goal: we know the results which come about when that goal is attained; (2) We know the character of the obstructions between us and the goal but of the exact character of the obstruction we can never learn too much; (3) The art and technique of removing the obstruction between us and the goal are legitimate only by the test of whether or not they remove the obstruction.

The method of attack on the problem can always be improved by learning more about the character of the factors in the problem, and by learning new arts and techniques which can be applied to the problem, and by studying to improve our skill in practicing existing arts and techniques. The currently existing art and technique is not to be considered optimum merely because it does the job. The time and ease of work could be shortened by new techniques or advancing skills for old techniques.

All this is interjected so that dianetics, unlike Aristotelian logic and natural history, will be recognized as an advancing, changing science. It is interjected at this place because no auditor should just sit back with this routine and never try to improve the routine.

Very well: this is the routine: it works but it can never be made to work too quickly or too well:

- (1) Place the patient in reverie and scout into the prenatal area to see if engrams are available for lifting without further work. If they are there and can be found, take the charge out of them and erase them if possible. Do not try to erase anything as remote from basic-basic as birth unless the file clerk insists on presenting birth. In other words, get the subject into the prenatal area and look for the earliest engrams. Do not ask for specific instances, particularly for something like birth, just take whatever is presented. If you can't get back early, take step two.
- (2) Scout the patient's life, while he is in reverie (do this in any event sooner or later if the case slows down but only if it slows down to a point where early engrams are either not reducing or are without any emotion). Establish in this scout whomever may have been depended upon by the patient and be suspicious always that he has not told you the really important allies, but do not tell him you are suspicious.
- (3) Find out when the patient lost any ally through death or departure. Approach this moment and one way or another, by getting earlier material and this incident or getting just this incident, discharge the sorrow of loss out of the incidents. Treat any incident in which the ally departs or the patient is separated from the ally as an engram and erase it accordingly or run it until it has no "charge" of sorrow on it. If the "charge" holds, suspect an early moment of sorrow about this ally and find that and treat it as an engram.
- (4) First, last and always, the job is to get basic-basic and then ever afterwards the currently existing earliest moment of pain or sorrow, and to erase every incident as it is advanced by the file clerk or found by repeater technique.
- (5) Any incident that hangs fire always has a similar incident earlier, and the patient should be taken earlier for the prior incident when an engram will not "reduce" on recounting.
- (6) At any time the engrams start to become emotionless in tone, even though they reduce, suspect another ally computation and, early or late in the patient's life, get it and reduce it at least until the emotional discharge is gone. Do not get everything in a case restimulated by changing from an unreduced incident to something which looks more fruitful, but reduce everything in view before you go looking for a new sorrow charge.

- (7) It is better to reduce an emotionless early engram than it is to upset the case by hounding him for an ally computation when a cunning search fails to reveal none in sight. Erasing early emotionless engrams will eventually bring a new ally computation into sight if you occasionally look for it.
- (8) Consider that any hold-up on a case, any unwillingness to cooperate, stems from ally computation.
- (9) Treat all demon circuits as things held in place by life force units absorbed into the bank and address the problem of demon circuits by releasing charges of sorrow.
- (10) Consider that loss by death or departure of an ally is identical with a death of some part of the patient and that the reduction of a death or departure of an ally will restore that much life back to the patient. And remember that great sorrow charges are not always death or departure but merely may be a sudden reversal of stand by the ally.

Always keep in mind that that person who most nearly identifies himself with the person of the patient, such as a sympathetic mother or father or grandparent or relative or friend, is considered by the reactive mind to be a part of the person himself and that anything happening to this sympathetic character can be considered to have happened to the patient. In such a case, where an ally has been found to have died of cancer, you may occasionally find the patient to have a sore or scaly place where he supposed the ally's cancer to have been.

The reactive mind thinks in identities only. The sympathetic pro-survival engram identifies the patient with another individual. The death or loss (by departure or denial) of the other individual is therefore a reactive mind conviction that the patient has suffered some portion of death.

Emotional charges may be contained in any engram: the emotion communicates, in the same tone level, from the personnel around the "unconscious" person into his reactive mind. Anger goes into an engram as anger, apathy as apathy, shame as shame. Whatever people have felt emotionally around an "unconscious" person should be found in the engram which resulted from the incident. When the emotional tone of personnel in an engram is obviously angry or apathetic from the word content and yet the patient, recounting, does not feel it, there is something somewhere which has a valence wall between the patient and the emotional tone, and that valence wall is nearly always broken down by the discovery of an engram with a sorrow charge sometime earlier or later in a patient's life.

The only legitimate reason for entering later portions of a person's life before the prenatal area has been well exhausted is search for sorrow discharges occasioned by the death, loss or denial by an ally. And by "denial," we mean that the ally turned into an active enemy (real or imaginary) of the patient. The counterpart of the ally, the pseudo-ally, is a person whom the reactive mind has confused with the real ally. The death, loss or denial by a pseudo-ally can contain a sorrow charge.

According to theory, the only thing which can lock up life units is this emotion of loss. If some method existed of doing nothing but freeing all life units, the physical pain could be neglected.

A release is brought about, one way or another, by freeing as many life units as possible from periods of loss with minimal address to actual engrams.

The loss of an ally or pseudo-ally need contain no other physical pain or "unconsciousness" than the loss itself occasions. This is serious enough. It makes an engram.

Any person who is suddenly discovered to be occluded in a patient's life can, with some reliability, be considered an ally or pseudo-ally. If, either while remembering or returning, large sections of a patient's association with another person are missing, that person

can be called an occluded person. It is a better guarantee of ally status if the occlusion surrounds the death of the person or a departure from or a denial by that person. It is possible for occlusion to take place, also, for punishment reasons; which is to say, the occluded person may also be an arch enemy: in such a case, however, any memory present will concern the death or defeat or illness of the occluded person. Occlusion of a person's funeral in the memory of a patient would theoretically label that person an ally or pseudo-ally. Recollection of the funeral of a person but occlusion of pleasant association might tend to mean that the person was an enemy. Such rules are tentative. But it is certain that any occlusion means that a person had a vast and unrevealed significance in a patient's life which should be explained.

It may be remarked at this point that the recovery of the patient will depend in large measure on the life units freed from his reactive bank. This is a discharge of sorrow and may be quite violent. The usual practice is to "forget" such things and the "sooner forgotten, the sooner healed." Unfortunately this does not work: it would be a happy thing if it did. Anything forgotten is a festering sore when it has despair connected with it. The auditor will find that every time he locates that arch denier, "forget it," he will get the engram it suppressed; when he can't locate the engram and yet has found a somatic, a "forget it" or "don't think about it" or "can't remember it" or "don't remember it" or some other denier will be sitting there in the context of the engram. Forgetting is such unhealthy business that when a thing has been "put out of mind," it has been put straight into the reactive engram bank and in there it can absorb life units.

This "loopy" computation, that forgetting things makes them bearable, is incredible in view of the fact that the hypnotist, for instance, gets results with a positive suggestion when he puts one of these deniers on the end of it. That has been known now for a great many eons: it was one of the first things the author was taught when he studied Asiatic practices; from India it long ago filtered to Greece and Rome and it has come to us via Anton Mesmer: it is a fundamental principle in several mystic arts: its mechanics were known even to the Sioux medicine man. Yet people at large, hitherto unguided about it, and perhaps because they lacked any real remedy, believed that the thing to do with sorrow was to "forget it."

Even Hippocrates remarks that the whole of an operation is not finished until the patient has recounted the incident to all of his friends in turn, and while this is inadequate therapy, it has been, like the Confessional, a part of popular knowledge for lo, these many ages: yet people persist in suppressing sorrow.

The auditor will many times in his activity be begged by a patient "not to talk to me about so-and-so's death." If he is foolish enough to heed this tearful plea when the patient is in reverie, then the auditor is actively blocking a release. That is the first incident he should get!

Perhaps it would be bad, without dianetic technique, to approach such things; but with our art it is easy not only to enter the actual moment of the incident but to then recount it until the tears and wailings are but echoes in the case book. Treating that loss like an engram, recounting it until it is no longer painful emotionally, is to give back to the patient vitality he has not had since the incident took place. And if the incident does not ease on a dozen recountings, slide back down its sorrow track, just as you would with any other engram, and find earlier and earlier moments. A patient starting to discharge sorrow at the age of fifty may find himself, two hours later, down in the basic area recounting the primary moment of sorrow, at the moment when the lost ally first became an ally. If the auditor can get the whole chain on any one ally, exhausting sorrow from it from later to earlier, taking all the sorrow he can get from every incident and stripping the entire series of engrams of their charge, he may, in a few hours work, rid the case of enough emotional charge to then begin an orderly erasure.

Please observe this difference: the Achilles heel of the ally computation can be considered late on the chain of incidents which concern that ally, which is to say that we have a funnel here, upright in time, which can be entered late and followed early: the Achilles heel of the contra-survival engram chain is in the earliest incidents, exactly the reverse of the emotionally painful engrams.

To regain out of the engram bank life units so that enough free emotion is available to release or clear a case, start with late ally or pseudo ally losses and work back earlier.

To release the physical pain of the individual from the engram bank, start early (as close to conception as you can get) and work through to late. Physical pain in the contra-survival chain can suppress painful emotion in the pro-survival chain.

Painful emotion in the pro-survival chain can suppress physical pain in the contra-survival engrams.

If you were to draw a picture of the prenatal area of the reactive engram bank, it would appear somewhat as follows: a long line drawn horizontally, representing time, would have dark blots on it representing engrams; one end of the line would represent conception, the other end birth: above this line would lie a dark area, like a heavy mist, extending from one end of the line to the other and dropping down almost to it: above this dark mist would lie another horizontal line, the apparent time track along which the patient returns. The first long line is the actual time track; the mist is painful emotion; the uppermost dark line is what the patient mistakes and uses for his time track.

The painful emotion is, of course, occasionally tapped in the prenatal area itself, and the opportunity of dispersing it by so discovering prenatal emotional charges should never be overlooked by the auditor: indeed, once much of the later life painful emotion is discharged, a great deal of painful emotion can be found amongst the early engrams. The better part of this mist, and the first part the auditor often contacts, is in late life: although it originates, as charge, in late life, it can be said to lie on this prenatal area.

Moments of loss, the loss by death or departure of any of the patient's allies, and the loss of an ally because he turns against the patient, trap these emotional charges and intervene them between the patient and actuality. Although the moment of loss was post-birth, in infancy, childhood, adolescence, adulthood, it was retroactive in suppressing early engrams.

This aspect of painful emotion is a key-in of the early incidents by the moment of loss. In other words, a moment of great loss suppresses the individual on the tone scale to a point where he approximates the level of early engrams and these, keyed-in, hold the units of charge thereafter.

Life units so seized are held and are the life of engrams. As in electricity, a positive charge glances away from a positive charge: like charges repel each other. The analyzer, operating, it can be said for analogy, on the same kind of charge as that contained in the engram, glances away from the engram, which remains thereby unknown and intact.

As the individual returns into the area of the early engrams -- which are held keyed-in by virtue of the seized charges from late incidents -- he can quite comfortably pass by enormous quantities of aberrative material without even suspecting it is present. However, when the late moments of painful emotion are released, the auditor can go immediately into the early area and find engrams of physical pain which he had not hitherto been able to uncover.

Actually the late moments and the early moments are both engrams: the news or observation of loss shuts down the analyzer and everything which then enters it is engramic and is filed in the reactive mind. Because of sight and a memory of activity which is connected to the present, all of which serves to keep an individual oriented, a person can often recall the moment of loss, whereas he cannot recall prenatal material, for he lacked in that area any connection with orienting factors which would impinge themselves on the analyzer. While the prenatal infant definitely, especially in the late stages, has an analyzer, experience and memory are not coordinated and the existence of engrams is not then suspected by the analytical mind. This is not true of the later periods of life, particularly those after speech has been learned and is being used. The fact of the matter is that this later-life ability to recall surrounding

circumstances without feeling any extremity of pain also serves to hide here the existence of an actual engram: a person feels that he knows all about such a moment of loss analytically: actually he has no contact with the engram itself, which contains a moment of "unconsciousness" of a lesser depth than that, for instance, of the anesthetic variety. Childhood losses of allies, however, can be so entirely occluded that the allies themselves are not remembered.

The auditor will find very late engrams easy to contact. And he will also discover something else. The patient may not be, as he is returning to such a moment of loss, occupying his own body. This "phenomenon" has been known for several thousand years and even the latest mention of it merely said that it was "interesting" without making any further effort to find out why a person, returned to an area in hypnotic regression, sometimes could be found within himself (which is to say, seeing things as though he were himself) and sometimes saw things there and himself included as part of the scenery (as though he had a detached view). Because we have discovered that a natural function of the mind is to return in an awake state to past incidents does not alter the fact that we encounter aspects hitherto known as mysterious "phenomena" of drug dreams and hypnotism. We are not by any means practicing hypnotism; so this means that hypnotism and dianetics use similar abilities of the mind -- it does not mean that such abilities belong in the field of hypnotism. And one of the various aspects of the return is that it occasionally -- or, in some patients, continually -- encounters areas where the patient is "outside" his body. These exteriorized views of self have two explanations. One of them is valence, whereby the patient has taken unto himself the identity of another person and sees the scene through that other person's eyes; the other is exteriorization, in which painful emotion is present in such quantity that the patient cannot occupy himself. That painful emotion may stem from past or future incidents to the moment when the patient is witnessing a scene to which he has been dianetically returned. On several recountings of the scene, the patient will come nearer and nearer to an occupation of his body until at last he sees the scene from within his body. At times no emotional discharge (tears, etc.) takes place until the patient has gone over the incident several times and until he is within his own body. It is as though, returned, he had to scout the ground to find out if it was safe to occupy himself. If, after a few recountings, no discharge such as tears takes place, then the emotion is suspended elsewhere, earlier or later but usually much later. Exteriorization because of emotion is the same as exteriorization because of physical pain to all intents and purposes of the auditor. When he encounters a case which, all the way up and down the track, is continually exterior, he should address his skill to the release of moments of painful emotion.

All patients seem to have the idea that time heals and that some incident of ten or twenty years ago no longer has any effect upon them. Time is a Great Charlatan, not a great healer, as has been remarked. Time by the processes of growth and decay alters, and environment introduces new faces and activities and thus alters the restimulators: a moment of painful emotion in the past has, like any other engram, its own restimulators and is, in addition, holding keyed-in all the early engrams which relate to it so that their restimulators also work: every restimulator has a set of restimulators which are associated to it by the analytical mind, which cannot see the real restimulator. All this makes a complex pattern but complex in therapy only if one does not know the source of aberration. If the auditor returns the patient to any moment of painful emotion in the past and runs it as an engram, he will discover that all its original charge is present and will discharge.

He will usually find the patient shying away from any thought of going into the actual engram: the pre-clear may attempt to detail all manner of bric-a-brac, his own thoughts, the reasons why it no longer is painful to him, and so forth. These thoughts and data before the fact or after it are about as much use in running an engram as a dissertation about "childhood illusions" was to the problem of removing aberrations from the human mind. The auditor who will listen to these "reasons" and "I remembers" in lieu of running the engram itself will not get his patient well and will waste valuable hours of therapy. An auditor who will do this belongs to the hand-patting school of thought which believes sympathy has value. He does not belong in an auditor's chair. It is wasted time, wasted valuable time, to listen to anything the patient thought or said or did or believed when the patient should be going into the engram and

running it as an engram. Certainly there is a necessity to find out, from the patient's talk, where that engram is, but once it is located, all else is dross.

Take a moment when a child is notified of his parents' deaths. The auditor learns that the parents died when the child was two years of age. He can then deduce, without further trouble or questions, that somebody must have told his patient about the death of the parents, that there was a precise moment when the patient, then an infant, learned about that death. Recounting the matter in present time -- without being returned, the patient is using all the intervening years as buffers against the painful emotion. The auditor returns the patient, without further preamble than the usual routine of putting the patient into reverie, to the moment when the patient learned of the death of the parents. The patient may do a little fumbling to orient himself in the past, but shortly he will have a contact with the instant somebody informed him. Be assured, if that child loved his parents at all, that an engram exists here. The engram starts at the first moment the child is informed, when the analyzer can be expected to have shut down. The end of the engram is a moment, an hour, a day or even a week later when the analyzer again turned on.

Between the first moment of analytical attenuation and a regain of analytical power is the engram. The first minutes of it are the most severe. Running an hour of it (an hour of incident, not of therapy) should be more than ample. Most auditors run only the first few minutes several times to get a test of whether or not there is going to be any emotional discharge. Run such a period of loss which must contain painful emotion exactly as you would run a period of physical pain and "unconsciousness" with another source. For the period of painful emotion is an "unconscious" period just as certainly as if the patient had been struck with a club. If the emotion in this period can be contacted with four or five recountings (each time starting at the beginning, making sure the patient is returned and in contact with all perceptics of the incident, and running it for what it is, an engram) then the engram should be recounted until the emotion in it is gone, until the patient is bored with it or even cheerful about it. If, after four or five recountings the patient is still well exteriorized, still has not contacted any emotion, then the charge is suspended elsewhere, either earlier or later, and tries should be made in terms of other losses, no matter how many years from the unyielding incident, to get a discharge.

After a discharge is blown off elsewhere the incident first addressed, as in the case of the two-year-old who lost his parents, may discharge. It is certain that sooner or later such an incident will discharge and it is also certain that the case will not make much progress in getting any bulk of physically painful engrams until such a severe incident is well discharged.

Discharges are contacted, often, in very unlikely places. Somewhere they contact the surface enough so that a touch by the returned patient will permit the units to free, permit engrams to key-out and come into view on the time track in their proper places.

The engram bank becomes severely distorted by painful emotion and the areas of painful emotion become severely distorted by physical pain elsewhere. The filing system of the reactive mind is bad. The file clerk is able to recover and deliver to the auditor only so many painful emotion engrams or physical pain engrams at a time.

They may be disordered in their positions on the track, which is to say, the auditor may contact an early physically painful engram (always his most important job) then contact one in mid-prenatal, then one post-birth, and thereafter no other engrams of the physical pain variety seem to be present (engrams of the physical variety which contain knock-outs by accidents, illnesses, surgery or injury). This does not mean that the case is stalemated or that the patient is cleared. It more likely means that there are incidents of the other engram variety (painful emotion, stemming from loss by death, departure or reversal of allies) which can now be contacted.

The auditor then looks for and exhausts the emotional discharge from the loss engrams, usually later in life.

These, with the units freed back in circulation, allow earlier physical pain engrams to appear and the auditor reduces each one of these he can contact. As soon as he can no longer find physically painful engrams, he goes back to a search for painful emotion engrams and so forth alternately as necessary. The mind, being a self-protecting mechanism, will sooner or later block the patient from physical pain engrams if painful emotion engrams are ready; and it will block him from painful emotion engrams as soon as physical pain engrams are ready.

Start late to get painful emotion and work back early.

Start early to get physical pain engrams and work toward late. And whenever any engram is contacted, run it until it is no longer troublesome in any way to the patient or is entirely gone (refiled, but gone for all the auditor and patient will be able to tell at the moment). If an incident, after many recountings, shows no signs of lightening (somatic decreasing or emotion either not expressed or not decreasing), only then should the auditor seek another incident. In a painful emotion engram the charge is often later, in a physical pain engram the suspension is invariably caused by the existence of the same phrase in an earlier physical pain engram which can be contacted, and in such case the auditor should go back over the phrases which brought him to the somatic until he finds a contact and a lift of the engram.

It should be extremely clear by this time that rationalization about action or conduct or conditions does not advance therapy and is of no use beyond occasional aid in locating engrams. It should be equally clear that no amount of explanation or hand-patting or evaluation by the auditor is going to advance the erasure of the engrams themselves. It should be plain that what a person thought at the time of the incident was not aberrative. It should be clear that painful emotion puts the compartments and demon-circuits into the mind and that the physical engrams hold the aberration and physical pain in the body.

This entire operation is mechanical. It has nothing to do with justified thought or shame or reasons. It has only to do with exhausting the engram bank. When the bulk of painful emotion is gone, the person is released; when the engram bank is exhausted of content, the person is cleared.

The mind is like a fine piece of equipment: as itself and as a mechanism it is almost impossible to destroy except by removing some of its parts: engrams do not remove parts of the mind, they add unnecessary things to it. Envision a beautiful, stream-lined machine, operating perfectly -- that would be the mind without the additions of pain and painful emotion. Now envision this beautiful machine in the hands of a crew of moronic mechanics: they start to work around it and do not know that what they do affects the machine at all. Now they see that something is wrong with the machine and are all unwitting that they have placed various assorted monkey-wrenches, hatpins, old cigar butts and yesterday's garbage into it and around it. Their first thought is to put something new on or in the machine to correct its operation and they add arbitrary gadgets to it in order to patch up the machine's operation. Some of these gadgets appear to help the machine (sympathy engrams) and can be used, in the presence of the remaining bric-a-brac, by the machine itself to help its stability. The morons interrupt the fuel supply (painful emotional engrams) or, like the Japanese captain who beat the car with a switch when it would not go, try to goad the machine (punishment drive) and so add more trouble. At last this machine appears to be a hopeless wreck, being almost hidden beneath everything added to it and thrust into it, and the moron mechanics shake their heads and say, "Let's put something else on it or it will stop!" They do and the machine appears to stop (goes insane).

In dianetics, a workmanlike job of clearing away the debris in and around the machine is performed. It is not done by adding any more debris. The moron mechanics (the content of the reactive mind) seem dismayed at this action, but the machine itself, suddenly aware that something is being done for it which will actually bring it into good running operation again, begins to help. The more debris which is cleared, the better it runs and the less force the moron mechanics have. The course of improvement should be and is rapid. We can stop when the machine is running at least as well as the "normal" machine (a release) or we can stop when we have all the debris out of the machine (a clear). When we have effected a clear, we behold

something which has never been beheld before because it never before existed in a debris-free state: a perfect machine, stream-lined, powerful, shining, able to adjust and care for all its own operations without further therapeutic assistance of any kind.

CHAPTER VIII

Some Types of Engrams

Two examples of each kind of engram are given, so that the auditor can clearly understand their differences:

CONTRA-SURVIVAL ENGRAM

This is any kind of engram which lies across the dynamics and has no alignment with purpose: Fight between mother and father shortly after conception. Father strikes mother in stomach. She screams (first percepts are pain, pressure, sound of blow and scream) and he says, "God damn you, I hate you! You are no good. I'm going to kill you!" Mother says, "Please don't hit me again. Please don't. I'm hurt. I'm hurt. I'm frantic with pain!" Father says, "Lie there and rot, damn you! Good-bye!"

In this engram we have a severe aberrative situation, first, because it is early; second, because its content says the person who has it is hurt and frantic; third, because it has a holder and is therefore apt to become chronic ("Lie there"); fourth, because it can produce disease ("and rot"); fifth, because it has religious connotation about God and being damned; sixth, because it gives the individual a feeling other people are no good ("you" applies to other people, ordinarily); seventh, because it has an emotional tone, by content, of hostility ("I hate you") and eighth, because the individual, post-birth, has to live with these restimulative persons, his father and mother. It has other additional effects, giving, like all engrams, two additional and unnecessary valences to the individual, one of which, the mother's, is a coward valence and the other, the father's, a bully valence. The individual may dramatize this in several ways: if he does not dramatize it, he feels the pain (as he would then be in his own valence) whenever it is restimulated; if he dramatizes the mother, he will feel the pain she received, which is a blow in the stomach (whereas his own was on his head and heart); if he dramatizes the father, he will be in trouble with society, to say nothing of his own wife and children. There is no winning with any engram of any kind but so long as a person has engrams, some kinds, the sympathy engram particularly, serve to hold away antagonistic engrams.

The second contra-survival example is a morning sickness engram where the mother is vomiting so violently that the compression on the child is severe and renders it "unconscious." The mother is vomiting and gasping and saying to herself between spasms, "Oh, why was I ever born! I knew I shouldn't have let him come in me. I knew it, I knew it. It was wrong but he had to do it anyway. Ugh, how nasty. Sex is nasty. It's horrible. I hate sex. I hate men. I hate them. Oh, ugh, it won't come up, it won't come up. I am so sick at my stomach and it won't come up."

In this engram we have something a woman might dramatize if she were pregnant but which a man could never dramatize as pregnancy but only by being sick at his stomach. Much morning sickness seems to be an aberration stemming from engrams: somewhere back in time some mother may have vomited from food poisoning and started the whole thing -- perhaps in the days when Man was still in trees. Now note that the mother is throwing up, that the content of her stomach is being regurgitated: the engram, however, says that it won't come up: when this is dramatized with the individual in his own valence, he experiences pressure on him and "unconsciousness" and thus such a dramatization is impossible; when this is dramatized it must be dramatized as the mother but the action is not dramatized so much as the command and we get a condition where the individual with such an engram, when he is sick, cannot vomit. The command of the engram is more important than the action people take in it. On a reactive level there is no rationality. If this were on a conscious level, where it would not be aberrative, of course, the action could be mimicked and then would contain actual vomiting, the action on the conscious level being more important than the word content.

In therapy, when we encounter this engram, we may have difficulty entering it because it says that “I shouldn’t have let him come in me,” which is a denier. We also find, with the “It won’t come up,” a holder. The engram will most certainly lift the moment these words and the somatic lift, and these words could not interrupt the engram. If the engram does not lift, it is because there is a previous engram with much the same content (the aberree has a pattern of dramatization which he repeats over and over and over, giving people around him many incidents which are more or less alike except in their point in time). This could be restimulated in the environment (but not in therapy) to a point where it would cause madness, for “it” may also refer to the child, who identifying himself with the word “it,” then cannot rise to present time. In therapy the engram is somewhat drained of power just by being touched with the returned analytical mind; further, the auditor discovers the patient is not moving on the track and a scout of the situation soon discovers the holder, for the patient will sooner or later say he “can’t come up” even if the auditor has not guessed it.

In the aberrative sphere, this engram would probably put a heavy block across the second dynamic and we would find the person in whose reactive mind it was being frigid, prudish and sharp with children (all of which go together in various combinations). Further, we would find an apprehension that “he” was going to have to do something when he found out it was wrong.

In the psycho-somatic sphere it might cause headaches during or because of coitus or a tendency to nausea whenever coitus was performed. Any of the phrases of this engram, like any other phrases in any other engram, would tend to give him both the somatic and the aberration, providing, of course, the individual was in a state of low analytical power as found in weariness or slight illness. Thus, this one is waiting until somebody says during a future “unconsciousness” period, preferably in a voice like the mother’s would sound through the walls of the abdomen and womb, “Ugh, how nasty!” or some other phrase to key it in. “Nastier,” by the way, would not key it in: “ugly” despite a similar syllable to “Ugh” would not key it in. The sound of vomiting itself probably would key it in.

PRO-SURVIVAL ENGRAM

This could be any engram which, by content only, not by any real aid to the individual containing it, pretended to assist survival. Let us take a coitus engram: mother and father are engaged in intercourse which, by pressure, is painful to the unborn child and which renders him “unconscious” (common occurrence, like morning sickness, usually present in any engram bank). Mother is saying, “Oh, I can’t live without it. It’s wonderful. It’s wonderful. Oh, how nice. Oh, do it again!” and father is saying, “Come! Come! Oh, you’re so good. You’re so wonderful! Ahhh!” Mother’s orgasm puts the finishing touch on the “unconsciousness” in the child. Mother says, “It’s beautiful.” Father, finished now, says, “Get up,” meaning she should take a douche (they do not know she is pregnant) and then begins to snore.

Obviously this is a valuable incident because one “cannot live without it.” Furthermore, “it’s beautiful,” also, “it’s wonderful.” But it is also extremely painful.

It cannot be followed because it has first something which beckons part of the mind back, “Come!” and then, later, tells it to “Get up.” Things that are “beautiful” and “wonderful” can cause our patient, not in therapy, to have an orgasm when she looks at beautiful and wonderful things, providing they have been so labeled.

Dramatization of this can be in either the father valence or the mother valence: to dramatize it in the personal valence would mean physical pain. Thus, the individual holding this, will be found, varied only by his other coitus engrams, to be, as father, disgusted after the act and telling his partner to “Get up.” The emotion is contained in how the words, “Get up,” were spoken: this is a telegraphed emotion out of voice tones, not word content: engrams always contain both.

In therapy, we find the reactive mind very chary of letting this one come to view because, after all, one "cannot live without it." There are whole classes of these favorable evaluation phrases in engrams and wherever he comes upon one the auditor will find the pre-clear's reactive mind holding out on him. "I don't want to lose you," "Hold on to this," "I can't let go of this, I'd fall," and so forth. But this is, after all, just another engram and "pleasant" or not is aberrative.

Masochistic and sadistic impulses often stem from coital engrams which contain those specific things, so the auditor is not to infer that merely because this coitus is painful to the child, it will make the child a masochist or a sadist. If masochism or sadism is present in the patient it is caused by engrams which contain rapes, beating for sexual gratification, enjoyment of pain, etc., and engrams which homonymically seem to state that sex and pain are alike such as a "normal" coitus which says, "It hurts so good! Hurt me again, Bill. Hurt me again! Oh, shove it in me, way up! Make it hurt so I can come." Dramatized by a boy, this might very well bring about sodomy because the engram is not an observed action but a series of commands, literally taken.

Thus our pro-survival coitus engram, as the first example of one here, is relatively innocent in a person's aberrative pattern. But by an accident of words, it could be very different in its aberrative effect.

The second pro-survival example concerns another prenatal engram. (One auditor commented, while he was being cleared, that he "had thought of my life B.D. -- before dianetics -- as a graph of years, in which the time from conception to birth occupied one-fiftieth of the linear distance between conception and present time, but now think of the prenatal period as occupying two-thirds of the distance between the beginning and now." The prenatal area, cleared, at last went back to being one-fiftieth.)

The mother, subject to high blood pressure, continually brought about a condition of great pain in the unborn infant, particularly when she was agitated. (This is a prime source of migraine headache.) Whatever it was which agitated her into high blood pressure at the moment this engram was received was unknown -- and much of the "plot" of prenatal life may remain unknown for the explanatory data may come before the pain and the engram and a complete recording only happens after the instant of pain when some degree of "unconsciousness" comes about. The mother, at the beginning of the engram, when pressure began to build up and stiffen out the unborn child, was weeping. She was by herself. "Oh, how am I ever going to get out of it. Everything looks so drab and colorless to me. Oh, why did I ever start it; I can't possibly go through with it. But I have to, I have to. I would be sick if I didn't. Oh, Lord, everything comes in on me at once. I am utterly trapped. But there, I will go through with it, I'll feel better. I'll be brave and do it. I've got to be brave. I am brave. I am the bravest person in the world. I have to be and I am." The pressure receded.

Exactly what this was about will remain a mystery to the auditor who reduced it, the patient who had it, the auditor and the reader: such is often the case with an engram. They are conceived in misunderstanding and they aren't to be understood, save mechanically, and only deleted from the engram bank.

This is a particularly dangerous engram to have for it contains a manic in the words, "bravest person in the world." "I," of course, is ordinarily used by the unborn child to be himself, when the engram is at last able to affect an analyzer in which there is speech. Before that moment, of course, there is just a recording without word meaning, although even before the words are given meaning, the engram can be aberrative. This is further dangerous because it says, "I'm trapped," and because it says, "Everything comes in on me at once." "Trapped" is our enemy, the holder. But "everything comes in on me at once" is a grouper. Further, the remainder of the content, as an engram, will not compute in the analyzer. It says one "must go through with it," but that one "cannot go through with it," that one "would get sick if I didn't go through with it" but that "it is impossible." Everything being equal to everything, as our

moronic enemy, the reactive mind computes, this engram both repels and attracts therapy: it brings about a condition of indecision in the analytical mind which is insufferable.

The individual holding this engram might find himself -- as it acted as aberration -- first in the manic portion of being the bravest person in the world and then, regressed a trifle by a slight change of restimulators such as his migraine headache getting bad, find himself utterly undecided about any course of action and with the telegraphed emotion, contained in the tears, of being very depressed. But this is pro-survival because it apparently dictates a way out of a situation. As an additional factor, it brings, with its phrase about "everything being drab and colorless" color blindness at least in recall so that the recalled images of the past are "seen" in the mind as having no color. It can bring about, if added to by enough subsequent dramatizations, actual perceptic color blindness. The whole engram is very likely, when combined with other factors, to place the individual in an institution with all of his somatic turned on (migraine) and, because of the grouper, all other pain he felt in his life turned on as well. This grouper bunches the track of the engram bank all into one place and then puts the individual squarely in that place.

In therapy, when this was contacted, a case which had been classified as "insane" came into a release state of "normal." The patient had been institutionalized, was in the foetal position and had regressed physically. That she kept screaming these exact words and weeping had been placed on her record as the manifestation of a childhood delusion. The case was opened by repeater technique, using the words she kept screaming, after she had had her attention fixed upon the auditor by loud, monotonous noise. There were some former incidents containing these words which had to be reached before the incident in dramatization would ease. However, engrams like this are commonly contacted in more or less "normal" people and are relieved as routine. A very high degree of restimulation had been experienced by this patient and several severe "loss" engrams had occurred which had kept earlier content keyed-in.

It might also be remarked in re all these "trapped," "caught," "can't get out of it" cases (which is to say where there are several holders and also a high quantity of painful emotion) that certain foetal aspects are visible even when the case is "normal." A shiny skin, a spinal curvature, only partial development of the gonads, all are common and one or many such signs may be present.

SYMPATHY ENGRAM

The first example is an illness suffered by a patient when he was a small boy. At two years and a half he was taken ill with pneumonia. He had a considerable background of attempted abortion and the usual engram cargo received from aberrated parents. He was extremely worried about the quarrels and upsets of his own home; numbers of his engrams had been keyed-in and amongst them was his pneumonia. His grandmother came and took him to her home because, whenever he was ill, his mother would go away and leave him. The incident was extremely occluded and was only reached after several late life painful emotion engrams had been discharged and after almost a hundred prenatal physical pain engrams had been released. The grandmother, when he was crying in delirium, mistook his activity as demonstrating that he was "conscious," which he was not, and she sought to reason with him. She said, "Those people don't really mean to be so bad to you, honey. I know they have good hearts really. You just do what they say and believe what they tell you and you'll be all right. Now promise you'll do that, won't you, honey." The child, in the last depths of reaction, responded and promised her he would believe them and do what they said. "I love you very much," the grandmother continued, "and I will take care of you. Now don't worry, honey. Forget it now. Just get a little rest."

The phrases contained in this engram, because they were on a trance level and because they could be held in place by his fever and pain, produced a very profound effect on the child. He had to believe whatever was said. This means literal belief and cost him, for one thing, much of his sense of humor. Because he wanted to be all right, he had to believe what his

parents said; the things they had said, prenatally, contained every kind of a bad datum possible about who was the boss and how much fun it was to beat the mother and so forth. All this, then, was made into "true data" which, because his sympathy engram said so, he had to believe. No more horrible curse could ever be laid on anyone than those in sympathy engrams which say "Believe what is said," "Believe what is read," "Believe people," because that engram means literally that the poor old analyzer will now never be able to evaluate its own data unless, by utter rebellion, the individual negates against the whole world, which can occasionally be done. Let this individual, however, as this one did, marry a woman who has characteristics similar to his grandmother's (a pseudo-grandmother) and he becomes prey to: (a) the pain and illness, chronic, which he experienced in his grandmother sympathy engrams (necessary to get and keep her sympathy); and (b) all his prenatals, since the pseudo-grandmother throws him into his own valence: This makes him quarrel, which makes his wife fight back, and suddenly this woman is not pseudo-grandmother but pseudo-mother. Exit sanity.

In therapy, when we encounter this sympathy engram at last, it is discovered to have been buried in two ways: (a) it was aligned with purpose; and (b) it had a forgetter mechanism on it.

Because of (a) the self-protection of the mind permitted it to give up the engram only when enough tension was taken off the case to permit the mind to get along without this engram.

In (b) we have a device which is common in engrams. Whenever we try to run an engram which has somatics enough even to make the pre-clear roll around on the couch but which contains no word content, we suspect a forgetter mechanism. There are evidently people in this world who think that the panacea for all mental discomfort is to forget: "Put it out of my mind," "If I remembered it I would go mad," "Junior, you never remember a thing I tell you," "Nobody can remember anything," "Can't remember," and just plain "I don't know," as well as the master of the family of phrases, "Forget it!" all bar information from the analyzer. A whole case, freshly opened, may keep answering everything with one of these deniers (there are many other kinds of deniers, if you recall). Repeater technique will eventually begin to release the phrase from various engrams and begin to show up incidents. To have a grandmother who says, "Forget it" continually every time a child gets hurt is to be cursed beyond Macbeth. A forgetter, used by an ally, all by itself and with practically no pain or emotion present will submerge data which, in recall, would not be aberrative but which, so buried -- by a forgetter -- makes things said just before it aberrative and literal.

Hence this engram remained utterly out of sight until the case was almost finished and as soon as it was contacted, the already de-intensified reactive bank collapsed and the patient was cleared.

The second example of the sympathy engram concerns a childhood experience of a patient who, at the beginning of therapy, was a remarkably confused individual. Here is an example of sympathy engram which is not uncommon. (It will not be primary in any ally computation but because it is often repeated in the same case, becomes aberrative.) This incident occurred when the child had been badly hurt in an accident. He had received a fractured skull and concussion and was for many days in a coma. He had never learned that such an incident happened to him although examination afterwards disclosed evidence of the fracture and disclosed also that while he had known there was a ridge in his skull he had never wondered about it for an instant. His father and mother were, at the time, on the verge of divorce and, in the presence of the only partly conscious child, quarreled several times in these few days, evidently upset by his accident and recriminative as to whose fault it was. The first part of the series of engrams within this one large engram are unimportant as an example save that they brought about a condition where the mother put herself forward as a defender of the child who was not under attack by the father. The mother's conversation aberratively indicted that the father was attacking the child, and the words in an engram rather than the action are important as aberrative factors. Finally the father left the house and home. The mother sat down

by the boy's trundle bed and, weeping, told him she would keep him from dying, that she would "work and slave and wear her fingers to the bone" to keep him alive and "I am the only reason you are alive. I have defended you against that beast and monster. If it were not for me, you would have died long ago and I am going to care for you and protect you. So don't pay any attention to anything people tell you. I am a good mother. I have always been a good mother. Don't listen to them. Please, baby, stay here and get well, please!"

This remarkable piece of nonsense came, of course, straight out of her reactive mind. She did not feel guilty about the way she was taking care of the baby, though she had done her cyclic worst for this child since conception. (There is no such thing as guilt nor a guilt complex that is not straight out of an engram that says, "I am guilty" or some such similar phrase.)

Here is ambivalence at work. By ambivalent is meant power on two sides. It had better be called multivalence, for it is demonstrable that people have many valences, twenty or thirty not being unusual for a "normal." This mother, with her wild pleas and her mawkish sentimentality, shifted around in valences like a whirling dervish. She was capable of being viciously cruel, torturing her child with, as the Navy calls them, "capricious and unusual punishments": yet one of these valences which, unfortunately for the patient, only turned on when he was ill, was one of savage protection for the child and assurances to him that she loved him and would never leave him to starve, etc. She formed, in this child, because of her own reactive pattern and her inabilities, close to a thousand engrams before he was ten. This particular specimen given was fairly standard.

The aberrative aspect of this engram was a "conviction" that if one's mother were not around and if one were not on good terms with her, one would starve, die or suffer generally. Also it meant, because of the time it was given, having a bad headache if one wanted to live. The whole series of these engrams made a highly complex pattern of psycho-somatic ills including sinusitis, a chronic rash, allergies and numerous other actual physical ills, despite the fact that the patient had always tried to be as forthright in his physical being as possible and was not in any way a hypochondriac.

In therapy the entire chain of fights in this area, much of the prenatal area and most late life painful emotion engrams were relieved before this sympathy engram displayed itself.

As a note on the subject of sympathy engrams, these are in nowise exclusively found in childhood: they exist prenatally and postnatally -- and sometimes late in life. Any persons who defend the child against further abortion attempts become part of the sympathy engram chains and, of course, they are allies whose loss is something to be dreaded. Late sympathy engrams have been discovered at fifty years of age. One, discovered at thirty, consisted of a nymphomaniac nurse who, during the period when the patient was still under ether and still in pain, talked to him obscenely, played with his genitals and still managed, by the content of her remarks, to plant a sympathy engram which produced a very serious psychic condition in the patient. (It is in nowise true that many cases of sexual play exist while the patient is under anesthetic or drugged but because this is a standard psychotic reaction of delusion is no reason to rule that the incident cannot occasionally happen.)

The sympathy engram only has to sound like a sympathy engram to become one: there is no evaluation of actual intent by the reactive mind.

PAINFUL EMOTION ENGRAM

Three of these are given to illustrate a type of each. They can happen at any period, including prenatally, but are most easily tapped in more recent life, when they will then lead back to early incidents of physical pain, sympathy engrams and the like. The first example is a case of loss by death of an ally. A girl, at the age of eighteen, was given a painful emotion engram by being told by her parents that her aunt was dead. The aunt was a prime ally. The patient, treated at the age of thirty-one, recalled the death of her aunt but attributed her sorrow

to other things such as a restimulation of what she called her own “death instinct” (which was, in reality, engramic chatter by mother about wanting to die and get it all over with). Actually the aunt had been a large factor in dissuading the mother from “getting rid of” the child and had made the mother promise that she would not. The aunt had also tended the child, postnatally, through illnesses and was, in fact, the only refuge for the girl when a termagant mother and a religiously bigoted father would converge on her, for neither had wanted her and there had been a number of efforts to terminate the pregnancy pre-term.

Her father communicated the information to the girl with a sonorous voice and appropriately long face. “I want you to be very respectful at the funeral, Agatha.” (“What funeral?”) “Your aunt just passed to the great beyond.” (“She’s dead?”) “Yes, death must come to us all and we must all be prepared some day to meet the fate which waits for us at the end of the road. For it is a long path, life, and God and flaming hell wait at its other end and someday we all must die. Be sure you are very respectful at the funeral.” She had begun to pale at the word “funeral,” she was to all purposes “unconscious” when she heard the first mention of “death” and she remained “unconscious,” if moving about, for two whole days. The case had been very slow until this engram was discovered and run. An enormous discharge of grief took place, which had never before manifested itself. It was reduced to boredom in eight recountings, at which the first moment of the aunt’s intervention in the abortion attempts was automatically contacted and released.

Thereafter the case made progress in the prenatal area, prohibition against “getting rid of it” having been removed and (according to theory, free units being available), the charge had come off the prenatal area. There were five other allies in this case, the girl, with parents who had been so wicked to her, having attached herself to anyone who would show her interest and refuge. As lower physical pain came into view, more allies showed up and more painful emotion engrams were discharged, permitting new physically painful engrams to display themselves.

The next example is an engram from a patient who had all his life been reared and cared for by “moneyed parents.” He had a very severe prenatal area which yet would not lift to view. It was discovered at length that his nurses had been his only source of love and affection and that his mother, being a woman who liked to unsettle the household as often as possible, would discharge a nurse every time she found the child had grown fond of her, even though the mother herself made it plain that she considered the child “nasty.” The engram: the boy sees his nurse coming out of the house with her suitcase in her hand: he stops playing in the yard and runs to her to “scare her”: she is quite angry from the scene she has just had -- an Irish girl -- and yet she smooths her face and kneels down beside him. “I am leaving, Buddy. I can’t stay here any more. No, I can’t be your nurse now. But there, there, you’ll have another one. Don’t cry. It’s not good for little boys to cry. Good-bye, Buddy. I love you.” And she goes off out of sight.

He was stunned from the first instant she said she was leaving. The prohibition against crying was from an ally: whatever an ally says must be good and must be believed because allies are survival and one must survive: allies therefore must be believed. He had not cried except on rare occasions of enormous sorrow in all the years thereafter. Eight of these departures were touched without result but with this one, they all loosened and discharged, one after the other.

Any departure of or from an ally contains an emotional charge which, if it will not display itself, is elsewhere suppressed.

The third example of the painful emotion engram is the third type, loss of an ally by reversal. A wife loved her husband very dearly. They had gotten along well together until his parents came into the vicinity and began to malign his wife. He was furious with them for it and quarreled with them. His wife was a pseudo-ally and unfortunately that ally had told the child to believe his parents. (This is fairly chronic with allies -- if they would give the child correct data when he is emotionally disturbed or ill, there would be less trouble. A remark such

as, “Well, you’ll grow up some day and be able to care for yourself,” is much better than a hat full of Emersonian platitudes.) This brought about a tragic reversal. The reactive mind, restimulated at the sight of his wife (the husband was emotionally disturbed, very restimulated already by his parents) threw in the data that one must believe one’s parents. This made his wife no good, as per their aberrative chatter. He went into his father’s valence to escape this imponderable situation and that valence beat women. He struck his wife repeatedly, dramatizing one of his father’s engrams: “I hate you. You are no good. I should have listened to them sooner. You’re no good.”

The wife was in therapy. This charge suppressed itself, not out of shame for her husband’s actions but for the mechanical reason that the early area had to be relieved before this one would discharge (smart file clerk). Her case had slowed down to a point where the board looked entirely clear although somatics (which she attributed to natural causes) and aberrations (which she said were reasonable reactions) still manifested themselves. Suddenly this incident appeared when repeater technique was used on the auditor’s random guess: “I hate you,” for it was known that she said this now and then to her husband. Three recountings discharged this painful emotion despite its violence (it made her weep until she almost choked). Immediately twelve prenatals, all fights between her mother and father (an ally, of which her husband was the pseudo-ally) wherein the mother beat her abdomen and cursed the child, appeared and were erased and the case progressed to clear.

Loss of dogs, dolls, money, position, even the threat of a loss, anything may bring about a painful emotion engram so long as it is loss. It may be loss by death, loss by departure, loss by reversal. Anything connected with the life of the patient and associated by him with his own survival seems to be capable of locking up life units when lost. A condition of such painful emotion is that it has early physically painful engrams upon which to append. The physically painful engram is still the villain but it has an accomplice in the painful emotion engram.

CHAPTER IX

PART ONE

Mechanisms and Aspects of Therapy

THE CASE ENTRANCE

Every case presents a new problem of entrance. No two human beings are exactly alike and no two cases will follow the exact pattern. However, this presents no problem to dianetics since the mechanics are always the same.

There are three case classifications: the sonic-recall, the non-sonic recall and the imaginary recall (what auditors call a “dub-in” recall).

In the sonic recall case, the entrance is very easy. But in all cases the basic procedure is the same. Put the patient in reverie (and don't worry too much if he doesn't go into a very deep reverie because reverie only serves to fix his attention on himself and the auditor and you can at least accomplish that). Install a canceller. Return him to childhood to pick up a pleasant incident and then find a minor pain incident such as a slap in the face. Run him through this a few times just to let him get the idea. If he doesn't respond well, put him into yesterday and let him ride to work and ask him about sounds and sights, then send him to childhood again.

The object of finding a minor incident such as a slapped face is to find out if the patient has a pain shutoff. A pain shut-off is not particularly difficult in dianetics. You can get back before the command which installed the anesthesia, but it is interesting to know about it because you want to look for it early in the case. See then if the patient has an emotional shut-off. This again is not particularly embarrassing but again is data you want to find eventually.

Test now to find out if the patient is within himself or if he is outside himself, watching himself. If he is exteriorized, you are working a case which has considerable walled up emotion in it which must be discharged.

Now make a try to basic-basic. You might surprise yourself and get it. And you might work fifty hours for it, releasing the case the while. Get whatever the file clerk will give you in the prenatal area and what you get, reduce.

Whether basic-basic is contacted or not, locate as many prenatals as will present themselves without much coaxing and reduce each one.

If you find no prenatals, bring the patient up to present time but remind him to keep his eyes closed. Now ask him a few questions about his family, his grandparents, his wife or, if the pre-clear is a woman, her husband. Ask about any former husbands or wives. Ask about children. And ask particularly about death. You are looking for a painful emotion engram, an instant of loss which will discharge.

Finding out about one, even if it is just the death of a favorite dog, return the pre-clear to it and run it from the first moment he hears the news of it and for the ensuing few minutes of it. Then start it again. Reduce the moment as an engram. You want an emotional discharge. Run it several times. If you don't get a discharge, find some other moment of loss, some failure, something, anything which will discharge: but do it all quietly as if with sympathy. Lacking any success, start in repeater technique, never for a moment giving any intelligence that you are anything but calmly concerned for his welfare (even if some of his gyrations worry you). Try such phrases as “Poor little -- “ using his or her childhood name.

When the pre-clear has repeated this several times (the auditor at the same time stating that somatic strip will return to any incident containing the phrase to assist the “suck down”), he may find himself in a high tension incident which will discharge. If nothing discharges yet,

keep calm (all this work will pay dividends in the next session or the next or next), keep searching, keep observing. There is emotional charge here somewhere which will discharge. Try other combinations of words such as those which would be said to a sick and worried child, make the pre-clear repeat them.

If you have had no success as yet, make another test, without saying it is a test, to see if the pre-clear is actually leaving present time. Don't let him "try to remember" -- you want him to return and that is another process, although it is just as natural to the brain. If he is stuck in present time, start him on repeater technique again, suggesting bouncers: "Get out and never come back!" "You can't ever return!" etc., which would account for his being still in present time. If he is not returning after some of this, start in with holder phrases: "I'm stuck!" "Don't move!" and so forth.

Stay calm, never appear anxious. If you get neither a discharge nor an engram with repeater technique in this first session and if you get no motion on the track, read this manual again and try your patient not later than three days after this first session. At that time some of the data you have asked for may be available.

Ordinarily, however, you will receive either a prenatal or a discharge and if you get a discharge, then ask the somatic strip to go back for the prenatal it was sitting on. Reduce everything you can find. If birth turns up and seems to be in full recall, try to reduce that but do so in the knowledge that it probably will not lift very far and in the knowledge that you had better run it over and over and over to de-intensity it all you can.

Sometimes the pre-clear will go into a deeper reverie than you wish. But do not try to wake him into a higher level. Work him where he is. But if he seems to be in something approaching hypnotic trance, be very careful of your language. Never tell him, for instance, to go back there and stay there until he finds something. That's a holder. Don't use holders and bouncers and groupers et al. on anyone in dianetics. "Will you please return to the prenatal area?" "Let's see if the somatic strip can locate an early moment of pain or discomfort." "Please pick up the somatic at the beginning and roll the engram." "What do you hear, please?" "Continue" (when you want him to keep on going from the point of the engram where he is to the later end of the engram). "Recount that again, please."

There's nothing to be nervous about. If you get nervous, then he'll get nervous.

Sometimes you run into a pain shut-off. This has a tendency to put the pain into the muscles and the muscles will jump and quiver and the patient may sense this and still feel nothing more. Once in a great while a patient will have such a thorough pain shut-off that he bounces about, all unconscious of the action, and almost falls from couch to floor. If you run into this, do not be alarmed: the pain is locked in somehow. Get early enough and you'll locate a somatic he can feel, or go late and find an emotional charge.

Don't be misled if he tells you, with regard to emotion, that he has worked it all out in psycho-analysis or some such thing. He may have walled in the death of his wife or sweetheart or child, but the whole engram is still there, crammed with captured units, ready to be run exactly as an engram.

If you run into a heavy emotional charge, simply let the patient weep, keep him at the business of running the engram in a soft, sympathetic voice, have it recounted until there is no charge left in any of it and then run him early into the prenatal area or early childhood to get a physical pain engram that must have been below that emotional charge and held it in place.

The extravagance of emotional discharge is nothing to be alarmed about. Bringing the patient out of it and to present time suddenly would cause him unhappiness about it. Running the painful emotion engram will discharge, in a few recountings, sorrow which society has believed could never be countered or relieved except by repression. Get the moment he first heard the news or observed the thing which made him feel so bad. Run it far enough from its

beginning to make sure that you have the initial shock -- a few minutes of engram time will do -- and then get him to recount it again. He may observe himself to be far outside himself when you start. The moment may not discharge until you have run it several times. Remember, he is returned to the incident, he is not running it as a memory, a thing which would do no good whatever.

Do not let him replay anything, ever. Replay is a bad habit some pre-clears have of playing over what they remember they said the last time instead of progressing through the engram freshly on each recounting and contacting what is contained in the engram itself. Tell the pre-clear there may be some more in it, ask him what color the bed in the room he is returned to is, keep his attention, by any quiet mechanism, upon the scene. And do not let him replay ever, not on any engram at any time: he could replay forever without therapeutic value, each time saying what he remembered he said the last time. There is a difference between this and the repeated re-experiencing of the engram to gather additional data and to get rid of the charge.

Discharge emotion, reduce incidents of physical pain as early prenatally as possible. If you can't get into the prenatal area at first, it has many bouncers in it and repeater technique will take you there.

If the patient keeps saying such a thing as "I can't remember," be patient -- always follow the code. Have him start running that phrase as repeater technique. If he gets a somatic but contacts nothing else, send him earlier. If he gets another and still can't contact on "I can't remember," send him earlier, his whole engram bank must be strewn with them -- poor fellow. Somebody really didn't want him to know what had happened to him. Eventually you will get back to an engram which will release a phrase. When he has gone over the phrase a few more times, he will smile or chuckle or perhaps merely feel relieved. Now you can either run the engram in which you found the earliest phrase, which is best, or you can come back toward present time, lifting the phrase as it later appeared. Or you can start on something else which may block the case.

The goal and the whole goal is to place the standard bank in entire conscious reach of the individual by deleting (a) early and subsequently all physical pain engrams; (b) all demon circuits (which are merely contained in engrams and come up more or less automatically); and (c) all painful emotion engrams.

The process of work is to get as early as you can, preferably prenatal and very early in that, and try to find and reduce an engram, complete with all somatics (pain) and perceptics (words and other sensations). If you fail in this, you go late, any time from birth forward to present time, and find a moment of loss or threatened loss from which you can get an emotional charge. Then you go back early, early, early and find the engram on which it rested. You try always, until you are certain you have it, to get basic-basic, the earliest engram. You reduce as many early engrams as you can find, using the file clerk and repeater system, and when you seem to run out of material, you go later into life and try to find another emotional charge.

The physically painful engrams cover up later emotional charges. Emotional charges cover up physically painful engrams. Back and forth, back and forth. Run as much as you can get early: when it seems to be running out or getting too unemotional, get some later material.

This is the way you work a case. No matter what kind of a case it is, no matter what the state of its recall, no matter if the case is normal, psychotic or neurotic or what, this is the way.

These are the tools:

- (1) Reverie or fixed attention if you cannot get reverie.
- (2) Return.
- (3) Repeater technique.

- (4) A knowledge of bouncers, holders, groupers, misdirectors, denyers.
- (5) A knowledge of the painful emotion engram.
- (6) The reduction or the erasure.
- (7) The flash answer.
- (8) The valence shift.

This is all you need to do:

- (1) Keep the patient mobile, able to move on the track.
- (2) Reduce or erase everything you get your hands on.
- (3) Deduce from the remarks of the patient, in or out of therapy, what must be his bouncers, holders, groupers, misdirectors, denyers.
- (4) Keep it solidly in mind that the number one goal is basic-basic, the earliest moment of pain and “unconsciousness.”
- (5) Keep in mind that the patient may have “computations” which make his illness or his aberrated state “valuable” to him and discover whence those “computations” come by flash answer to your questions.
- (6) Keep the case progressing, gaining, work only for progress and gain, not for sudden, soaring results. Worry only when the case remains static and worry then in terms of finding the engram which is balking everything. Its content will be a close approximation to the way the patient says he feels about it and will contain the same or similar words.
- (7) Get the patient back to present time each time you work and feed him the canceller. Test him with an age flash, get his first reply to how old he is, find the holder at that age if he is not at present time.
- (8) Keep your temper no matter what the patient says.
- (9) Never try to tell him what his data means: he knows and he alone knows what it means.
- (10) Keep your nerve and run dianetics; like Farragut said, “Damn the torpedoes! Go ahead.”
- (11) Wife, son, whatever you may be to the pre-clear, you are the auditor when you are auditing. He cannot compute his own engrams to find them -- if he could they would not be engrams. You can compute them. Do what you think a good auditor would do, never what the patient says save only when he accidentally concurs in his opinion that a good auditor would do that. Be the auditor, not a recording device. You and the file clerk in his mind are running the case: what his engrams and his analytical mind believe should have no force in any of your computations. You and his file clerk know. He, as “I” doesn’t know.
- (12) Be surprised at nothing. Audit.

These are the things you must not do:

- (1) Dilute dianetics with some practice or belief of yesteryear; you will only slow or sidetrack a case. Analyzing data received on any other basis than getting more engrams leads to delay and confusion for the pre-clear. It is a temptation to use this material for other reasons than getting engrams if one has been trained in another field than dianetics. Yielding to that temptation before one knows how dianetics works is a very unfair test of dianetics, completely aside from the way it snarls a case. The temptation is great because, with dianetics, you get such a wealth of data.
- (2) Do not bully the patient. If the case is not progressing, then the fault lies with the auditor. Do not surrender to an old practice of getting mad at a patient just because he doesn't get well. You may be sure the engram you have just reduced out of his reactive engram bank is the reason he won't take baths, but if he still refuses to bathe, be certain there is an earlier reason.
- (3) Don't assume grandly that you have a "different" case just because it doesn't resolve swiftly. They are all "different" cases.
- (4) Don't run for help to somebody who does not know dianetics if your nerve fails you. The reason the case did not progress or became involved is right there -- your nerve failed you. Only dianetics can work a problem in dianetics.
- (5) Do not listen to a patient's complaints as complaints; use them as data to get engrams.
- (6) Do not suppose that just because you cannot reach prenatal engrams in a case that they are not there. There are scores and scores of them in every case. Remember that an engram isn't a memory, it has to be developed to become within recall. There is no human being walking on earth today who does not have a plentitude of prenatals.
- (7) Do not allow the patient to use his mother or his memory of what he has been told as a by-pass of prenatals. Every time you find a patient talking in past tense instead of present tense he is not returned to an incident. Unless he is returned, the engram will not lift.
- (8) Do not suppose that because a patient does not feel bad today about a sorrow of yesterday that a despair charge is not located back on his track when he received the impact of that despair. Time may encyst, it does not heal.
- (9) Do not think in terms of "guilt complexes" or "shame" unless you think of them as engram content for there they will be found. Never suggest to a patient that he may be at fault in an engram.
- (10) Any departure from optimum behavior or conduct or rationality on the part of the patient is engramic: don't make "allowances for human nature" any more than you, as a mathematician, would make allowances for an adding machine which brought up wrong answers. Sexual fears, repressions, defenses are not "natural" as they have been regarded in the past.
- (11) Don't worry about the patient's aberrations. Work to contact and reduce and erase engrams. You will find, in any patient, enough aberrations to fill a dictionary.
- (12) Don't fret if your patient does not become a clear in an evening or a month. Just keep working. You'll have him above normal so quickly you won't realize when you passed it. Above that you are shooting for a very high goal.

STUCK IN PRESENT TIME

Cases, when they are entered, are found in various positions and situations on the time track; sometimes they are off the time track entirely and sometimes the time track is all snarled up in a ball. Now and then the time track is found to be in good condition and the engrams available, but this is not ordinary.

No case can be said to be more difficult than another except in the matter of recalls, “dub-ins” and shut-offs. But the case which seems to be “stuck in present time” and on whom no repeater phrase works is very often quite puzzling to an auditor. The pre-clear will not return to engrams. Ordinarily there may be pain and emotional shut-offs and the painful emotion cannot be quickly discharged. Sometimes somatics will turn on but no content can be gained. Sometimes there is no somatic but content. The situations are quite various.

There are several things an auditor can do. The first of them is to use his wits. The next is to indoctrinate the patient into returning. This indoctrination is quite simple. The auditor takes the patient back a few hours and has the patient tell what he sees. The sonic and visio may be occluded but the patient may have some idea of what is taking place. The auditor then takes him back a few days, then a few months and finally several years, each time getting the patient to describe his “surroundings” as best he can. The patient now has the idea of returning. He can travel at least along portions of his life which are not occluded by engrams.

When the patient is returned to some early moment in his life, begin to use repeater technique on him, aiming toward obvious things such as feeling shut-offs (going over the word “feel”) or forgetter mechanisms (such as “forget”). An engram may then be contacted and reduced.

If repeater technique still does not work and still does not get data, diagnose by his behavior in therapy and his statements what must be troubling him or occluding his recalls and again use these guesses as repeater. For instance he may have no recollection of some member of his family. Have him repeat the familiar name. Or have him repeat his own childhood nickname until an incident is contacted.

Should this still fail, then find some light locks, incidents which contain minimal pain, and run those. Such things as falls from a tricycle, getting sent from the table, getting spanked or scolded, being kept after school and so forth will serve. After he has reduced several locks, again try to find an engram.

The running of locks will not bring about any great recovery, and there are thousands and thousands of locks in any case, most of which will vanish without assistance from the auditor once the severe engrams are located. But locks may be used to indoctrinate the patient into returning and therapy in general and may even bring about an improved condition in him by demonstrating to him that he can face his past.

The foremost things to do in any case at the beginning are to (1) attempt to locate and erase basic-basic, and (2) discharge painful emotion. The sooner emotion can be released, the better, and there is always emotion on a case just as there are always a plenty of prenatal incidents.

But when a case is stuck in present time either when it is opened or during progress, it is highly charged with occluded emotion and it is obeying a restimulated engram to the effect that it must go all the way to now and stay there. The wording of this engram will generally be expressed by the patient himself in complaining of his trouble. Repeater technique is used with this clue. That failing, indoctrinate the patient by taking him back to what he can contact and when indoctrination is done, as above, start using repeater technique again.

There is one motto which applies to all therapy, “If you keep asking for it, you’ll get it.” Any and all engrams surrender on the basis of returning the patient to the area time and again, session after session. The engram bank may be balky but enough asking will bring forth any data in it sooner or later. Just keep asking, keep the routine of therapy running. Even a

“stuck in present time” case will eventually begin to return on the sole principle of repeater technique.

There are certain things that the auditor may be doing which are wrong. He may be trying to work the case on data taken from parents or relatives, which is usually fruitless in view of the fact that it undermines the pre-clear’s faith in his own data (all the data will check with the relatives; just don’t worry about checking it until the case is finished). Or he may be trying to work the case in the presence of other people. Or he may be violating the auditor’s code. A list of these deterrents to progress is to be found elsewhere in this volume.

BASIC-BASIC

The first goal of the auditor is basic-basic and after that always the earliest moment of pain or discomfort which he can reach. He may have to go late for emotional charges and these themselves may be physically painful. Emotion may bar the patient from basic-basic. But always that first turn-off of the analyzer is important and when it is gained, subsequent engrams are much more easily reduced.

Basic-basic is the vital target for two reasons: (1) It contains an analyzer shut-off which itself is restimulated every time a new engram is received. The common denominator of all engrams is analyzer shut-off. Turn it on the first time it was shut off and a vast improvement takes place in the case, for thereafter analyzer shut-off is not as deep. (2) An “erasure” (which is to say an apparent removal of the engram from the files of the engram bank and refiling in the standard bank as memory) of basic-basic widens the track beyond it markedly and brings many new engrams into view.

Basic-basic is occasionally found weeks before mother’s first missed period, which would place it much earlier than any examination for pregnancy or an attempted abortion. Sometimes in a non-sonic case sonic is discoverable in basic-basic but far from always.

Considerable material may be “erased” before basic-basic appears.

Sometimes basic-basic gets “erased” without either the auditor or the pre-clear knowing that it has been reached, basic-basic being merely another engram in the basic area. Sometimes much painful emotion must be discharged in the later life areas before basic-basic discloses itself.

Always, however, basic-basic is the target and until he has a good idea that he has reached it, the auditor, once every session, makes an effort to get it. Thereafter he tries to get the earliest moment of pain or discomfort he can reach every session. If he can reach nothing early, he seeks to discharge a late emotional engram -- when it is completely discharged, “reduced” or “erased” as an engram -- then he goes down into the earliest material the file clerk will give him.

Whatever comes up, the auditor seeks to take all the charge out of it, whether that charge is pain or emotion, before he proceeds on his way to new material. This is done merely by returning the patient back over the incident many times until it no longer affects him either painfully or emotionally, or until it seems to vanish.

THE REDUCTION AND THE ERASURE

These two terms are highly colloquial. Serious effort has been made to deter their use and substitute for them something sonorous and wonderfully Latin, but no progress has been made to date. Auditors insist on using colloquial terms such as “AA” for attempted abortion, “louse up” for engrams which seriously aberrate, “aberree” for a person not released or cleared, “zombie” for an electric shock or neuro-surgical case and so forth. It is feared that a tendency

exists in them to be disrespectful to the hallowed and sacred tomes of yesteryear, to the dignity of past Authorities which labeled much and did little. However this may be, “reduction” and “erasure” are in such common use that to change them is hardly necessary.

To reduce means to take all the charge or pain out of an incident. This means to have the pre-clear recount the incident from beginning to end (while returned to it in reverie) over and over again, picking up all the somatics and perceptions present just as though the incident were happening at that moment. To reduce means, technically, to render free of aberrative material as far as possible to make the case progress.

To “erase” an engram means to recount it until it has vanished entirely. There is a distinct difference between a reduction and an “erasure.” The difference depends more upon what the engram is going to do than upon what the auditor wants it to do. If the engram is early, if it has no material earlier which will suspend it, that engram will “erase.” The patient, trying to find it again for a second or sixth recounting, will suddenly find out he has no faintest idea what was in it. He may ask the auditor who, of course, will give him no information whatever. (The auditor who prompts is slowing down therapy by making himself the patient’s memory.) Going through it and trying to find it may cause the patient some amusement when he cannot. Or it may make him puzzled for here was something which had, on first contact, a painful somatic and a highly aberrative content which now no longer seems to exist. That is an “erasure.” Technically the engram is not erased. If the auditor cares to spend some time, solely for purposes of research, he will find that engram in the standard banks now, labeled “formerly aberrative: rather amusing: information which may be useful analytically.” Such a search is not germane to therapy. If the incident had a somatic, was recounted a few times and then, when its last new material was found, vanished, it is erased so far as the engram bank is concerned. It will no longer be “soldered” into the motor circuits, will no longer be dramatized, it no longer blocks a dynamic and is no longer an engram but a memory.

The “reduction” has some interesting aspects. Let us take a childhood incident (age of four, let us say) which had to do with a scalding. This is contacted while much data remains in the basic area. It has many things below it which will hold it in place. Nevertheless, it has emotional charge and therapy is slowed by that charge. The file clerk hands out the scalding. Now it will not erase, but it will reduce. Here is a job which will take more time than an erasure. And there may be several aspects to that job.

The somatic is contacted, the incident is begun as close to the beginning as the auditor can get, and is then recounted. This scalding, let us say, has apathy as its emotional tone (Tone 0.5). The pre-clear slogs through it apathetically, well exteriorized, watching himself be scalded. Then suddenly, perhaps, an emotional discharge may come off, but not necessarily. The pre-clear returns to the beginning and recounts (re-experiences) the whole thing once more. Then again and again. Soon he begins to get angry at the people involved in the incident for being so careless or so heartless. He has come up to anger (Tone 1.5). The auditor, although the patient would like to tell how vicious his parents are or how he thinks laws ought to be passed about scalding children, patiently puts the pre-clear through the incident again. Now the pre-clear ceases to be angry and finds that he is bored with the material. He has risen up to boredom on the tone scale (Tone 2.5). He may protest to the auditor that this is a waste of time. The auditor puts him back through the incident again. New data may show up. The somatic may or may not be still present at this period but the emotional tone is still low. The auditor puts the pre-clear through the incident again and the pre-clear may, but not always, begin to be sarcastic or facetious. The incident is again recounted. Suddenly the pre-clear may be amused about it (but not always) and the incident, when it obviously has reached a high tone, may be left. It will probably sag in a few days, but that is a matter of no great importance for it will be erased wholly on the return from basic-basic. In any case it will never be as aberrative as it was before the reduction.

A reduction will sometimes result in the whole engram’s apparently disappearing. But it is obvious when this will occur. Without much lifting in the tone scale, the incident, by repetition, simply goes out of sight. This is reducing to recession. In a few days that incident

will be back in force again, almost as strong as ever. There is material before it and emotional charge after it which make it unwieldy.

Several things can happen, then, to an engram in the process of work. It can reduce, which is to say, discharge emotionally and somatically and be of no great aberrative power thereafter. It can reduce to recession, which is to say it merely goes out of sight after several recountings. It can erase, which is to say, vanish and cease to be thereafter so far as the engram bank is concerned.

A little experience will tell an auditor what engrams are going to do after he has contacted them. Erasure takes place, ordinarily, only after basic-basic has been reached or, for that matter, when the basic area is being worked. The reduction occurs with an emotional discharge. The reduction to recession happens when there is too much in the engram bank suppressing the incident.

Every now and then even the best auditor will get hold of an engram and decide to grind it out now that it has been contacted. It is a sorry job. Perhaps it is better to grind it out than to merely restimulate it and let the patient be irritated by it for a couple of days. Perhaps not. But in any case that engram which reduces only to recession was better not contacted in the first place.

New auditors are forever charging at birth as an obvious target. Everybody has a birth: in most patients it can be located rather easily. But it is a painful incident and until the basic area has been thoroughly worked and until late life painful emotion has been discharged and until the file clerk is ready to hand up birth, the incident is better left in place. It will usually reduce to recession and afterwards keep popping up to plague the auditor. The patient gets obscure headaches, gets sniffles, feels uncomfortable afterwards unless birth is taken on the return (from the basic area). The auditor is wasting time, of course, by trying to remove these headaches and sniffles because birth, with the whole prenatal life before it, will not properly reduce or erase but only recede. It is too often the case that birth, if prematurely contacted, will give the patient a headache and a cold. These discomforts are minor and of no great importance, but the work the auditor may have invested in working an incident which will only reduce to recession is lost work.

True, the file clerk occasionally hands out birth: if he does, there is an emotional charge on it which will discharge and the incident will reduce properly. The auditor by all means should take it. True, a case sometimes stalls down and the auditor runs birth anyway just to see if he can speed things up. But merely going back to birth to put one's hands on an engram because he knows it is there will bring about discomfort and lost time. Go prenatal as far as you can and see what the file clerk will hand forth. Try repeater technique in the basic area.

You may get incidents which will erase. If there is nothing there, find out about a painful emotion engram in late life, the death of a friend, the loss of an ally, a failure of a business, something. Blow a charge from it and reduce it as an engram and then go back prenatally as early as possible and see what has turned up. If the file clerk thinks you need birth, he'll give it out. But do not ask for birth just to have an engram to work, because it may prove to be a thoroughly uncomfortable and fruitless endeavor. Birth will come up when it will come up and the file clerk knows his business.

Charging into any late period of "unconsciousness" such as surgical anesthetic, where physical pain is present in large quantities, can bring about this needless restimulation. You can, of course, fare better with such things in reverie than in hypnosis or narco-synthesis where such a restimulation might bring about severe results. In reverie the effect is light.

HANDLING THE SOMATIC STRIP

There are two little men on each side of the brain, a set for each lobe, hanging by their heels. The outer one is the "motor strip," the inner one, the "sensory strip." If you wish to know more about the structure of these pairs dianetic research will have the answer in a few more years. Currently there is something known about them, a description. To an engineer who knows dianetics the current description which will be found in the library is not entirely reasonable. These are, possibly, switchboards of some sort. Readings can be taken in the vicinity of them -- just aft of the temples -- if you have a very sensitive galvanometer, a galvanometer more sensitive than any on the public market today. Those readings show emanations of a field of some sort. When we have established the precise type of energy flowing here, we can probably measure it with better precision. When we know exactly where the thinking is done in the body we will know more about these strips. All dianetic research has established to date is that, beneath a welter of labels, nothing is actually known which is worth recounting about these structures beyond the fact that they have something to do with coordination of various parts of the body. We do, however, refer to them for lack of something better, in the course of therapy. Now that we know something about function, further research certainly cannot help but yield precision answers about structure.

The auditor can turn somatics on and off in a patient like an engineer handles switches. More aptly, he can turn them on and off in the body like a conductor runs a street car along a track. Here we have the game referred to previously when we talked about the time track.

In a patient who is working well, the "somatic strip" can be commanded to go to any part of the time track. Day by day, hour by hour, in normal life the somatic strip ranges up and down this track as engrams are restimulated. The auditor, working a patient, may find his own somatic strip obeying his own commands and some of his own somatics turning on and off, a fact which is at worst mildly uncomfortable. The whole body, the cells, whatever it is that is moving we do not really know. But we can handle it and we can assume that it at least passes through the switchboard of the little men who hang by their heels.

"The somatic strip will now go to birth," says the auditor.

The patient in reverie begins to feel the pressure of contractions thrusting him down the birth canal.

"The somatic strip will now go to the last time you injured yourself," says the auditor.

The pre-clear feels a mild reproduction of the pain of, perhaps, a bumped knee. If he has sonic and visio recall, he will see where he is and suddenly realize that it was in the office: he will hear the clerks and typewriters and the car noises outside.

"The somatic strip will now go into the prenatal area," says the auditor.

And the patient finds himself in the area, probably floating along, not uncomfortable.

"The somatic strip will now go to the first moment of pain or discomfort which can now be reached," says the auditor.

The patient drifts around a moment and suddenly feels a pain in his chest. He begins to cough and feels depression all over him. Mama is coughing (often source of chronic coughs). "Roll the cough," says the auditor.

The patient finds himself at the beginning of the engram and begins to run it. "Cough, cough, cough," says the patient. He then yawns. "It hurts and I can't stop," he quotes his mother. "Go to the beginning and roll it again," says the auditor. "Cough, cough, cough," begins the patient, but he is not coughing as badly now. He yawns more deeply. "Ouch. It hurts, it hurts, and I can't seem to stop," quotes the pre-clear, listening directly if he has sonic, getting impressions of what's said if he does not have. He has picked up words now that were suppressed in it by "unconsciousness." "Unconsciousness" is beginning to come off with the

yawns. “Roll it again,” says the auditor. “I can’t stop,” says the pre-clear, quoting all that he finds this time. The somatic is gone. He yawns again. The engram is erased.

“The somatic strip will now go to the next moment of pain or discomfort,” says the auditor.

The somatic does not turn on. The patient goes into a strange sleep. He mutters about a dream. Suddenly the somatic gets stronger. The patient begins to shiver. “What occurs?” says the auditor. “I hear water running,” says the pre-clear. “Somatic strip will go to the beginning of the incident,” says the auditor. “Roll it.” “I keep on hearing water,” says the pre-clear. (He must be stuck, the somatics did not move. This is a holder.) “Somatic strip will go to whatever it is that is holding,” says the auditor. “I’ll hold it in there awhile and see if it does some good,” quotes the pre-clear. “Pick up the beginning of the incident now and roll it,” says the auditor. “I feel myself being jostled,” says the pre-clear. “Ouch, something bumped me.” “Pick up the beginning and roll it,” says the auditor. “I’m sure I must be pregnant,” quotes the pre-clear. “I’ll hold it in there awhile and see if it does some good.” “Is there anything earlier?” says the auditor. The pre-clear’s strip goes to the earlier moment where he feels pressure as she tries to get something into the cervix. Then he rolls the engram and it erases.

This is handling of the somatic strip. It can be sent anywhere. It will pick up the somatic first, usually, and then pick up the content. Using repeater technique, the somatic is “sucked down” to the incident and the somatics turn on. Then the incident is run. If it does not lift, find an earlier incident simply by telling the somatic strip to go to the earlier incident.

If the somatic strip does not move, which is to say, if somatics (physical sensations) do not turn on and off, then the patient is stuck somewhere on the track. He can be stuck in present time, which would mean he has a bouncer thrusting him all the way up the track. Use repeater technique or merely try to send the somatic strip back. If it won’t go, get various bouncer phrases like “Can’t go back,” “Run a mile,” etc. and with them suck the somatic strip down to the incident and run it.

The somatic strip may move through an incident with full sensation and yet, returning over the same ground several times will not bring out data. Time after time this can be done without result in some engrams: the somatics remain almost the same, undulating through the incident each time but with no other content. Then the auditor is “bucking” a denier, a phrase such as “This is a secret,” “Don’t let him know,” “Forget it,” etc. In such a case he sends the somatic strip to the phrase which denies the data: “Go to the moment a phrase is uttered denying this data,” says the auditor. After a moment, “If he found out about this, it would kill him,” quotes the pre-clear, either from sonic or from impressions. Then the auditor sends the somatic strip back to the start of the incident and it goes on through it, this time with other perceptic content. The somatics, unless the incident is very late prenatal with basic area full of material, undulate (fluctuate according to the action of the engram) and diminish to either reduction or erasure on consecutive recountings.

The auditor tells the somatic strip to go earlier, sometimes it goes later. This is a misdirector. “Can’t tell which way I am going,” “Going backwards,” “Do just the opposite,” these are the type of phrases of the misdirector. The auditor recognizes that he has one in the pre-clear, guesses it or discovers it from the pre-clear’s wording of the complaint about the action, and by repeater or direct command of the strip, picks up the phrase and the engram, reduces or erases it and continues.

If the somatic strip does not respond according to command, then a bouncer, a holder, a misdirector, or a grouper has been restimulated and should be discharged. The somatic strip will be where the command is which forbids it to function as desired.

There are good and bad conductors of this somatic strip. The good conductor works closely with the file clerk, using such broad orders as “The somatic strip will pick up the earliest moment of pain or discomfort which can be reached,” or “The somatic strip will go to

the highest intensity of the somatic you now have” (when a somatic is bothering the patient). The bad conductor picks out specific incidents which he thinks might be aberrative, bullies the somatic strip into them and somehow beats them down. There are moments when it is necessary to be quite persuasive with the strip and moments when it is necessary to pick out incidents of physical pain, but the auditor is the best judge of what should take place. As long as the strip will work smoothly, finding new incidents and running over them, he should not tamper with it beyond making sure that he reduces everything the strip contacts.

A very fine way to thoroughly wreck a case is to put the somatic strip into an incident, decide something else is more important and go rushing off to it, get that half lifted and go off to something else. By the time three or four incidents have been so touched but not reduced, the strip stalls down, the track starts to bunch up and the auditor has a snarl which may take him many hours of therapy or a week or two of rebalancing (letting the case settle) to bring back to a workable state.

The patient will sometimes want a somatic turned off. It has been bothering him. That means that the strip is somehow hung up in some incident which therapy or the patient’s environment has restimulated. Ordinarily it is not worth the time and trouble to locate the incident. It will settle out of its own accord in a day or two and it may be an incident which cannot be reduced because of the earlier engrams.

The somatic strip is handled in a late incident just as it is sent to an earlier one. Despair charges are contacted in the same way.

If you want a test to see if the strip is moving, or to test recall, send it back a few hours and find out what you get. While the prenatal area is easier to reach than yesterday in many cases, some idea will be gained of how the patient is working.

PRESENT TIME

The beginning is conception. Your patients sometimes have a feeling that they are sperms or ovums at the beginning of the track: in dianetics this is called the sperm dream. It is not of any great value so far as we know at this time. But it is very interesting. It does not have to be suggested to the pre-clear. All one has to do is send him to the beginning of the track and hear what he has to say. Sometimes he has an early engram mixed up with conception.

At the late end of the track is, of course, now. This is present time. It happens now and then that patients are not getting back to present time because they have struck holders en route. Repeater technique with holders will generally free the strip and get it to present time.

A patient may get a trifle groggy with all the things which have been happening to him in the course of a therapy session. And he may have reduced resistance to engrams as he comes back up the track and may thus trip a holder. The auditor should be very sure the patient is up in present time. Occasionally the patient will be so thoroughly stuck and the hour so advanced that the effort to bring him all the way up is not feasible at the time. A period of sleep will generally accomplish it.

There is a test whereby the auditor can tell if the pre-clear is up to present time. He snaps a question at the pre-clear, “How old are you?” The pre-clear gives him a “flash answer.” If it is the pre-clear’s right age, the pre-clear is in present time. If it is an earlier age, there is a holder there, and the patient is not in present time. There are other methods of determining this but it is not very important, by and large, if the patient does fail to make it.

Snapping questions at people, asking how old they are, elicits some surprising answers. Being stuck on the track is so common in “normal” people that a day or two or a week or two of failure to reach present time in a pre-clear is far from alarming.

Anyone who has a chronic psycho-somatic illness is definitely stuck somewhere on the time track. Snap questions about it get, "Three," or "Ten years," or some such answer quite ordinarily even when asked of people who suppose they are in good health. Reverie reveals to them where they are on the track. Sometimes, in the first session, a pre-clear shuts his eyes in reverie to find himself in a dentist's chair at the age of three. He has been there for the last thirty years or so because the dentist and his mother both told him to "stay there" while he was shocky with pain and gas -- so he did, and the chronic tooth trouble he had all his life is that somatic.

This doesn't happen very often, but you can find someone you know, it is certain, who would flash answer "Ten years" and, being put in reverie, would find himself, as soon as the engram came to view, lying flat on his back in a ball park or some such situation, with somebody telling him not to move until the ambulance came: that's his arthritis!

Try it on somebody.

THE FLASH ANSWER

A device in common use in therapy is the flash answer. This is done in two ways. The first mentioned here is the least used. "When I count to five," says the auditor, "a phrase will flash into your mind to describe where you are on the track. One, two, three, four, five!" "Late prenatal," says the pre-clear, or "yesterday" or whatever occurs to him.

The flash answer is the first thing which comes into a person's head when a question is asked him. It will come from the engram bank, usually, and will be useful. It may be "demon talk" but it is generally right. The auditor merely asks a question, such as what is holding the patient, what denies him knowledge, etc., prefacing the question with the remark, "I want a flash answer to this."

"I want a flash answer to this," says the auditor. "What would happen if you became sane?" "Die," says the patient. "What would happen if you die," says the auditor. "I'd get well," says the patient. And with this data they then make an estimate of the current computation on allies or some such thing. In this case, the ally said to the pre-clear when he was ill, "I'd die, just die if you didn't get well. If you're sick much longer I'll go insane." And a former engram said the pre-clear had to be sick. And this is, after all, just an engram. So repeater technique is used on the word "die" and an ally is uncovered that the pre-clear never knew existed and a charge is blown.

Much valuable data can be recovered by clever use of the flash answer. If there is no answer at all, it means that the answer is occluded and that is almost as good a reply as actual data since it means some kind of a cover-up.

DREAMS

Dreams have been used considerably by various schools of mental healing. Their "symbology" is a mystic foible forwarded to explain something which the mystics did not know anything about. Dreams are crazy house mirrors by which the analyzer looks down into the engram bank.

Dreams are puns on words and situations in the engram bank.

Dreams are not much help, being puns.

Dreams are not much used in dianetics.

You will hear dreams from patients. Patients are hard to shut off when they start telling dreams. If you want to waste your time, you will listen.

VALENCE SHIFT

A mechanism used in dianetics is the valence shift.

We know the way a patient gets into valences when he dramatizes his engrams in life. He becomes a winning valence and he says and does rather much what the person in the winning valence did in that engram.

The theory behind it is this: returned to a time the patient may consider too painful to enter, he can be shifted into a valence which felt no pain. A dull way to persuade him is to tell him he does not have to feel the pain or the emotion and let him go through it. This is very bad dianetics because it is a positive suggestion and every safeguard must be taken to keep from giving suggestions to the patient, for he may be very suggestible even when he pretends not to be. But there is the valence shift and this permits the patient to escape the pain and still remain in the engram until he can recount it.

Example, father beating mother, unborn child knocked "unconscious." The data is available in the father valence with no pain, in the mother valence with her pain, in the child's valence with his pain.

The way to handle this, if the patient positively refuses to enter it although he has somatics, is to shift him in valence. The auditor says, "Go into your father's valence and be your father for the moment." After some persuasion the patient does so. "Bawl your mother out," says the auditor. "Give her a fine talking to." The patient is now on that circuit which contains no "unconsciousness" and approximates the emotion and the words his father used to his mother. The auditor lets him do this a couple or three times until the charge is somewhat off the engram. Then he turns the patient's valence into the mother: "Be your mother for the moment now and talk back to your father," says the auditor. The patient shifts valence and is his mother and repeats his mother's phrases. "Now be yourself," says the auditor, "and recount the entire incident with all somatics and emotion please." The patient is able to re-experience the incident as himself.

This works very well when one is trying to get at an ally. "Shift valence," says the auditor to the returned patient, "and plead with your mother not to kill the baby." "Now be a nurse," says the auditor, with the pre-clear returned to some incident he seems very fearful about entering, "and plead with a little boy to get well." The patient will correct the auditor's concept of the script and usually will proceed.

The patient will often refuse to go into a valence because he hates it. This means there must be considerable charge in the person he refuses to be.

This mechanism is rarely used but is handy when a case is stalling. The father did not obey the holders or commands, he uttered them. The nurse would not obey her own commands. And so forth. Thus many holders and deniers can be flushed to view. It is useful in the beginning of a case.

Valence shift is seldom used except where an engram is suspected which will not otherwise be approached by the patient. He will often approach the engram with valence shift when he will not approach it as himself. Valence shift is somewhat undesirable when employed on a suggestible subject since it violates the dianetic rule that no positive suggestion be used beyond those absolutely necessary in returning and recounting and uncovering data. Therefore valence shift is seldom employed and rarely on a suggestible person.

TYPE OF CHAINS

Engrams, particularly in the prenatal area, are in chains. That is to say there is a series of incidents of similar types. This is useful classification because it leads to some solutions. The chains one can most easily contact in a pre-clear are the least charged. The most aberrative chains will usually be the hardest to reach because they contain the most active data. Remember the rule that what the auditor finds hard to reach, the analyzer of the patient found hard to reach.

Here is a list of chains -- not all the possible chains by any means -- found in one case which had passed for "normal" for thirty-six years of his life.

COITUS CHAIN, FATHER. 1st incident zygote. 56 succeeding incidents. Two branches, father drunk and father sober.

COITUS CHAIN, LOVER. 1st incident embryo. 18 succeeding incidents. All painful because of enthusiasm of lover.

CONSTIPATION CHAIN. 1st incident zygote. 51 succeeding incidents. Each incident building high pressure on child.

DOUCHE CHAIN. 1st incident embryo. 21 succeeding incidents. One each day to missed period, all into cervix.

SICKNESS CHAIN. 1st incident embryo. 5 succeeding incidents. 3 colds. 1 case grippe. One vomiting spell -- hangover.

MORNING SICKNESS CHAIN. 1st incident embryo. 32 succeeding incidents.

CONTRACEPTIVE CHAIN. 1st incident zygote. 1 incident. Some paste substance into cervix. entirely and completely unable to confront and attack an engram which the auditor is certain is present: and this is rare.

FIGHT CHAIN. 1st incident embryo. 38 succeeding incidents. Three falls, loud voices, no beating.

ATTEMPTED ABORTION, SURGICAL. 1st incident embryo. 21 succeeding incidents.

ATTEMPTED ABORTION, DOUCHE. 1st incident foetus. 2 incidents. 1 using paste, 1 using lysol, very strong.

ATTEMPTED ABORTION, PRESSURE. 1st incident foetus. 3 incidents. 1 father sitting on mother. Two mother jumping off boxes.

HICCOUGH CHAIN. 1st incident foetus. 5 incidents.

ACCIDENT CHAIN. 1st incident embryo. 18 incidents. Various falls and collisions.

MASTURBATION CHAIN. 1st incident embryo. 80 succeeding incidents. Mother masturbating with fingers, jolting child and injuring child with orgasm.

DOCTOR CHAIN. 1st incident, 1st missed period. 18 visits. Doctor examination painful but doctor an ally, discovering mother attempting an abortion and scolding her thoroughly.

PREMATURE LABOR PAINS. 3 days before actual birth.

BIRTH. Instrument. 29 hours labor.

In that mother was a sub-vocal talker this made a sizable quantity of material to be erased for the remainder of the patient's life was in addition to this. This was a 500-hour case,

non-sonic, imaginary recalls which had to be cancelled out by discovering lie factories before the above data could be obtained.

There are other chains possible but this case was picked because it contains the usual ones found. Mother's lover is not very unusual, unfortunately, for he puts secrecy into a case to such an extent that when the case seems very, very secret, then a lover or two will seem indicated. But don't suggest them to a pre-clear. He may use them for an avoid.

DIANETIC DON'TS

Don't give any patient a positive suggestion as therapy in itself or to assist therapy.

Don't fail to give a canceller at every session's beginning and use it at every session's end.

Don't ever tell a patient he can "remember this in present time" because the somatic will come to present time and that is very uncomfortable.

Don't ever, ever, ever, ever tell a patient that he can remember everything that ever happened to him in present time because that groups everything in present time if the patient has slid into a deep trance. And that makes it necessary to unsnarl a whole case. Want to waste two hundred hours?

Don't ever retaliate in any way when a patient in reverie gets angry at you. Follow the auditor's code. If you get angry with him you may throw him into an apathy which will take you many hours to undo.

Don't evaluate data or tell a patient what is wrong with him.

Don't crow. If the pre-clear is your wife, or husband, or child, don't rub it in that the favorite argument phrase was out of an engram. Of course it was!

Don't question the validity of data. Keep your reservations to yourself. Audit the information for your own guidance. If the patient doesn't know what you think, the engrams will never get a chance to evade.

Don't ever snap a patient to present time just because he begs for it. If he is in the middle of an engram, the only way out of it is through it. The power of the engram is slight when the patient is returned to it. It turns on hard when the patient comes to present time. The patient will have a nervous shock if he is snapped to present.

Don't ever get frightened, no matter what kind of squirming or squalling a patient may do. It isn't serious, any of it, although it is sometimes dramatic.

Don't ever promise to clear a case: promise only to release it. You may have to go away or work on something more urgent. And a broken promise to a pre-clear will be taken very hard.

Don't interfere with the private life of a pre-clear or give him guidance. Tell him to make up his own mind about what he should do.

Don't break the auditor's code. It is there to protect you, not just the pre-clear. Therapy can't hurt him if you do but half a job on it and do half of that wrong; breaking the code can make you very uncomfortable because it will make you a target of the pre-clear and cost you considerable extra work.

Don't leave engrams half-reduced when you are given them by the file clerk.

Don't get inventive about dianetics until you have worked at least one case out. And don't get too inventive until you have worked a case which has sonic, a case which has shut-off sonic, and a case which has imaginary sonic. Clear these and you will know. And you will have met enough engrams to get some ideas that can be of great benefit to dianetics. If you don't get ideas after that and after you yourself are in therapy and cleared, there's something wrong. Dianetics is an expanding science; but don't expand it until you know which way it travels.

Don't mix gasoline and alcohol, or dianetics and other therapy except purely medical, dispensed by a professional medical doctor.

Don't get a case snarled up and then take it to a psychiatrist who knows no dianetics. Only dianetics can unsnarl dianetics and yesterday's methods won't help your patient one slightest bit when all he needs is another run through the one you snapped him out of too fast. Take a cinch on your nerve and send him back through the incident again. In dianetics today's obvious nervous breakdown is tomorrow's most cheerful being.

Don't quit, don't balk. Just keep running engrams.

And one day you'll have a release. And another day you'll have a clear.

TYPES OF SOMATICS

There are two kinds of somatics, those which properly belong to the patient and those which belong to his mother or some other person. The first actually happened, so did the second. But the patient should not have his mother's somatics. If he does, if he is found complaining of headaches whenever his mother has a headache, there is an engram, very early, which says he must have whatever she has: "The baby is part of me," "I want him to suffer as I suffer," etc. Or the phrase may be some entirely misunderstood thing literally taken. However, all this "comes out in the wash" and should be no great concern of the auditor's.

"UNCONSCIOUSNESS"

While "unconsciousness" has been covered elsewhere in various ways, in therapy it has two special manifestations. The yawn and the "boil-off."

The engram of physical pain contains deep "unconsciousness" and if it is going to lift, particularly in the basic area, it comes off in yawns. After a first or second recounting, the patient starts to yawn. These yawns are turning on his analyzer.

In a very extreme engram -- a prenatal electric shock which mother received -- five hours of "unconsciousness" "boil-off" have taken place during therapy. The shock lasted for less than a minute but so close did it bring the individual to death that when the incident was first contacted in therapy, he swam and floundered and had strange dreams, muttered and mumbled for five hours. That is a record. Forty-five minutes of this "boil-off" is rare. Five or ten minutes of it are not uncommon.

The auditor will take a patient into an area. No somatic turns on. But the patient begins to drowse into a strange kind of sleep. He rouses from this from time to time, mutters something, usually idiotic, rouses again with a dream and generally makes no progress to all appearances. But progress is being made. A period when he was almost dead is coming up to the surface. Soon a somatic will turn on and the patient will run an engram a few times on command, will yawn a little and then brighten up. Such a quantity of "unconsciousness" was, of course, sufficient to keep his analyzer about nine-tenths shut off when he was awake for, if it was near basic, it was part of every other engram. Such an engram, with such deep

“unconsciousness,” when released, produces a marked improvement in a case, as much as a painful emotion engram at times.

It is up to the auditor to sit it through no matter how long it takes. It may make an uncleared auditor very sleepy to watch all this but it should be done. He will rarely strike one that lasts an hour but every case has such a period lasting from ten minutes to a half hour.

He should stir the patient up once in a while and try to make him go through the engram. There is a very special way to stir a patient into life: don't touch his body for it may be highly restimulative and make him very upset. Touch only the bottoms of his feet with your hand or your own feet and touch them just enough to jog him into attention for a moment. That keeps the “boil-off” in progress and does not permit the patient to sag into ordinary sleep.

The “boil-off” can be confused, by an inexperienced auditor, with an engram command to sleep. However, if the auditor will observe the patient closely, he will find that in the “boil-off” the patient gives every appearance of being drugged while in a sleep command, he simply goes to sleep and does it very smoothly. The “boil-off” is a trifle restless, full of mutterings and flounderings and dreams. The sleep is smooth.

An engramic command to go to sleep, acting on the returned pre-clear, is broken by sending the somatic strip to the moment when the sleep command is given. If the pre-clear contacts it and goes over it, he will quickly awaken on the track and continue with therapy.

The “boil-off” may be full of yawns, mutterings or grunts. Sleep is usually quiet and gentle.

Just why this is called a “boil-off” and just why auditors are fond of the term is obscure. It was originally and sedately named “comatic reduction” but such erudition has been outvoted by the fact that it has never been used.

If you are fond of listening to dreams, you will find them in plenty in the “boil-off.” As images on the desert are distorted by the glass snakes of heat waves, so are the engramic commands distorted to the analyzer through the veil of “unconsciousness.”

LOCKS

It is one of the blessings of nature that the lock is something which needs minor attention. A lock is an incident which, with or without charge, is in conscious recall and which seems to be the reason the aberree is aberrated. Perhaps this was another way the bank protected itself. A lock is a moment of mental discomfort containing no physical pain and no great loss. A scolding, a social disgrace: such things are locks. Any case has thousands and thousands of locks. The auditor will discover them in plenty if he cares to waste time looking for them. The treatment of these locks was the main goal of an old art known as “hypno-analysis.” Most of them can be reduced.

The key-in of an engram takes place at some future date from the time the engram was actually received. The key-in moment contains analytical reduction from weariness or slight illness. A situation similar to the engram, which contained “unconsciousness,” came about and keyed-in the engram. This is a primary lock. Breaking it, if it can be found, produces the effect of keying out the engram. But it can be considered a waste of time even if it has some therapeutic value and was used, without understanding, by some past schools.

If an auditor wants to know how the case was reacting to life, he can find some of these thousands and thousands of locks and look them over. But that is probably all the interest he has in them, for locks discharge. They discharge automatically the moment the engram holding them is erased. A whole life rebalances itself when the engrams are gone and the locks need no

treatment. Neither does the pre-clear now cleared need education as to how to think: like the blowing of locks, this is an automatic process.

These locks lie down amongst the engrams sometimes. The pre-clear may be deep in the prenatal area and suddenly think about a time when he was twenty or, as is common in therapy, think about an engram he heard from somebody else. This is a good clue. Pay no further heed to the lock: find the engram to which it attached itself, for there is an engram immediately with it. In dreams these locks in distorted form, come swimming up out of the bank, complicating the dream.

THE JUNIOR CASE

Do not take on a Junior for your first case if you can avoid it. If father was named George and the patient is called George, beware of trouble. The engram bank takes George to mean George and that is identity thought de luxe.

Mother says, "I hate George!" "That means Junior," says the engram though mother meant father. "George is thoughtless." "George must not know." "Oh, George, I wish you had some sex appeal, but you haven't." And so go the engrams. A Junior case is seldom easy.

It is customary to shudder, in dianetics, at the thought of taking on a Junior case. An auditor can be expected to slave his hardest when he has a case with non-sonic, which is off the time track, and which is named after father or mother. Such cases resolve, of course, but if parents knew what they did to children by giving them any name which might appear in the engram bank, such as that of parents or grandparents or friends, it is certain the custom would vanish instanter.

RESTIMULATING THE ENGRAM

"Ask often enough and you will receive," is always true when working the engram bank. Simply by returning into an area enough times engrams will appear. If it is not there today, it will be there tomorrow. But if it is not there tomorrow, it will be there the day after and so forth. Emotional discharges are most certainly located by asking for them time after time, returning the patient over the part of the track where the charge is expected to lie. What repeater technique will fail to do can be done by returning the patient, session after session, to a portion of his life. Sooner or later it will come into view.

OCCLUDED LIFE PERIODS AND PEOPLE

Whole areas of the time track will be found occluded. These contain suppressors by way of engram command, ally computations and painful emotion. Persons can vanish utterly from sight for these reasons. They come to view after a few engrams have been lifted in basic or the area has been developed as above.

ANIMOSITY TOWARD PARENTS

It always happens, when one clears a child or adult, that the pre-clear goes through stages of improvement which bring him up the tone scale and cause him, of course, to pass through the second zone, anger. A pre-clear may become furious with his parents and other offenders in the engram bank. Such a situation is to be expected. It is a natural by-product of therapy and it cannot be avoided.

As the case progresses the tone scale, of course, rises and places the pre-clear in a state of boredom toward the villains who have wronged him. At last he reaches Tone 4, which is the

tone of the clear. At this time he is very cheerful and willing to be friends with people whether they have wronged him or not: of course he has the data about what to expect of them, but he nurses no animosity.

If a parent feels that the child, knowing all, would turn against him, then the parent is mistaken. The child has already, as an aberree, turned very thoroughly against the parent whether his analyzer knows all or not and the most uncertain and unlovely conduct may result from further hiding of the evidence.

It is a matter of continual observation that the good release and the clear feel no animosity whatever toward their parents or others who had caused their aberrations and indeed stop negating, defending and fighting so irrationally. The clear will fight, certainly, for a good cause and he will be the most dangerous opponent possible, but he does not fight for irrational reasons like an animal and his understanding of people is very much enlarged and his affection can at last be deep. If a parent wishes love and cooperation from a child, no matter what he has done to that child, permit therapy and achieve that love and cooperation with the child self-determined and no longer secretly in apathy or rage. After all, the clear has learned the source of his parents' aberrations as well as his own; he recognizes that they had engram banks before he did.

PROPITIATION

In the process of work a stage will be passed, in the upper range of apathy, of propitiation. This conciliation is an effort to feed or sacrifice to an all destructive force. It is a state wherein the patient, in deep fear of another, offers expensive presents and soft words, turns the other cheek, offers himself as a doormat and generally makes a fool out of himself.

Many, many marriages, for instance, are marriages not of love but of that shabby substitute, propitiation. People have a habit of marrying people who have similar reactive minds. This is unfortunate for such marriages are destructive to both partners. She has a certain set of aberrations: they match his. She is pseudo-mother, he is pseudo-father. She had to marry him because father tried to murder her before she was born. He had to marry her because mother beat him when he was a child. Incredible as it may seem, these marriages are very common: one or the other partner becomes mentally ill, or both may deteriorate. He is unhappy, his enthusiasms crushed; she is miserable. Either with another partner might be a happy person yet, out of fear, they cannot break apart. They must propitiate each other.

The auditor who finds a marriage in this condition and attempts to treat one of the partners, had better treat both simultaneously. Or such partners had better treat each other and soon. Tolerance and understanding are almost always fostered by mutual help.

Propitiation is mentioned here because it has a diagnostic value. People who start bringing the auditor expensive gifts are propitiating him, and it probably means that they have a computation which tells them, engrammatically, that they will die or go crazy if they become sane. The auditor may enjoy the gifts, but he had better start looking for a sympathy engram not yet suspected or tapped.

LOVE

Probably no single subject in the concerns of Man has received as much attention as Love.

It is not untrue that where one finds the greatest controversy, there he will also find the least comprehension. And where the facts are least precise there one can also find the greatest arguments. And so it is with Love.

Without doubt Love has ruined more lives than war and made more happiness than all the dreams of Paradise.

Entangled with a thousand songs a year and submerged beneath a solid tonnage of poor literature, Love should have a proper chance to be defined.

It has been discovered that there are three kinds of Love between woman and man: the first is covered under the law of affinity and is the affection with which Mankind holds Mankind; the second is sexual selection and is a true magnetism between partners; the third is compulsive "Love" dictated by nothing more reasonable than aberration.

Perhaps in the hero and heroine legends there have been cases of the second kind, and surely as one looks about him in this society he can discover numbers of happy partnerships based on a natural and strongly affectionate admiration. The third kind we find in plenty: tabloid literature is devoted to it and its travails; it crams the courts with urgent pleas for divorce, with criminal acts and civil suits; it sends children weeping into the corner away from quarrels and it launches from its broken homes broken young women and men.

Dianetics classifies this third kind of love as "reactive mind partnership." Here is a meeting of minds -- but the minds are on the lowest computational level possessed by man. Driven together by compulsion, men and women mate who will find in that mating nothing but sorrow and reduction of their hopes.

He is pseudo-brother who beat her regularly or he is pseudo-father whom she had to mind. Maybe he is even pseudo-mother who screamed ceaselessly at her but whom she had to placate, and he might be the doctor who hurt her so savagely. She may be his pseudo-mother, his pseudo-grandmother whom he had to love despite the way she undermined his decision; she may be a pseudo-nurse in some operation long gone or the pseudo-teacher who kept him after school to whet her sadism upon him.

Before the marriage takes place they only know there is a compulsion that they must be together, a feeling that each must be extremely nice to the other. And then the marriage takes place and more and more restimulation of ancient pain is felt until at last each is ill and life, complicated now perhaps by unhappy children, is an unhappy ruin.

The mechanism of propitiation carries with it covert hostility. Gifts given without cause and beyond the ability to expend, self-sacrifices which seem so noble at the time compose propitiation. Propitiation is an apathy effort to hold away a dangerous "source" of pain. Mistaken identity is one of the minor errors of the reactive mind. To buy off, to nullify the possible anger of a person perhaps long since dead but living now again in the partner, is the hope of propitiation. But a man is dead who will not sometimes fight. The hostility may be masked, it may be entirely "unknown" to the individual who indulges it. Certainly it is always justified in the mind of the person who exerts it and is supposed to be a natural consequence of some entirely obvious offense.

The wife who makes inadvertent blunders before the guests and by them accidentally gives away the truth of her husband's favorite myth, the wife who forgets the little favors he has asked, the wife who suddenly stabs him with a "logical" pin in the region of his hopes: these are wives who live with partners whom they must, out of some wrong done years before the courtship and by some other man, propitiate, and these are wives who, propitiating, numb the hopes and misunderstand the sorrows of their mates.

The husband who sleeps with another woman and "accidentally" leaves the lipstick on his tie, the husband who finds her excellent cooking bad and idleness in her days, the husband who forgets her letters he must mail, the husband who finds her opinions silly, these are husbands who live with partners whom they must propitiate.

A soaring, roller-coaster curve of peace and war in the home, failures to understand, mutual curtailment of liberty and self-determinism, unhappy lives, unhappy children and divorce are caused by reactive mind marriages. Compelled by an unknown threat to marry, repelled by fear of pain from trust, this "meeting of minds" is the primary cause of all marital disaster.

The law lacked definition and so invoked great difficulty in the path of those involved in such marriages. The track of it is the dwindling spiral of misery which accompanies all chronic restimulation and leads only down to failure and to death. Someday there will, perhaps, exist a much more sentient law that only the unaberrated can marry and bear children. The present law only provides that marriages must be at best most difficult to part. Such a law is like a prison sentence for the husband, the wife and the children -- all and every one.

A marriage can be saved by clearing its partners of their aberrations. An optimum solution would include this in any case since it is most difficult for a wife or a husband to rise, even when divorced, to any future plane of happiness: and where there are children, if clearing is not effected, a great injustice has been done.

It is usually discovered that when both partners in a reactive mind marriage are cleared of aberration, life becomes considerably more than tolerable; for human beings often have a natural liking even when no sexual selection has been present. The restoration of a marriage by clearing the partners may not bring about one of the great loves that poets strummed about but it will at least bring a high level of respect and cooperation toward the common goal of making life worthwhile. And in many marriages so cleared it was discovered that the partners, beneath the dirty cloth of aberration, loved each other well.

A major gain to such a clearing is for the children's sake. Nearly all marital discontent has as its major factor aberration on the second dynamic, sex. And any such aberration includes a nervous disposition toward children.

Where there are children, divorce does not answer, clearing does. And with clearing comes a fresh new page of life on which happiness can be written.

In the case of the reactive mind marriage, turn-about clearing is often complicated by the concealed hostilities which lie below the propitiative mechanism. It is wise for the partners to look outside the home, each interesting a friend in a therapy turn-about. If such mutual clearing is begun, with the partners working on each other, much restraint of anger and exertion of patience must be practiced, and the auditor's code must be most severely followed. It requires a saintly detachment to bear the Tone One of the partner who, returned to a quarrel, seasons the recountings with further recrimination. If it must be done, it can be done but, when many quarrels and travails have beset a couple, it is easier if they each look without the home for a therapy partner.

Additionally, there is a kind of "rapport" established between any auditor and pre-clear and after the therapy session is done, a strengthening of the natural affinity is such that a small deed or word may be taken as a savage attack with the result of a quarrel and the inhibition of therapy.

Men can be considered to be best audited by men and women by women. This condition is changed when one deals with a woman who has such severe aberrations about women that she is in fear around them or when one is auditing a man who has deep fear of men.

The dynamics of men and women are somehow different and a wife, particularly if there have ever been quarrels of any magnitude, sometimes finds it difficult at times to be sufficiently insistent to audit her husband. The husband may audit, in the usual case, without great difficulty but when in therapy himself, his feeling that he must rise superior to the situation forces him to attempt auto-control, a thing which is impossible.

THE ERASURE

Sooner or later -- if you keep trying -- you will get basic-basic, the earliest moment of "unconsciousness" and physical pain. You will know when you have it, perhaps, only because things start to erase rather than reduce. If the patient still has a sonic shut-off, you can still erase: sooner or later that sonic will turn on, perhaps not even until the case is almost finished. You will reach basic-basic sooner or later.

The erasure, then, is more or less the same procedure as the entrance. You erase all the early engrams, always the earliest you can find, and you keep discharging painful emotion engrams either in the basic area or in the later periods after birth and later in life. You erase as much as you can find in the early part of the case, then you release all the emotion you can find later in the case (erase everything in each engram you touch) and then you come back and find early material.

The reactive engram bank is a hurrah's nest. The file clerk must have a great deal of trouble with it. For things are keyed-in early and late, sometimes all he can get is material under certain topics, sometimes all he can get is material under certain somatics (all teeth, for instance), sometimes he can go in an orderly parade forward in time and give consecutive incidents: this last is the most important proceeding.

Not until you have worked out every moment of physical pain and discharged all the moments of painful emotion will the case be cleared. There will be times when you are sure that you are almost to the goal only to discover, going into the prenatal area again, a new series of material uncovered by the later life painful emotion you have released.

One day you will find a case which will not have any occlusions anywhere on the track, which will no longer be interested in engrams (apathy cases aren't interested at the start; clears, at the top level, are not interested either, making a cycle, though the clear is a long way from apathetic), which will have all recalls, which will compute accurately and make no errors (within the limitations of the data available) and which, in short, has an exhausted engram bank. But do not be too optimistic, ever. Keep looking until you are sure. Observe the case to make certain no aberrations are displayed about anything, that dynamics are high in it and that life is good. If this person now feels he can solve all the problems of life, lick the world with one hand tied behind him and feel a friend to all men, you have a clear.

The only way you can go wrong is to compute with the idea that human beings are full of error and evil and sin and that if you have made a person less unhappy and above normal he is to be judged a clear. This is a release.

In gold panning, it is true that every tenderfoot mistakes iron pyrites -- fool's gold -- for gold. The tenderfoot will crow with delight over a bright bit of something in his pan which, actually, is worth a few dollars a ton. And then he sees real gold! The moment he sees real gold in that pan, he knows what gold really looks like. It cannot be mistaken.

Aside from the fact that psychometry would show a clear phenomenally intelligent, would show his aptitude and versatility wide, there is another quality, the human quality of a freed man. You take a release through psychometry and show him to be above normal, too. But a clear is a clear and when you see it you will know it with no further mistake.

That a clear is no longer interested in his extinct engrams does not mean he is not interested in the troubles of others. That a person is not interested in his own engrams does not necessarily argue a clear but may well be another mechanism, the apathy of neglect. To have engrams and neglect them is a common aberration with the reactive mind on a tone scale of apathy. To have no engrams and neglect them is another thing. Every apathy case, neglecting his engrams as an answer to his woe, insisting he is happy, insisting, as he racks himself to pieces, that there is nothing wrong with him, will, in work, particularly after basic-basic is lifted, become interested in his engrams and more interested in life. It is easy to tell the apathy

case from the clear for the two are at opposite ends of the spectrum of life: the clear has soared up toward victory and triumph, the apathy case knows victory and triumph are not for him and explains they are not worth it.

What the life span of a clear is cannot be answered now; ask in a hundred years.

How can you tell a clear? How close does the man measure to optimum for Man? Can he adjust to his environment smoothly? And far more important, can he adjust that environment to him?

Sixty days and again six months after a clear has apparently been effected, the auditor should again make a search for any neglected material. He should question the possible clear carefully as to the events of the past interval. In such a way he can learn of any worries, concerns or illnesses which may have taken place and attempt to trace these to engrams. If he cannot then find engrams, the clear is definitely and without question, cleared. And he will stay that way.

If a case merely stalls, however, and while aberration seems to be present, engrams cannot be found, the cause probably lies with thoroughly masked despair charges -- painful emotional engrams. These are not necessarily postnatal, they can be within the prenatal period and involve circumstances which are very secret -- or so the engrams announce. Also, some cases have stalled and proven "impenetrable" because of a current or immediately past circumstance the patient has not revealed.

There are two reasons which can delay a case:

(a) the person may be so aberratedly ashamed of his past or so certain of retribution if he reveals it that he does nothing but avoid;

and

(b) the person may be in fear because of some existing circumstance or threat.

The auditor is not interested in what the patient does. Or in what the patient has done. Dianetics treats of what has been done to the person exclusively in therapy. What has been done by a patient is of no concern. The auditor who would make it any concern is practicing something other than dianetics. However, a patient, because of his engrams, may become obsessed with the idea that he must hide something in his life from the auditor. general classes above cover the general conditions.

These active reasons, as under (a), may be such a thing as a prison sentence, a murder hitherto unknown (although many people think they have done murder who have not even threatened it to anyone), abnormal sexual practices, or some such circumstance. The auditor should promise not to reveal any confidential matter, purely as a matter of routine and explain the principle of "done to. not done by." And no auditor would taunt or revile a patient for having been victimized by his engrams. As under (b) there may exist some person, even the wife or husband, who has cowed the patient into secrecy. One case is at hand where no advance was made although there were many incidents contacted: the incidents would not reduce or erase no matter where they were. It was discovered that this case, a woman, had been beaten savagely and often by her husband and that she had been threatened with death if she told the auditor a word of these acts; and yet these acts contained the whole despair charges of the case and had to be released. Seeing this, finally suspecting, the auditor was able to gain her confidence and locate the despair charges. Even if he had not gained her confidence, by constant restimulation of late life areas he would have provoked her tears. In another case, that of a small child, "dub-in" recall was so obvious and lie factories were so busy that the auditor at last realized that he was attempting to penetrate not just the secrecy on an engram but the secrecy imposed upon a child by some one at hand. The mother, in this case, out of the idea that she would be apprehended, had furiously threatened the child to say nothing about his

treatment at home. There was more than this behind the case, there were eighty-one attempted abortions, an incredible number.

Anything is the business of an auditor if it has become an engram. If society has jailed a man, if all is not well in the home, these are things done to a person. What the person did to "deserve" this treatment is of no concern.

THE FOREIGN LANGUAGE CASE

Now and again an auditor will encounter a strange sort of hold-up in a case. He will be unable to get anything to clear or make sense in the prenatal area and sometimes in childhood as well as the prenatal area. He may be encountering a "foreign language case." Occasionally the child did not know he was born to other parents (who may have spoken a foreign tongue) than those he has known as his parents. This is a special sort of mix-up of its own which is rather easily resolved simply by running engrams. It is always possible for the patient to forget that his parents spoke some other tongue in the home. Another tongue than the one the patient is using or other than that of the country in which the patient resides is, in one way, an asset: it gives a prenatal area which is very difficult to restimulate although it may still be acting upon the patient's mind. But it is no asset to the auditor, who must now deal with a patient who does not know the language, who may not have sonic recall and yet has an engram bank full of data which once had meaning and really is his basic language.

The best remedy for such a case is to get an auditor who knows both the language used in the prenatal area and the present tongue. Another remedy is to take a dictionary to the case and figure out the bouncers et al. from the dictionary. Another way is to regress the patient often enough into the infant period that he begins to pick up the language again (making the file drawer of it come forth) and then ask the patient for phrases which, in the foreign tongue, would mean this or that. Gradually he may recover the language and so exhaust the bank. This is an extremely difficult case only when there was no childhood use of the other tongue. Given childhood use of that tongue, the auditor simply keeps returning the patient to childhood when he knew the tongue and then returning him into the prenatal area: the patient can translate what is happening. The cliches of other tongues than that the auditor speaks are often quite productive of other literal meanings than comparable cliches in the auditor's tongue. This difference of cliché is a very responsible agent in the social aberrations of one nation as they differ from those of another. "I have hot," says the Spaniard. "I am hot," says the Englishman. Engrammatically, they mean different things, even if they mean the same to the analyzer.

CHAPTER IX

PART TWO

Mechanisms and Aspects of Therapy

EXTRA-SENSORY PERCEPTION

Every time the auditor has a case with dub-in recall or which is highly charged with emotion, the case may return into the prenatal area and start describing scenery. This is the awe and wonder of some beholders. There is the patient in the womb and yet he can "see" outside. The patient tells about father and mother and where they are sitting and what the bedroom looks like, and yet there he is in the womb. Some pretty theories can be advanced for this: one of them is that the tortured foetus develops extra-sensory perception in order to see what is coming next. ESP is an excellent theory and some observation may confirm it but not in the foetus.

One must recall that the foetus, even if it has highly developed and clever cells, is yet not a truly rational organism. The presence of the engram does not necessarily mean that the foetus could think. The engram became most severely aberrative when the child finally learned speech. The engram is not a memory but a recording of pain and percepts.

Returning a grown man or a child into the prenatal area returns there an experienced mind which, connecting with these engrams, forms conclusions. To listen to some pre-clears one would think they read Keats and drank lemonade every afternoon at four throughout the prenatal period.

To return reason and analytical power back into a period when neither reason nor analytical power existed, of course, impinges upon the returned individual many ideas. All he is supposed to run are the engrams and their contents. He may additionally, by dream mechanisms and current computation, try to fashion in a whole technicolor picture of the scenery.

This prenatal ESP does not in fact exist. It has been proven, after considerable test, that whenever the returned pre-clear thinks he sees something, the scenery itself is mentioned in the engrams and gives him an imaginary picture of it. There is no prenatal ESP, in other words. There are only descriptions and actions which suggest scenery and these suggestions, operating now upon the imagination, bring about the supposed visio.

This is most chronic with patients who have high powered lie factories. When the auditor sees this he begins to form a notion of the case he is engaged upon, he knows "dub-in sonic" may be used and he should find and discharge all painful emotion he can reach for it is this painful emotion which so disposes a case to avoid. He can find, then, the lie factory itself, not the lie factory of the lie factory which produces lie factories, but the actual engram which causes all this delusion.

However, never bring a pre-clear up short on this material. Don't tell him it is imaginary, you'll drive the lie factory into higher effort. For there are sympathy computations here, despairful losses, great prenatal pain and childhood neglect. And it would take little to shatter what self-confidence this patient has managed to assemble. Therefore walk softly, look for despair charges, allies, sympathy engrams and get the lie factory. Then the case will settle down and progress to clear.

ELECTRIC SHOCK

It has been found important, in entering a case to locate and relieve all engrams caused by electric shock of whatever kind. These seem to produce a grouping of engrams, whether they are received prenatally (as some have been), accidentally, or at the hands of psychiatrists.

Any electric shock seems to have more than usual force in the engram bank and apparently deranges the memory files of both past and future events surrounding the shock area. Further, electric shock injury contains a great depth of "unconsciousness" which thereafter holds the analytical mind in a reduced state.

TACIT CONSENT

In the case of two pre-clears working on each other, each one assuming in his turn the auditor's role, a condition can arise where each prevents the other from contacting certain engrams.

For example, pre-clear A has an ally computation concerning a dog. He unknowingly seeks to protect this "pro-survival" engram within himself although, of course, failure to release it will hinder therapy. As he audits pre-clear B he has a tendency to project his own problems into pre-clear B, which is to say he has some slight confusion of identity. If pre-clear B is known to have some "pro-survival" engram about a dog, then pre-clear A, auditing, will actually avoid making pre-clear B contact B's own engram. This is a mistaken idea that by letting B keep his dog engram, A can retain his dog engram. This is "tacit consent." It might be summed as a bargain: "If you don't make me get well, I won't make you get well." This should be guarded against: once known that such a condition exists and that such reluctance to clear the other is manifested, "tacit consent" ceases.

It may also happen that a husband and wife may have a mutual period of quarrels or unhappiness. Engaged upon clearing each other, working alternately as auditor, they avoid, unknowingly but by reactive computation, the mutual period, thus leaving in place painfully emotional engrams.

Tacit Consent is not easily recognized by the individuals so involved, and pre-clears, alternating as auditors, should be very wary of it for it cannot do other than slow a case.

EMOTION AND PAIN SHUT-OFFS

A case which manifests no emotion or cannot feel pain when emotion and pain should be present in some incident is suffering from a "feeling" shut-off: this most likely will be found in the prenatal area. The word "feeling" means both pain and emotion: thus the phrase, "I can't feel anything," may be an anesthetic for both.

If an exteriorized view of the incident (where the patient sees himself and is not in himself) or what pretends to be prenatal "ESP" is present, the emotional shut-off probably stems from painful emotion engrams in late life or at least post-birth. If there is no exteriorized view and the patient is within himself, and yet no sharpness of pain or emotion manifests itself while he is running through an engram, an early emotional shut-off or an early pain shut-off should be suspected and should be located by repeater technique. Run the words "No emotion" until a paraphrase is obtained: run the words "I can't feel," or some other phrase meaning the same thing and the patient, if the engrams are available and are not suppressed by others, will eventually respond.

It may happen that a case may "work" very well, which is to say that engrams present themselves and can be run and reduced, without emotion manifesting itself as part of the content and with somatics which are dull and not so much pain as simply pressure. If the pain and emotion shut-offs do not yield at first to repeater technique, many engrams may have to be

run in the basic area without pain or emotion but only with pressure and word content. In such a case pain and emotion can eventually be contacted, after which therapy is more beneficial.

EXTERIORIZED VIEWS

Whenever you find a patient, returned, outside himself and seeing himself, that patient is off the track. He should not be told so but the despair charges, which is to say, the painful emotion engrams, should be found as soon as possible and discharged. This is something of the same mechanism as the ESP described above.

TELEPATHY

Every few cases some pre-clear may try to palm off telepathy as an aberrative factor. This is more rainbow chasing. There may be telepathy but so far as research has shown the foetus doesn't receive any and even if he receives it, it is not aberrative in any way.

Exhaustive tests were made on telepathy and ESP and in every case an explanation was found which did not need to go into mind reading or radar sight.

When a patient tries to tell the auditor that he is reciting mother's thoughts received prenatally, be certain that somewhere around there is an engram in which she says these exact words aloud. Mothers, especially when aberrated severely and especially when aberrated severely enough to attempt abortion, have many engrams they dramatize. The power of the dramatization commonly manifests itself as monologues. Some mothers have a very great deal to say to themselves when alone. All of this speech is, of course, transmitted to the child when he is injured, and he may be injured without mother being injured as in an attempted abortion. For considerable time after such an injury the child is usually "unconscious" and in pain; he therefore records in engrams these monologues (and often the voice is quite loud). He doesn't hear it: it is simply cellularly recorded. All such monologuing is aberrative, of course, and produces some remarkable patterns of insanity and neurosis.

But of telepathy, there is none that is aberrative so far as we know at this time. So the auditor should not accept telepathy any more than he would accept ESP.

PRENATAL LIVING CONDITIONS

It is very noisy in the womb. A person may think he has sonic and yet hear no "womb" sounds, which means that he does not have sonic but only "dub-in." Intestinal squeaks and groans, flowing water, belches, flatulation and other body activities of the mother produce a continual sound.

It is also very tight in later prenatal life.

In a high blood pressure case, it is extremely horrible in the womb.

When mother takes quinine a high ringing noise may come into being in the foetal ears as well as her own -- a ringing which will carry through a person's whole life.

Mother gets morning sickness, has hiccoughs and gets colds, coughs and sneezes.

This is prenatal life.

The only reason anybody "wanted" to "return to the womb" was because somebody hit mother and yelled "Come back here!" so the person does.

THE ENGRAM FILING SYSTEM

Engrams are not filed in the orderly fashion managed by a cleared standard bank. Engrams are filed in a way which would defy Alexander. Hence, it is difficult to know when the proper consecutive item will appear.

Time, topic, value, somatic and emotion are the methods of filing.

The return from basic-basic may be an apparent orderly progress into late life. Suddenly a despair charge is triggered and discharged. The auditor looks back at the prenatal area and finds a whole new series of incidents in view. Progress is then begun back to present time, step by step, another discharge is triggered and another series of prenatals come into sight. These are erased and progress is made back toward present time when still another despair charge is released and still more prenatals come to view. These are erased and so forth and so on.

The engram filing system gives out data by somatic, time, topic, value or emotion. Usually the file clerk hands out material on the basis of time and topic. Emotion in the bank keeps the file clerk from getting at a certain series of incidents; when the emotion is discharged, the incidents become available and incidents are brought out until another emotional charge stops the file clerk. The wit of the auditor is most used, not in getting prenatals, but in finding these later life emotional charges and discharging them.

All in all the engram filing system is very poor, unlike the standard bank. But it is also very vulnerable now that we understand it.

The engram filing system data can be erased. Standard bank data cannot be erased. Pain is perishable -- pleasure endures.

ALLEVIATION

The psycho-analyst or general counselor in human relations is occasionally faced with a type of problem which dianetics, applied in small quantity, can resolve easily.

It is possible, when a person has been too disturbed by an event of the day to address himself to the problem at hand to alleviate his disturbance with a few minutes of work.

A sudden change in the aspect of a patient, a sudden deterioration of his serenity, generally stems from some incident which has caused him mental anguish. Although this change of mind has its source in the restimulation of an engram, the moment of restimulation, which is a lock, may be addressed and alleviated with success.

Using reverie or merely asking the patient to close his eyes, the analyst can request him to return and be in the instant wherein he was disturbed. That instant may be in the same day or the same week as the office call. A moment of analytical shut-down will be discovered wherein some restimulative person or circumstance upset the equilibrium of the patient. This moment is a lock. It can be recounted, ordinarily, as an engram and the latest source of tension will relieve so that work can be continued. The engram itself, upon which the lock depended, may not be accessible without a full dianetic address to the problem.

The auditor, finding a patient much disturbed, can often save time by relieving the lock which caused the immediate disturbance of the pre-clear.

Locating locks on a wholesale basis is unremunerative from a dianetic viewpoint since there are thousands and thousands of them in every case. Locating the last lock, which is hindering work, may be of benefit.

THE TONE SCALE AND REDUCTION OF ENGRAMS

Because it is very important, the mechanism of the reduction of a late painful emotion engram must be specifically detailed.

The uses of reduction on late engrams are wide and various. When the auditor gets into trouble with his pre-clear by some violation of the auditor's code, he can treat the violation as a painful emotion engram and reduce it, at which moment the effect of his blunder will be gone in the pre-clear. The auditor merely returns the pre-clear back to the blunder and runs the error itself as an engram. When the husband has quarreled with his wife or she has found out some unpleasant thing about his activities, he can treat the quarrel or the discovery as a painful emotion engram and release it with the result of no further worry about it by his wife. When the little boy's dog has just been run over, the incident can be treated as a painful emotion engram and released. When the pre-clear's wife has just left him, treat the leaving as a painful emotion engram and release it. Whatever the shock or upset, it can be reduced in an individual by regular reduction technique and the individual will cease to be troubled by it in the painful emotion sense. It does not matter whether the engram occurred two hours or ten years ago, painful emotion can be reduced from it. It is run exactly like any other engram, beginning at the beginning of the first shock with the patient returning to it and continuing far enough along it to adequately embrace its first impact.

The aspect of this reduction is a pattern which does not much vary. If the news struck the individual into apathy, then, as he recounts, he will, unless there is a severe emotional shut-off elsewhere, progress through the incident a time or two, perhaps, before he contacts it properly. Then there will come the tears and despair of apathy. Another two or three runs should bring up anger. Then further recounting (always from beginning to end as re-experience) brings the tone up into boredom. Further recounting should bring it to Tone 3 or 4, release or, most favorably, laughter.

This progress of the tones is the clue which led to the establishment of the tone scale from 0 to 4. A Tone 4 is laughter.

There is sometimes a stage in the Tone 2 area where the patient begins to be offhand and flippant. This is not Tone 4, it denotes more data present. He may resist recounting at this point, saying the incident is released. The auditor must insist on further recounting whenever he finds the pre-clear unwilling to recount again, for here is data being suppressed and more charge is present. The flippancy is generally found to be an escape mechanism and is sometimes uttered in the very words which are yet concealed. More recounting (without the auditor insisting any certain words be found) is then done until the patient reaches Tone 4.

Here we have, in vignette, the behavior of the whole engram bank in the process of therapy. The entire bank rises from its initial tone level eventually up to Tone 4, higher and higher as more and more engrams are erased or reduced. The bank's rise is not, however, a smooth upward curve for new engrams will be contacted with apathy in them and some have manics in them. The painful emotion engram, however, does a rather smooth rise. If it is going to release at all it will rise up the scale. If it does not rise up the scale -- apathy to anger, anger to boredom, boredom to cheerfulness or at least no concern -- then it is suppressed by an incident with similar content.

An engram may begin at Tone 1 -- anger -- and rise from there. If it is found to be in Tone 2 at the start -- boredom -- it is hardly an engram.

It may, however, be in a false Tone 2 and suppressed by other data so that the patient merely appears bored and careless about it. A few recountings may bring about release of it, at which moment it will sag instantly to apathy -- Tone 0 -- and then come on up the scale of the tones. Or another engram may have to be contacted.

The whole physical being follows this tone scale throughout a course of therapy. The mental being follows this tone scale. And painful emotion engrams follow it.

On an erasure down in the basic area or when returning from basic-basic, two or three runs will erase an engram of whatever kind unless it is the basic on a new chain of similar incidents. But engrams which show no emotion anywhere on the track are suppressed by emotional or feeling shut-offs, late painful emotion or early engrams which simply shut off the pain or emotion in so many words.

A case should be kept "live." There must be variability of emotion. A monotone recounting, which is to say, one which does not vary the engramic tone but merely reduces, is necessary in the basic area at times, but anytime a patient becomes orderly and "well-drilled" and expresses no concern over his engrams as he recounts them, there is late painful emotion to be tapped or early emotional shut-off. Conversely, if the patient is too continuously emotional about all and anything, if he weeps awhile and then laughs hysterically, therapy is being done but one should be alert for something engramic in the prenatal area which says he has to be "too emotional" -- which is to say, he has engrams which make him emotional by their command content.

The tone scale is very useful and is a good guide. It will be most prominent in reducing post-speech engrams, but will also appear earlier.

Any painful emotion engram can be run. If it is properly reducing and not suppressed elsewhere, it follows the tone scale upwards to Tone 4.

IF THE PATIENT DOES NOT WORK WELL ON REPEATER TECHNIQUE

If, when the patient repeats a line the auditor has given him, the patient does not move to an incident, three things can be wrong: first, the patient cannot move on the track; second, the phrase may be sensibly withheld by the file clerk until such time as it can be cleared; or third, the phrase does not exist as engramic material.

The patient may also have strong "control yourself" engrams which manifest themselves by his snatching control from the auditor, being very bossy or simply refusing cooperation. Repeater technique, when directed at "control yourself" and "I've got to operate" and allied phrases, can then work.

The usual reason repeater technique does not work is that the patient is in a holder. If he is returned but does not shift on the track when repeater technique is given him, use repeater technique on the holders.

Remember that a "feeling" shut-off can deny all somatics so that the patient does not feel them. If the patient seems insensible to trouble on the track, be sure that he has a feeling shut-off.

A large emotional charge may also inhibit repeater technique.

The somatic strip does not go well into emotional charges -- painful emotion engrams -- and repeater technique is therefore indicted.

If repeater technique "the worst thing that could happen to a baby" and so forth and from his conversation may be garnered new phrases for repeater work which will take the patient into an engram.

SINGLE WORD TECHNIQUE

Words as well as engrams exist in chains. There is always a first time for the recording of each word in a person's life. The whole common language may lie within the engram bank.

The possible combinations of that common language may well approach infinity. The ways various deniers, bouncers et al., can be phrased are always beyond count.

Two “happy” facts exist, however, to reduce the auditor’s labors. First, the dramatis personae of his engrams are at this date aberrated. Each aberration has standard dramatizations which he repeats over and over in restimulative situations. The reaction, for instance, of the father to the mother is repetitious: if he utters a set of phrases in one engramic situation, he will utter it in subsequent similar situations. If the mother, for example, has an accusative attitude toward the father, then that attitude will be expressed in certain terms and these terms will appear in engram after engram. The second fact is that where the father or mother is abusive to the other, the other will eventually begin to suffer contagion of aberration and will repeat the other’s phrases. In a first-born child, where parental brutality is present, one can observe the parents through the engrams of the patient and see one or the other gradually take up the other’s phrases either to worry about themselves or to redeliver them. All this tends to make the engrams appear in chains of incidents, each incident much like the next. When one has the basic on each type of chain, the subsequent incidents on that chain are sufficiently similar to permit many incidents to be reduced or erased immediately after the first is found. The first incident on the chain, the basic for that chain, holds the others more or less in place and out of sight; therefore, the basic of the chain is the goal.

Each word in the bank can be discovered to have been delivered to the bank for the first time. Words also reduce in chains with the virtue that each subsequent appearance of the word in the bank locates automatically a new engram, which, of course, is reduced or erased as soon as it is contacted or as soon as its basic can be located.

Single word technique is very valuable and useful. It is a special kind of repeater technique. On most patients, the repetition by themselves of one word will cause the associated words to suggest themselves. Thus, one asks the patient to repeat and return on the word Forget. He starts repeating the word Forget and shortly has an associated set of words, making a phrase, such as “You can never forget me.” Here we have a phrase in an engram and the remainder of the engram can then be run.

When a late engram has had to be contacted to progress a case and yet will not relieve, it is possible to take each word or phrase of that late engram and run it back with repeater technique. Thus the earlier engrams which hold this late engram in place can be located and reduced, and eventually one will have reduced the late engram itself. This, by the way, is a common and useful practice.

There is a law about this: When any phrase or word in an engram will not reduce, the same phrase or word occurs in an earlier engram. One may have to discharge late emotion to get the earlier phrase, but ordinarily single word repeater or phrase repeater will attain it.

There are only a few dozens of words necessary to get almost any engram. These would be the key single word repeaters. They are such words as these: forget, remember, memory, blind, deaf, dumb, see, feel, hear, emotion, pain, fear, terror, afraid, bear, stand, lie, get, come, time, difference, imagination, right, dark, black, deep, up, down, words, corpse, dead, rotten, death, book, reed, soul, hell, god, scared, miserable, horrible, past, look, everything, everybody, always, never, everywhere, all, believe, listen, matter, seek, original, present, back, early, beginning, secret, tell, die, found, sympathy mad, crazy, insane, rid, fight, fist, chest, teeth, jaw, stomach, ache, misery, head, sex, Anglo-Saxon four letter words of sex and profanity, skin, baby, it, curtain, shell, barrier, wall, think, thought, slippery, confused, mixed, smart, poor, little, sick, life, father, mother, familiar names of parents and any others of household during prenatal and childhood period, money, food, tears, no, world, excuse, stop, laugh, hate, jealous, shame, ashamed, coward, etc.

Bouncers, deniers, holders, groupers, misdirectors et al., each have their common single words and these are few. The bouncer would contain: out, up, return, go, late, later, etc.

The holder would contain: catch, caught, trap, trapped, stop, lie, sit, stay, can't, stuck, fixed, hold, let, lock, locked, come, etc.

The grouper would contain: time, together, once, difference, etc.

The single word technique shines nowhere brighter than in the Junior Case -- where the patient carries the name of one or another parent or grandparent. By clearing out the patient's name from the prenatal engrams (where it is applied to another person but misinterpreted by the patient as himself) the patient can regain his own definition and valence. Always use the patient's first name and last name (separately) as repeater, Junior or not.

If the engram bank is blank on a phrase, it probably is not blank on a common word. Any small dictionary will provide an ample fund for single word technique. Use also any list of familiar first names, male and female, and you may discover allies or lovers not otherwise contactable.

The painful emotion engram sometimes yields slowly by simply directing the somatic strip to it. Sometimes the patient finds it difficult to approach an overcharged area. Single word technique using the name of the ally, if known, or words of sympathy, endearment, death, rejection or farewell and the love name of the patient as a child in particular will often yield swift results.

By the way, in using repeater technique, word or phrase, the auditor must not stir the case up too much. Get what shows and reduce that. Reduce the somatic the person manifests when he goes into reverie and always try to find it for a while, even if you don't succeed. If you stir up something en route down a chain which won't reduce, mark it to be reduced when you have the basic.

Using single word technique one often obtains phrases which would otherwise remain hidden but which come into view when the key word is tapped. Using "hear" as a single word, for instance, the following phrases came to light which had thoroughly impeded the progress of the case. No effort was being made to contact such an engram in the prenatal area. Indeed, the "fight" chain had never been suspected since the patient had never dramatized it and because such a violent prenatal fight chain existed the fact that his parents fought violently in the home was utterly struck from the standard banks so that he would have denied such a thing with shocked surprise had it been suggested. The somatic was unusually severe, caused by the father kneeling on the mother and choking her:

Patient repeated "hear" several times, the auditor asking him to return to an incident containing that word. The patient continued to repeat and then suddenly sank into a stupor when he reached the prenatal area. He remained in this "boil-off" for about thirty minutes and then, the auditor rousing him occasionally to make him repeat the word "hear," manifested a strong somatic. "Hear" became "Stay here!" The somatic became stronger and "Stay here" was repeated until the patient could move freely on the track through the engram. He contacted his father's voice and was most reluctant to carry on with the engram, due to its intense emotional violence. Coaxed and edged into it by the auditor, the engram was recounted.

FATHER: "Stay here! Stay down, damn you, you bitch! I'm going to kill you this time. I said I would and I will. Take that! (Intensified somatic as his knee ground into the mother's abdomen) You better start screaming. Go on, Scream for mercy! Why don't you break down? Don't worry, you will! You'll be blubbering around here, screaming for mercy! The louder you scream the worse you'll get. That's what I want to hear! I'm a punk kid, am I? You're the punk kid! I could finish you now but I am not going to! (Auditor suddenly has trouble, patient taking last phrase literally and stopping his recounting; auditor starts him again) This is just a sample. There's a lot more than that where it came from! I hope it hurts I hope it makes you cry! You say a word to anybody and I'll kill you in earnest! (Patient now running ahead with such an emotional surge that commands are less active on him. This command to

remain quiet disregarded) I'm going to bust your face in. You don't know what it is to be hurt! (Somatic lessened by removal of the knee) I know what I'm going to do to you now! I'm going to punish you! I'm going to punish you and God is going to punish you! I'm going to rape you! I'm going to stick it into you and tear you! When I tell you to do something you've got to do it! Get up on the bed! Lie down! Lie still! (Crack of bones as she is struck in the face with a fist. Blood pressure coming up and hurting baby) Lie still! You'll always be here! I'm going to finish this! You're unclean! You are dirty and diseased! God's punished you and now I'm going to punish you! (Coitus somatic begins, very violent, further injuring child) You've got something terrible in your past. You think you've got to be mean to me! You try to make me feel like nothing! You're the one that's nothing! Take it, take it!" (String of sexual banalities screamed for about five minutes) The patient recounted this three times and it erased. It was basic-basic! Three days after conception as nearly as could be judged by the subsequent days to the missed period. It threw into view almost all the other important data in the case, which then resolved and was cleared.

The single word might have landed the patient on some other of the "hears" in the case. In this event it would be necessary to pick it up at its earliest moment or the remainder of the engram might not erase or reduce.

The word "hear" might also have landed the patient later on the track in which case the engrams would have had to have been traced back earlier until one was found which would erase, reducing each one as it was encountered until the earliest was reached when all would erase.

In using single word repeater as in phrase repeater, the auditor should not permit a rapid, unmeaning repetition but a slow repeat, the auditor requesting the somatic strip to return the while and asking the patient to contact anything else which might associate with the word.

Caution: if the patient is not moving on the track, do not give him repeater words or phrases at random as these will pile up engrams where the patient is stuck. Use only efforts to get the patient moving on the track by discovering and reducing the phrase that is holding him.

Caution: basic-basic does not always have words in it, often being only painful and accompanied with womb sounds. It will, nevertheless, hold everything in place by its perceptics.

SPECIAL CLASSES OF COMMANDS

There are several distinct classes of commands. They are outlined here for ready reference with some samples of each.

Aberrative commands can contain anything. The auditor does not much concern himself with them. Refer back to our young man and the coat in Book II and there we find, in the guise of hypnotic commands, some idea of what aberrative commands are. "I am a jub-jub bird," "I can't whistle Dixie," "The world is all against me," "I hate policemen," "I am the ugliest person in the world," "You haven't any feet," "The Lord is going to punish me," "I always have to play with my thing," may be very interesting to the patient and even amusing to the auditor and may have caused a considerable amount of trouble in the patient's life. Where dianetic therapy is concerned, these all come up in due course. Looking for a specific aberration or a specific somatic is sometimes of interest and sometimes of some use, but it is not usually important. These aberrative commands may contain enough data to make the patient a raving zealot, a paranoid or a catfish, but they are nothing to the auditor. They come up in due course. Working on them or about them is secondary and less.

The primary business of the auditor in any case is to keep the patient moving on the track, keep his somatic strip free to come and go and reduce engrams. The moment the patient acts as though or responds as though he was not moving or the moment the file clerk will not

give forth data, then something is wrong and that something has to do with a few classes of phrase: there are thousands of such phrases contained in engrams, variously worded, but only five classes:

DENYERS

“Leave me alone,” which means, literally, that he must leave the incident alone. “I can’t tell” means he can’t tell you this engram. “It’s hard to tell” means it is hard to tell. “I don’t want to know” means he has no desire to know this engram. “Forget it” is the classic of the sub-class of denier, the forgetter mechanism. When the engram simply won’t come to view but there is a somatic or a muscle twitch, send the somatic strip to the denier. It is often “Forget it” or “Can’t remember” as a part of the engram. “I don’t know what’s going on” may be Mama telling Papa something but the pre-clear’s analyzer, impinged, then doesn’t know what’s going on. “It’s beyond me” means he is right there but he thinks he isn’t. “Hold on to this, it’s your life!” makes the engram “vital” to existence. “It can’t be reached,” “I can’t get in there,” “Nobody must know,” “It’s a secret,” “If anybody found out, I’d die,” “Don’t talk,” and thousands more.

HOLDERS

The holder is the most frequent and the most used since whenever the pre-clear can’t shift on the track or come to present, he is in a holder. A holder combined with a denier will still hold: if it can’t be found, look for the denier first, then the holder. “I’m stuck” is the classic phrase. “That fixed it” is another. “I’m caught” doesn’t mean to the pre-clear what Mama meant when she said it. It may mean to her that she is pregnant but it tells the pre-clear he is caught on the track. “Don’t move,” “Sit there until I tell you to move,” “Stop and think” (on this last phrase, when it is uttered on a first recounting the auditor may have to start him going again for he does just that, he stops and thinks and he would stop there and think for some time: the auditor will see this strange obedience to this literal nonsense as he works a case). And thousands more. Any way words literally understood can stop a person or keep him from moving.

BOUNCERS

The bouncer could best be demonstrated by a curve. The pre-clear goes back into prenatal and then finds himself at ten years of age or even present time. That’s a bouncer at work. He goes early on the time track: it says come back up.

When the pre-clear can’t seem to get earlier, there is a bouncer ejecting him from an engram. Get a comment from him on what’s happening. Take the comment or some phrase which would be a bouncer and use repeater technique until he settles back down on the engram. If he contacts it easily, it won’t bounce him again. “Get out” is the classic bouncer. The patient usually goes toward present time. “Can’t go back at this point” may mean Mama has decided she will have to have the baby after all or finish the abortion but to the pre-clear it means he must move on up the time track or that he can’t get any earlier period. “Get up there.” “Run a mile” (“Beat it,” would not be a bouncer; it would mean the pre-clear should beat the engram). “I must go far, far away,” so he does. “I’m growing up,” “Blow you higher than a kite,” “Batter up.” And thousands more.

GROUPER

The grouper is the nastiest of all types of command. It can be so variously worded and its effect is so serious on the time track that the whole track can roll up into a ball and all incidents then appear to be in the same place. This is apparent as soon as the pre-clear

hits one. The grouper will not be discovered easily. But it will settle out as the case progresses and the case can be worked with a grouper in restimulation. "I have no time" and "Nothing makes any difference" are the classic groupers. "Everything comes in on me at once" means just that. "They're all in there together," "Screwed up," "Balled up," "It's all right here." "You can remember all this in present time" (a serious auditor error if he uses this to a suggestible patient, for it will gloriously foul a case). "You associate everything." "I am tangled up," "Jam everything in there at once," "There's no time," and thousands more.

MISDIRECTOR

This is an insidious character, the misdirector. When it appears in an engram, the patient goes in wrong directions, to wrong places, etc. "You're doing it all backwards." "All up now" is a grouper and a misdirector. "Always throwing it up to me" puts the pre-clear up the track some distance and from there he tries to pick up engrams. "You can't go down" is partly bouncer, partly misdirector. "We can't get to the bottom of this" keeps him off from basic-basic. "You can start over again" keeps him from finishing the recounting, whereupon he goes back to the beginning of the engram instead of running it. "Can't go through that again" keeps him from recounting. "I can't tell you how it began" keeps him starting his engrams in the middle and they will not then reduce. There are many such phrases. "Let's settle down" and all "settlings" make him drift backwards down the track. "I am coming down with a cold" puts the aberree in a common cold engram. This can be counted upon to make every cold much worse. "Come back here" is really a call back but it directs him away from where he should be. A patient who reaches present time with difficulty and then begins to go back has a "Come back here" or a "Settle down." "Down and out" misdirects him not only away from present time but to the bottom of the track and off it. This is a misdirector and a derailer all at once. "Can't get past me" is a misdirector on the order of a reverser. "You don't know down from up" is the classic phrase. "I'm all turned around."

A special case is the derailer which "throws him off the track" and makes him lose touch with his time track. This is a very serious phrase since it can make a schizophrenic and something of this sort is always to be found in schizophrenia. Some of its phrases throw him into other valences which have no proper track, some merely remove time, some throw him bodily out of time. "I don't have any time" is a derailer as well as a grouper. "I'm beside myself" means that he is now two people, one beside the other. "I'll have to pretend I am somebody else" is a key phrase to identity confusion. "You're behind the times" and many more.

There is another special case of the misdirector. The auditor says to go to "present time" and the file clerk throws out a phrase with "present" in it. It does not matter if the present in the phrase was a Christmas present, if it is in the prenatal area, the pre-clear goes there, ignoring what the auditor meant. "That's all at present," is a vicious phrase, putting everything in present time. "It's a lovely present."

And others. "Now" is sometimes confused with present time but not often. The auditor should not say "Come to now," because if he did he would find more "nows" than he could comfortably handle. "Present" is a rarer engramic word and is therefore used. "Now" appears too frequently.

Several severely aberrated persons who had little memory of the past have been found to be entirely off their time tracks, regressed into the prenatal area and stuck when the case was entered. As far as their wits were concerned, they had only a few months of past from where they were back to conception. And yet these people had managed somehow to function as normals.

Emotional charges usually hold the person off his track and, indeed, are the only things which give these engram commands any power according to current findings.

DIFFERENCES

There are two axioms about mind function with which the auditor should be familiar.

- I. THE MIND PERCEIVES, POSES AND RESOLVES PROBLEMS RELATING TO SURVIVAL.
- II. THE ANALYTICAL MIND COMPUTES IN DIFFERENCES. THE REACTIVE MIND COMPUTES IN IDENTITIES.

The first axiom is of interest to the auditor in his work because with it he can clearly establish whether or not he is confronting a rational reaction. The seven-year-old girl who shudders because a man kisses her is not computing; she is reacting to an engram since at seven she should see nothing wrong in a kiss, not even a passionate one. There must have been an earlier experience, possibly prenatal, which made men or kissing very bad. All departures from optimum rationality are useful in locating engrams, all unreasonable fears and so forth are grist to the auditor's mill. The auditor, with the above law, should study as well, the Equation of the Optimum Solution. Any departure from optimum is suspect. While he cares little about aberrations, at times a case will stall or seem to have no engrams. He then can observe the conduct of his patient and his patient's reactions to life in order to gain data.

The second law is dianetics' contribution to logic. In the philosophic text this is more fully entered. Aristotle's pendulum and his two-valued logic were abandoned not because of any dislike of Aristotle but because broader yardsticks were needed. One of these yardsticks was the spectrum principle whereby gradations from zero to infinity and infinity to infinity were used and Absolutes were considered utterly unobtainable for scientific purposes.

In the second axiom the mind can be conceived to recognize differences very broadly and accurately, in its nearest approach to complete rationality and then, as it falls away from rationality, to perceive less and less difference until at last it achieves a near approach to utter inability to compute any difference in time, space or thought and so can be considered completely insane. When this follows one thought only, such as a sweeping statement that "All cats are the same," it is either careless or insane since all cats are not the same, even two cats who look, act and sound alike. One could say, "Cats are pretty much the same," and still be dealing with rather irrational thought. Or one could recognize that there was a species *felix domesticus* but that within it cats were decidedly different not only from breed to breed but cat to cat. That would be rationality, not because one used Latin but because he could tell the difference amongst cats. The fear of cats has as its source an engram which usually does not include more than one cat and that is a very specific cat of a specific breed with a certain (or perhaps uncertain) personality. The pre-clear who is afraid of all cats is actually afraid of one cat and a cat which is most likely dead these many years at that. Thus as we swing from complete rationality down to irrationality there is a narrowing of differences until they nearly vanish and become similarities and identities.

Aristotle's syllogism in which two things equal to the same thing are equal to each other simply does not begin to work in logic. Logic is not arithmetic, which is an artificial thing Man invented and which works. To handle a problem in logic the mind flutters through an enormous mass of data and computes with dozens and even hundreds of variables. It does not and never did think on the basis that two things equal to the same thing are equal to each other except when employing mathematics it had conceived the better to resolve abstract problems. It is an abstract truth that two and two equal four. Two what and two what equal four? There is no scale made, no yardstick or caliper or microscope manufactured, which would justify the actuality, for instance, that two apples plus two apples equal four apples. Two apples and two apples are four apples now if they are the same apples. They would not equal four other apples by any growth or manufacturing process ever imagined. Man is content to take approximations and call them, loosely, exactitudes. There is no Absolute anything save in abstract terms set up by the mind to work out exterior problems and achieve approximations. This may seem to be a

stretched conception, but it is not. The mathematician is very well aware that he is working with digit and analogue approximations set up into systems which were not necessarily here before Man came and will not necessarily be here after he is gone. Logic, even the simple logic of wondering about the wisdom of going shopping at ten, is handling numerous variables, indefinites and approximations. Mathematics can be invented by the carload lot. There is no actual Absolute, there is only a near approach. Our grammarians alone, much behind the times, insist, probably in memory of the metaphysician, on Absolute Reality and Truth.

This is here set down partly because it may be of interest to some but mainly because the auditor must realize that he has an accurate measuring stick for sanity. Sanity is the ability to tell differences. The better one can tell differences, no matter how minute, and know the width of those differences, the more rational he is. The less one can tell differences and the closer one comes to thinking in identities ($A = A$) the less sane he is.

A man says, "I don't like dogs!" Spot it, auditor, he has an engram about one or two dogs. A girl says, "All men are alike!" Spot it, auditor, here's a real aberree. "Mountains are so terrible!" "Jewelers never go any place!" "I hate women!" Spot them. Those are engrams right out in broad daylight.

Those engrams which inhibit the analytical mind in differentiating are those engrams which most seriously inhibit thinking.

"You can't tell the difference," is a common engram. "There is no difference," "Nothing will ever make any difference to me again," "People are all bad," "Everybody hates me." This is insanity bait, as the auditors say, and puts a man "spin-bin bound."

There is another class of identity thought and that is the group which destroys time-differentiation. "You don't know when it happened!" is a classic phrase. "I don't know how late it is," and others have a peculiar effect on the mind for the mind is running on a precision chronometer of its own and the engrams can thoroughly misread the dial. On a conscious level one goes along fairly well on analytical time. The engrams slide around back and forth according to when they are keyed-in or restimulated. An engram may underlie today's action which belonged forty years ago on the time track and should be back there. It is not remarks about time difference so much that aberrate, it is the untimed character of engrams. Time is the Great Charlatan, it heals nothing, it only changes the environmental aspects and a man's associates. The engram of ten years ago, with all its painful emotion, may be encysted and "forgotten" but it is right there, ready to force action if restimulated today.

The reactive mind runs on a dime-store wrist watch, the analytical mind runs on a battery of counter-checking chronometers of which a liner could be proud. The cells think that wrist watch is a pretty fair gimmick -- and it was, it was, back there in the days when Man's ancestor was washed in by the waves and managed to cling to the sand.

Thus, a primary test for aberration is similarity and identity, the primary test for rationality is differentiation and the minuteness or largeness with which it can be done.

"Men are all alike," she says. And they are too! To her. Poor thing. Like the fellow who raped her when she was a kid, like her detested father who said it.

RELATIVE IMPORTANCES AND "BELIEVE" AND "CAN'T BELIEVE"

The auditor will find himself confronted with two arch enemies in "you must believe it," and "I can't believe."

The mind has its own equilibrium and ability and it is aided no more by engrams than an adding machine is aided by a held-down seven. One of the most important functions of the mind is the computing of the relative importances of data.

In discovering and conducting research on dianetics, for instance, there were billions of data about the mind accumulated throughout the last few thousand years.

Now, with a six foot rear vision mirror we can look back and see that here and there people had expressed opinions or turned up unevaluated facts which are now data in some of the axioms of dianetics or parts of its discoveries. These facts existed in the past, some exist now in dianetics, but with a tremendous difference: they are evaluated. Evaluation of the data for its importance was vital before the information was of value. Dr. Sententious might have written in 1200 A.D. that he believed actual demons did not exist in the mind; Goodwife Sofie in 1782 was heard to say that she was certain that prenatal influence had warped many a life; Dr. Zamba might have written in 1846 that a hypnotized patient could be told he was crazy and that he would thereafter act crazy. Dr. Sententious might have said also that angels, not demons, caused mental illness because the patient had been evil; Goodwife Sofie also might have said that punk water poultices cured "ravings"; Dr. Zamba might also have declared that hypnotized patients needed only a few more positive suggestions to make them well and strong. In short, for every datum which approached truth there were billions which were untrue. The missing part of each datum was a scientific evaluation of its importance to the solution. The selection of a few special drops of water from an ocean of unspecial drops is impossible. The problem of discovering true data could be resolved only by jettisoning all former evaluations of humanity and the human mind and all "facts" and opinions of whatever kind and starting fresh, evolving the entire science from a new highest common denominator (and it is true that dianetics borrowed nothing but was first discovered and organized; only after the organization was completed and a technique evolved was it compared to existing information).

The point here is that monotone importance in a class of facts leads to nothing but the most cluttered confusion. Here is evaluation: opinions are nothing, authority is useless, data is secondary: establishment of relative importance is the key. Given the world and the stars as a laboratory and a mind to compute the relative importance of what it perceives, and no problems can remain unsolved. Given masses of data with monotone evaluation and one has something which may be pretty but is useful.

The stunned look of fresh-caught ensigns of the Navy when they first see in the metal the things about which they have so laboriously read is a testimony to more than the faulty educational system currently employed: the system seeks to train something which is perfect -- the memory -- ; it aligns little or nothing with purpose or use, and ignores the necessity of personal evaluation of all data both as to need for it and its use. The stunned look comes from the overwhelming recognition that whereas they have thousands of data about what they see, they do not know whether it is more important to read the chronometer when they take a sextant sight or use only blue ink in writing a log book. These gentlemen have been wronged educationally not because they have not been given thousands of data relative to ships but because they have not been told the relative importance of each datum and have not experienced that importance. They know more facts than the less educated but they know less about factual relation.

More pertinent to the auditor, there are two species of engramic commands which give monotone evaluation to data. The persons who have either of these as a major content in the engram bank will be similarly aberrated even if each manifests the aberration with opposite polarity.

Every now and then some unfortunate auditor finds a "Can't believe it" on his hands. This case is extremely trying. Under this heading come the "I doubt it," the "I can't be sure," and the "I don't know," cases.

Such a case is easy to spot for when he first comes into therapy he begins by doubting dianetics, the auditor, himself, the furniture and his mother's virginity. The chronic doubter is not an easy case because he cannot believe his own data. The analyzer has a built-in judge

which takes in data, weighs it and judges it right, wrong or maybe. The engramic doubter has a "held down 7" to the effect that he has to doubt everything, something much different from judging. He is challenged to doubt. He must doubt. If to doubt is divine, then the god is certainly Moloch. He doubts without inspecting, he inspects the most precise evidence, and he still doubts.

The auditor will return this patient to a somatic which tears half his head off, which is confirmed by scars, which is confirmed by aberration, and which is doubted as an incident.

The way to handle this case is to take his pat phrases and feed them to him in reverie or out of reverie with repeater technique. Make him go over and over them, sending his somatic strip back to them. Shortly a release of the phrase will take place. Feed all doubter phrases which the patient has used in this manner. Then continue the case. The object is not to make him a believer but to place him in a situation where he can evaluate his own data. Don't argue with him about dianetics -- arguing against engrams is senseless since the engrams themselves are senseless.

In ten or twenty hours of therapy such a patient will begin to face reality enough so that he no longer doubts the sun shines, doubts the auditor or doubts that he had a past of some sort. He is only difficult because he requires these extra hours of work. He is usually, by the way, very aberrated.

The "Can't believe it" finds difficulty in evaluation because he has difficulty giving credence to any fact more than any other fact: this produces an inability to compute relative importances amongst data with the result that he may be as concerned with the shade of his superior's tie as with the marriage he himself is about to undertake. Similarly, the "You must believe it" case finds difficulty in differentiating amongst importances of various data and may hold equally firmly the idea that paper is made from trees and that he is about to be fired. Both cases "worry," which is to say they are unable to compute well.

Rational computation depends upon the personal computation of the relative importances of various data. Reactive "computation" deals exclusively with the equation that widely different objects or events are similar or equal. The former is sanity, the latter is insanity.

The "Must believe it" case will present a confused reactive bank, for the bank embraces the most unlikely differences as close similarities. The "Must believe it" engram command can dictate that one person, a class of persons, or everyone must be believed, no matter what is written or said. The auditor, returning the patient, will find major aberrations held in place by a lock containing only conversation.

When father is the actual source and is an ally of the patient, the auditor will discover that almost everything father said was accepted literally and unquestioningly by his child. The father may not have been aware of having established this "Must believe it" condition and he may even be a jocular man, given to jokes. Every joke will be found to be literally accepted unless the father carefully labeled it a joke, which meant it must not be literally accepted. One case folder is to hand here where father was the source of "Must believe": one day the father took his daughter, three years of age, down to the seacoast and, through the fog, pointed to a lighthouse. The lighthouse gave an eerie aspect in the foggy night. "That's Mr. Billingsly's place," said the father, meaning that Billingsly, the lighthouse keeper, lived there. The child nodded faithfully, if a little frightened, for "Mr. Billingsly" threw around a mane of hair-shadows -- glared to seaward with one eye sweeping the water and stood a hundred feet tall and "Mr. Billingsly" let out moans which sounded quite ferocious. His "place" was a ledge of rock. As a pre-clear twenty years later the daughter was discovered to be frightened of any low moaning sound. The auditor patiently traced down the source and found, much to the delight of himself and the daughter, "Mr. Billingsly." Vast quantities of aberration, peculiar conceptions and strange notions were found to derive from casual statements the father had made. Being skilled in his task, the auditor did not bother to try to locate and erase everything the father had

said -- a task which would have taken years and years: he located, instead, the prenatal "You must believe me" and its engramic locks, and all the non-engramic locks, of course, disappeared and were automatically re-evaluated as experienced data rather than "held-down sevens." Of course there is always much more wrong with a case than a mere "You must believe me," but the change of viewpoint which the patient experienced immediately afterwards was startling: she was now at liberty to evaluate her father's data, which she had not been before.

Because they teach in terms of altitude* and Authority, educational institutions themselves form a social "You must believe it" aberration. It is impossible to reduce an entire university education even if it sometimes appears desirable, but by addressing the moments when the patient was hammered into believing or accepting school, from kindergarten forward, many a fact-clogged mind can again be made facile which was not so before, for the facts will be re-evaluated automatically by the

* (By altitude is meant a difference of level of prestige -- one on a higher altitude carries conviction to one on a lower altitude merely because of altitude. The auditor may find himself unable to gain sufficient altitude with some patients to work them smoothly and he may have so much altitude with others that they believe everything he says. When he has too little altitude, he is not believed; when he has too much he is believed too well.) mind for importances, not accepted on monotone evaluation as is the case in "formal education."

The "Can't believe it" is a subject so weary and dreary to the auditor that he may find himself, after a few finished cases, running adroitly away from one. The "I don't know" and the "I can't be sure" cases are not as bad as the "I can't believe it." The prize case in difficulty in dianetics is a patient who is a Junior named after either father or mother, who has not only shut-down pain, emotion, visio and sonic recall but also "dub-in" for them on a false basis, with a lie factory working full blast, who is uncooperative and who is a "Can't believe it."

Monotone evaluation hinders the "Can't believe it's" acceptance of all facts. Any case may have a few "Can't believe its" but some cases are so thoroughly aberrated by the phrase that they disbelieve not only reality but also their own existence.

The mind has a "built-in doubter" which, unhindered by engrams, rapidly sorts out importances and, by their weights, resolves problems and arrives at conclusions. The rational mind applies itself to data presented, compares it to experience, evaluates its veracity and then assigns it relative importance in the scheme of things. This is done, by a clear, with a rapidity which sometimes requires the splitting of seconds. By a normal the time required is extremely variable and the conclusions are more apt to be referred to another's opinion or compared to Authority rather than to personal experience. That is the fundamental effect of contemporary education which, through no particular fault of its own and despite every effort it has made to free itself, yet, through lack of tools, is forced to follow Scholastic methods. These, by contagion of aberration, persist against all efforts of advanced educators. The normal is taught on one hand to believe or else he'll fail and on the other to disbelieve as a scientific necessity: belief and disbelief cannot be taught, they must be personally computed. If a mind could be likened to a general served by his own staff, it could be seen to have a G-2 which, as a combat intelligence center, collected facts, weighed them for importance and formed an estimate of a situation or the value of a conclusion. As the intelligence officer would fail if he had a signed order to disbelieve everything, so does the mind fail which has a reactive command to disbelieve. Certainly a military organization would lose to every puny enemy if it had, conversely, a command to believe everything, and a man will fail if he has a reactive mind order to believe all information in the world around him.

The believe and disbelieve engrams present different manifestations, and while one cannot be said to be either more or less aberrative than the other, it is certain that the disbelieve engram, by and large, seems to make the less sociable man.

Disbelief occurs in various degrees, of course. There is, for instance, a social disbelief engram which promotes a class of literature which is as insincere as it is unwitty. Insincerity, shame of emotional demonstration, fear of praising may stem from other things than merely a disbelief engram, but a disbelief engram is most certainly present in the majority of such cases.

The auditor will find, when he is trying to enter a very strong "Can't believe it" case, that experience is disbelieved, the auditor is disbelieved, hope of results is disbelieved and that the most ridiculous and unreasonable insults and arguments may be presented. The patient may squirm in a veritable snake pit of somatics and still disbelieve that he is re-experiencing anything.

It is a sadly chronic fact that an aberree has a certain set of cliches from out of his engram bank. He will repeat these cliches for all occasions and circumstances. Mother, having an engram bank of her own and father having his, will be found to be uttering pretty much the same sort of statement time after time. These are dramatizations. One of the parents may have had an "I don't know" ready to precede everything he or she said, which makes a whole "stack" of "I don't know's" in the engram bank: which much undermines understanding. In the same way, "You must believe!" or "You can't believe!" may become "stacked" in the engram bank. Once one has heard a few engrams from a patient, he knows he will have many, many more similar engrams from that source. Once an auditor has listened to the personnel in the patient's engram bank for a very short time he knows pretty much what he will have in many, many more engrams. Hence any phrase is liable to be much repeated in the engram bank, with varying somatics and accompanying perceptics. If Mother is troubled with high blood pressure, it is raised by Father -- to the intense discomfort of the child and a degree which often produces a later migraine headache -- she is apt to utter, "I can't believe you would treat me this way." Privately, she must have been hard to convince (one doesn't convince much against engramic "reasoning"), for he treated her this way about every three days; and every three days she was saying, "I can't believe you" or "I can't believe you would do this to me," or "I can't believe anything you say," or some such thing.

The "Can't believe" is apt to be rather hostile since "Can't believe" is often hostile conversation. "You've got to believe me" is more apt to be a pleading or whining sort of an engram. "Believe what I tell you, God damn it," is, however, fully as hostile as an auditor might expect.

An auditor who finds a case intensely and unreasonably skeptical should expect a "Can't believe" stack in the engram bank. If he finds a patient incapable of holding an opinion of his own but weather-vaning to each new person or quoting an Authority (all authorities get easily identified with father in the reactive bank), he should suspect a "Must believe" in some form as well as other things. There are many manifestations of either case. The chronic aspect in therapy is that the "Can't believe" suspects his own data so strongly that he alters it continually and the engrams which, after all, have just one, exact package of content, will not properly reduce; the "Must believe" takes up every engram he hears about as his own and that does him little good.

Do not suppose that any case has a standard aspect, however. The language contains many words and combinations of words, and aberrees are not unusual who have the entire basic language and all its idioms securely connected up to some somatic or other. Cases ordinarily contain "Can't believe" and "Must believe" phrases in the same bank. Only when these phrases become top-heavy does the person respond in a set pattern. When the set pattern is of either species of phrase, then the auditor confronts a patient who must have had, at best, a most unhappy life. But either case clears. They all clear, even Juniors.

PHYSICAL PAIN AND PAINFUL EMOTION COMMANDS

Besides visio and sonic, another vital recall to therapy is the somatic, which is to say the physical pain of the incident. Running a physically painful incident without a somatic is worthless.

If physical pain is present, it may come only after considerable “unconsciousness” has been “boiled-off.” If the incident contains pain but the somatic is not turned on, the patient will wriggle his toes and breathe heavily and nervously or he may have jumping muscles. The foot wriggling is an excellent clue to the presence of any somatic turned on or not turned on. Breathing heavily and jumping muscles and various twitches without pain denote two things: either a denier is in the incident and the content isn’t being contacted or, if the pre-clear is recounting, the somatic may be shut-off in the incident or elsewhere, either earlier by command or late by painful emotion. The patient who wriggles a great deal or who does not wriggle at all is suffering from a pain or emotion shut-off or late painful emotion engrams or both.

There is a whole species of commands which shut-off pain and emotion simultaneously: this is because the word “feel” is homonymic. “I can’t feel anything” is the standard, but the command varies widely and is worded in a great many ways. The auditor can pick up his own book of these from patients who, describing how they feel or rather, how they don’t feel, give them away. “It doesn’t hurt” is a class of phrases specifically shutting off pain, a class which includes, of course, such things as “There isn’t any pain,” etc. Emotion is shut-off by a class of phrases which contain the word “emotion” or which specifically (literally translated) shut off emotion.

The auditor should keep a book of all deniers, misdirectors, holders, bouncers and groupers which he discovers, each listed under its own heading. In this way he adds to material he can use for repeater technique when he sees something is wrong with the way the patient is moving on the track. But there are four other classes of phrases which he should also study and list: shut-offs, exaggerators, derailers and lie factories. He can also add to his classes.

He will discover enormous numbers of commands in engrams which can accomplish these various aspects. And he should be particularly interested in the pain and emotion shut-offs and the exaggerators, which is to say, those engramic commands which give the aspect of too much pain and too much emotion. There is no reason to give large numbers of them here. They are quite various, language being language.

Many combinations are possible. A patient can be found to weep over the most trivial post-speech things and yet have few or no somatics. Several things can cause this. Either he had a mother or a father who wept for nine months before he was born or he has an exaggerator at work which commands that he be emotional about everything: “Too much emotion.” In combination with this he can have something which says he can feel no pain or can’t hurt or even can’t feel.

A patient who aches and suffers and yet cannot weep would have a reverse set of commands: he has a “no emotion” command early on the track or a long chain of them and yet has commands which dictate pain to excess: “I can’t stand the pain,” “The pain is too great,” “I always feel I’m in agony,” etc. “I feel bad,” on the other hand, is a shut-off because it says there is something wrong with the mechanism with which he feels and implies disability to feel.

Both pain and emotion can be commanded into exaggeration. But it is a peculiar thing that the body does not manufacture pain to be felt. All pain felt is genuine, even if exaggerated. Imaginary pain is non-existent. A person “imagines” only pain he has actually felt. He cannot imagine pain he has not felt. He may “imagine” pain at sometime later than the actual incident but if he feels pain, no matter how psychotic he is, that pain will be found to exist somewhere on his time track. Scientific tests have been carefully conducted in dianetics to establish this fact and it is a valuable one. You can test it yourself by asking patients to feel various pains, “imagining them” in present time. They will feel pains for you so long as you ask them to feel pains they have had. Somewhere you will find the patient unable to actually feel the pain he is

trying to “imagine.” Whether he is aware of it or not, he has had pain wherever he “imagines” it and is simply doing a somatic strip return for you on a minor scale.

This aspect of pain is quite interesting in that many patients have, at one time or another in their lives, pretended to the family or the world that they had a pain. The patient thought, when he asserted this “make-believe” pain, that he was lying. In therapy the auditor can use these “imaginings” for they lead straight to sympathy engrams and actual injury. Further, these “imaginary” pains are generally displayed to the person or pseudo-person who was the sympathy ally present in the engramic moment. Thus, if a small boy always pretended to his grandmother, and thought he was pretending, that he had a bad hip, it will be discovered eventually that sometime in his early life he hurt that same hip and received sympathy during the engramic moment which is now eclipsed from the analyzer. Patients often feel quite guilty over these pretenses. Sometimes soldiers in the recent war have come home pretending they had been wounded and, when in therapy, are afraid the auditor will find out or give them away to their people. This soldier might not have been wounded in the war, but an engram will be found which contains sympathy for the injury of which he complains. He is asking for sympathy with a colorful story and believes he is telling a lie. Without informing him of this dianetic discovery, the auditor can often flush into view a sympathy engram which might otherwise have to be arduously hunted down.

“Cry baby” is a phrase against which the pre-clear will negate in an engram, thus inhibiting tears. It is quite ordinary to find the pre-clear confusing himself with older brothers and sisters who are in his prenatal life: their jeers, mother’s orders and so forth then all register. If the pre-clear knows of any older children, the auditor should look for them in the engrams of prenatal life, for children are quite active and often bounce up and down on mother’s lap or collide with her. Any childish phrases of derision are then not always post-birth.

It has been said during dianetic research that if one could release all the painful emotion of a lifetime, he would have ninety-percent of the clearing done. However, the painful emotion is only a surface manifestation of the physical pain engrams and would not be painful if the physical pain did not co-exist or exist priorly.

When emotion and pain shut-offs exist in a case, the patient is normally tense of muscle and nervous, given to twitching or merely tension. When pain and emotion are exaggerated by commands, one has a highly dramatizing case on his hands.

THE ALLY VERSUS THE ANTAGONIST

It is necessary for the auditor to know the reactive mind’s evaluation of importances. Moronic or not, the reactive mind distinguishes violently between friend and foe, about the only piece of differentiation it does.

There is a prime test for an ally. And recall that the ally is a part of sympathy engrams, the things which are most likely to produce psycho-somatic illnesses, immaturities and confusion on a grand scale. As long as it can rebel and negate, the reactive mind takes care of the enemies so far as it is able. It can, of course, be twisted by circumstance into the valence of the enemy and so cry havoc and abreact in general if this was a winning valence. But it will not ordinarily use the data of the enemy contained in a contra-survival engram save to negate against it. When the general tone nears Zone One, of course the reactive mind starts picking up and obeying antagonistic commands. Thus, if father is the villain of the piece, an antagonist, father’s commands are not the reactively obeyed commands but the commands the aberree will usually negate against or avoid.

This is not the case, however, with the ally. The ally, the person from whom sympathy came when the patient was ill or injured, is heeded and obeyed since his “purpose” is apparently aligned with the purpose of the individual to survive. If one thing about a person is

right then, according to our moronic little friend, the reactive mind, everything about that person is right, everything that person says and does is right and particularly is right whatever that person said in the engram.

The chronic psycho-somatic illness is ordinarily from a sympathy engram. This is quite important, for the sympathy engram will be the last or hardest to reach, being aligned with survival purpose.

A “Must believe” from an ally means that the person must believe. A “Must believe” from an antagonist ordinarily brings about a circumstance that the person must not believe.

Here, in the ally and the antagonist, we have the age-old tale of the hero and the villain, the heroine and the villainess, Mazda and Ahriman, the cowboy in the white hat and the cowboy in the black. The Hindu trinity is found, as source, in father, mother and unborn baby. But the war of “good and evil” is found as reactive data in the engram bank in the form of the ally and the antagonist.

The very best logic of which the reactive mind is capable is two-valued, white and black, and two-valued logic finds its response only in the reactive bank. And the reactive mind works out all problems in absolutes, bringing about logical monstrosities, for there is the absolute of good, the absolute of evil and the absolute of identity thought. Any rational computation demonstrates an absolute to be impossible from a standpoint of truth or workability: but the reactive mind never quibbles, it just reacts. It knows a champion when it sees one (it thinks) and it knows a villain (it supposes). The ally, the champion, is everybody who has any characteristic of the ally and the antagonist, the villain, is everyone who has any characteristics of the antagonist. Further, anything associated with the ally is a champion and everything associated with the antagonist is villainous. If the ally is an aunt, then aunts are good. If the antagonist is a sign painter, then sign painters are all evil. Further, the dollies Auntie crocheted mean that dollies are good and that all lacework is good and that anything on which lacework sits is good and that anything which looks like lacework is good and so on in the ad absurdum which only the reactive mind can manage without a qualm. And the signs the painter painted were evil and where they sit is evil and paint is evil and smell of paint is evil and brushes are evil so hair brushes are evil so the dresser on which hairbrushes sit is evil and so on.

There is an axiom here which is well not to slight in working a patient:

ANY CHRONIC PSYCHO-SOMATIC ILLNESS HAS AT ITS SOURCE A SYMPATHY ENGRAM.

And another:

A REACTIVE MIND WILL NOT PERMIT AN INDIVIDUAL TO BE ABERRATED OR CHRONICALLY PSYCHO-SOMATICALLY ILL UNLESS THE ILLNESS HAS SURVIVAL VALUE.

This does not mean that the individual has a power of choice analytically. It does mean that the reactive mind, working quietly and hitherto hidden so well, chooses, on identity computation, physical and mental conditions to match any circumstance even remotely similar to any concept in the engram bank.

There is such a thing as necessity level. This rises and keys-out engrams and can key out the control of the reactive mind itself. Necessity level often rises. The individual can force it to rise analytically whether or not actual cause exists. A person may have no engram about going to the electric chair for murder and yet have an engram about murdering people. Necessity level rises and analytically overwhelms all impulse to kill for the analyzer knows all about electric chairs. When the necessity level cannot rise, then one is dealing with a low dynamic individual. An artist, terribly aberrated about his work through the kind efforts of

obligingly caustic critics, can yet boost himself by his necessity bootstraps to do another piece of work and damn the aunt who said he gave her too many chins in her portrait and ripped the work to shreds or damn the critics who said he was too new and his work too swift. Necessity level can soar above the reactive mind by, as the marine sergeant said, "Sheer guts." Given too many current restimulators, used too hard by life, an individual, caught in the dwindling spiral of reactivated engrams, may come at last to a point where he cannot longer remain well. If this is his first serious sag and if the sag is deep, a psycho-somatic illness will appear and become more or less chronic and, this is important, it will stem directly from a sympathy engram.

All psycho-somatic ills carry with them, if less obvious, aberrative commands which mean that a person suffering from psycho-somatic illness, whether he relishes the idea or not, is also suffering from the aberration which is part of the same engram.

If the auditor wants to find the real holders, the real reasons his case appears to resist getting well, the real aberrative factors and illnesses, he will look to the ally or allies, for any case may have many. He will exhaust from them the painful emotion of loss or denial and backtrack immediately to find the underlying engrams.

Remember too that the reactive mind is not bright enough to realize that two sides of the same person are the same person. Hence we can have Mother-the-white-angel and Mother-the-howling-harridan. As the white angel she is implicitly followed, as the harridan she is negated against. Father may be Father-the-beneficent and Father-the-baby-killer. And so with all allies. But only the pure, the absolute, the never changing ally who, resolute and firm, stayed the cold sharp hand of death and placed tenderly in the expiring hand of the wistful child the strong and flaring torch of life (or at least said, "Poor baby, you feel so bad; please don't cry,") is the model, the paragon, the gold-footed idol with free access to the gods. (This was grandpop: he drank too much and he cheated at cards, but the reactive mind doesn't see it that way because grandpop hauled baby through pneumonia and was darned sure baby got well: good acts if he hadn't been so melodramatic about it and if he hadn't talked so much while the poor kid was "unconscious.")

Question the patient adroitly about Father and Mother: if he isn't much disturbed by their deaths (if they are dead) or if he is simply careless of them or if he bares his teeth, they are antagonists; the allies are elsewhere. If the mother and father are indifferently or angrily or propitiatively regarded, be very sure then, that the patient had a rough time of it between conception and birth and later and be sure, if this is the case, that there will be allies in plenty for the child will have sought them out in every scrape or injury. But you will not find the allies, usually, by mere questions. The reactive mind considers them to be pure gold even if the engrams in which they appear have somatics enough to wreck a person for life. It hides allies. The auditor has to look for them through discharging painful emotion. The death, departure or denial by an ally is a certain painful emotion engram. One way or another, working at it from later painful emotion or earlier physically painful engrams, the ally will eventually uncover and can be entered as memory in the standard banks and erased as illness out of the engram bank.

The solution of chronic psycho-somatic ills lies largely in the field of sympathy engrams. These will not erase early, however, for they are the inner bastion behind which the reactive mind crouches and observes the storming of the outer defenses by antagonists. The painful emotion of ally losses masks, at times, not only allies but antagonists as well. The sympathy engram is not the only source of psycho-somatic illness by far, but it is the source of the chronic psycho-somatic ill.

By the way, nothing in this dissertation about allies should be construed to mean that one should not show love to a child. Observers in the past have jumped at questionable conclusions when they felt that demonstrated affection aberrates a child. Lack of affection may kill him, but the reverse is not true. The only way an ally can aberrate a child is by talking to and sympathizing with a child who is very ill or "unconscious" from injury. If he does this he alloys the child's personality with his own, creates an eventual possibility of psycho-somatic illness and aberration and may generally disable the child for life (except for dianetics, of

course). Love a child best and do for him best when he is well. Do anything you please with him when he is well, say what you please. When he is sick or hurt, it is best, as the bosun said, "Patch him up and keep God-damned quiet!"

TOKENS

The tale of the magic amulet, the lucky talisman, the belief in the charm and the long catalogue of fetishes, the objects and mannerisms which one keeps as sakes are the "dearly beloveds" of the reactive mind.

There is nothing wrong with a man keeping llamas in the parlor or wearing purple and green suspenders or rubbing fire plugs for luck, nor is there anything wrong with sighing over a stolen lady's slipper or smoking Pittsburgh stogies. Any Rights of Man should provide for such eccentricities. But the auditor can use this data to detect vital information.

In dianetics, the term token is defined to embrace the objects and habits which an individual or society keeps by not knowing they are extensions of an ally.

By identity thought there are associative restimulators for every restimulator in the environment -- these things connected with the restimulator. Being blank on the subject, the analytical mind, apprised by physical reaction that a restimulator of something is nearby, then picks up the associative restimulator but does not select the actual restimulator. (In Book II, the young man's signal to remove his coat was a touch of the tie: he did not cite the tie in his complaint, the nearest he came to it was the person and clothing of the hypnotic operator. These were associative restimulators.)

A restimulator for a contra-survival engram might be an electric light; the aberree looks to the shade, the pull chain, the room or the person under the light to be a source of annoyance, and not only does he not know that a restimulator is present but supposes that the associated objects have some evil in themselves.

The associative restimulator for a contra-survival engram needs no name other than that, associative restimulator. The pain is the thing, the things associated in any way with the thing are the thing, are other things, etc. is the reactive equation which fills the world of the aberree full of fear and fills him full of anxiety. Leave a child in a place or a room where he has been unhappy and he may become ill, for he is confronted with some restimulator and he can at best explain, like the adult, his fear in terms of things not rationally connected to the restimulator. This is the mechanism of engramic restimulation.

It is mostly terribly uncomfortable to any aberree who, try as he might, cannot say why he does not like some person or object or locale and who cannot connect any of the three with the actual item which is the restimulator and does not know he has an engram about it. This method of detecting engrams leads nowhere quickly since one cannot select objects, persons or locales and know they are restimulators. They may be only associative restimulators to the actual restimulator item in the environment. (Words contained in engrams, by the way, and any other precise restimulator can "push-button" the aberree into action or apathy if they are used upon him. In words it has to be the exact word; for instance painted will not do when painter is in the engram. What is painted, however, may be an associative restimulator and the aberree may declare he does not like it; that he does not like it does not mean that it will "push his buttons" and made him cough or sigh or get angry or get sick or whatever the engram containing the word dictates he should do.)

The token is a very special kind of restimulator. While the auditor may not find much use for the associative restimulator as applied to contra-survival engrams, he can employ the token as a means of detection to locate allies.

The token is any object, practice or mannerism which one or more allies used. By identity thought the ally is survival; anything the ally used or did is, therefore, survival. The valence of the ally is that one most frequently employed by the aberree. While the clear can shift himself into valences he imagines or beholds at will and convenience and out of them at will and can stabilize in his own at will, the aberree skids around into valences without his knowledge or consent and is most likely to be in any valence but his own. The person who seems to be a different person every time he is met or a different person to each person he meets, with special valences manifesting here and others manifesting there, is shifting into various winning valences; interfered with in his shifts, he goes into secondary valences; if forced into his own valence he becomes ill. It is understood, of course, that all valences manifest something of himself.

Shifting into ally valences is the fundamental practice of the aberree. He will feel most at ease when his own valence is alloyed to some degree with an ally valence. So long as the ally or the pseudo-ally is not available, the aberree reminds himself of the ally valence with tokens. These tokens are the things the ally possessed, practiced or did.

An aberree will often inextricably associate himself with a pseudo-ally, as in marriage, and then make the astonished discovery that he is not partnered with the optimum ally conduct. (Mother was an ally, Mother baked bread; wife is pseudo-Mother though neither she nor he knows it; wife does not bake bread: Mother frowned on lipstick, wife wears lipstick; Mother gave him his way, wife has a bossy attitude; wife is pseudo-Mother because she has similar voice tones only.) The aberree then reactively and unknowingly attempts to coax wife or partner into the ally valence by assuming that the moment of the sympathy engram is present time -- a mechanical shift caused only by the restimulation of the sympathy engram because of voice tones or some such thing -- and proceeds to manifest the ghost of the engram illness or injury or operation as a psycho-somatic sickness. The computation of the reactive mind is simple -- just like Simple Simon -- one forces the ally into being by manifesting the somatic with which the ally sympathized. This can also be an effort to turn a partner in which the reactive mind thinks it has discovered an ambivalent friend-enemy into the sympathy valence. Wife is cruel.

Mother was cruel until the injury, then she was nice. Manifest the injury as a chronic psycho-somatic illness and wife will be nice. Actually wife isn't nicer, so the computation gets stronger, the illness gets stronger, and down into the dizzy dwindling spiral we go. The psycho-somatic illness is also a denial of dangerousness, a plea of helplessness -- a shade of opossum playing, fear paralysis: "I'm no menace to you. I'm sick!"

The aberree goes into his own valence of the time of the sympathy engram in his bid for sympathy and his denial of his own dangerousness. The valence of himself, of course, is complicated by the age-tab and somatic of the engram in which he was immature and not well.

The psycho-somatic illness is, as well, a token, which is to say it is a reminder of a time when he once had love and care and was told so. He needs it about as much as he needs to be atom bombed, of course, but this is good, solid reactive mind "survival" and the reactive mind is going to make it so he can survive if it kills him.

This is all mechanical and is actually merely restimulation of an engram, but it is better understood as a low order computation.

In the absence of an ally, and even in the presence of the ally, he uses reactive mimicry. Conscious mimicry is a wonderful way to learn. Reactive mimicry is most alloying to the personality. Reactively, he once had an ally and imitates the ally. Consciously he may not even recall the ally or the habits of the ally.

The ally, remember, is somebody who has entered the interior world of the mind when the analyzer was shut down by illness or injury or an operation and gave forth sympathy or protection. The ally is part of the sympathy engram. If a child had grandparents he liked and was lucky enough not to be ill around them or be talked to by them in sympathetic terms when

he was ill or injured, the grandparents would still be much loved. In dianetics an ally is only some one who has offered sympathy or protection in an engram. We don't have to have engrams to be loved or to love: quite the contrary, one is better loved and loves more without engrams.

The token applies, dianetically, only to the ally and is an object, practice or mannerism similar to an object, practice or mannerism of the ally.

The ally smoked Pittsburgh stogies, so the aberree may smoke Pittsburgh stogies no matter what they do to his throat or his wife. The ally wore bowlers, the lady aberree dotes on riding habits but has never ridden a horse. The ally knitted, the aberree specializes in wearing knit things or a lady at least makes a pretense of knitting and sometimes wonders why she ever took it up, she is so bad at it. The ally used profanity, the aberree uses the same profanity. The ally wipes his nose on his sleeve and picks his nose, the aberree wipes his nose on a dinner jacket and fiddles with his nostrils.

The token may be a reminder of pure ally or it may be a reminder of the friend side of an ambivalent friend-enemy. And it may be a winning valence that was also ambivalent toward the aberree. The token is never an associative restimulator in the meaning that it reminds of some antagonist, for associative restimulators are abhorred.

The most chronic token, the most constant habit, practice or mannerism of the pre-clear is a direct arrow to the pure ally. And the pure ally is the one the reactive mind will guard to its highest level of the beset donjon keep. And that is the target of the auditor. He may have to relieve the majority of the engram bank before he can erase the engram which is most likely to aberrate the individual, to saddle him with strange practices and to make him chronically ill.

Observe your pre-clear and see what he does and says that are strange to his personality, things he does but does not much seem to enjoy. See what he uses and what his mannerisms are. Amongst this collection you may, by asking discreet questions, jog an ally into his memory which he had forgotten and so jogging, reach swiftly toward the sympathy engram in which that ally is contained or reach toward, for an emotional discharge, the painful emotion engram of the loss of that ally, his illness or incidents concerning him.

Another but special token is that which stems from a "die if you don't" command. Fathers, for instance, suspicious of paternity, sometimes claim while trouncing or upsetting mothers that they will kill the child if it isn't just like Father. This is a very unhappy type of token to say nothing of being, usually, a bad engram; it can go to the extent of remodeling structure, of making noses long or hair absent; it may compel an aberree into a profession he does not admire and all out of the engramic command that he must be like the parent. As this type of command is usually given before birth it is often addressed, unknowingly, to a girl, fathers not being gifted ordinarily with clairvoyance; in such a case it will bring about a most remarkable structural change in a woman and form some unusual mannerisms, "ambitions" (like the dog that gets whipped if he doesn't fetch the duck) and some habits which, to say the least, are astonishing. Father, post-birth, to accomplish the reactivation of such an engram, must be quite ambivalent so that the friend-enemy compute comes into being. Not to be like father is to die: to force father into his sympathy engram self the reactive mind must manifest the token of illness. Token and likeness is the answer to such a computation. And recall, all such computations are not simple but are made further complex by the addition of dozens of other engramic computations.

The friend-enemy is rather easy to find as an enemy, not too hard to find as a friend. Standard technique with its repeater and return et al. would in themselves at last locate any engram and erase the bank so that it properly refiles. The use of the token facilitates the auditing.

In the case of the pure ally, the champion of the right, standard technique also at last arrives. But here how smooth the use of the token sometimes makes the road! For the token

may be as alarmingly strange as an elephant in a bird cage. It takes a real ally to keep some of these odd habits around.

Measure the pre-clear against his environment and education and his society and profession. See what doesn't seem to belong amid the things he uses, the objects he adores and the mannerisms his friends find so strange. Then find out if he or the spouse knew of anyone who did those things or liked those things.

Do not suppose from all this that our clear has jettisoned all strange mannerisms. Self-determinism is individuality in the extreme; personality is inherent and revealed by clearing, looms up high above the aberree. The engrams compress a man and make him small and afraid. Released his power comes into play. The sympathy engram is to a man like a crutch when he has two sturdy legs. But oh, the pre-clear sobs where he loses old Uncle Goston, whose habit of spitting on the floor, as transplanted, so astonished our pre-clear's friends and business associates. But the grief is brief, usually the half-hour it takes to run the sympathy engram out. Suddenly the pre-clear recalls Uncle Goston, recalls a thousand things Uncle Goston and he used to do, for the engram had Uncle Goston occluded and amongst those missing from the sight of "I." Although it might have said in the engram, "All right, there, there, there, Billy. I'll take care of you. Don't thrash around so. You'll be all right.

There, there, there. Poor little fellow. Poor little fellow. What a terrible rash you've got. How feverish. There, there, there, Billy. You'll be all right as long as I am here. I'll take care of my Billy. Go to sleep now. Go to sleep and forget it." And Billy was all the time "unconscious" and never "knew" about it. Afterwards he got a partner who looked like Uncle Goston (but happened to be a fool), and when bankrupt somehow developed a rash and a chronic cough and got very "feverish" about his business affairs. He took to spitting on the floor no matter where he was; and his health got worse and he got worse: but if you had asked him about any uncles before he went into therapy, he would have been very vague. "Give me a flash reply," says the auditor. "Who used to spit on the floor? "Uncle Goston," answers the pre-clear. "Gosh, that's funny (hawk, spit), I hadn't thought of him for years. He was never around much, though (not more than ten years constantly, the auditor may discover). Don't suppose he's important. Let's take up Mrs. Swishback, that teacher I had -- " "Let's return now to the time Uncle Goston helped you," says the auditor, "The somatic strip will now go back to the time your Uncle Goston helped you." "I feel like my skin's on fire!" complains the pre-clear. "This must be -- hey, it's my allergy! But I don't see anybody. I don't -- Wait, I get an impression of somebody. Somebody -- Why, it's Uncle Goston!" And he runs it and the rash goes away. But maybe the auditor had to get a hundred engrams before he got this one. And then the pre-clear suddenly remembers about him and Uncle Goston and the time -- but get on with therapy.

Complete remembering seems to be a synonym for complete sanity. But don't suppose that just because a clear gets rid of his Uncle Gostons and his habit of spitting on the floor that he will not now indulge in any eccentricity. The difference is, he is not compelled into eccentricity without his consent. Good Lord, what a cleared mind can think up to keep itself from being bored!

WHAT TO DO IF A CASE STOPS PROGRESSING

Even in the easiest cases there will come times when progress seems to stop. Here is a list of possibilities of why:

1. The pre-clear is not moving on the track despite appearances, but is being subject to one of the five types of commands which can inhibit his free motion or information. The commonest of these is a holder and the pre-clear may be found to be in an engram and in a strange valence.

2. There is an emotional or pain shut-off. These can always be detected even at the beginning of a case. The patient's muscles will tremble or twitch when he is in an engram but he will not feel the somatic: this is inevitably a pain shut-off. Out of therapy the patient may be very tense, his neck muscles in particular may be tight: this is often an emotional shut-off. Either of these conditions can be observed in many aberrees before beginning therapy. If they appear while therapy is in progress, look for pain or emotional shut-offs.
3. There is an exaggerator of emotion and a pain shut-off so that the patient weeps over anything but wriggles and twists when asked to approach pain. He is feeling emotion without feeling the pain.
4. There is an emotional charge in some area which has not been discharged but which is ready to discharge. Or, conversely, if you have been trying to get an emotional discharge in a late painful emotion engram and have had no success, there is a feeling shut-off early in the prenatal area.
5. The Auditor's Code has been broken. Change auditors or reduce the moments when the code was broken.
6. There is an emotional upset in the patient's life current with therapy. Question him closely and remove the charge, if possible, of the emotional upset as an engram.
7. The auditor has missed an important point in this book. Study it.

IF A CASE "REFUSES" TO GET WELL

It has long been a popular idea, if an erroneous fact, that people desire to retain their neuroses. In any case which "resists" therapy, you may be certain that the engrams are resisting, not the patient; do not, therefore, attack the patient but the engrams.

There are many computations which give the appearance of resistance. The commonest of these is the ally computation, which derives from engrams containing allies who seem to plead that the patient is not to rid himself of anything. An ordinary situation is one in which some relative or friend of the mother's is advising the mother against aborting the child. The ally is pleading, "Do not get rid of it!" The pre-clear knows this person to be a friend of his of the highest order. The pre-clear may interpret this to mean that he is not to get rid of his engrams.

Another computation is the stupidity computation, wherein the pre-clear begins to believe he will be stupid or lacking a mind if he gives up engrams. This stems, for example, from the mother saying she will lose her mind if she loses the child: she calls the child "it." A whole chain of these may appear in a case, giving the pre-clear the idea that if he parts with any engrams, he will lose his mind. This is the primary reason why past schools believed that the mind was composed of neuroses instead of an inherent personality. The engrams, even though unknown, appeared very valuable, which they are not -- none of them.

Yet another computation is one of secrecy. It seems to the pre-clear that his life depends upon holding some secret. This is common in a case where the mother has had a lover. Mother and the lover both enjoin secrecy. The pre-clear, obeying engramic commands, believes that he has much to lose if he tells this secret even though those who enjoined it were not even aware that he was present, or if they knew, that he was "listening." One secrecy computation stems from the mother's fearing to tell the father that she is pregnant: if the mother is an ally of the child, then the child will be extremely tenacious of this type of engram.

All cases have one or more computations which inhibit a delivery of engrams. Some have all the above and more. This is no great worry to the auditor for, by repeater technique, he can open the engram bank.

DRUGS

The so-called hypnotics have no great use in dianetics except, on occasion, when a patient is psychotic and narco-synthesis is employed. By hypnotic is meant such preparations as phenobarbital, hyacine, opium and so on. These sleep-producing drugs are undesirable save only as a sedative and would be administered as sedatives by a medical doctor. Any patient who needs a sedative already has a medical doctor whose business it is. The auditor should not, then, concern himself with hypnotics or anything producing sleep. Some pre-clears will beg to be given sleeping drugs to "facilitate therapy" but any such drug is an anesthetic and shuts down somatics, inhibiting therapy. Further, none but the insane should be worked in amnesia trance, particularly a drug trance, for the work is longer than necessary and the results slow, as elsewhere explained. Dianetics wakes people up; it does not try to drug them or hypnotize them. Hence, the hypnotic drug is worthless to the auditor.

Patients who wish to be knocked over the head with lead pipes or otherwise put into a deep trance should not be allowed to have their way even when they humorously present their own lead pipes.

The trick is to put "I" in contact with the file clerk. All hypnotics work to shut-down "I." While the file clerk can be reached and sonic and visio are available and even while, with much labor, a clearing can be so effected, even the most "hopeless" case is better worked in contact; the work is faster, more satisfactory and less troublesome.

When one discovers the science of mind, he inevitably discovers numerous other things not properly in his province. Amongst these is the confusion which has unwittingly existed about hypnotics. Those things labeled "hypnotics" as named above are not hypnotics at all but anesthetics. And those things labeled anesthetics are not anesthetics but hypnotics. This will become brilliantly clear to the auditor when he finds himself tangling with his first "anesthetic" nitrous oxide engram in some pre-clear. Perhaps there will have been another engram wherein morphine was administered for days and even weeks, leaving the patient in a stupor which, by the definition "hypnotic" should have been a trance: the aberrative material will be there but it will be found to be slight -- compared to a chloroform or nitrous oxide engram.

Ether, chloroform and nitrous oxide, the "anesthetics," place the patient in a deep hypnotic trance: the reactive bank is wide open and all reception is sharp, clear and aberrative in the extreme. Of the three, nitrous oxide is easily the worst, being no anesthetic which would dull pain at all but a first class hypnotic. In nitrous oxide the pain is filed and the content is filed with high and brilliant fidelity. Some years ago some investigator wondered if nitrous oxide did not make the brain decay. Fortunately brains do not decay that easily; but nitrous oxide does bring into being particularly severe engrams. The serious late-life engrams which the auditor will encounter may include, at the list's top, a nitrous oxide dental or surgical or obstetrical engram. Nitrous oxide engrams are particularly bad when they involve exodontistry; they often form the most severe late-life engram. Aside from the fact that all exodontists have in the past talked too much and have offices which are far too noisy with street sounds, running water and flapping drill belts, nitrous oxide is not at all anesthetic and sharpens rather than dulls pain.

In reverse, nitrous oxide makes an excellent hypnotic for institutional therapy. It is far from the best obtainable from the chemists, that is certain, for some brilliant chemist will certainly be able to bring out a good gas hypnotic now that dianetics is known and the need of it in institutions is realized.

There are some drugs which assist reverie, however. The commonest and most easily obtainable is plain, strong coffee. A cup or two of this occasionally alerts the analyzer enough

so that it can reach through deeper layers of “unconsciousness.” Benzedrine and other commercial stimulants have been used with some success, particularly on psychotic patients. These bring the mind enough awake to permit it to overcome engramic commands. Such commercial stimulants have the disadvantage of exhausting a Q quantity in the mind.

This Q Quantity has not been much studied. It is as though the brain burns a certain amount of Q when it is exhausting engrams. For instance, therapy every day may bring results more rapidly but it will also bring some stale sessions. Therapy every two or three days produces the best results as observed. (Therapy once a week permits the engrams to sag and slows a case, one week being too long.) Benzedrine burns up Q. After a few sessions with benzedrine the current stock of Q is exhausted and the work has been observed to deteriorate either until a higher dosage was administered -- and there is a close limit to that -- or until more Q was manufactured.

Here, with all this, must be included an important and vital fact. It should be on a page by itself and underscored. All patients in therapy should be given a dosage of vitamin B1 orally or by injection at the minimum of 10 mg. per day. Reducing engrams exhausts Q which seems to depend in some measure on B1. You can be absolutely certain of nightmares in a patient who is not taking his B1. Taking liberal doses of that, he will have no nightmares. DT's are probably caused by a similar exhaustion of Q Quantity. DT's are best treated by B1 and dianetics. Something like DT's on a very minor scale have been observed to develop in occasional patients who were negligent about their B1. With it, in therapy, they thrive.

Alcohol is rarely an assist to the auditor. In fact, alcohol is rarely an assist to anyone. A depressant, classifiable at best as a poison, alcohol has the single virtue of being highly taxable. All alcoholics are alcoholic because of their engrams. All alcoholics, unless they have injured their brains -- which case is cited only because it is possible, not because research in dianetics demonstrated any real evidence of it -- can be released. Alcoholism is engramic. It has become, in some very understandable way, a class of contagious aberration whereby the reactive mind confuses alcohol and “being a good sport” or “having fun” or “forget your troubles.” Some of these things can also be obtained by strychnine and cyanide. Alcohol has its uses: one can put specimens of frogs and such in it: one can clean the germs off needles with it: it burns well in rockets. But one would not consider preserving his stomach in a glass jar and, unless insane, does not think of himself as a needle. While some drunks think they act like rockets, few have been observed to reach an altitude of more than the floor. It is not only a poor stimulant-depressant, it is also an hypnotic in the finest sense: what is done to a drunk becomes an engram. The chronic alcoholic is physically and mentally ill. Dianetics can clear him or even merely release him without too much trouble for alcohol is apparently not physiological in its addictive effect. With the whole range of chemistry to choose stimulants and depressants from, why the government chooses a superiorly aberrative and inferiorly stimulative compound to legalize is a problem for the better mathematicians, possibly these who deal exclusively in tax income problems. Opium is less harmful, marijuana is not only less physically harmful but also better in the action of keeping a neurotic producing, phenobarbital does not dull the senses nearly as much and produces less after effect, ammonium chloride and a host of other stimulants are more productive of results and hardly less severe on the anatomy: but no, the engrams, contagion unpleasantly along from the first crude brew which made one of our ancestors drunk, decree that alcohol is the only thing which is to be drunk if a person wants to “forget it all” and “have a good time.” There is really nothing wrong with alcohol save that it depends mainly on engrams and other advertising for its effect and is otherwise remarkably inferior in performance: that it makes such aberrative engrams is probably its main claim to fame and infame. Making one drug immoral and another one taxable is a sample of the alcohol engram in society. However, although it is immensely legal, it is doubtful if the auditor will find any use for it in therapy.

And speaking of drugs, that three thousand cycle note in your ears came either from a nitrous oxide engram or mother taking lots of quinine before you were born in the hope that she would not be a mother, saying the while, “It makes my ears ring so: it just keeps on and on and on and will not stop!”

AUTO-CONTROL

Since the beginning of dianetics research eleven years ago, patients have, in the majority, had some belief that they could run their cases in auto-control.

Not understanding that an auditor is only interested in what has been done to, not done by a patient, some shyness or imagined guilt often prompts this vain hope that one can accomplish therapy alone.

It cannot be done. That is a flat statement and it is a scientific fact. The auditor is necessary for a large number of reasons. He is not there to control or order the pre-clear about, but he is there to listen, to provide insistence, to compute the trouble the pre-clear is having and remedy it. The work is done on these equations:

The dynamics of the pre-clear are less than the force in his reactive bank.

The dynamics of the pre-clear plus the dynamics of the auditor are greater than the force in the pre-clear's reactive bank.

The analytical mind of the pre-clear is shut down whenever he reaches an engram and he is then unable to pursue it and recount it enough times to discharge it without auditor assistance.

The analytical mind of the pre-clear plus the analytical mind of the auditor can discover engrams and recount them.

(There is another equation, not elsewhere mentioned, but germane to the auditor's code, which demonstrates mathematically the necessity of that code:

The force of the pre-clear's engram bank plus the force of the auditor's analytical mind is greater than the analytical mind and the dynamics of the pre-clear. This explains the necessity of never attacking the pre-clear personally. It also explains the behavior of the aberree under attack in usual life and why he grows angry and apathetic, for this equation overwhelms his analyzer.)

These equations demonstrate actual natural laws.

Auto-control finds the pre-clear attempting to attack something which has never been overcome by his analyzer although his analyzer has never been trying, interiorly, to do anything else but attack that bank so long as the analyzer would operate. The fact that the pre-clear's analyzer shuts down whenever he comes into an area of "unconsciousness" was why the engrams could take him over and use him as a puppet when they were restimulated -- they simply shut down the analyzer.

Many efforts by many patients have been made to put dianetics on an auto-control level. They have all failed and thus far it is believed to be utterly and completely impossible. The pre-clear in auto-control reverie may be able to reach some locks: he can certainly reach pleasant experiences and achieve data recall by return: but he cannot attack his own engrams without a standard auditor-pre-clear arrangement.

Aside from dianetic reverie, some pre-clears have been foolish enough to attempt auto-hypnosis and thus reach their engrams. Hypnotism in any form is unwarranted in dianetics. Auto-hypnosis used in dianetics is probably as close to fruitless masochism as one can get. If a patient places himself in auto-hypnosis and regresses himself in an effort to reach illness or birth or prenatals, the only thing he will get is ill. Of course, people will try. None are ever convinced until they have tried once they begin to agitate about auto-control. But be sure to

have a friend and this book handy so that he can audit away the headaches and such that suddenly turn on.

Dianetic reverie, which means with an auditor present, is not dangerous or severe. Auto-control is often very uncomfortable and often fruitless. It should not be attempted.

The clear alone can auto-control his whole time track back to conception and does when he wants specific data from anywhere in his life. But he is clear.

ORGANIC MENTAL ALTERATIONS

There are several things which can happen to the nervous system including the brain which can cause structural change. These are called in dianetics, organic mental alterations. They are not called "organic neuroses," or "organic psychoses" because the alteration of structure does not necessarily produce aberrations. There has been a confusion in the past between behavior caused by organic differences and behavior caused by engrams: this confusion came about because the engram bank and the reactive mind were not known.

Any human being with an organic mental alteration also has engrams. The behavior dictated by the engrams and the action caused by alteration are different things. Engrams carry dramatizations, delusions, tantrums and various inefficiencies with them. Alterations establish inabilities to think or perceive or record or recall. For instance the radio set may have new filters and circuits added to it which change and vary its performance and reduce it from optimum; these would be engrams: the radio set might have original tubes or circuits deleted from it or it might have some of the wires crossed; this would be organic mental alteration.

The sources of organic mental alteration are as follows:

1. Variation of the blueprint of structure by reason of a changed gene pattern. Some parts of the body would grow too much or too little to establish any alteration of structure. This is usually so gross a change that it is obvious. The feeble-minded and so on may suffer either from engrams or an altered blueprint, but usually both.
2. Alteration of the nervous system by disease or growths which divides into two classes: (a) Disease destruction as in paresis. (b) Additional construction as in the case of tumors.
3. Alteration of the nervous system by drugs or poisons.
4. Alteration by physical disorder as in the case of a "paralytic stroke" wherein certain tissues are inhibited or destroyed.
5. Physical change in structure due to injury as in the case of a head wound.
6. Alteration of structure by surgery as a necessity to remedy injury or disease.
7. Iatrogenic alterations (caused by doctors) undertaken under a misapprehension of brain function. These can be divided into two classes: (a) Surgical, to include such things as the trans-orbital leukotomy, pre-frontal lobotomy, topectomy and so forth. (b) Shock "therapies" of all kinds including electric shock, insulin shock, etc. etc. etc. etc. etc. etc. etc. etc. etc. etc.

The first six sources of organic mental alteration are much less common than has been supposed. The body is an extremely hardy mechanism and its repair facilities are enormous. If an individual can be made to speak or follow orders at all, it is conceivable that the techniques of dianetics can be applied to reduce the engrams in the engram bank, bringing about considerable improvement in the condition and mental ability of the individual. When these

various sources are so severe that they inhibit any use of therapy, and when it is certain that no recourse to therapy is possible and that it is utterly impossible to reach the engram bank by standard technique, hypnotism or drugs, such cases can be considered beyond help of dianetics.

Category 7 presents another problem. Here we have selective experimentation at work and it would be flatly impossible to conceive, without months of study of their experimental subjects, how many brands and varieties of operation have been performed and how many odd and bizarre shocks have been used.

All iatrogenic alterations of the nervous system can be considered under the heading of "reduced ability," in other words, inability. In each case something has been done to reduce the ability of the individual to perceive, record, recall or think. Any of these complicate a case for dianetics, but they do not inevitably bar dianetics from working.

In shock cases, such as electric shock, tissue may have been destroyed and the memory banks may in some way have been scrambled, the time track may be altered and other conditions may exist.

In all such iatrogenic alterations, the results of dianetics must be considered equivocal. **BUT IN ALL SUCH CASES, PARTICULARLY THOSE OF ELECTRIC SHOCK, DIANETICS SHOULD BE USED IN EVERY POSSIBLE WAY IN AN EFFORT TO IMPROVE THE PATIENT.**

All shocks and operations should be picked up for what they are -- engrams.

NO PERSON WHO CAN PERFORM ROUTINE TASKS OR WHOSE ATTENTION CAN BE ATTRACTED AND FIXED SHOULD FEEL DESPAIR OR BE CONSIDERED HOPELESS.

Any person who has been subjected to such treatment may not be able to reach optimum mental efficiency but he may be able to reach a level of rationality even yet in excess of the current normal. The thing to do is try. In spite of what has happened or what has been done, in the large majority of cases there may be a chance of excellent recovery.

ORGANIC DERANGEMENT

A standard class of prenatal engrams has as its content the worry of the parents that the child will be feeble-minded if not now aborted in earnest. This adds an emotional overload to such engrams and it adds, as importantly, an aberrative condition in the now grown patient that he is "not right," "all wrong," "feeble-minded," and so forth. The difficulty of aborting the child is nearly always underestimated: the means used are often novel or bizarre: the worry because the child has not come out of the womb after the abortion attempt is acute, and the concern that he is now damaged beyond repair all combine to make severely aberrative engrams and, because of their content, engrams which are difficult to reach.

The aberrative quality of the "feeble-minded" species of remark is of course, high. The worry that the child may be born blind or deaf or otherwise incapacitated is common. The former class of engramic remarks can bring about actual feeble-mindedness; the latter concern over blindness and so on bring about, at best, impaired visio and sonic recall.

The shut-off of the recalls is occasioned as well by an engramic belief in the society at large that the unborn child is blind, unfeeling and not alive. This belief is introduced into AA (attempted abortion) engrams by people's self-justification remarks while attempting an abortion: "Well, he can't see, feel or hear anyway." Or, "It doesn't know what's going on. It's blind, deaf and dumb. It's a sort of growth. It isn't human."

The greater part of all sonic and visio recall shut-off has as its source the remarks made at such times or by painful emotion and other engramic data. Hundreds of hours of therapy may pass before these recalls turn on.

The bulk of all shut-offs will turn on in the course of therapy. There are thousands of engramic remarks and emotional situations which will deny the pre-clear his recall and that recall can be expected ordinarily to restore.

A very low dynamic patient (for people have various native strengths of the dynamic) may have recalls shut-off rather easily. A high dynamic patient would require much more aberration before the recalls are closed down.

These recalls can be turned on simply by running out the physically painful and painful emotion engrams.

It must not pass unremarked, however, that the abortion attempts actually can, if rarely, derange the brain and nervous mechanisms beyond the foetal ability to repair. The result of this is actual, physiological disability.

Children and adults now classified as feeble-minded may then be separated into two groups: the actual, physiological class and the aberrated class. Further, recall shut-offs must be classified into two classes as well, regardless of the dynamic and intelligence of the individual: those occasioned by brain damage received during an attempted abortion and those which are solely aberrational and derived from engramic commands and emotion.

The ability of the foetus to repair damage is phenomenal. Brain damage can ordinarily be repaired perfectly regardless of how many foreign substances were introduced into it. Just because the brain was touched in an attempted abortion is no reason to suppose that the recall shut-off has this as a source, for this is the rarer of the two causes.

It is understood that this is being read by many with recall shut-offs and it is understood that it may well produce a considerable upset. But remember this, sonic and visio recall are not vital to a nearly full release. This comment about organic damage does not mean that a release cannot be effected which will leave the person more competent and happier, for this can always be done regardless of the recalls. And remember this, recalls almost always turn on even if it takes five hundred hours or more. This condition is only remarked because it will be found in some few cases.

The "tests" and "experiments" with human brain vivisection in institutions are not, unfortunately, valid. For all the pain and trouble and destruction caused by these "experiments," they were done without a proper knowledge of aberration and mental derangement. None of such data is of any value beyond showing that the brain can be cut in various ways without entirely killing the man. For the patients used responded both to engramic disorder and the physical disorder caused by the psychiatrist, and there is no way to differentiate between these after the operation except by dianetics. Conclusions drawn from this data are then invalid conclusions, for the response of the patient after the operation might have stemmed from a number of sources: engramic, the engram of the operation itself, attempted abortion damage early in life, brain disability on account of the operation and so forth. Hence, draw no conclusions that impairment of conceptual thinking, for instance, results only when a part of the brain is removed, that recall is shut off only when the brain is vivisected and so on. From a scientific standpoint no such "findings" were conclusive of anything except that the brain can be damaged late in life without entirely killing a man and that surgery of any kind often brings about a mental change in the patient. True, it may have been discovered that this or that portion of the switchboard called the brain, when removed, removed also some ability to perform.

DIANETIC FIRST AID

It will be of interest to those associated with emergency hospital work particularly that the healing and recovery of any patient can be enormously benefited and the term of illness shortened by removing the engram occasioned at the moment of injury.

The accident case sometimes dies, in a few days, from shock, or does not recover and will not heal swiftly. In any injury -- a burn, cut, a bruise of whatever kind -- a trauma lingers in the injured area. The moment of the injury created an engram. This engram inhibits the release of the trauma. The fact that the injured part still hurts is an organic restimulator which depresses the ability of the patient to recover.

Using reverie or merely working the patient with his eyes closed, and working the patient as soon after the injury as possible, the doctor, nurse or relative can return the injured person to the moment when the injury was received and usually recover and exhaust the incident as a usual engram. Once the engram of the injury is reduced, the general mental tone of the patient improves. Further, the injured area is no longer inhibited from healing.

Some experimental work on this demonstrated that some burns would heal and disappear in a few hours when the engram which accompanied their reception was removed. On more serious injuries tests showed definite and unmistakable acceleration of the rate of healing.

In operations, when anesthetics have been used, dianetics is useful in two ways: (1) as a preventive measure and (2) as a recovery measure. In the first, no conversation of any kind should be held around or with the "unconscious" or semi-conscious patient. In the second, the trauma of the operation itself should be recovered and relieved immediately afterwards.

A PROBLEM IN MUTUAL THERAPY

R and his wife C cleared each other in eight months with dianetics, working four hours a night four nights a week, each of them auditing the other for two hours of the four. This mutual arrangement had been complicated by the fact that whereas R was very eager to be cleared, his wife was quite apathetic about the work: he had managed only after much persuasion to get the cases started.

He was a high dynamic case with much emotion encysted; she was an apathy case who entirely neglected her troubles (black panther mechanism). He was troubled with a chronic ulcer and anxieties about his job; she was troubled with a general allergic condition and a chronic carelessness in domestic affairs. They were not to any great degree mutually restimulative, but they had problems about tacit consent, avoiding the subjects which had most upset them while together, such as a miscarriage she had had and the loss of their home by fire many years before, as well as other shocks. Further they were faced by R's intensity on the one hand and his introversion, which caused him to slight her therapy, and C's apathy on the other hand, which at once aided R's effort to take more time as the pre-clear than she and which made her less interested in being a good auditor.

Further complication took place because C did not understand the auditor's code or its use and on several occasions had become angry and impatient with R when he was in session and returned, an attitude which tended to force R into an anger valence.

Along this uncertain course therapy had been continuing. R was then informed of tacit consent and told he had better release some of their mutual painful emotion. He thereafter addressed the engram of the burning home and suddenly found himself able to audit some early sympathy engrams of his wife's which had not heretofore been available. It was discovered that her allergies stemmed from a father sympathy compute and that R was the pseudo-father. This resulted in a marked improvement in C's case. She began to suffer less from her allergies and a chronic heart pain she had had so long that she no longer heeded it vanished as well. She became interested in being a good auditor and studied the subject. She became slightly annoyed

with R when he demanded more than his share of therapy time. (This increase of interest is always true of any aopathy case which began with neglect of engrams.)

R, however, was much inhibited by her periods of anger and found that he now operated almost exclusively under auto-control, a condition wherein he decided what should be run and what should not be run in himself. This auto-control is, of course, useless, since if he knew about his aberrations and the data in his engrams, they would not be engrams. He, therefore, started on a period of refusing to display any emotion since she had mocked him about it, would not follow her directions and was, in short, obeying the engrams which she had given him when angry with him during past sessions. C was advised to pick up the moments of anger she had displayed as an auditor during therapy and when these were reduced, it was found that R worked well again and cooperated.

His ulcer stemmed from an attempted abortion. His father, an extremely aberrated individual, had sought to abort the baby when it was seven months in the womb. The mother remonstrated that the baby might be born alive. The father said that if it were alive when born he would kill it as soon as it came out. He had said, further, that the mother had to hold still while he operated. On another occasion the father had said that he would lock the mother in a closet until she decided to abort the child. (This case was much complicated because the mother had been afraid to tell the father and had pretended not to be pregnant for three months, giving the husband the belief that the child, seven months along, was actually only four months along. Therefore, there was much secrecy in the case, much confusion and conflicting data.) This meant that R had a severe holder in the prenatal area: he was held by the engram which included a penetration of his stomach. This was the key engram, which is to say other engrams, by the mechanism of similar somatic and content, had gathered around it to suppress it. This was the tangle of incidents which C was confronting unknowingly: it had become more tangled by her anger. R would now cooperate but his time track had wound into a ball around the holder engram, the key. Two exodontistries for the removal of wisdom teeth with nitrous oxide anesthesia were also suppressing the prenatals.

C worked for some time trying to get at the late extraction engrams, which contained an enormous amount of conversation between the dentist and his assistants and R's mother, who, unfortunately for his sanity, had accompanied him to the dentist's office.

R was made intensely uncomfortable by the continual restimulation of engrams which yet could not be reached. He was no more uncomfortable than he had often been in the past and his discomfort would have been absent had C understood and followed the auditor's code. The case made no progress for several weeks.

C's therapy was progressing. It was intensely restimulative to R to work upon her and increase his discomfort, but the more he worked on her the better auditing she did and the more intelligent she was (her I.Q. went up about fifty points after five weeks of therapy). C desired to know how she could break the impasses in his case and was informed that she was now practicing tacit consent, for she had many times been needlessly thoughtless of R long before therapy was undertaken and she now realized what she had done to him and yet could not bring herself to face the fact that she was a responsible party to so much of his unhappiness -- she had quite ordinarily used angry language to him which she well knew would "push-button" him into doing something or into retreating from a quarrel, which language had been restimulative to him long before therapy.

C thereupon entered into painful emotion engrams late in R's life and, by working early physically painful engrams which said R could "feel nothing" alternately with late engrams when he was feeling intensely on an emotional plane but could not exhibit it, began to release the emotion in the case. R then showed steady improvement. Late painful emotion was released and early prenatals would show to be reduced, at which more late emotion would be visible for reduction.

It was suddenly disclosed in the case that the reason R was so easily upset by C lay in the person of a nurse who had attended R during his tonsillectomy when he was five years of age. C had some similarity of mannerism to this nurse. This was a sympathy engram, and when it was released the time track began to straighten out and the abortion engrams could be more easily contacted.

It so happened that R had been well off his time track most of his life, his memory occluded, his recall in poor condition. This was found to lie in the hidden key engram, the abortion attempt wherein his father had vowed to kill him if he came out and had added that the child could not see, feel or hear anything anyway, engramic material which was demonstrated by R's inability to move on his time track.

The moment the key was found -- two hundred and eighty hours of therapy had elapsed -- R came back on the time track, could move on it, and the erasure of his engrams proceeded in an orderly fashion.

C had been cleared about two months before R reached the final engram. C's allergies, however, disappeared long before her case was cleared completely and R's ulcer and some other psycho-somatic difficulties also vanished well before his case was finally cleared.

A PROBLEM IN A RESTIMULATED CASE

G was cleared in ten months of sporadic sessions. His case had the initial diagnosis of non-sonic, non-visio, pain and emotional shut-off, permanent light trance, permanent "regression" at the age of three years. This is to say that the instant he went into reverie he was startled and frightened to find himself in a dental chair, three years old, and having a tooth pulled, an engram in which he had been situated, unknowingly, about half of his ensuing life. It had been the partial cause of his chronic tooth decay and his inability to sleep as negation against the anesthetic. The situation was obvious since he immediately began to wrestle about and lisp, which condition was instantly remedied by running the engram so that he could come to present time, which he did.

He had had considerable difficulty in life, was a high dynamic but manifested apathy. It was discovered after seventy-five hours, at which time release took place, that his wife was sometimes his pseudo-grandmother and also, by ambivalence, was his pseudo-mother. As his sympathy computation demanded that he be ill so that his grandmother would stay with him and as his contra-survival engrams demanded that his mother was only nice to him when he was ill, the reactive computation added up to the fact that he must be ill continually, which demand had been obeyed by his body for twenty-three years. All this was recovered and remedied, of course, only by reducing engrams.

The erasure began to take place at the end of about two hundred hours of therapy and was proceeding when the case suddenly stopped all progress. For fifty or more hours of therapy, few engrams could be located, those which were located could not be reduced, no painful emotion could be reached and whatever engrams were reached and reduced were located and treated only because the auditor in this case used highly skilled forcing techniques which are almost never necessary and should not be employed save in psychotic cases. Such endeavor had not been necessary at the beginning of the case. Something was obviously wrong.

On close questioning it was discovered that G's wife was violently opposed to dianetics, that she never lost any chance of leveling the most scathing attacks against it to G and particularly when he was in the company of friends. She derided him as being psychotic. She sought a lawyer to give her a divorce (announcing it after he had entered therapy but actually having had continual consultation on it with a lawyer for two years past) and generally agitated and disturbed G to such an extent that he was continually receiving painful emotional engrams even though he did not display any emotion against her.

They had a child, nine years of age, a boy. G was very fond of the boy. The child had had an unusual number of childhood illnesses and suffered from eye trouble and chronic sinusitis; he was backward in school. The wife was somewhat sharp with the child. Anything he did made her nervous.

The auditor in the case, on learning the facts about her attitude toward her husband in general and dianetics in particular, held a conference with her about her husband. She was found to be unopposed to therapy for herself. Shortly after the conference, G and this woman had a brief quarrel in which G made the remark that she must be aberrated. She took intense affront at this and said that he must be the one who was crazy since he was interested in dianetics. He countered with the fact that of the two he must be the least aberrated since he was taking steps to do something about it. Further, he pointed out that she must be aberrated or she would not be as quarrelsome with the child as she was, a fact which definitely indicated that she must have a block on her second dynamic, sex.

The following day he came home from work and found she had withdrawn the money from the bank and gone to another town, taking the boy with her. He followed and found her staying with some of her relatives. She had told them that he beat her and had gone so crazy that he had to have therapy. The truth of the matter was that he had never touched her brutally in his life. In this meeting, before witnesses, she began to rave and revile any "system of psychiatry" which believed in pre-speech memory. He pointed out to her that many schools of the past had believed in pre-speech memory, that the whole background of psychiatry had long talked about "memories of the womb" without knowing what they were, and so forth.

Her relatives, seeing him so calm about it, forced her to return home with him. En route she made a dramatic gesture, although in no way threatened, of committing suicide by leaping out of the car.

The auditor in the case had a private conversation with her on her return. He had somewhat belatedly deduced the fact that there was something in her life which she was afraid her husband would find out and that, confronted with a science which could recover all memory, she had become wildly emotional about it. She at length admitted under close questioning, that this was the case, that her husband must never know. She was so disturbed that the auditor, with her consent, gave her a few hours of therapy. It was instantly discovered that her father had many times threatened to kill her mother and that her father had not wanted her. Further, it was found that her father's name was Q and that her engram bank was strewn with remarks such as "Q, please don't leave me. I will die without you." Additionally, when she was no longer in session, she suddenly volunteered what was to her a hysterically humorous fact that all her life she had been having affairs with men named Q no matter what their shape or size or age. This was far from a release but in view of the fact that his other patient, G, was jeopardized by all this unnecessary hubbub and that therapy was being stalled, the auditor further questioned her. She divulged that she had tried many times to abort their son because she was terribly frightened that he would be a blond whereas she and her husband had dark hair. Further, the engrams of that child, she knew, contained data which she considered incriminating beyond mere abortion; while pregnant she had had intercourse with three men other than her husband.

The auditor pointed out to her that this guilt feeling, no matter how real, was still engramic in her and that it was doubtful if her husband would kill her on receipt of these tidings. He told her that she was condemning a child to a second-rate existence and that she was reducing her husband to apathy by her fears and causing the auditor far more work than was necessary. In her husband's and the auditor's presence she confessed her infidelity and learned with some amazement that her husband had known about it for years. He had not known about her attempts on their child.

She was requested to study a therapy manual and clear the child which, with her husband's help, she did. The auditor continued G on to clear, who then cleared his wife.

ADVICE TO THE AUDITOR

The hidden source of human aberration was hidden for a number of very specific reasons. The auditor will encounter all of these and although with these techniques, the ability of the reactive engram bank to deny him is precisely nil, he should know the nature of the beast he has under attack.

The mechanisms of protection which the engram bank had -- although they are not very good now that we know how to penetrate this armor of insanity's cause -- are as follows:

1. Physical pain.
2. Emotion in terms of captured units.
3. "Unconsciousness."
4. The delayed character of the key-in.
5. Delay between restimulation and illness.
6. Utter irrationality.

Of the physical pain we know much -- that the mind, in memory, sought to avoid it just as the mind in life seeks to avoid it as an outside source: hence, memory blockage.

Emotion of loss piles up to make a buffer between the individual and the reality of death.

"Unconsciousness" is not only a mechanism of hiding data, it is also a block to memory which cannot jump the gaps of past moments when the fuses were blown.

An engram might slumber for the better part of a lifetime and then, given the correct set of restimulators in the right moment of physical weariness or illness, manifest itself, making an apparent cause of insanity or lesser aberration many years after the actual incident had taken place.

Another aspect of the bank protective mechanism was the restimulator lag, which is to say that when a keyed-in engram was restimulated it often required two or three days for action to take place. (Example: say a migraine headache has as its restimulator a rhythmic bumping sound; that sound is heard by the individual who has the engram; three days later he suddenly has a migraine.) Given this lag, how could one locate the cause of a specific restimulation of a sporadic illness?

The utter irrationality of an engram, the ultimate in irrationality, that everything equals everything else in the engram and that these are equal to things in the exterior environment which are only vaguely similar is a feat of idiocy which any sentient man might be expected to overlook as a "thought process."

Man has been looking for this source for some thousands of years; but he was looking for something which was complicated on the grounds that anything which could be so harrowing, so destructive, so vicious and so capable of producing complex manifestations must therefore have a complex source; on examination it is remarkably simple.

The auditor will have very little to do with trying to draw a line between sanity and insanity, they are such relative terms. He will be asked to compare dianetics with old standards

such as the complex classifications of Kraepelin: it can be done but it has the usefulness of Aristotelian natural history, of interest only to the historian.

If an individual is incapable of adjusting himself to his environment so as to get along with or obey or command his fellows, or, more importantly, if he is incapable of adjusting his environment, then he can be considered to be “insane.” But it is a relative term. Sanity, on the other hand, closely approaches, with dianetics, a potential absolute meaning for we know the optimum mind. Modifications of education and viewpoint may make the rational action of one person appear irrational to another but this is not a problem of sanity, it is a problem of viewpoint and education, with which the auditor will have but small concern.

Thus the patients the auditor will encounter will fall into the three general dianetic classes of non-sonic recall, imaginary recall and sonic recall. The question of sanity does not arise: the question of how difficult or how long the case may be is fairly well determined by the degree of these three conditions.

However, the auditor will find that he may have in his hands a truly “insane” case, one which is “psychotic.” The treatment of such a case depends on which of the three above classes the psychotic patient may be entered. The problem is to de-intensify the engrams of the patient as swiftly as possible.

The conditions and mechanisms which hide the engram bank do not vary: they are uniformly present in every patient, in every human being. The techniques of dianetics may be improved upon -- and what scientific technique, particularly in its first few years of existence cannot be -- but they also do not perform selectively but are applicable to all individuals.

Hence, if we have an “insane” patient, the fundamental problem does not change and dianetic technique works as in any other case. The task is to reduce the intensity of charge in the case so that it can be resolved by standard technique.

Insane patients are often found stuck on the time track, in which case a holder is fed to them, one kind after another, until they are moving again. If the patient is regressed, he has become so thoroughly stuck that he has lost touch with the present time. Any patient can begin to relive instead of merely return and the auditor, as the remedy for this, merely snaps at them that they can remember this, which places them in a returned status again. Insane patients are often found listening to one engram over and over, in which case it is again only necessary to fix attention and feed them holders until they are once more moving on the track. Insane patients are sometimes discovered completely off the time track, listening to demons or seeing illusion. The problems are always the same; use repeater technique when, by one means or another, their attention has been fixed and then either get them moving on the track or get them back on the time track. The schizophrenic is usually a long way off his time track.

The best way to de-intensify a case so that it can be entered in routine therapy is to discover and discharge painful emotion engrams. If ordinary means fail, get the help of a medical doctor, place the patient under nitrous oxide or sodium pentothal and reach a deep level of trance where the patient will be found, ordinarily, to be capable of moving on his track even though he was off his track when awake. Find a late despair engram and discharge it as described in the chapter on emotion. The technique for deep trance is no different except that very cautious safeguards must be taken to say nothing which will aberrate the patient further but to limit all conversation to therapy patter, being very careful to include the canceller.

The insane patient is obeying some engramic command, perhaps many, no matter what he is doing. That command may dictate, by the patient’s misinterpretation, some strange action; it may dictate demons; it may dictate anything. But diagnosis merely consists of observing the patient in order to discover, by his actions, what the engramic command might be.

This volume does not cover Institutional Dianetics beyond these few remarks, but an auditor who knows the fundamentals in this volume and with any understanding can bring

about a "sanity" in patients in a short time which the boards of these institutions normally consider a miraculous recovery. The patient, however, is very far from a release, and many more hours should be spent in discharging further painful emotion and reducing engrams before an auditor should consider it safe to permit him to leave therapy.

The auditor should be extremely cautious, at least for the next twenty years, about any case which has been institutionalized, for he may be getting a case with iatrogenic psychosis -- caused by doctors -- in addition to the patient's other engrams. Dianetics may help a mind a little in which the brain has been "ice-picked" or "apple-cored," but it cannot cure such insanity until some clever biologist finds a way to grow a new brain. Electric shock cases are equivocal: they may or may not respond to treatment, for brain tissue may have been burned away to a point where the brain cannot function normally. In entering any such case, the auditor will be perplexed by the scrambled condition of the standard bank, to say nothing of the circuits by which he should be able to reach the engram bank. Syphilis and other brain erosions should be similarly classified and should be approached or undertaken only with the full knowledge that dianetics may not be able to help the dismembered machine at all. There have been many thousands of these brain "operations" and hundreds of thousands of electric shock treatments: thus the auditor should be alert not to engage upon what may be a hopeless cause when there exist so many cases which can better be helped. Any case which has been institutionalized should be suspected. And if anything unusual in the way of memory scramble or lack of coordination is observed, searching inquiry may reveal hidden institutionalization. Further, an auditor called upon to assist a case which is about to be institutionalized should always be wary. The case which is being sent to an institution may be a case which has been in one before, regardless of the protestations of relatives or friends that such is not the circumstance.

Similarly combat exhaustion cases should be warily undertaken, for the case was probably processed before quitting the service, at which time electric shock or brain operation or narco-synthesis may have been applied without the knowledge or consent of the patient.

These warnings are given not because the auditor will be in any particular physical danger -- patients seldom do anything but cooperate, sane or insane, when dianetics is applied, even if they snarl about it -- but because much work may be expended only to discover that the entire mental machinery has been wrecked beyond repair.

If the auditor undertakes an electric shock case, he should address his primary attention to the release of that shock as an engram, for there is all manner of careless chatter contained in these institutional engrams, which may further inhibit treatment. This is aside from the fact that any electric shock, anywhere in the body, has a tendency to derange the engram bank and bind it so that its incidents are more than usually snarled.

For no other reason than the advance of dianetics, and the conservation of an auditor's time, it should also be remarked that the third degree methods of some police departments and general police abuse of criminals or ordinary citizens may have to be released in a case before it can be further treated. Prison terms may contain large despair charges sufficient to derange the mind and yet may be hidden by the patient under the mistaken idea that the auditor is interested or will be disappointed in his "character."

Various other things enter into the engram bank which would not be suspected as obstacles to therapy unless mentioned. Hypnotism can be extremely aberrative and may hold up a case. An auditor should have some working knowledge of it so that he can release the engrams it makes, not so he can work dianetics. Hypnotism is the art of implanting positive suggestions in the engram bank. Here they may append themselves to engrams and become locks on those engrams. As most engram banks contain a sample of most common words, hypnotism is almost certain to be aberrative. The reduction of analytical power by artificial means places the subject in an optimum condition for the receipt of an engram. The hypnotist uses the forgetter mechanism with most of his suggestions and most people have similar engramic remarks which make it impossible for the hypnotist's suggestion to release. Hypnotism can be considered as a "high-powered" lock and may be a serious obstacle in the

patient's engram bank. With clearing, the suggestions having no anchors of pain below them in engrams, vanish as locks. But hypnotic suggestions may have to be found and cleared before a case can proceed. Hypnotism is very commonly used in this society and it is very often the case that, with the forgetter mechanism, the patient is unable to recall whether he had ever been hypnotized or not. Return technique will discover it, repeater technique, making the patient return with repetition of hypnotic patter (by the patient) such as "Go to sleep, go to sleep, go to sleep," can be depended upon to locate it.

Not all hypnotism is in the parlor. Perverts quite commonly use it despite the fact that the "moral" nature is supposed to rise in a hypnotized subject. Incidents even with people of repute have been found in patients when examining their childhood. These incidents were often entirely occluded to the patient, so thoroughly cowering were the commands contained in the hypnotic suggestion.

Dianetics and hypnotism can be combined, but so can dianetics and astronomy. The auditor will find himself working with hypnotic patients and will have to be very careful with patter in order to install minimal words of his own in the engram bank so as not to turn dianetics into hypnotism.

Any benefit derived from hypnotism is in the field of research or the installation of a temporary manic engram. The latter has far more harm than value. Hypnotic anesthetic is vastly overrated. And hypnotism as a parlor game is a thing which no society should tolerate, for it may be sufficiently destructive to cause the engrams to restimulate to a point of insanity. And the hypnotist never knows the content of the engram bank. Any good hypnotist, if he can conquer his desire to talk, should make a good auditor: but if he tries to combine dianetics and hypnotism he will find himself with a very thoroughly sick patient on his hands. Never install a positive suggestion of any kind in a patient no matter how much he may beg for one. It has proven nearly fatal.

An entire case can be worked in deep amnesia trance. It is often possible to waken a sleeping person into a deep trance simply by speaking to him quietly several nights in succession at the same hour and finally getting him to respond to the invitation to talk. Dianetic therapy can then be entered upon and pursued and will succeed particularly if the auditor is not careless enough to artificially restimulate a late physical pain engram, treating in the post-birth life mainly engrams of painful emotion.

If the person on whom the therapy is being done is aware of the action, he can be put into reverie so that earlier data can be reached, "I" being more powerful than the weak if wise attention units which constitute basic personality. He is alternately worked in amnesia trance and then in reverie. The case will resolve eventually even if reverie is not used. But there are grave responsibilities with amnesia trance: a canceller must always be installed and used in every session. Minimal conversation must be employed. All auditor desires should be stated as questions if possible, as these are not aberrative to the degree that commands are. This method has been successful and can be used, but reverie, even if it appears slower, even if sonic is not present, is far more satisfactory for the excellent and incontrovertible reason that the patient recovers more swiftly and recovers on a steady upgrade whereas amnesia trance may incapacitate him for days together, when incidents are apparently lifted in deep trance but nevertheless "hung up" in the awake state. Amnesia trance is definitely not advised: it has been subjected to much research and has been found to be both uncomfortable for the patient and harassing to the auditor. However, if other methods cannot be used for one reason or another (and none of those reasons include the desire of the pre-clear who, if the auditor would let him, might crave drugs, hypnotism and positive suggestion in an effort to escape his engrams and who, if allowed, would have himself a wonderfully messy case for the auditor to unsnarl), amnesia trance can be employed, but always with the greatest caution and always with the full knowledge that the patient's recovery is retarded by as much as a factor of three, for working on a level with the engram bank leaves the analyzer circuits unused in the discharge. Reverie is best.

EXTERNAL PROBLEMS WITH PATIENTS

It may happen that a patient who has made progress suddenly ceases to make further progress. The answer may lie elsewhere than therapy. The environment of the pre-clear may be so intensely restimulative that he is distracted, always in restimulation and thus works slowly. It may be discovered, in such a case, that the pre-clear (as in one case) has made a bargain with a wife or husband who desires divorce that he or she wait until the pre-clear is cleared. Other situations of a life nature can place an environmental value on not being cleared. The auditor has no business with the private lives of his pre-clears, but in a case where therapy itself is made difficult by existing situations the auditor, with his time at stake, has every right to discover the reason. All these reasons will compute into some environmental advantage in not being clear. Removing the pre-clear temporarily from his home, for instance, may change his environment and advance therapy. The auditor has a right to ask that, clear or not, the patient resolve the problem on his own initiative. It is common with pre-clears that they do not realize that they are releases for so glittering is the goal of clear that they cease to compare themselves to the normal which they have already overpassed.

A patient can commonly be expected to introvert to a very marked degree in the course of dianetic therapy. As the case progresses this introversion reaches an acute stage about three-quarters or thereabouts through and thereafter recedes. Ambiversion is a marked characteristic of the clear. When introversion has been marked, a fairly good gauge of the advance of the case is in the pre-clear's interest in exterior things.

Nearly all pre-clears talk a great deal about their engrams up to the point when they are very solid releases. If they don't or won't talk about their engrams in common conversation, the auditor can suspect something highly protected in the engram bank concerning the necessity to hide something: the auditor can act accordingly. Although the auditor may weary of such conversation, it nevertheless reveals much new material to him if he observes the phrases which the pre-clear uses about engrams.

It is very, very true that aberration is caused by what has been done to not what has been done by the patient.

The actions of the patient in dramatizing, in committing crimes and so forth are not aberrative to the patient. Therefore the pre-clear's activities need be no concern whatever of the auditor's. Whole cases have been completed without the auditor's knowing what the pre-clear did for a living. While responsibility for his actions is necessarily demanded of him by an aberrated society, antisocial activity is the result of engrams which dictate it. The patient is not responsible for what he himself has done. Cleared, the matter is different. A clear can be considered entirely responsible for his own actions, for he can compute rationally on the basis of his experience. But the aberrant has little or no real control over his actions. Therefore, the auditor should make it plain that he does not care what the aberrant who becomes a pre-clear has done in life. The problem on hand between the auditor and the pre-clear is an engram bank which contains, exclusively, what other people have done in life and what has been done to the pre-clear in moments when he could not protect himself. This approach is not only truth, it has a therapeutic value, for in so explaining himself an auditor can often obtain cooperation which would otherwise be denied.

The auditor should never violate the auditor's code with a patient. Extended terms of therapy inevitably result from such violations.

RESTIMULATION

The mind is a self-protecting mechanism -- but so is dianetics. A science of thought which works would so closely approximate the working principles of the mind that it would follow in parallels the injunctions and provisos of the mind itself. Such is the case with

dianetics: the mind is diagnosed by its reaction to therapy, therapy is improved by the reactions of the mind to it. This is a working principle of great value since it explains much observed phenomena and predicts most of the remainder. Part of this parallelism is the self-protection feature.

It is almost impossible to injure a mind: it is an extremely tough organism. Of course, when one begins to hew and saw upon it with metal or poison it with drugs or bacteria or throw its natural armor aside as with hypnotism, unfortunate things can occur.

Charlatanism is almost impossible where dianetics in any of its principles is being practiced. One either practices all dianetics and gets results or practices himself into a decline: that is a mechanical, scientific fact. Dianetics, as a self-protecting science, demands practice by clears or at least good releases. A clear very closely follows in all his conduct the better aspects of the auditor's code: his ethical level is very high. Hence, anyone starting a practice of dianetics is going to find himself, no matter what his original intention, thrust toward the goal of being a clear.

There is an excellent reason for this. There is a principle known as restimulation of the auditor. We have an understanding now of what makes an engram come into restimulation. When it comes into restimulation, it forces the pain or the action of the engram into being in the organism. The observation of some percept in the environment which approximates a recording, sound or sight or organic sensation, in the engram brings the engram into greater or lesser play. Similarly, when an auditor is not cleared himself or when he is not in therapy himself working toward the goal of a clear, he becomes restimulated. He is, after all, listening constantly to engramic material in a patient. This engramic material is the very stuff of which insanity is made. Anyone has engrams: sooner or later a patient is going to start going over an engram of his own which will approximate the auditor's own engrams. This leads to great discomfort for the auditor unless the auditor is in therapy and can have the discomfort so brought forth released. So long as one is merely working late locks, this is not so much the case and has made it possible for practitioners and mental healers of the past to escape much of the penalty of their own aberrations, but when one deals with the root material of these aberrations, a constant hammering by restimulators can bring about a serious condition. This is the mechanism which causes people in asylums to fall prey themselves to psychoses, although one must have had them in the first place for them to have been restimulated.

The auditor may run one or two cases without any serious repercussion: indeed, no matter what the repercussion, it can be eliminated by dianetics. To save his own comfort, however, he should himself be cleared or released as soon as possible. He can work as a release without too much trouble, and this makes it possible for him to make a mutual compact where he is worked on while he is working the other. A condition can then come about where two pre-clears are each auditors. This alternation between the couch and the auditor's chair will usually work very well.

Two persons, however, after they have begun work, may discover that they are mutually restimulative -- which is to say each is a pseudo-person in the other's engrams or one is restimulated (voice tone, incidents) by the other. This should be no bar to therapy. It has been overcome and therapy has gone forward despite the most severe restimulative circumstances. A common avoidance technique on the part of a subject is to claim the auditor restimulates him: it is not sufficiently important to stop therapy. It may be, however, that two people can enter a third into the chain and by one clearing the next considerably ease the tension. The triangular work plan, where no person is working on the person who is working him, is quite successful.

A husband and wife who have quarreled long and often may find it too restimulative to clear each other. It is possible to do if other arrangements cannot be made and it is often done: but if therapy does not go well, he should find a therapy partner and so should she. Mothers who have attempted abortion on their children or otherwise maltreated them can accomplish therapy on those children, but in any case of restimulative circumstance such as this, the

greatest precaution must be taken by the auditor to adhere severely to the auditor's code -- to do otherwise might bring much more stress into therapy than is necessary. In such a case, the mother had better herself have at least a release accomplished upon her before she attempts to clear her children -- and she should not touch those children until they are at least eight.

The subject of auditor-restimulation, where the auditor restimulates the pre-clear or the pre-clear restimulates the auditor, does not include the routine aspect of therapy that the pre-clear is always being artificially restimulated via standard therapy. An engram can be restimulated by being touched several times and so it will lift. The auditor-restimulation problem is a specific one where the auditor is a pseudo-enemy, a similarity to a person who has harmed the patient. Wild antagonism on the part of a patient to an auditor is usually traced to this. Some patients have such a hatred of men that only women can work them, some have such a hatred of women that only men can work them. But even when there is a wild antipathy, if there exists no other auditor or person who can be trained quickly as one, therapy can proceed anyway: and it will accomplish results.

REBALANCING A CASE

Any case dropped out of therapy will rebalance itself in a few weeks, which is to say, it will settle to a new high for the individual. Unless drug hypnosis or some other dianetically illegal method is used, all cases will so rebalance, much benefited. Restimulations can be expected to die down if they are due to therapy. The patient will gradually find his own level in the released state. Cases do not have to be carried forward to clear if auditor time is short, but it is, of course better if they are and, indeed, the majority of patients will insist that they be.

WORKING TIME IN THERAPY

The usual period of a dianetic treatment is two hours. In these two hours, with the usual patient, everything is going to be accomplished which can be accomplished on that day. Working every day is not necessary, but working every two days or every three days is desirable. Working with periods a week apart is not optimum, for the case tends to rebalance. Further, there is a "sag" in a case, usually every fourth day when it is not worked in periods as short as three days. The fourth day "sag" is a natural mechanical thing: an engram, keyed-in, when it is restimulated in life, takes about four days to cut in sharply. In therapy, three days is sometimes required to "develop" an engram. This does not mean that three days have to elapse before it is available and it does not mean that work has to stop for three days, but it does mean that engrams, not being memories and articulate as such, take three days, sometimes, to come to the surface.

To be more clear, an engram can be asked for on day one and will be found on day three. Meanwhile the auditor is getting other engrams. This process is so automatic that it requires no attention and will not come to notice except in cases that are being worked once a week. The engram is asked for on day one, is ready to reduce on day three, sags on day four and is rebalanced by day seven.

The three day aspect is interesting in another sense. This time of three days is just an observation of the average behavior of pre-clears. Precision investigation may fix it at 2.5 days or 3.6 days (it varies in individuals), but three days is close enough for our purposes. When one is doing just a release on a case, he will sometimes find that it is necessary to take a late engram and run it: the physical pain engram of later life (post-birth) will appear to rise, will remain constant for three days and then will "sag." When it sags, the auditor will have to go back to it and run it again. Taking out these "sags" will eventually make the later life engram stay in a recessed state.

Euphoria often sets in on a case when the auditor touches an engram which contains a manic. The patient will then go around saying how wonderful dianetics is because he is now in

magnificent condition and is so happy. Watch out. In three or four days this manic will have sagged back to a depressive state. Be wary if somebody experiences one of these sky-rocket "recoveries" for it is about as permanent as the fire of a burning match. It goes out and leaves very cold ashes. The auditor, seeing this euphoria, had better enter the case again and reduce the engram it contains more thoroughly or get a more basic engram.

The length of time it takes to clear a person is quite variable. By blowing despair charges and working a few early engrams, an auditor can get a better state of being in the patient than in any past therapy in twenty or thirty hours: this is a release. It compares to two or three years of past therapeutic work. The length of time it takes to get a clear cannot be compared to any past standard because a clear is something no past standard ever dreamed about.

In a sonic case, where recall is in good condition, a clear can be obtained in a hundred hours. In a case which has thoroughly shut down recalls, anything can happen up to, in extremity, a thousand hours. Similarly, the imaginative case which has things which never happened, may be long.

Look at it this way: we can get the results of two or three years of psycho-analysis in a score or two of hours of dianetics and what we accomplish with dianetics does not have to be done again, which is not true with psycho-analysis. This is the release. He can go about his business in a far more competent fashion, his emotional charges being largely freed. In the clear we are attempting and can achieve a supernormal state of mind. Thousands and thousands and thousands of hours were spent in the education of a man: the expenditure of two or even ten thousand hours of work to make him rank about what would formerly have been possible for him is work well spent. But we do not have to spend anything like this amount of time. People have been cleared in anything from thirty hours, when they had sonic and little volume, to five hundred hours when they had shut-down recall plus imaginary recall. What an auditor can do with his first few cases by way of time is a question mark. He will get to the clear eventually and certainly in less than twelve hundred hours in a severe case. All the time he is working toward a clear he is achieving a higher and higher release which, after at least fifty hours, rises well above the current norm and keeps right on soaring. Improvement is such that from week to week the charge is physiologically noticeable and psychologically startling. If one thinks the reach for clear is a short jump and a small gain, then he has no conception of just how high that goal is.

Most auditors will try for release at first and are wise if they do. When their own case is finally cleared, only then will they suddenly realize that the state was worth far more time than was expended to attain.

It is impossible to forecast, with a new auditor, just how much time he will consume in making errors, learning his tools, attaining skill. It is therefore impossible to estimate for him how long it will take him to gain a clear in a patient. A well trained auditor never takes more than eight hundred hours with the worst of cases: five hundred is high.

DATA FROM RELATIVES

The auditor will always be plagued by the anxiety of the patient to get data from relatives or friends. The request for this data itself is restimulative both to the pre-clear and the relative. Mothers have been made very ill by being given the restimulators of their own past illnesses by the child who has "suddenly found out."

It is a uniform experience that the data obtained from relatives, parents and friends by the pre-clear is absolutely and utterly worthless. Here we are depending upon an aberree's memory when we have at hand, with dianetics, a reliable source of accurate material. Auditors have had cases progress very smoothly and then suddenly stop progress: on inquiry it is discovered that the pre-clear has been running around to his parents and relatives for material

and they, wanting nothing more than that he forget all about what they have done to him, throw him red herrings which have to be carefully eliminated. These are the villains of the piece, the people who have done the things to the pre-clear which made him an aberree. If one expects accurate data from them, one might as well expect the moon to be green cheese.

If the auditor wants data from these people and requests it, by-passing the pre-clear, he may get somewhere. But any data so received has a value which, in intelligence, is used to label "Incompetent Source -- Improbable Material."

Warn a pre-clear not to bother his relatives and parents and explain to him that he can make them ill by asking for data, on the restimulator principle. If we want confirmation of the data received, the only way to get it is put the parent or relative in therapy. At such time, we shall get the basic dramatization sources: in the prenatal life and childhood of the parent. This is a problem of research, not of therapy.

If the auditor has Mama available, he can run off the child's birth and then Mama giving birth, keeping the two apart, and get his check on the accuracy of therapy. And there are other data that can be so compared, using proper safeguards.

The subjective reality, not the objective reality, is the important question to the auditor. First, last and always, does the patient get well?

STOPPING THERAPY

The woman scorned has a violent rival in the pre-clear on whom therapy has been stopped by the auditor's decision.

Keeping the pre-clear in therapy, no matter how seldom are the sessions, satisfies in some measure the effort his basic personality makes to fight clear of the aberrations.

The basic personality, the file clerk, the core of "I" which wants to be in command of the organism, the most fundamental desires of the personality, may be considered synonymous for our purposes. There is an enormous surge of this basic self -- which is really the individual himself -- to conquer the engrams. The engrams, borrowing life from their host, appear as things which do not want to be conquered. As mechanistic as all this actually is, the auditor will often find himself wondering at the resistance the engrams can make and marveling at the efforts of the basic personality to conquer the engrams. He works with the basic personality, the individual himself, and ignores the engramic efforts to interfere. But there is a situation in which the basic personality seems to give free play to the engrams in an effort to accomplish therapy.

In work, a "patient" might have been skeptical, sarcastic or even vicious to the auditor. Or the patient may have been thought to be completely neglectful of his engram bank. Or the patient may even rage that he hates therapy. For some of these reasons the auditor may injudiciously decide to cease working the patient. The patient is so informed. For a short while, perhaps, the patient may manifest no reaction but in a few minutes, a few hours or a few days, basic personality, denied a route out, may begin to use every weapon to hand to compel the auditor to resume therapy.

Disturbed by cessation of therapy, even though he may have insisted upon its being stopped, the ex-patient may begin either to rapidly decline or to attack to his face or behind his back the auditor and even therapy itself. The woman scorned has rarely made such thorough upsets as ex-patients who have been refused continuance of therapy. Auditors have been personally reviled, have had other pre-clears searched out and undermined by violent attacks upon therapy itself, have been targeted by all manner of accusations and whispering campaigns and have been made most uncomfortable by pre-clears who have had further therapy denied to them before a release had taken place. Even solid, legitimate releases, whose psycho-somatic

ills have disappeared and who should be quite cheerful, have been observed to create turbulence when the auditor would not take them through to clear. Any number of mechanisms may be used by the ex-patient. as many mechanisms as men use to force other men into action. One of the mechanisms is a resumption of apathy and a "swift decline." Another is wild campaigning against therapy. Another is personal attack of the auditor. Each has, as its provable intention, the resumption of therapy.

The mind knows how the mind works. And the mind which has tasted a way out of pain and unhappiness may be expected, if that way is blocked, to use all methods to cause therapy to be resumed.

No matter how thoroughly disagreeable the ex-patient has been, the moment the auditor starts therapy upon him again, the attitude alters. No further destructive efforts are made against the auditor or therapy but all is almost as well as it was before the cessation was declared.

Do not suppose, however, that the pre-clear, if he has been neglectful, recalcitrant or generally uncooperative before, will now embrace therapy as chastened patient. Far from the case, he is now at least as difficult to work as he was before plus some additional antagonism engendered by the cessation order.

In such a case the auditor is damned if he does and double-damned if he doesn't. But there is a way out of this. The phenomenon of "transference," where the patient simply transfers his griefs to the practitioner, is not the mechanism here at work; transference is a different thing, bred of a thirst for attention and a feeling of needed support in the world. Transference can be expected to keep up forever if permitted; the patient of a doctor, for instance, may go on and on having illnesses just to keep the doctor around. Transference may occur in dianetic therapy, the patient may lean on the auditor solidly, beg the auditor for advice, appear to hold out engrams in an effort to keep the auditor working hard and available and interested; all this is the resultant of a sympathy computation and is aberrated conduct. The clever auditor will not give advice or attempt to run anyone's life, for a person works well only as a self-determined organism. In dianetic therapy, no matter what the attitude of the patient, no matter how great his "desires to be ill" or his transference of burden, no matter about even his vicious remarks to the auditor during sessions, the condition cannot obtain forever.

Basic personality is trying to get through; "I" is trying to integrate self. Even indifferent work will eventually release enough charge from a case and reduce enough engrams to bring a higher stability to the patient. Basic personality gets stronger and stronger and therefore more self-reliant. The introversion occasioned by continual effort to reach the interior world of the engram bank de-intensifies and extroversion comes more and more into being as the case advances. The way out is to work the patient smoothly and well and one day he will be well released or clear. But meanwhile, if you stop therapy on anyone, don't be surprised at anything that happens; you can only remedy it by resuming the case.

AUDITOR EVALUATION

The auditor must do much evaluation to himself. He does not evaluate or force upon his pre-clear any computation. If the pre-clear computes that this was what was making him ill, then this is what the auditor accepts. Explaining to the pre-clear what it was in the engram which affected him so and so is not only a waste of time but also makes the pre-clear confused. The reason an auditor evaluates is to make sure he is not accepting imagined data or incomplete data as engrams.

An incident will not lift unless the data in it is correct: this is automatic. Change just one syllable in the incident and it will stick. Or, if it seems to go away, it will be back. So there is no fear that any incident which decreases with recounting is incorrect. The data in it must be more or less correct or it would not so reduce. Thus the auditor who challenges incidents, data or otherwise plays god is going to have a thoroughly fouled up case on his hands before he goes very far, and he is going to have a subject who is not progressing. If the subject begins to

run an engram where Mama is having intercourse with five Eskimos, let him run it and never, never, never, never tell him that you feel it was untrue. If you tell the subject you think he is imagining things, you may give him a serious set-back. Tell him you think Mama had her reasons and you have sided with the opposition: you are not attacking the engram, you are helping Mama attack the subject. To criticize, correct or otherwise judge the pre-clear has no slightest part in dianetics and will do more to slow up a case than any other single action. An auditor who challenges the material given him may be practicing witchcraft or Chinese acupuncture or shamanism or voodoo, but he is not practicing dianetics. And he will not get results. One remark to the subject such as, "I think that you are mistaken in believing your mother would try to abort you," or "I feel that you are imagining it" may set your pre-clear back fifty hours. The auditor does not criticize or judge the pre-clear, nor does he evaluate for the pre-clear that person's material.

Auditing is all done privately and to oneself. If the patient has just recounted his fifth prenatal train wreck, you may be sure you have run into a lie factory in some engram. The wrong way to go about correcting this is communicating it to the pre-clear. The right way to go about it is to find the lie factory, an engram containing such a remark as, "Tell me anything! Tell me anything. I don't care so long as you say something. But for God's sakes don't tell me the truth, I can't stand it!" Or, "You can't tell him the truth. It would hurt too much." There are a thousand forms of lie factory. And they are not too uncommon.

Never tell the pre-clear why you are looking for anything. If you say you want a lie factory, the lie factory will make up a lie factory. If you say you want an emotional charge, you will inhibit any emotional Charge from discharging. Simply make a quiet estimate of the situation, reduce everything which seems valid and keep on trying to get the reason why the case is not functioning as well as possible.

The test for validity of an engram is not plot. Plot is worthless. Engrams are just collections of remarks contained in periods of "unconsciousness." It makes no difference whatever whether these remarks agree with the way the auditor thinks a life should be run or the way a pre-clear should look up to his parents. Plot is something writers put in stories. Auditors have nothing to do with it. An engram is basically illogical and irrational; don't try to read rationality into one! If the parents were known to be fine, upstanding members of the community and the engrams seem to indictate that Mama nightly played the prostitute, accept the engrams.

Validity is very simply established. Ask these questions of the engrams:

- (1) Does it have a somatic?
- (2) Does the somatic undulate, which is to say, undergo a running change?
- (3) Does it reduce? (If it does not, the content the pre-clear is running is wrong or the engram is way up the chain and has others before it.)
- (4) Does the engramic content agree with the patient's aberration?
- (5) Does the somatic agree with psycho-somatic ills the patient is known to have had?
- (6) Does it bring relief to the patient? And this last is more important than all the rest.

Because mental healers of the past have grandly said, "Oh, this does not fit with my idea of how life is run" is no reason an auditor should run dianetics off the rails. Mental healers of yesteryear did not get results. Dianetics gets results: and one of the most important reasons why dianetics gets results is that it is not trying to warp life to fit dianetics but is applying dianetics to life. Many new and startling things will come to the notice of the auditor.

His motto, as seen on an ancient English crest where a ninety-foot raven stood upon a castle, could read, "Be surprised at nothing."

The Kinsey report did not begin to tell the story you, as an auditor, will get in dianetics. Because the mother, by herself, is neither the face she showed Junior nor the face she showed society and because mother and father, by themselves, do not conduct themselves as they might be supposed to have done in society is insufficient reason to force a pre-clear to go on being an aberree.

Continually in the psychiatric texts we come upon patients who tried to tell psychiatrists about prenatal life and who were told, with droll solemnity that the incidents were imaginary. Patients who had been given up on all fronts by all existing schools because their data was not tailored to fit the belief of those schools have recovered fully and achieved optimum mental condition, well above that of their former mentors, with dianetics, partially because dianetics does not set itself above the facts of life. He not only requires the patient to face reality by running the engrams but he also requires himself to face reality by accepting the fact that whatever the content, if it fits any of the above conditions listed, it is valid in therapy.

Auditing means to listen; it also means to compute. Computing on a case consists of establishing where the patient departs from optimum rationality in his conduct of life but, more important, where physically painful and painful emotion engrams exist and how they can be approached and reduced.

Patients discover some astonishing things about their parents and relatives when they are in therapy. Often they discover, like one patient who had believed he had daily been beaten by his father, that life was actually much better than it had seemed.

Pre-marital conception cases are very common, with the patient yet unborn discovering himself at his parents' wedding. And these cases are often very difficult to resolve since they contain so much secrecy in their engrams.

The lie factory mechanisms will often try to give Mama extra lovers and try to make Papa into a raving beast, but a lie factory is very easy to detect: the incidents brought forth do not run like engrams: the second time over their content is widely changed, they do not have somatics and their content is not aberrative.

In short, the test is whether or not one has an actual engram, not whether or not the engram makes sense. For father could well have been a raving beast in a boudoir and mother could well have had coitus with the boarders: and father could well have been a tame lamb for all the reputation mother gave him post-birth and mother could well have been a frigid prude despite the wild tales the pre-clear might have heard. The truth will come out in the reduction but its truth is no concern of the auditor's beyond getting up engrams.

First, last and always, get engrams, get them as early as possible for pain, later for emotion, get them, erase them, discharge them, clear them! That they did not compute as true data was what drove the aberree into being an aberree. Leave plot to writers: our task is therapy.

But don't "buy garbage": ask for the somatic, see if it varies as the pre-clear utters the words. Test for engrams. And devil take the plot.

CHAPTER X

Dianetics -- Past and Future

THE HISTORY OF DIANETICS

The history of dianetics would be the history of a voyage of discovery, of an exploration into new and nearly uncharted realms, Terra Incognita, the Human Mind, a land which lies an inch behind your forehead.

The voyage has taken twelve years and the labor has been long, but we have charts now and can go and return at will.

Observations of savage and civilized races in this and far climes formed the foundation for the anthropological research: the writings of a few men in the last four thousand years formed the scholarly pilots. The ancient Hindu writings, the work of the early Greeks and Romans including Lucretius, the labors of Francis Bacon, the researches of Darwin and some of the thoughts of Herbert Spencer compose the bulk of the philosophic background. Inevitable absorption from our current culture provided much unnoticed information. The remainder has been what the navigator calls, "off the chart."

In 1935 some of the basic research was begun: in 1938 the primary axioms were discovered and formulated. For the next several years these axioms were tested in the laboratory of the world. The war interrupted the work, as wars will, being chaos, but shortly after the cessation of actual hostilities, research was renewed. Within a year the fundamentals of this science as they applied to the human mind had been integrated. They were tested on a long series of random patients and each test further refined the work, but each application brought specific results.

Five years after the initial resumption of labor, in 1950, the work was prepared for release, all tests having brought forth the conclusion that dianetics is a science of mind, that it does disclose hitherto unknown laws about thought and that it has worked on every type of inorganic mental and organic psycho-somatic illness. Further, in the refinement of form attained, it was proven possible for the work to be used easily by people not lengthily trained.

The goal we have here reached is a science which is workable and which can be worked with success by briefly taught individuals. This goal has not hitherto been attained or even approached.

Once one has gained a foothold on unknown lands, more things become known to him and with each new datum his horizon further widens, including broader bodies of knowledge. Dianetics cures, and cures without failure. And there are further goals.

Education, medicine, politics and art and, indeed, all branches of human thought, are clarified with dianetics. And even so that is not enough.

Dianetics has, as yet, a brief history: it has a strong youth: it forecasts a better tomorrow. Before it is much older it will have included even more within its scope. The history of dianetics is scarce begun.

Plan A included the perfection of the science, its testing on patients of all kinds and, finally, the dissemination of dianetics as pertaining to therapy. That plan ends with the release of this book.

Plan B includes a further research into life force, an attempt at resolution of some of the ills not yet embraced such as cancer and diabetes, and the perfection of techniques discovered and their dissemination. That will end Plan B.

Plan C includes an effort to discover a higher echelon of universal origin and destination, if the problem is one of origin and destination, and the factors and forces involved to the end of securing a better understanding and useful application of the knowledge so gained, if gained, and if so gained, its dissemination.

A portion of Plan B is the organization of a foundation so that the research can be more swiftly accomplished.

The history of dianetics has just begun. What other things begin with the origin of a science of mind only tomorrow can tell.

JUDICIARY DIANETICS

This brief summary of Judiciary Dianetics is included in this present work as an aid to the auditor.

JUDICIARY DIANETICS covers the field of adjudication within the society and amongst the societies of Man. Of necessity it embraces jurisprudence and its codes and establishes precision definitions and equations for the establishment of equity. It is the science of judgment.

Jurisprudence and its adjudications are constructed on the cornerstones of right and wrong, good and evil. Definition of these is inherent in dianetics: by these definitions a correct solution can be reached with regard to any action or actions of Man.

The fundamental test of rationality is the ability to differentiate right from wrong. The fundamental factors in establishing censure are good and evil. Without precision definition of these four factors any structure of law or judgment is rendered forceless and becomes involved through its introduction of arbitrary factors which seek to adjudicate by introducing errors to nullify errors. Penal codes which will answer all needs can only be written when precision, scientific definition exist for the four factors, and civil equity which will not lead to injustice can only then be established and formulated.

The problems of jurisprudence and, indeed, all judgment, are inextricably interwoven with the problems of behavior.

An ideal society would be a society of unaberrated persons, clears, conducting their lives within an unaberrated culture: for either the person or the culture may be aberrated. The aberrations of the culture enter into the equations of conduct as irrational factors both from the door of education and of social customs and jurisprudence. It is not enough that an individual be himself unaberrated, for he discovers himself within the confines of a society which itself has compounded its culture into many unreasonable prejudices and customs.

The establishment of actual source for wrong and evil is a fundamental problem of all jurisprudence. The actual source unfortunately lies in the irrationalities of those in past generations who, working with limited knowledge and oppressed by their environs, sought solutions with equations which contained false and indefinite factors. These generations, long entombed, cannot be brought to bar. We are the heirs to all the ages of the past and that is good: but we are heirs as well to all the irrationalities of the past and that is evil. Under such circumstances and in the absence of broad reason, adjudication by the auditor of the pre-clear as relates to evil or wrong actions cannot be performed with accuracy. The criminal and the insane, the hypochondriac and the wife-beater, the merciless dictator who seeks to shake the world and the street cleaner who only sits and weeps are all, each one, gripped and driven by their own sources of unreason, by the world which has entered into the hidden depths of their pain-wracked minds and which, in the form of social aberration, pounds against them from without.

The auditor is interested in what has been done to, not done by his patient; for whatever the patient has done is forever beyond recall and was not the source but was only the manifestation of his griefs.

Given a society of unaberrated persons, given a culture from which has been deleted all unreason, then and only then can Man be truly responsible for his acts, then and only then. But we must take the shadow of the responsibility now for the fact of it. A man does not have to surrender to his engrams.

Perhaps at some distant date only the unaberrated person will be granted civil rights before law. Perhaps the goal will be reached at some future time when only the unaberrated person can attain to and benefit from citizenship. These are desirable goals and would produce a marked increase in the survival ability and happiness of Man.

Even now the codes of jurisprudence can be reformed and it can be ascertained with precision whether the act which brought the individual before law was an aberrated act, or stemmed from an aberration of culture, or was an act which was committed to the detriment of another or of society. Surely the process of punishment can be refined so as to sentence the individual not to further aberration as a prisoner or a ruined man but to a higher plane of reason through the deletion of the aberration.

The past acts of an individual who has been cleared should be stricken from his record even as his illnesses have been, for with the cause removed there can be no point in retribution unless society itself is so aberrated that it desires to operate on sadistic principles.* There is more than idealism here for it can be shown that aberration in individuals and the society rise in progressive ratio to the amount of punishment employed.

Efforts to resolve problems of jurisprudence which yet did not embrace precision definitions for right and wrong, good and evil, had recourse only to a principle known in dianetics as the Introduction of an Arbitrary. Our present society is not aberrated in this respect: the insane man is not held guilty or responsible for his acts. Lacking definition of a precise scientific nature for insanity and failing to recognize that all irrational acts are temporary insanity, the society has not been able to carry out its fundamental intention.

Broad, unchangeable rules were thrust into problems in an effort to resolve them and yet each new rule further drove reason aside so that more rules were needed. An arbitrary structure is one in which one error has been observed and an effort has been made to correct it by introducing another error. In progressive complexity, new errors must be introduced to nullify the evil effects old errors. A culture, to say nothing of jurisprudence, grows complex and unwieldy in progressive ratio to the number of new evils it must introduce in an effort to nullify old evils. At last there can be no reason; there can be but force and where there lives no reason and yet lives force, there is naught but the maelstrom of an insane rage. Where there dwells an insane rage, still unresolved, there must at length come apathy; and apathy, dwindling down, inevitably reaches death.

We are here at a bridge between one state of Man and a next. We are above the chasm which divides a lower from a higher plateau and this chasm marks an artificial evolutionary step in the progress of Man.

The auditor is at that bridge; when cleared he will be at its higher end. He will watch much traffic cross. He may see customs, laws, organizations and societies attempt to avoid the bridge but, being swept along, tumble into a nothingness below.

In his attitude toward his pre-clears or toward society at large, he can gain nothing by reprimanding and judging past error in the light of current sentience. Not only can he gain nothing but he can inhibit progress. It is a remorseless fact that the attack upon unreason has begun. Attack unreason, not the society or the man.

DIANETICS AND WAR

The social organisms which we call states and nations behave and react in every respect as though they were individual organisms. The culture has its analytical mind, the combined sentience of its citizens in general and its artists, scientists and statesmen in particular. The social standard memory bank is the data accumulated along the generations. And the social organism has as well its reactive mind as represented by the prejudices and irrationalities of the entire group. This reactive mind is served by an engram bank wherein lie past painful experiences and which dictates reactive action on certain subjects whenever those subjects are restimulated in the society. This, all too briefly, is an analogy used in Political Dianetics.

The social organism behaves in a manner which can be graphed on the tone scale; it has its survival dynamic and its suppressors, its internal suppression due to engrams and its urge toward an infinity of optimum duration. Criminals, traitors, and zealots constitute, for instance, internal engrams which suppress the survival potential on the tone scale.

There is a precision definition for each social level as related to the tone scale. A free society, working in complete cooperation toward common goals would be a Tone 4 society. A society hindered by arbitrary restrictions and oppressive laws would be a Tone 2 society. A society managed and dictated to by the whims of one man or a few men would be a Tone 1 society. A society governed by the mystery and superstition of some mystic body would be a Tone 0 society. The potential of survival in each case can be seen anywhere in history. Any Golden Age is a Tone 4. Oppressive practices, individual greeds and miscalculation in general reduce the society by introducing into it dissatisfied elements. To cope with these, in the past, further oppression has been used. The survival of the society reduced further. With more oppression came new engrams and so down the tone scale slipped the chances of long survival. And with this reduction of potential came pain as the lower zones were entered.

Societies rise and fall on the tone scale. But there is a danger point below which a society cannot go without reacting as would an individual so suppressed: the society reaches a break point and goes mad. This point is around 2.0.

The quarrel of society with society, nation with nation, has many causes, all of them more or less irrational. There have been many times when one society was forced to crush another less sentient than itself. But with each clash, new engrams were born both in the international scene and within the societies themselves.

War is an international Tone 1. It is no more rational than any individual who, reaching a general and chronic Tone 1, is placed in an institution or, temporarily Tone 1, commits some crime and is thereafter imprisoned. But there is no jailer to societies, there is at this time only death and so they die and so they have died.

Before this time no tool could be employed by a nation but force when faced with another nation gone mad. By contagion of aberration, both nations then went mad. No nation ever fully won a war. No nation ever finally triumphed by force of arms. No nation ever averted war by posing threat or exhibiting defense.

Man is now faced, by these pyramiding hatreds, with weapons so powerful that Man himself may vanish from the earth. There is no problem in the control of these weapons. They explode when and where Man tells them to explode. The problem is in the control of Man.

There is no national problem in the world today which cannot be resolved by reason alone. All factors inhibiting a solution of the problem of war and weapons are arbitrary factors and have no more validity than the justified explanations of a thief or murderer.

The farmer of Iowa has no quarrel with the storekeeper of Stalingrad. Those who say such quarrels exist lie.

There are no international concerns which cannot be resolved by peaceable means, not in the terms of supra-national government, but in the terms of reason.

Jockeying with indefinable ideologies, playing with mass ignorance, non-existent entities like nightmares march the world in the form of the Gods of Ism.

No self-interest can be so great as to demand the slaughter of Mankind. He who would demand it, he who would not by every rational means avert it, is insane. There is no justification for war.

Behind the curtains of language and different customs populaces are taught to recognize no kinship with other populaces. Taught by their own terrors and governed by their own aberrations leaders hold up other isms as detestable things.

There is no perfect political state on earth today, there is not even a good definition of a perfect political creed. States are the victims of internal and external aberrations.

Dianetics addresses war because there is in fact a race between the science of mind and the atom bomb. There may be no future generation to know which won.

Rationality alone can guide Man past these threats to his extinction.

Insanity does not exist without a confusion of definitions and purpose. The solution to the international problem does not lie in the regulation or curtailment of weapons nor yet in the restraints of men. It lies in the definition of political theory and policy in such terms that there can be no mistaking the clear processes; it lies in the establishment of rational goals toward which societies can collectively and individually work; and it lies in an inter-social competition of gains so great that none become dispensable to any other.

Man's primary fight is not with Man -- that is insanity. Man's primary fight is with those elements which oppress him as a species and bar his thrust toward high goals. Man's fight is with the elements, with space and time, and with species which are destructive to him. He has hardly begun his conquest. He is just now armed with tools enough and science enough to make good his conquest of the Universe. He has no time to bicker and indulge in tantrums and yah-yah across back fences about atom bombs.

The harnessing of atomic power puts other worlds within his reach. Why haggle for this one? The late discoveries in the field of photo-synthesis bid fair to feed and clothe him royally even though he number a thousand times his present two billions on earth. For what reason can he quarrel? Why?

Two rational men will enter into a contest of gain and worth and production. Are these mighty nations, these powerful, fearful, thundering "giants," actually small and poorly educated, barely sane little boys screaming insults at each other over the possession of a dead cat? What of armies? Armies die. If might makes right, then Rome still rules the world. Who fears now this archeological curiosity that was Rome?

There is a higher goal, a better goal, a more glorious victory than gutted towns and radiation-burned dead. There is freedom and happiness and plenty and a whole Universe to be won.

He who would not see it is far from worthy to rule. He who would indulge his hates is too insane to advise.

How much can Man conquer? He loses if he conquers Man. He wins if he conquers his own fears and conquers. then the stars.

Attack the natural enemies of Man, attack them well, and war of Man with Man cannot thereafter be a problem. This is rationality.

Dianetics is not interested in saving the world, it is interested only in preventing the world from being saved. One more time would be fatal! Dianetics is not against fighting; it defines what may be fought. Those things include the sources of Man's travail within the individual, within the society and the enemies of all Mankind. Man, bewildered, has not known his enemies. They are visible now; attack!

THE FUTURE OF THERAPY

In twenty or a hundred years the therapeutic technique which is offered in this volume will appear to be obsolete. Should this not prove to be the case, then the author's faith in the inventiveness of his fellow man will not have been justified. We have here something which has not before existed, an invariably working science of Mind. The application methods cannot but be refined.

All sciences begin with the discovery of basic axioms. They progress as new data is discovered and as the scope of the science is widened. Various tools and techniques rise up continually, improved and re-improved. The basic axioms, the initial discoveries of dianetics are such solid scientific truths that they will be altered but little. The data discovered by those axioms is already large and daily expanding. The techniques of using that data as represented in this volume will, before much more time elapses, be modified and improved. Their virtue just now is that these techniques work and produce good, solid, scientific results.

Once upon a time somebody set up the basic principles which had to do with fire. There had not been controlled fire before. Cooking, heating and finally metallurgy made a new culture. The basic principles of fire are not much altered. The techniques employed in handling fire soon after it was discovered by Man would be considered somewhat obsolete to us now. We have matches and lighters and fuels today, but just after fire was understood and began to be used, the bow-drill fire-maker and flint and steel would have been considered marvelous inventions: even so Man was already using fire and had been using it with profit for some time both as a weapon and as a household utility when the bow-drill and flint and steel were discovered or invented.

In the case of the wheel, basic principles were laid down which have not altered to this day. The first workable wheel must have been a rather unwieldy affair. But compared to no wheel, it was a miracle.

Thus with dianetic therapy. The basic principles, axioms and general discoveries of dianetics form an organization not before possessed by Man. Not unlike the first fires and the first wheels, the therapy technique can be enormously improved. It works now; it can be used now with safety and effectiveness.

There are two definite drawbacks to this present technique. It demands more skill of the auditor than should be necessary and it is not as swift as it could be. The auditor should not be required to do any computing whatever and indeed, a therapy technique could be envisioned where no auditor at all was necessary, for he is vital at the present time. A complete clear should take but a handful of hours. The problems here are those of improvement in terms of less skill required and less work.

One might say that it is an imposition upon a mathematician and philosopher to require him to resolve all the problems himself and to put forth all improvements. Indeed, it is an imposition that he be required to develop any technique of application at all, for there should be in any society an apportionment of labor.

When the basic axioms and computations were finished, it was impossible to release them for there were none to whom such research could be released for application. Thus the work had to be carried out to its furthest extent of not only experimentation but the development and proof of the techniques of application.

One might here use an analogy of bridge engineering. Let us suppose that two plateaus exist, one higher than the other, with a canyon between them. An engineer sees that if the canyon could be crossed by traffic, the hitherto unused higher plateau, being much more fertile and pleasant, would become the scene of a new culture. He sets himself the task of building a bridge. It has been supposed that no bridge could be built across the canyon and indeed, since those on the lower plateau could not see the higher level, the existence of the higher plateau itself was denied. The engineer, by evolving new principles of bridge building and discovering new significance in his materials, manages to throw a bridge across the canyon. He himself crosses and he inspects the plateau carefully; others cross over his bridge and examine the new terrain with delight. Still more and more cross the bridge. The bridge is solid and, if not wide, can yet safely be negotiated. It has not been built for heavy fast traffic. But it contains the basic principles and axioms by which the canyon can be spanned again and again. Many people begin to approach the canyon and look up.

What sort of an opinion would you have of the society on the lower plateau if they but moaned and wept and argued and gave no hand at all in the matter of widening the bridge or making new bridges?

In this handbook we have the basic axioms and a therapy which works.

For God's sake, get busy and build a better bridge!

APPENDIX I

The Philosophic Method

Science seems always to advance, while philosophy seems always to lose ground. Yet this is only because philosophy accepts the hard and hazardous task of dealing with problems not yet open to the methods of science -- problems like good and evil, beauty and ugliness, order and freedom, life and death; so soon as a field of inquiry yields knowledge susceptible of exact formulation it is called science. Every science begins as philosophy and ends as art; it arises in hypothesis and flows into achievement. Philosophy is a hypothetical interpretation of the unknown, ... or of the inexactly known ... it is the front trench in the siege of truth. Science is the captured territory; and behind it are those secure regions in which knowledge and art build our imperfect and marvelous world. Philosophy seems to stand still, perplexed; but only because she leaves the fruits of victory to her daughters the sciences, and herself passes on, divinely discontent, to the uncertain and the unexplored.

Shall we be more technical? Science is analytical description, philosophy is synthetic interpretation. Science wishes to resolve the whole into parts, the organism into organs, the obscure into the known. It does not inquire into the values and ideal possibilities of things, nor into their total and final significance; it is content to show their present actuality and operation, it narrows its gaze resolutely to the nature and process of things as they are. The scientist is as impartial as Nature in Turgenev's poem: he is as interested in the leg of a flea as in the creative throes of a genius. But the philosopher is not content to describe the fact; he wishes to ascertain its relation to experience in general, and thereby to get at its meaning and its worth; he combines things in interpretive synthesis; he tries to put together, better than before, that great universe-watch which the inquisitive scientist has analytically taken apart. Science tells us how to heal and how to kill; it reduces the death rate in retail and then kills us wholesale in war; but only wisdom -- desire coordinated in the light of all experience -- can tell us when to heal and when to kill. To observe processes and to construct means is science; to criticize and coordinate ends is philosophy: and because in these days our means and instruments have multiplied beyond our interpretation and synthesis of ideals and ends, our life is full of sound and fury, signifying nothing. For a fact is nothing except in relation to desire; it is not complete except in relation to a purpose and a whole. Science without philosophy, facts without perspective and valuation, cannot save us from havoc and despair. Science gives us knowledge, but only philosophy can give us wisdom.

Will Durant

APPENDIX II

The Scientific Method

The Scientific Method is based solidly on definite rules, but is none the less, like the American Way of Life, something that must be lived to be fully understood. The United States has a Constitution, but the American Way of Life is far more than that; so the Scientific Method is, while based on certain readily cited rules, far more than those rules.

For one thing, the Scientific Method implies zestfully, gleefully attacking, with every available weapon of logic, every possible logical loophole in -- your own structure of logic and theory. It requires that a man tear into his carefully built theory with the vim, vigor and spite of his worst enemy. It implies that a scientist's best friend will review his work starting with the premise that it's all wrong and do his best to prove it's wrong.

For the intellectual triumph, the warm glow of victory in science, comes not from producing a new theory -- but from producing a new theory that stands up, and is useful, even when the most knowing make deliberate attempts to find a flaw.

The Scientific Method is behind the testing of Navy armor plate. The production of a perfect piece of 16-inch armor plate is routine and gives no special satisfaction. But the production of a slab of 16-inch armor plate with a 16-inch armor-piercing projectile with its nose buried in that armor, a plate bulged, distorted, but unpierced and unbroken -- that is triumph and satisfaction. We don't test the 16-inch plate with machine-gun fire, or with 6-inch projectiles. Test it with the heaviest, deadliest weapons you've got; then, and only then, do you have something to be proud of.

So with a theory.

There are rules for argument that lead to the building of a theory; they can be condensed to three key, critical points, the sense of which is clear. The problem in application is the subtlety with which violations of those rules can creep in. The critical rules are:

1. Argument by appeal to authority is of no value whatever.
2. The observation, not the observer's report, are the important data.
3. No theory, however well-established or long-held, can stand in the face of one relevant, contradictory fact.

The first of those rules is the one that is most often violated, usually quite unintentionally and without realizing it. Everybody knows that appeal to authority is no sound way to argue a case, even if the authority happens to be right. Yet so subtle can appeal to authority be that, it is exceedingly easy to miss noticing its insertion; the preceding sentence, for instance, deliberately exemplifies one type of very easily missed "appeal to authority," actually the most common of all such appeals. "Everybody knows," "of course," "naturally" and similar phrases are the slipperiest customers in that respect. "Everybody knew" the world was flat for a long, long time, and "of course" the Sun went around the Earth, as any fool could plainly see. And common clay and the precious ruby have nothing in common -- nothing, that is, except the same elements in somewhat different proportions.

But even the less subtle appeal-to-authority that is stamped with the Great Name is a source of immense amounts of trouble. It was not Aristotle's fault that, for nearly a thousand years, science was stopped still by consistent appeal to Aristotle; he didn't claim he knew all the answers -- the scholastic arguers did. Even today, in an age which has some understanding of the scientific method, Great Name arguments show up -- except, of course, that the Great Name himself has become a Great Name by most carefully refraining from using that method!

The sentence, "Einstein says that nothing is faster than the speed of light; it is theoretically impossible," contains two arguments by appeal to authority, and sounds so learnedly scientific that anyone might be taken in by it. Saying a thing is "theoretically impossible" is, actually, appeal to the authority of present theories. But a theory is not a fact -- it's an intelligent set of opinions, and no more, as any scientist realizes. So far as the Great Name argument goes, those are easy to spot, and their value comes into focus very quickly if you simply substitute the arbitrary name "Joe Doakes" for the Great Name. The corrected, scientific-method sentence above -- so far as argumentative value goes -- would read, "Joe Doakes says nothing is faster than the speed of light; in his informed opinion it appears impossible."

Scientifically, there is no difference whatever between the two statements, so far as evidential value goes. The evidence-statement on the subject would read, "Einstein suggested, and physical experiment appears to prove, that nothing is faster than the speed of light; current physical theory, which seems to fit most of the observed data, indicates it is impossible."

That is, admittedly, a much less solidly satisfying sort of statement. It sounds weak, uncertain of itself or anything else. And it is the sort of statement -- the sort of thinking -- that went from the first small scientific evidence of the atomic theory in 1800 to atomic fission in less than a century and a half. It is the scientist -- who operates on the principle that he doesn't already know all the answers -- who is out looking for new and better answers. A man who thinks in terms of "This is the answer. I know this is true. That is impossible, because it disagrees with what I know," does not have to do research. He already knows the answers. He is in no danger of making new and disturbing discoveries that might upset his certainty of mind. The scientist, on the other hand, operates with the certain knowledge that he is uncertain; he is never disappointed, for new data is constantly being found -- he's looking for it -- that shows that he was, indeed, a bit mistaken.

The non-scientist, who likes to work with Truths and Certainties and think in Absolutes, the method of uncertainties and probabilities seems stifling, an impossible method of operation. It is so impossible that it produces, in a single century, electric light and power, radio, television, atomics, the entire science of organic chemistry ranging from dyes to synthetic drugs, automobiles, airplanes -- practically an entirely new civilization.

By realizing that no theory is final, complete, or perfect, a new concept is admitted: a theory is good so long as it is useful. It is, naturally, a very pleasant thing if the theory also happens to be true, but that (shocking though the thought may be to the layman) is not at all necessary. The really important question is not, "Is it true?" but "Does it work?" If it works, we can use it and pretend it's true; if it is true, that's an added bonus.

This reasoning, which seems to some specious and downright dishonest, is the only method so far found that produces results. Look about you: every product that has been touched by machines in its production is a demonstration of the observed fact that, by provisionally assuming a theory is true, concrete, useful results can be obtained. And that by maintaining a willingness to discard or modify that theory at the first sign of failure, progress is made.

For if a theory is good only when it works, then the first time it fails to work -- the first fact it encounters which does not fit -- the theory must be discarded, and a new and better one found. Only someone who insists that a theory is Truth would hesitate to discard a theory that didn't work. And a scientist never insists that a theory is Truth; only that it is useful.

When an apparent contradiction appears, however, the most careful checking must be instituted. First: check the interpretation of the theory. The basic concepts of the theory might be right, and the application of those concepts wrong. The reinterpretation of the theory may explain the new fact. Second, and actually simultaneously, remember that the observation, not the observer's report, is the datum, and repeat the observations. The observer may have been wrong. Men can't see beyond the violet or below the red; quinine makes a man's ears ring, so he hears sounds that aren't there, and no man can hear sounds above 20,000 cycles when they

are there. Under ultraviolet light, the human eyeball glows slightly, so that one sees a mist of light that isn't there, but since we can't see ultraviolet light itself, an observer will not see the source of ultraviolet that is there. Always check the observations; the observer may be wrong.

But actual observations, facts, are never wrong.

One source of a lot of misunderstanding is the difference between theoretical impossibility and factual impossibility. That is best illustrated, perhaps, by the old story of the man who telephoned his lawyer, explained a legal contretemps, and was told, "Don't worry about it; they can't put you in jail for that!" The client replied, "I'm calling from the jail."

A slight change on that might demonstrate reverse aspect. Make the troubled caller a circus owner; this time we'll say the lawyer replies, "That's serious. I'm afraid they can put your elephant in jail for that."

In each case, theory is in conflict with physical fact; in each case, as it invariably must by the very nature of things, theory, not fact, breaks down.

But all of this is, in essence, a discussion of the scientific method of argument, of thought. There is, at the root of it all, the scientific technique, the final test and proving ground of all scientific thinking. Ideally, the scientific method follows seven steps:

1. Make a series of careful observations.
 - A. These observations must be repeated, and are acceptable as observations only if many people following the prescribed techniques can duplicate the results.
 - B. Variations of the prescribed techniques must be tried to eliminate the possibility that the observed results might be due to a factor other than that intended. As a gross example, suppose it is reported that a magnet will attract objects. Demonstration show it does attract and lift iron balls; that is Step A above. Now variations of the experiment show that the magnet attracts iron but not copper, silver, etc. The observed effect -- attraction -- is real. Variation of the original experiment is needed to show the actual limits of the effect.
2. Combining all relevant data, from all relevant experiments, formulate a hypothesis.
 - A. The hypothesis must explain all observed data.
 - B. It must not demand as a consequence of its logical development, the existence of phenomena that do not, in fact, exist.
 - C. But it should indicate the existence of real, hitherto unobserved facts.
3. Using the hypothesis, predict new facts.
 - A. A logical structure broad enough to explain all observed, relevant phenomena will necessarily imply further phenomena that have not yet been observed. Use this mechanism to predict the existence of something which, under previous theories, would not exist.
4. Perform an experiment and make observations on these predictions.
5. As a result of the experiment, discard the hypothesis, or advance it now to the status of "Theory."
6. Make further predictions, further experiments, and collect more observational evidence until a contradictory relevant fact is found.

7. Discard the old theory, take the new total of observational data, and form a new hypothesis.
8. See Step Three.

This process seems, at first glance, a completely circular, going-nowhere system. It isn't; the 50-passenger airliner flying by just overhead testifies to that. Notice that each time round that cycle the new hypothesis shows how to get new data, new experimental evidence, new information. The process is not circular; it's an expanding spiral, and each sweep around it covers a broader and broader field of understanding.

But the most important step of all -- the one that took men longest to make once the idea of organized knowledge was started -- is Step Seven. "Discard the old theory ... and start all over again." It's hard for men -- who are basically conventional, status-quo animals! to give up the comfortable familiarity, the nice, easy routine, of that Old Time Theory, to embark on a completely new system that calls for a total revision of all their thoughts. It's so easy and comfortable to believe that the old theory is Truth, and doesn't and won't ever need changing, even if it doesn't work all the time. Like an old pair of shoes, it is comfortable, and familiar, even if the holes are apparent.

The true scientist is in a somewhat different position. He starts off with any theory and finds it useful only so long as it works. If it no longer works, it should be discarded, and a new, better one fashioned.

And that is an old, comfortable familiar theory that you can settle down into, and stick with for life. Expect change; you can be sure you won't be disappointed.

APPENDIX III(A)

Mind Schematic

The mind schematic is a block diagram illustrating analogically the observed operation of the mind in the organism. It may be likened to the schematic diagram of an electrical circuit, in which the position and relationship of elements derive from the connections to them and not from their placing on the page. The connecting lines represent paths for the transmission of messages which control activity. In this activity we can trace three separate behavior patterns.

First is the basic cycle of automatic physical adjustment, involving only the Life Function Regulator as it regulates the life processes of the Organism. This cycle involves the continuous metering of body conditions, such as heart rate, temperature, digestion, with the issue of orders through the automatic nervous system to correct untoward conditions as they develop. Here lies control of circulation, respiration, perspiration, endocrine secretion and all other body fluid flow, and hence control of metabolism itself for each part of the body and for the whole. The Life Function Regulator, like the governor of an engine, balances the life processes against each other and against the environment of the Organism, through the simple cycle of measure and correct, measure and correct, measure and correct.

It is to be noted that the Life Function Regulator in operating to regulate the Organism regulates the physical aspects of the Analyzer, the Standard Memory, the Reactive Mind and the Learned Motion Pattern Responder, all of which are parts of the Organism. The functions of these parts are described at suitable points in the development of the behavior patterns involving them.

Second is the cycle of reasoned behavior. The phases of this cycle are the receipt of percepts by the Analyzer, the comparison of these percepts with the contents of the Standard Memory and the selection of relevant data, the computation of possible actions and the choice of action to be taken, and the transmission to the Organism of orders which result in that action. These orders are ordinarily converted from relatively simple to complex patterns in the Learned Motion Pattern Responder, whose function is commonly attributed to the spinal cord. Reasoned behavior is rarely recyclic, because each act changes the relationship of the Organism to its environment, thereby changing the percepts, so that the next act differs in a progressive pattern.

The Standard Memory, on which the Analyzer depends for data, is a tremendous file of recordings covering every sight, sound, smell or other perception of the individual's life, awake or asleep. The only exceptions are that it does not record pain and that it does not receive data when the Gate is closed during "unconsciousness." Such data are recorded in the Reactive Mind, to be discussed later, and cannot be transferred automatically to the Standard Memory after consciousness is restored, because the recordings of pain and unconsciousness with them prevent access by the Analyzer. For the same reason they are not available for conscious recall. The contents of the Standard Memory are complete and detailed, including shades of colors and timbres of sounds, and are indexed accurately by time, by topic, and by value to the Organism.

The Analyzer is a calculating machine arranged to analyze each situation in the light of available data and to determine and direct the next acts of the Organism so as best to enable the individual, his progeny, associates, and environment to survive. Except for bias toward survival, which is essential to the continued exercise of its faculties, the Analyzer is self-determined, and is the seat of choice in the human being. Its ability is so highly developed that it can handle several problems at once, involving procedures whose basic patterns are compare-select-act or compare-select-combine. This computing is ordinarily carried on below the level of awareness, not in language but in concepts, with only the premises and solutions appearing.

In emergencies which raise the necessity level the Analyzer not only orders the voluntary kind of behavior but also assumes control of the Life Function Regulator in order to

quicken the whole performance of the bodily machine. By this means it suppresses the behavior of the Reactive Mind.

Third is the cycle of reactive behavior. This cycle compasses automatic, or stimulus-response, behavior of such elaborateness that it is often mistakenly supposed to be volitional and deliberate. The phases of this cycle are the receipt of percepts by the Reactive Mind, where they stimulate reactions, the transmission of these reactions to the Organism as commands, the physical response of the organism to these reactive commands, and new percepts arising from the physical activity. This cycle of perceive and react, perceive and react, may occur once, may repeat in a spiral of increasing vigor, or may develop a series of cycles progressively varied in their nature. Each of these response patterns will contain emotion, speech, motion and psychosomatic disturbances in varying proportions.

The exact nature of reactive behavior will follow precisely, congruently, the content of memories in the Reactive Mind. These memories cover only perceptions received and recorded during "unconsciousness" and in the presence of pain. They therefore cover events or groups of events in which the individual has been a passive participant, but include data from all the senses.

Reactive Mind memories are restimulated, or triggered, by percepts which are at least fragmentarily congruent with them, such as a word or group of words, a smell, a scene or a blow. The effect of repeated or extensive restimulation is to increase the sensitivity of the stimulus-response cells in which these memories may be conceived to be held, so that smaller and smaller restimulations suffice to trigger reactive behavior. Conversely, in the absence of restimulators these cells become less and less sensitive, so that strong, extensive or repeated restimulation becomes necessary to produce reactive behavior. It is to be noted that this threshold is lowered by illness, injury or fatigue, as we often see in when people go "all to pieces" in a state of over-fatigue. The variation of sensitivity with degree of restimulation is independent for each memory of an event or group of events deriving from a separate period of "unconsciousness." It is apparent, however, that if portions of two or more such memories are identical, they will have common restimulators and will restimulate each other through their dramatization in reactive behavior.

Since Reactive Mind memories contain pain and "unconsciousness," it follows that these will appear to some degree in the dramatizations of these memories in reactive behavior, through action on the Life Function Regulator. The dramatization of pain, with its concomitant life function disturbances, can interfere seriously with organic function, particularly by affecting all kinds of body fluid flow. This mechanism is at the root of psycho-somatic illness. The dramatization of "unconsciousness" can interfere with rational behavior by causing temporary or partial Analyzer shutdown, with the filing of additional memories in the Reactive Mind instead of the Standard Memory. Through this mechanism the content of the Reactive Mind can multiply itself in the presence of chronic restimulators until the behavior of the individual becomes mostly or entirely reactive and the person is judged insane.

The three cycles of activity described may be followed readily on the diagram, where each forms a closed loop. The tempo of the whole is determined by the Life Force of the individual, which manifests itself physically as tenacity in life and mentally as vigor and persistence. This Life Force is not to be confused with physical vigor, which depends also on health, or with "energy," which depends in part on the content of the Reactive Mind. The Life Force should not be looked on as the fuel for the engine, but rather as the ignition.

APPENDIX III(B)

Analyzer Schematic

This schematic diagram is a device which enables us to resolve the Analyzer into components with an arrangement capable of explaining analogically its observed behavior as the conscious computing, counselling and control agency of the Organism. The schematic does this by placing the various elements conveniently and interconnecting them with circuit pathways to show the flow of signals and messages.

The key to understanding the Analyzer is the idea of multiple attention. It possesses a considerable number of units of attention, perhaps a score, and can devote them to a large or a small area of activity. Each of these units may be considered to be a separate computer circuit capable of compare-choose-combine or compare-select-act calculations. The input, or attention, end of each of these computers may then be considered to be one of the lines of an attention switchboard. The incoming trunks from any area of activity to which attention is paid will carry in all perceptions, data from the Standard Memory and, when necessary, output data from the computers themselves.

Complementary to the attention switchboard we must postulate an action switchboard which can direct the results of thought to the Organism as action orders, to other computers for further thought, or to the Standard Memory for filing or for delayed action.

The diagram shows these two switchboards with the computers between them, the incoming and outgoing trunk lines, and a group of interconnecting trunk lines which handle information being routed back from output to input for further use. It also shows separately a control center and a consciousness monitor, which must be described carefully in order to avoid errors in using such words as "awareness" and "consciousness."

The control center monitors all circuits and orders attention and action by acting as switchboard operator. It is thus another and more elaborate compare-select-act computer, exercising the function of personality. The diagram shows the connections for monitoring and control, and also the Life Force connection through which the whole Analyzer is animated. It is important to note that the control center operates continuously (but in varying degree of alertness), whether the individual is awake or asleep, going entirely out of operation only during complete unconsciousness.

The consciousness monitor is that element which defines our conscious awareness, our continuity of past, present and future, our ability to look out of our eyes and say, "This is I, looking out of here." While the control center is aware as a normal part of its operation cycle of perceive, judge and act, the consciousness monitor is more than aware; it is aware of being aware. It integrates the pattern of perception, not on a calculator basis, but on a display basis, producing a unified outlook. It is partly like the display panel in the control room of a large machine, which, when a button is pressed, shows in moving light the inner working of the machine, whose processes go on whether the button is pressed or not.

The consciousness monitor, however, goes out of operation when the curtain of sleep is drawn. And with it there go out of operation the first group of computers, all of which it monitors. The second group of computers, which it also monitors, do not necessarily cease operation at this time. In a light sleep the individual retains these attention units alert. As sleep deepens, however, they go out of operation one by one until in deepest sleep only the lowest group of computers, which are unmonitored, remain in operation.

These unmonitored computers provide the attention for a watchman function, to waken us when peril looms. They also provide creative imagination for the solving of problems while we sleep, and for the fabrication of airy structures in dreams. Less spectacular but equally important is their day-labor of scanning the Standard Memory for relevant data for every daily

computation in the moment-by-moment recalculation of the Organism's position with respect to survival and its next move to further that end. (Survival is here considered a spectrum, from self at one end to all life at the other.)

One trunk is shown entering the attention switchboard which existed but was unknown and unused save as a dream channel before dianetics. It is that from the Reactive Mind, and the Analyzer is unable to connect to it in its normal operation. With outside help, during therapy, however, a large number of units of attention may be directed along this trunk for the recovery of engrams from the Reactive Mind.

APPENDIX IV

Advice to the Pre-clear

Certain facts should be made known to the pre-clear. It is not vital that he know anything at all about the technique of processing or that he understand dianetics; all this is inherent in him and he will respond and work as desired by the auditor. In short, the auditor need not explain anything except those items listed below.

1. The pre-clear should take vitamin B1 while in therapy. It requires a certain mental energy to carry through with therapy and B1 is intimately connected with that energy's generation. If he doesn't take B1 he may have nightmares now and then. Ten to twenty milligrams a day are sufficient.
2. The pre-clear can in no way be damaged by dianetic technique. It is not hypnotism in any remote sense of the word; in the process he remains entirely awake and is able to pull himself out of any situation he feels he cannot face.
3. The auditor is not interested in anything the pre-clear has himself done. The data may be of some aid, of course, but it is not at all vital to a resolution of the case. The auditor is interested in what has been done to not what has been done by the pre-clear. Hence wild efforts to cover up material in the belief that the auditor will discover something bad in the pre-clear's life are all wasted, for the auditor doesn't want to know about it anyway. Further, the pre-clear can save a lot of an auditor's time by simply going into therapy without large preambles about guilt or sorrows. The auditor will ask for the personal relationships he needs such as attitude toward father and mother, grandparents and friends as well as the current environment. The auditor knows what he wants to know and the pre-clear doesn't. Therefore, just answer the questions. If the pre-clear is a junior (named after a relative) or if he was raised in a family which spoke some foreign tongue he should volunteer this information immediately. He should also tell the auditor if he has ever had any shock treatment or brain operations. Beyond that, random self-revelation has no use and only wastes time which could be better expended in work.
4. If the pre-clear has had some therapy such as psycho-analysis, he may tend to carry a "remembering" habit into dianetic process. Remaining in present time and "remembering" does no good. Dianetics has no relationship with past mental treatment. It is entirely mechanistic and works with engineering precision.
5. The pre-clear sometimes feels a vanity in a knowledge of some study of mental healing. It will not be of great use to him in dianetics. Arguing about dianetics with the auditor will not accomplish any therapy. If the pre-clear wants to know about dianetics, the auditor can tell him where he can buy a copy of the handbook. The auditor's time is wasted by endless argument over whether or not this or that is a fact. Entered into actual therapy, only then can the pre-clear understand the validity of dianetics. Without studying or experiencing at least as much as a demonstration run on the time track, the pre-clear can know little about dianetics. Short of knowing, the arguer has no data and all urge to argue thus proceeds from prejudice; there is no substitute for knowledge.
6. The pre-clear should know that the total process of therapy is a complete recall of his life and complete refileing of engrams (moments of actual "unconsciousness") as experience and memory. The pre-clear is not being asked to get rid of anything nor is he being asked to believe anything.
7. The pre-clear should understand that any attitude of antagonism or skepticism or even apathy or a "desire" to neglect his engrams is derived wholly from the engrams themselves and that these dictate his attitudes in a large measure. If he does not like the

auditor personally, then the auditor has some counterpart in an engram. Other auditors can be found, but this is not a good enough excuse to shift auditors.

8. Bombarded by his engrams, the pre-clear is apt to conceive the idea that he talks and acts only from those engrams and that he is never thinking analytically. Repeater technique tends to give this conception. It is not a fact, however, that the pre-clear operates only on engrams. The best and most effective portions of his life, all his rational acts, concerns and conclusions, are analytical. During therapy he has a tendency, at first, to believe everything must be engramic but this is not true. His analytical mind is powerful and active and as therapy progresses he is more and more in command of his actions and words.
9. At first, in therapy, the pre-clear is apt to introvert markedly. This is a temporary condition, usually, but may extend for some distance into therapy. Gradually he begins to extrovert. Finally he is no longer interested in his engrams, though he may be interested in those of others.
10. There has long been an incorrect theory that neurosis is the source of mental vigor and ambition. This is emphatically false. If the pre-clear believes that his engrams are of any assistance to him let him go hit his hand hard with a hammer and then argue that he will now be better at his profession because he has a bruised skin. No engram has any value. The engram is a parasite, regardless of its pretension that it aids the individual. Anything the pre-clear does with engrams he can do far better without engrams. It is true and valid that experience plays a major role in educating a man and determining his ambitions. Engrams are not experience; they are hidden commands. Only when they have been processed by dianetics can their content be properly used in thought and classified as valid experience. Knowledge of the exact content of his engrams makes a man wiser, but until he knows what they contain they can only drive him and hound him with pain and reduce his general health and ability to think.
11. Once he knows, in the most general sense, that he has engrams, a man can raise his necessity level to a point which will overcome them. He does not have to obey his engrams.
12. If the pre-clear is being audited by one who is engaging his first case and has lately studied dianetics, no apprehension need be felt. No damage can result, even if a large number of mistakes are made. The brain cannot be damaged by dianetic therapy. Engrams may be restimulated which contain such a phrase as "Stop it, you are taking my mind away, piece by piece!" or "You will be well as long as I am with you," but these are just engrams and their actual effect may well have been to make the individual quite ill. Have confidence in your auditor. He will become skilled with practice and the skills of dianetics themselves will carry you through. If he is clever and experienced, your auditor may bring about a quicker clear and a more comfortable passage through therapy. If he is not experienced, you and he may have some interestingly involved times. But no damage can be done.
13. If the pre-clear finds his auditor becoming angry with him, the pre-clear should refer to the Auditor's Code. It is there mainly to accelerate therapy and to protect the auditor, but it is of considerable use to the pre-clear who, by every right, should insist that it be observed. The engrams, when the pre-clear is returned to an early place on the time track he follows in therapy, often dictate irrational statements. The auditor should understand this. While engrams give the pre-clear no license to abuse an auditor when the pre-clear is not in session, in actual work the pre-clear should maintain his rights in the code to be treated fairly no matter what he does or says.
14. The pre-clear should not expect the auditor to shoulder all his burdens. The end of therapy is to make the pre-clear much less a "push-button" machine, pushed around at the whim of the world which uses his aberrations. The sooner the pre-clear asserts his

own self-determinism and exercises his power of decision in his own affairs, the faster therapy will advance. Self-determinism comes about automatically. It can be artificially induced by the pre-clear himself who, raising his necessity level to act with entire self-determinism, can meet the end half-way. The auditor is there to audit, not to be an adviser in the pre-clear's conduct of existence.

15. If the pre-clear catches himself lying to the auditor, he should know that he is only slowing therapy. If one has pretended war wounds never received or a glittering past, dianetic therapy is no place to carry out the illusion. Such pretenses stem from aberrations and a clear is not responsible for his own errors in the past once he is cleared, though society may for some time attempt to dictate, aberratedly, otherwise.
16. If the pre-clear is being audited by a marriage partner with whom there have been many quarrels, the way of therapy may be difficult. Either be as forbearing as possible or persuade some one outside the home to audit. Wrangles over therapy between marriage partners markedly slow therapy.
17. If the pre-clear is a child and is being audited by a parent, the child should be advised to express what he feels in therapy, not argued into different or false attitudes from some mistaken parental idea of respect. The parent is already restimulative to the child, being contained in many of the child's engrams; it is therefore possible for the parent to reactivate engrams by being overbearing. The child as a pre-clear should have every right of an adult including recourse to the Auditor's Code.
18. It is usually worthless for the pre-clear to seek data from relatives. The data is being sought from a source not necessarily unaberrated, with memory occlusions, and which has a personal interest in making everything in the past as creditable as possible. Such a relative may have great power over the pre-clear, being a part of the pre-clear's engrams. The seeking of data is always an effort to avoid confronting the engrams themselves and use the relative's account as a by-pass memory. Experience has taught that even when such a relative knows the data and remembers it, some personal interest may be served in delivering a distorted idea to the pre-clear. If the pre-clear wants his data checked by mother or father, be sure that mother or father has inflicted pain on him and is a source of much trouble in the engram bank, no matter what the pre-clear thinks. If the pre-clear wants a confirmation, take it after therapy is completed.
19. Should the pre-clear discover that anyone is attempting to prevent him from starting or continuing dianetic therapy, the fact should be communicated immediately to the auditor for this is a useful datum.

Anyone attempting to stop an individual from entering therapy either has a use for the aberrations of that individual -- on the "push-button" order -- or has something to hide. In the former case, a fear may exist that when the individual becomes stronger he cannot be handled easily by the complainant or that he may take revenge upon the complainant for past acts. In this case, it is true that the clear has no puppet strings and the fear is well-grounded. As for revenge, the clear, being free from the fears and commands in his engrams, holds no grudges: his understanding combines with his strength; a person is only a menace as long as he is aberrated and he poses no insane threats when he ceases to be aberrated. When the complainant against the undertaking of therapy fears the disclosure of information, this is the very data which the auditor most needs and which he can obtain through standard therapy. No matter how wonderfully logical are the arguments a wife or a relative may advance against therapy, it has its root in either fear that their control over the patient will be slacked or fear that data exists in the patient's engram bank which is detrimental to them. There is a further extension of this case: wives with children may have a fear that therapy will eventually be applied to the children, in which case much information might come to light which the husband or society "should never know." In any case, the aberrations of the person

arguing against the undertaking of therapy choose self-interest rather than the welfare of the pre-clear. There is no altruistic motive in any attempt to stop therapy.

20. The pre-clear should not regard himself as neurotic or insane merely because he wishes to undertake dianetic clearing. The greatest majority of those who will be processed will be "normal" people. The end of dianetic therapy is not to relieve subnormality but to create the optimum individual. Its concern is not with mental derangement but with the creation of mental freedom. Should anyone infer that the pre-clear engages to be cleared because he is "crazy" and that the critic scornfully does not need such a thing, the pre-clear need only point out that one of the ancient tests for insanity was whether or not the person boasted of his sanity. The average person today contains scores of major engrams. The pre-clear need only indictate that he must be the more sane because he is doing something about his engrams and is attempting to gain a more rational plane of existence. Psychiatry and psycho-analysis in specializing in neurosis and psychosis have fostered a public belief that when anyone does anything about his mind he must be neurotic or psychotic. Education is also doing something about the mind and yet none would declare all children in schools were neurotic and psychotic. Dianetic therapy specializes in creating the clear and though as a matter of course it resolves mental derangement, a clear is to a current normal person as the current normal person is to the insane -- such are the gulfs.
21. The pre-clear may find himself begging for amnesia trance, hypnosis, drugs and other means to "facilitate therapy." Such yearnings are not derived from any other reason than that the pre-clear is afraid to face his own engrams; deep trance does not resolve this problem. It can be used but is useful mainly on the insane. Dianetic reverie keeps a steady progress and is accompanied by a steady rise in the individual's health and outlook. Short-cuts have not proven practical. If they had, they would be included in dianetic therapy.
22. It is useful to advise the pre-clear that while he may grow as angry as he please at his relatives when he discovers what they have done to him, when he is clear he will no longer be angry and will then have the sometimes arduous task of making friends again. This does not excuse the relatives nor does it mean that the auditor should take umbrage at the pre-clear's enthusiasm for revenge when he discovers what Mama may have done to him or what Papa said; it does mean that whenever a pre-clear has given voice to these rancors to the offenders, he has afterwards had to patch up broken relations, for when therapy is ended there is no reason nor desire for rage. Therapy passes up a tone scale from apathy, through anger to cheerfulness. At the beginning of the case the pre-clear may feel very propitiative toward offenders against him and not even know they are offenders. Half through a case he may become incensed at the offenders and indeed, should become angry if the case is progressing at all. At the end of the case he realizes that he was dealing, after all, with aberrees, and he weighs their disfavours with their favours and understands without anger. If the pre-clear is a child who has been badly abused, the auditor may have a difficult time trying to keep him from being extremely angry and generally impolite to his parents. The phase is, after all, only a phase. When cleared the child can love his parents of his own free will and not out of fear and necessity. Such cases invariably right themselves. When one parent is the auditor, he may have upon his hands at one or another stage of the case, a very impertinent and even caustic youngster: if the parent wants the phase to pass, he will permit the rage to reign and vigorously follow the auditor's code, giving the child all the dignity of his righteous anger. After all, the child is entitled to a demonstration after keeping it in and living with it for years. He will not recover his feeling of love if that anger is checked and scolded.
23. The health of the pre-clear can be expected to take a roller-coaster aspect during therapy. It will not get steadily better on an even curve of progress. It will surge upward and fall back many times during one session of therapy and will be inconstant from day to day as new engrams restimulate and old ones reduce. He will not become seriously ill and

he cannot become as sick as he ordinarily was. But it is disconcerting to the pre-clear to have a nose cold three days after his birth engram was accidentally touched before it could be reduced; it would alarm a physician who did not know the patient was in dianetic therapy to watch blood pressure vary and the physical tone change so rapidly from lows to highs. Yet nothing serious happens and indeed the bulk of therapy is spent in improved and improving physical comfort. But a pre-clear should not be disheartened or dismayed to find himself with a flicker of “coronary trouble” on Tuesday, the shadow of a “migraine” on Saturday and a cough on Wednesday. These are somatics which sometimes come into restimulation before they can be reduced. Anything so restimulated by therapy cannot reach any dangerous heights and is of passing duration. They are the illnesses he will never have again and he should be glad to see them go. A very clever auditor can conduct a whole case without restimulating in the period after a session more than an occasional slight ache. But if somatics manifest themselves after and between sessions, do not be surprised, and above all do not interrupt therapy because of these aches and pains; they are less in any case than even a minor illness and are at worst merely uncomfortable. The point is, do not believe, as some patients are apt to do, that the presence of an unidentified ache or pain means anything serious is forecast in the way of illness. In therapy sessions some mild reproduction of past pain is felt and these may continue on a milder scale between sessions, that is all. You won’t get sick, you are getting well.

24. The daily work of the pre-clear should never be interrupted and laid aside in the thought that a week or two of dianetics and nothing but dianetics will solve all problems. In grade school, high school, and college 18,000 hours are consumed making an individual a storehouse of knowledge and skill. Many more thousands of hours are spent gathering experience on how to apply the knowledge and develop the skill. In dianetic therapy, a clearing of all occlusions puts the individual into possession of all he has ever studied, heard and learned and takes away the clumsiness and errors which may have inhibited his reaching the height where he belongs. It would be worth 10,000 additional hours of time to recover and be able to use and apply the knowledge, experience and skills of a lifetime. One receives a bonus of increased health, happiness and longevity, an increase in longevity which is at least a hundred to one for every hour of therapy. Yet therapy all the way to a clear takes far, far less than 10,000 hours of work. A case is as long as it has quality and quantity of engrams: if it takes a thousand hours, then blame the parents, not therapy. Yet few cases should consume a thousand hours even in unskilled hands and the bulk of them should take at most two or three hundred hours, a paltry amount of time compared to the thousands of hours of “forgotten” education, the tens of thousands of hours of occluded reading and experience which will be recovered, completely in addition to health, happiness and longevity. There is no Royal Road to Clear; it takes as long as it takes. The pre-clear should then settle his mind on the fact that he will be in therapy for some time. He should not hold off making decisions or hang his life on the end product of being cleared. Of course he will be impatient. Of course he will attempt to speed the process all he can and that is good.

But he should not forget to carry along his life nor should he abandon his diversions or his work. It has been proven that pre-clears follow a rapidly advancing curve of progress and that from week to week their potential rises. It has been observed that they neglect to remember (since it is no longer important to them in any way) that aberrations are fleeing from them at a rapid rate. In dianetics one does not “learn how to live with his troubles.” The troubles vanish like the bubbles in a ship’s wake. One does not keep them in mind and remember that the reason one does not like spinach was because Papa beat him when he would not eat it. The engram, refiled, does not inhibit the eating of spinach and Papa’s beating is no longer a source of pain. The troubles are gone.

Therefore, it sometimes appears to the pre-clear, who looks only at the engrams ahead, that he is standing still. The auditor may have to ask him how he felt this time last August and make the pre-clear ponder it well before the pre-clear recalls that last August

whenever he tried to write a letter he became nervous, that he hated his children's racket, and that rain made him wonder about suicide. When he has compared his existence at his present level in therapy and his level shortly after he entered therapy, the pre-clear will agree he has made progress.

In the next breath he is asking the auditor about possible identity of the ally they have just scented in the case. The pre-clear, in other words, recognizes no progress, since all progress is by loss of aberration; blind to this he tends to be extremely anxious and aggressive about getting along with therapy and does not stop being so (unless he is near the start and is a "neglect-engram" case) until one day he finds himself cleared. On that day he takes a glance at the fact that he is cleared and is already wading knee-deep in the enthusiastic business of living. So do not stop looking at the exterior world or living in it for the period of therapy. Take clearing interestedly but as routine to be followed. Give as much time to it as can be afforded and give the rest to life. And don't scold the auditor because work was started Tuesday and here it is Thursday and one is not yet cleared.

25. The pre-clear should thank the auditor after each session. And he should tell the auditor when he feels better and that he appreciates progress whenever progress has been made. The pre-clear introverts and forgets that the auditor deserves some courtesy. This is more important than is readily realized. Even the best of auditors are human.
26. The pre-clear has his own responsibility in aiding his own case. He has just as active a part in locating engrams as the auditor. The pre-clear who expects to be run through dianetic therapy as though he were a car, with no volition of his own, slows his case enormously.
27. The pre-clear who is being handled by an auditor less forceful than himself either from inherent personality or aberrations is liable to dictate to the auditor where they will look for engrams and what they will do about them. Remember that if a man knew his engrams they would not be engrams. Only an exterior mind, the auditor, knows what is best for the case. The pre-clear who attempts this is wasting his and the auditor's time. At the start of the session the pre-clear may dictate that, as he has a headache, they should put him back to a certain accident and see if that is it and so get rid of the headache. The headache isn't important, ever. Getting engrams that will erase or reduce is important. All such dictations are "dodges," aberrated efforts to avoid engrams. The less forceful auditor, man or woman, should recognize a "dodge" when they see one and the pre-clear, knowing this, should abandon this avoidance technique and let the auditor audit.
28. The pre-clear should understand that the auditor is restrained in many ways by the Auditor's Code. The pre-clear should know the code and, knowing it, should not impose unreasonably upon the auditor's time or patience, for the auditor also has a life to live and out of courtesy and the code, may be imposed upon without being able to prevent it. Be thoughtful.
29. There is one major motto in therapy for the pre-clear: "The only way out of it is through it!" Remember this. When the auditor says to go through the engram, be it ever so threatening, do not beg to come to present time for that brings the engram with it. Two or three runs and the power of that engram is broken forever. "The only way out of it is through it!" Remember that.
30. The pre-clear is the only one who "knows" what has been done to him. It may not be immediately in conscious recall, it may require dozens of hours to find specific information as to what people have done. But all the data is there, available for recall in therapy. If the data is not there, then it is not aberrative; if the data is there, it is aberrative. Only the pre-clear "knows" how long the case will take, only the pre-clear "knows" how many allies he is trying to disguise. The pre-clear may not be able to

immediately recall it, but the information is there; he “knows” it. All knowledge of his whole lifetime is available to him via dianetic therapy. The auditor can use technique to attain the information, but it is the pre-clear who does the work, does the recalling. He is assisted by the auditor and by dianetics. Neither the auditor nor dianetics “knows” what the content of the pre-clear’s engrams may be; only he knows that. The auditor and dianetics furnish the process, the pre-clear has the information necessary to resolve his case.

Good hunting!

GLOSSARY

ABERRATION: Any deviation or departure from rationality. Used in dianetics to include psychoses, neuroses, compulsions and repressions of all kinds and classifications.

ABERREE: Dianetic neologism for any aberrated individual.

ANALYTICAL MIND: That mind which computes -- the "I" and his consciousness.

AUDITOR: The individual who administers dianetic therapy. To audit means "to listen" and also "to compute."

BASIC: The first engram on any chain of similar engrams.

BASIC-BASIC: The first engram after conception, the basic of all chains by sole virtue of being the first moment of pain.

BOUNCER: Any engram command which, when approached by the analytical mind on the time track, makes the patient move back toward present time.

CHAINS: Any series of incidents in the engram bank which have similar content.

CIRCUIT: See DEMON.

CLEAR: The optimum individual; no longer possessed of any engrams. A clear is an individual who, as a result of dianetic therapy, has neither active nor potential psycho-somatic illness or aberration. Dictionary: Bright; unclouded, hence, serene; clean; audible; discriminating; understanding; free from doubt; sure; innocent; net, as profit over expenses; free from debt; free from any entanglement. V.t. To make clear, as of dirt or obstruction; to enlighten; to free from guilt, blame, etc.; to open for passage; to disentangle. V.i. To become clear and bright. N. A clear space or part.

DEMON: A by-pass circuit in the mind, called "demon" because it was long so interpreted. Probably an electronic mechanism.

DENYER: Any engram command which makes a patient believe that the engram does not exist.

DIANETICS: Greek, dianoua -- thought -- or more correctly, DIA (Greek) "through," NOUS (Greek) "soul."

DYNAMIC: The urge, thrust and purpose of life -- SURVIVE! -- in its four manifestations: self, sex, group, and Mankind.

ENGRAM: Any moment of greater or lesser "unconsciousness" on the part of the analytical mind which permits the reactive mind to record; the total content of that moment with all perceptics.

ENGRAM BANK: The storage place in the body where engrams, with all their perceptics, are recorded and retained and from which engrams act upon the analytical mind and the body.

ENGRAM COMMAND: Any phrase contained in an engram.

ERASE: To cause an engram to "vanish" entirely by recountings, at which time it is filed as memory and experience.

GROUPER: An engram command which makes the time track or incidents on it become tangled in such a way that the track appears shortened.

HOLDER: Any engram command which makes an individual remain in an engram knowingly or unknowingly.

MEMORY: Anything which, perceived, is filed in the standard memory bank and can be recalled by the analytical mind.

MISDIRECTOR: Any engram command which makes the patient move in a way or direction on the track which is contrary to instructions of the auditor or the desires of the analytical mind of the patient.

PERCEPTIC: Any sense message such as a sight, sound, smell, etc.

PRE-CLEAR: Any person who has been entered into dianetic therapy.

PRE-RELEASE: Any patient who is entered into therapy to accomplish a release from his chief difficulties, psycho-somatic or aberrational.

PSYCHO-SOMATIC: Any physical disorder or ill generated by the mind. Psycho-somatic ills are caused by engrams.

REACTIVE MIND: The cellular level mind which is not “unconscious” but is always conscious -- the hidden mind, hitherto unknown.

REDUCE: To render an engram free from somatic or emotion by recountings.

RELEASE: Any person who has been advanced to a state approximating 1950 normal by dianetic therapy, whether advanced from a psychotic or neurotic condition. The act of releasing by therapy.

SOMATIC: Dianetic neologism for pain, any body condition experienced when contacting an engram; the pain of a psycho-somatic illness.

SONIC: Recall by hearing a past sound with the “mind’s ear.”

STANDARD MEMORY BANK: The storage place in the mind where all consciously perceived data (sight, sound, hearing, smell, organic sensation, kinesthesia, tactile as well as past mental computations) are recorded and retained and from which they are relayed to the analytical mind. Includes all data of a conscious nature from conception to “now.”

SUPPRESSOR: The exterior forces which reduce the chances of the survival of any form.

SYMBIOTE: Any entity of life or energy which assists an individual or Man in his survival.

TIME TRACK: The time span of the individual from conception to present time on which lies the sequence of events of his life.

VISIO: Recall by seeing a past sight with the “mind’s eye.”

The aims of the Hubbard Dianetic Research Foundation are rooted in a new science of the mind, Dianetics. As described in the book *Dianetics*, the sole source of human aberration has been discovered, and techniques evolved for its invariable relief. Such a discovery will quickly affect every individual and every activity of human beings in all parts of the world. The aims of the Foundation, therefore, are:

1. To maintain the integrity of Dianetics.
2. To resolve concerns of the individual.
3. To stabilize and advance our society.
4. To stabilize the concerns of nations, and render a recourse to war unnecessary.

The speed with which Dianetics must accomplish its research program and expand on a worldwide scale, in order to achieve these purposes in time to prevent catastrophe, can easily be seen.

L. RON HUBBARD

5008C30 LECT Preventive Dianetics

Schizophrenia is caused by a superabundance of control circuitry. It is contained in the phrase, "I'm all alone." Paranoia has the phrase, "they're all against me."

The repeater phrase, "I love you," gets the PC into a sympathy engram.

Prevent aberration by keeping calm around a child. Don't quarrel, Pull attention units to PT by creating a necessity level, even if it has to be an artificial one. E.g. a person who is drowning and seeing his whole life flashing before him is coming up to PT. If you can do this to a kid in early life, nothing will bother him later. Cultural patterns such as an extended period of mourning are just cultural patterns; in the absence of engrams you don't get long term misemotion.

It should be made part of the social mores not to talk or even say, "Shh!" around injured or anaten persons.

In industry, you get the situation where an individual who has worked in one place gets a chain of injuries with the same perceptics and lots of words. Therefore, he is out of PT at work and may cause industrial accidents. 100% of auto accidents are caused by engramic restimulation (whether of the driver, mechanic, or manufacturers).

Accident proneness is telepathic. One finds that engrams are the best telepathic broadcasters. This is analogous to an alarm system for the herd. Thus, of two persons who have never met, one will act out the other valence in the other's engram.

At high tones, affinity is raw cohesiveness; at lower tones, it is as if there is a herd that must be alerted and needs shock (e.g. fear, grief, anger) to be broadcast to cohere the herd into fight or flight. You can notice this telepathic alarm system when you enter a room where people have been quarreling. So when you are in the society of others, you run into this all the time. Similarly, in the vicinity of accidents, other accidents occur. Engrams are keyed in and then acted out. Thus "accidents come in threes". If you took driver's licenses away from the 8% of people who have been involved in car accidents involving injury, you could eliminate 90% of the accidents.

If you audit grief charges in pregnant women, with sobbing or self-beating, etc., you may get transmission of engrams to the child. Then, when later you try to audit the child, you may get oddities, or restimulation, from dianetic patter, which is part of the child's incident. Therefore, probably dianetic patter will have to be changed in 15 to 20 years. So auditing a pregnant woman has to be adjudicated. You should go ahead if there is a threat of attempted abortion or difficult birth. Also, you should observe how the mother behaves during auditing. By the way, girdles, etc., cause more or less continuous engrams for the child, so watch out for young kids or unwed mothers, or anyone who would try to hide pregnancy.

Social aberrations are fragments of old morals whose practical origin is forgotten. Morals, in their turn, are a socially agreed upon attempt to handle a problem for which no rational answer exists. It's a jury-rigged solution. [Thus some morals may be unethical].

The Processing of Children

L. Ron Hubbard

It is possible to process a child at any age level beyond the point when he learns to speak. No extensive processing should be undertaken until the child is at least five, and full dianetic processing is not encouraged, except in very unusual circumstances, until the child is at least eight years of age. Much good can be accomplished before eight by straight line memory technique, but reverie should not be attempted before that age. In the period from eight to twelve years the child may be processed by any of the techniques outlined here. One should not force the child into the prenatal area until after he is twelve years old. Sometimes a child will willingly return to the basic area and if this happens naturally, engrams can be reduced or erased. If a return to the basic area is made by the child, it is to be accepted and treated as a matter of course, but the auditor should not in any way force him to do so.

In all except severe cases, a child may be successfully processed by a parent. In all cases, however, it is more difficult for a parent than an outside auditor, since the parent, by dint of being a parent, is a restimulator for the child. Even the tone of a parent's voice, without similarity of word content, will sometimes act as a restimulator. Nevertheless, with some intelligence and objectivity on the part of the parent, it can be done. It should be set up as a well defined program occurring in a slightly different form than any other household happening. It should be a new, different, exciting game in which the rules are slightly different from those of other forms of play. Even if the processing is done by an auditor from outside the household, the parents still form an essential part of the child's environment, and must be educated into acceptance of the facts of Dianetics.

There are three major steps in the processing of children:

1. Prevent restimulation.
2. Break locks.
3. De-intensify painful emotion.

The parent should attempt to avoid the language which is in the child's reactive bank. The emotions accompanying this language should also be avoided, as well as any known duplication of situations which are likely to have been recorded by the child's reactive mind. If the parent cannot recall the incidents in which engrams might have been created, or if he cannot remember the language used at that time, he can soon determine by the child's reactions what sets of words and what kinds of emotion are in the child's reactive bank. He should then be very careful to avoid this language, especially when situations exist which might be engramic. Any aberration in a child is evidence that a key-in has occurred, and the situations in which the aberrations are most apparent will have similar perceptics to the perceptics which were present when the engram was laid in.

For example, one set of parents tried desperately to keep their child from wetting the bed by continually telling him to go to bed and not to drink any water before he went. In spite of this "education" the child continued to wet the bed. Dianetic evaluation of this situation showed immediately that something in the immediate situation around the child was stimulating an engramic command which caused the bed wetting. In this case, as in many others, the action taken in all good faith by dianetically untrained parents was not preventing the aberration, but rather was keeping it chronically keyed in. These parents found that commands which meant reactively that if you are told not to drink water you must urinate in the bed were contained in the birth engram. The actual engram content was:

“The water is going to come.”

“It’ll break and go in the bed.”

“Just lie there and let it go.”

The engram was keyed out by removing the restimulators. When the parents stopped telling the child not to drink water before he went to bed, the bed wetting tapered off and then stopped entirely.

Locks can be contacted and blown through straight line memory techniques. The parent can be of great help in this part of the process because he knows pretty well when he has created a lock, especially in an emotional blow-up of any kind. By remembering the standard pattern of his dramatizations during emotional crises, he can help the child or the child’s auditor to find the locks which will best help the child to overcome his difficulties. Whenever anaten* is present in the child, and it is present when any engram is being restimulated, a lock can be created. The resulting aberration will depend on the emotion and pain of the lock as well as of the original engram. This fact, plus the nature of the aberration, can be used to determine which locks should be investigated first.

In a child, returning is a simple and natural mechanism, and the technique of blowing locks is to use a combination of memory and recall. Ask the child, for instance, if his mother ever bawled him out. If so, try to get him to remember a specific incident. At this point many children will close their eyes and return to the event. If the child can remember the exact words his mother used, and the words of any other people in the incident, allow him to run through it as often as it interests him. Most locks will blow with a single recounting, and will cease to have any aberrative effect on the child.

Grief can be contacted in a child as easily as in an adult. The chief point of difference is that the grief will be on moments which seem not very important to an adult. A child will have a definite sense of loss when, for instance, his mother did not allow him to sail his boat on a rainy day. The discharge over this type of grief engram will be small when compared to the grief occasioned by the leaving of a favorite nurse, or the loss of a pet, but any moment of grief which can be discharged will improve the health and well-being of the child.

THE ACCESSIBILITY OF CHILDREN

The auditor who wishes to deal successfully with children must have, above all, the ability to establish affinity with the child. This is a problem of interesting the child in the incidents which have caused his difficulty. A child’s attention is badly scattered. He has not yet learned to focus his attention well, and it is the part of the auditor to pick up his attention and channel it back against the locks and grief engrams.

A child has a great natural sense of dignity. Do not talk down to a child. Treat him with as much dignity as you can. You will find that the child has weird misconceptions about many everyday things around him. Trace these misconceptions to their source and you will usually find an adult who has not taken the trouble to give this child the right data. *Never talk over a child’s head to his parents.* It is better to talk over the heads of the parents to the child. Always work on a partnership basis with the child.

One little boy was almost completely inaccessible at the beginning of processing. He was very noncommittal about anything connected with his past life and completely silent in regard to his parents. Knowing that this behavior was not natural to a child, his auditor asked suddenly, “Which one of your parents told you they’d lick you if you told about their quarrels?” The little boy looked startled, and then burst into tears. Subsequent investigation proved that both parents had threatened him if he told anything about their fights. The auditor who deals with children needs to understand that there may be artificial barriers to the building of affinity with the child. In many cases the child can best be processed by dealing with the parents.

STEPS IN ADDITION TO PROCESSING

Quite often the processing of a child inevitably involves more than working with the child alone. Much of the aberration found in a child will have come from a lack of dianetic

knowledge on the part of the parents and steps other than putting the child on a couch and removing locks and running grief engrams need to be taken in the interests of preventing restimulation.

There are three ways of treating a person dianetically, and all of these ways are sometimes necessary in the processing of a child.

1. Standard processing procedures.
2. Dianetic education.
3. Shifting environment.

The case of the little boy who had been warned not to talk about his parents' quarrels will serve to illustrate the type of action sometimes required in addition to regular processing procedures. The measures taken in this instance were rather extreme, but were necessary for the child's health. Blowing of the locks on this case revealed that violent quarrels occurred as a regular feature in the household, particularly during mealtimes. It was not uncommon for dishes to be utilized as weapons, and for the child to be caught in the line of fire. The child was continually being restimulated at mealtime and was not being fed properly. During the course of processing he had not only blown locks and grief over these and other incidents, but had begun to pick up weight.

When the time came for him to return home, his auditor made the suggestion that the child should be allowed to eat his meals in the kitchen. Both parents immediately became very upset about what their boy had told concerning their quarrels, and the situation seemed to indicate that the parents were not going to be at all cooperative in keeping the child from further restimulation. Since the parents in this particular instance could not be reached with ordinary educational techniques, the auditor merely informed them that if the child ate his meals away from the family he would gain weight, and that if he did not gain weight the proper authorities to prevent cruelty to children would be contacted. The child gained weight.

DIANETIC EDUCATION OF PARENTS

The auditor who deals with children needs to evaluate the child's environment from a dianetic viewpoint. In many cases it will be the parents who need processing, not the child. In any case it is important that the parent understand what key-ins are, and how to avoid them. One of the important points to remember in this connection is that the "usual" childhood illnesses quite often occur *three days after* some emotional upset in the home. In processing the child, make sure to explore the area before any illness he may have had for the key-in which helped to bring it on. The first sickness of the child will help you locate the first key-in. If enough of these are found in the child, the parents will be convinced of the necessity of preventing further key-ins. If the child's processing does not provide enough evidence to persuade the parents of the importance of key-ins on the health of the child, it is a part of the processing of the child to demonstrate on one of the parents that such key-ins do take place, and that they affect health and happiness.

A small amount of education for the parents in the principles of Child Dianetics will sometimes accomplish more than the same number of hours spent in processing the child. Perhaps the single most important point in such education is to make clear to the parents the importance of giving goals to a child, and that the most important goal is that of growing up to be an adult. A child should have responsibility and independence commensurate with his status as a child. He should have things which are wholly his, and about which he decides everything. But under no circumstances should he be possessed automatically of as much right as an adult in the sphere of the home. To give him this is to remove the main goal of his life: growing up. The child, cared for without question and trained toward nothing, loses his prime incentive in life when the adults around him do not enjoy themselves as adults, take pleasure in their rights as adults, and insist on their rights as adults. When a child is kept dependent and shielded and recompensed for being a child, his incentive for being otherwise is much reduced, with a consequent deterioration of ability and a serious reduction in the quantity of knowledge he will acquire since he does not see any real reason to acquire it.

If a child is not robbed of his main goal, growing up, he can quite often salvage himself. But the child's idea of the adult world depends on the adults around him. If the child looks at mama and sees that she is really a sort of nursemaid for him, and that he can make her do most anything he wants her to do, and that she is always moaning and complaining about having so much work to do, about her health, about a lot of things, he is certain to conclude that he doesn't want to grow up to be like mama. If he looks at papa and sees that papa works all day at the office, comes home at night and sits in a chair doing nothing for the rest of the night, and "plays" by pushing a little white ball around on the lawn, the child may well decide that he doesn't want to be like papa, either. The child is making a pretty good analysis of the situation if he decides that he'd rather stay a child anyhow!

Education of the parent includes, of course, the basic ideas of Preventive Dianetics. Don't talk around a sick or injured child. As soon as anaten begins to depart after a minor accident, act to make the child comfortable, but do not talk for many minutes. Don't leave the child in a restimulative atmosphere. Don't take a child up from the middle of a nice sleep and tell her repeatedly to "sit there in that chair and listen to what a terrible thing it is to be married to a man," as one mother did. Try to keep the child away from highly charged dramatizations of any kind. Care for the child efficiently, but quietly. Do not establish yourself as an indispensable ally.

EDUCATION OF THE CHILD

If an auditor finds at the beginning of processing that the child he is working with is in need of constructive things to do (and this will be customary rather than unusual) it is sometimes a good thing to set up a definite program of acquiring skills for the child. These should be primarily bodily skills. This program can be used as a means of shifting his environment slightly away from most of the restimulation he is getting. Let the child pick his own program. Help him in setting it up, but if it is specifically designed to be *his* program do not in any way insist on its being carried out.

The child needs very little education in Dianetics, or in the dianetic viewpoint toward children. These things are natural for him. He will quickly come to look on his processing as an interesting game if the auditor builds the situation up in this way.

SEMANTIC RE-ORIENTATION

In one respect the auditor can perform a very important function in the education of the child. A child is almost always confused about the world around him because of the labels which have been placed on objects by adults who do not understand the serious nature of incorrectly labelling an object for a child. Consider the case of a child who has had no previous data concerning death who is read a poem about little tin soldiers and angels with golden hair. If this is his *first* understanding of the word "death" it must be very puzzling to observe the adult reaction to death. The impression made by this first misconception about the meaning of death must somehow be obliterated before any accurate communication on the subject can be made to the child. The divergence between this first conception of death and all future conceptions forms a troubled area in the filing system of the analyzer which will tie up some of the available attention of the child until the tension is resolved. The technique for accomplishing this is simply to treat the original incorrect labelling as a lock incident and to lift the tension from it by close present-time contact with it.

Sometimes a lack of semantic orientation will cause problems which have such far-reaching implications that the resolving of the semantic problem in the mind of the child will produce results which appear to be miraculous. One little girl was failing in arithmetic. She was very bright in other subjects and no reason suggested itself for her failure to be able to do her work in this one subject. She was given a few problems, but became hopelessly bogged down trying to work them.

Auditor: If an airplane is travelling at 10,000 feet at 2:00 P.M. and at 5,000 feet at 3:00 P.M., how far would a man have to fall to reach the ground at 3:00 P.M.?
 Little Girl: Gee! I dunno. Well, if it's ten thousand and then it's five thousand. Honest. I can't tell you. It's really a problem.

Auditor: Is it just that problems bother you?
 Little Girl: I guess so.
 Auditor: Does anyone around here ever talk about problems?
 Little Girl: Well, maybe mommy might talk about having lots of problems.
 Auditor: Has anyone ever called you a problem?
 Little Girl: Well . . . no. I don't think so.
 Auditor: Who might call you a problem?
 Little Girl: Well, maybe mommy. Oh! You mean *that* kind of a problem!

The word had assumed its right meaning, and the little girl soon started getting good marks in arithmetic.

SHIFTING ENVIRONMENT

An auditor may discover information which will make changes in the environment of the child necessary for the child's health. Usually it is possible to obtain the cooperation of the parents in making these changes. There is a great deal of natural affinity between parent and child, and the parent is usually genuinely interested in the welfare of the child. If it can be demonstrated to the parent that his child's health will be adversely affected if he visits his aunt and uncle every summer, this parent will usually discontinue the visit.

Most of the changes necessary in a child's environment will be along the line of removing him from the restimulative effect of allies. The insidious way in which allies can completely undermine the health and sanity of a child without even being aware of what they are doing is hard to imagine unless you have examined it for yourself.

In one instance an auditor visited a girl in a hospital. When he arrived he found that the grandmother had arrived previously, and that the girl had developed a fever. A little questioning established the fact that grandmother and the fever had arrived together. Straight line memory contacted an illness at nine years of age during which grandmother had re-established herself as an ally and insisted that she would be around any time the little girl was sick. When this lock was blown, the fever went down immediately and vanished completely in a few hours.

In this respect it is interesting to note that *any person who countermands the authority of a parent also undermines the independence of the child*. The child's reality consists largely of his relationship to his parents. Any factor which comes between him and his parents is not good for the growth of the child. Any relative or other person who interrupts the communication between a child and his parents, no matter how well meaning his efforts, and especially if he attempts to set himself up as another, less stem parent, is harming the health and sanity of the child. An auditor should use every possible means to have such a person removed from the immediate environment of the child.

SPECIAL PROBLEMS

The child is not capable of sustained concentration and should not be extended in this regard. Even in working pleasure moments the auditor should be careful not to attempt to keep the child concentrated on one activity any longer than the child can accomplish without tiring. When it is at all possible it is better to work every day with a child, since the working period with a child is shorter. The length of time a child may be able to work at one sitting may be very short, in some cases not more than fifteen minutes to a half hour, but if the child is unable to concentrate his attention for longer than this period, it will do no good at all to attempt to keep him at it longer. In this respect it might be well to note that although working time must necessarily be cut shorter, the amount of good that can be accomplished in a child by these shorter sessions sometimes seems miraculous to persons who have not tried using dianetic techniques with children.

One problem which exists with children more than with adults is that sometimes one or both of the parents will be actively against Dianetics. If this has extended to the point of using dianetic terminology in a disparaging way the task may be made even more difficult. The answer to this problem is, of course, affinity and communication between the auditor and the child. It is good in a case of this kind to emphasize even more the "playing a game" approach, and to avoid use of dianetic terminology until affinity is well established.

Another special problem with children is that the child will sometimes not willingly enter a lock incident which appears light to an adult. One way of getting around this is to ask the child to imagine a television or a movie screen and to picture an incident similar to the lock on this screen. Quite often the actual lock will appear on the screen. One word of warning about this technique (which also may be used with adults on badly occluded locks). *Never tell the child that any part of any situation is imaginary or a delusion.*

Children, even more than adults, lose their grasp on reality when their data is invalidated. If Junior's picture-screen image of mama has green hair, do not point out to him that mama's hair is really red. Simply run the lock through and proceed with processing. Eventually the data will begin to straighten out in Junior's mind and he will volunteer the information that mama's hair is really not green, but red, and that he knew it all along.

DIVIDENDS

Nothing in Dianetics provides more thrill than to see a child regain his grasp on reality. Once communication between an auditor and a child has been definitely established, the results of processing in a child are immediately apparent. A child grasps Dianetics easily, and it is not at all uncommon to see him beginning to use the new memory games on mama and papa and on playmates. Unless there is a very bad prenatal bank which has already been keyed in, a child's perceptics are usually in good shape. It is a pleasure to watch them regain their own data and re-establish its validity.

Children become particularly adept at running out minor pain incidents immediately after they occur. Since the latest bump or fall may be contacted and the pain lessened or relieved completely by the child itself, several auditors have taught their children the technique of taking care of minor bruises.

Considering the high adaptability of children it was not at all surprising when one professional auditor found his little girl out in the backyard, with a look of grim determination on her face, running out the licking papa had just administered!

Handling the Psychotic

L. Ron Hubbard

Man's chief weapon in the struggle for survival has been the analytical mind. It is his ability to act rationally that has brought man to his present position of dominance over the other forms of life on this planet. The story of the rise of civilization is the story of man's increasing rationality in the governing of his life. Despite the tremendous job of breaking away from the encystment of old habit patterns, and despite the insidious nature of the contagion of aberration, most of the areas of man's activity are at least partly rational. Only in one area has man made very little progress. *Man has not learned to be rational about irrationality.*

THE USUAL REACTION TO PSYCHOSIS

When confronted with the complete irrationality of psychosis, the first reaction is generally one of fear and terror. The average person, observing a psychotic for the first time, will feel a sweep of terror through him that is somehow connected with his own ability to survive. This is the most incomprehensible of all types of conduct. This psychotic has thrown away the thing which differentiates him from the lower animals. He seems, because of this one reason, less than human. Yet obviously, from his appearance, he is a part of the human race. But, if the human race should evolve in this direction it would no longer be human. After only a short contact with a psychotic, the average person begins to feel that he is not dealing with a human being, but with a thing that is not an animal, but most certainly not human, either.

The built-in reactive mind reaction to psychosis is not only that the psychotic has forfeited his own personality, but that he has forfeited his right to be a human being. Immediately after this sub-monitor-level computation is made, the attitude of the normal person toward a psychotic becomes punitive.

In a thousand years the phrases have changed somewhat, but the intent is still the same. "Kill him! Do away with him!" has changed to, "Take him away! Lock him up!"

"The devil is in him! Tie him to the whipping post!" has become a bit quieter: "He's not himself. Give him shock treatment."

"He'll kill us all! Throw him in the dungeon!" is now much more polite: "He may injure himself. He should be given a complete rest."

The slight change in attitude reflected by these changes in the language is all to the good, and should be heartily commended. Nevertheless the old feelings of terror have only a thin veneer of politeness over them, and the result as far as the psychotic is concerned is not much better. He is still shunted aside, put out of sight, thought of not as a person, but as something that is not quite human, and not quite an animal.

The confusion of personality with the reasoning faculty is very much in evidence in the reaction of an average family to a psychotic break. For a day or so, the family will continue to regard the person who has had a psychotic break as a human being. Then, bit by bit, they begin to excuse his irrationality on the basis that he is "not himself". By this time, fear begins and irrationality sets in. The family will begin to avoid the use of the person's name in their conversation. "What'll we do with him? We can't let him run around loose. He's liable to hurt someone. We'll have to get rid of him. He won't know the difference anyway, the way he is now."

Gradually the emphasis shifts from taking care of a real person to taking care that others are not hurt by something which is not a real person. The family is generally very glad to shift

the responsibility for solving this vexing problem into the hands of a professional person who is trained to handle the situation.

THE ATTITUDE OF THE PROFESSIONAL

Unfortunately, this shift is not always accompanied by a shift in attitude toward the psychotic. The professional bends his efforts toward making the psychotic an acceptable member of society, *not toward helping him to regain his rationality*. All too often, the highest goal of the professional person who deals with a psychotic is what is called a *remission*. This means that the psychotic can be handled by ordinary people, that he will not cause trouble, and so can be released from confinement. It means that the psychotic will not harm society. It says absolutely nothing about the psychotic himself.

The professional is not immune from the wish to *do something to* the psychotic. He, too, has changed his terminology in the past thousand years, and has refined his techniques. No longer does he house his patient in a dark, stone dungeon. Now he pads the cell! No longer does he publicly flog the miscreant, he privately and discreetly induces an artificial convulsion by running an electric current through his brain. No longer does he burn his patients' eyes out with a red hot poker, or cut off his tongue. He has recognized that the tongue is not responsible for what the psychotic says, nor the eyes for what he sees, so he turns to the brain which controls these members. Now he cuts, and digs, and slices at the brain itself with the most antiseptic of weapons, and in a small percentage of cases, produces a remission.

One successful prefrontal lobotomy was performed on a man who was most unhappy because he could hear voices. After the operation, he could still hear voices, but he was no longer unhappy about it. Before the operation, he was still fighting to be a sane and happy person. Afterwards, there was no fight left in him, and very little rationality. The doctors who performed the operation were very happy with the results.

Most medical men have a sincere interest in helping those who come to them for help. They are not to be censured for their inability to resist the behavior patterns which permeate society. At the same time, now that the real basis for irrationality has been discovered, they certainly should not be encouraged in a pattern of conduct which is so damaging to others.

PRESENT OUTLOOK

Dianetics cannot, at this moment, offer a completed program for the processing of all psychotics, no matter how badly they have been handled. Our work with persons who have had electric shock seems to indicate that most of the damage done to the nervous system by shock can be repaired by the body after dianetic processing. At any rate, a number of electric shocks have been run out as engrams, and the results in restoring sanity to the preclears who have been processed in this way are definitely encouraging. Some work has also been done with persons who have a part of their brain missing, and these persons also respond to dianetic processing, but, of course, the destruction of brain tissue introduces a wild variable, and results are also wildly variable.

Psychotics who have not been treated with shock of any type, or with surgery, may be successfully processed using the techniques outlined in *Dianetics: The Modern Science of Mental Health* as amplified by the material presented in *The Dianetic Auditor's Bulletin*. Data on the processing of psychotics is growing, and a new synthesis of these data will probably yield fresh techniques for the processing of psychotics, particularly in regard to accessibility. Such a synthesis will be made within the next few months, and a full report will be made at that time. In the meantime, much can be accomplished through the use of standard procedure processing and the hints which are given in this article. Immediately, however, three things can be accomplished:

1. Persons who understand that a psychotic is merely a person who does not have enough attention in present time to be able to act rationally, can stop being irrational about psychosis.
2. These people can help to keep others from being irrational about a psychotic.
3. There need be no despair about psychosis. Something *can* be done.

THE CLASSIFICATION OF PSYCHOTICS

A better definition of the dividing line between psychosis and neurosis is needed. The difference appears to be in whether "I", the awareness of awareness, has been completely taken over by an engram, a series of engrams, or a demon circuit. A neurotic person has not given up the strain of keeping some of his attention in present time, and will not do so until forced by chronic, constant restimulation to do so. When this happens, the neurotic suddenly becomes psychotic: a psychotic break has occurred.

As a neurotic person enters the section of the dwindling spiral of restimulation in which he is in danger of becoming psychotic, his hold on the reality around him becomes more and more frantic. He will cling desperately to the avenues of communication open to him. The attention which is still available for present time use will try in every possible way to stay in present time against the pull of the restimulated engram. But this very narrowing of the possibility of awareness in itself constitutes a lessening of the chance to remain stabilized, and bit by bit, the attention becomes more caught up in the engram or series of engrams which is in such violent restimulation. The last stage of the struggle is almost visible in the face of the person undergoing it. Then, suddenly, the last bit of attention is caught by the reactive mind and forced out of present time. The form of the psychosis depends entirely on the type of engram or circuit which is in restimulation.

In general, there are three types of psychotics: Computational, dramatizing, and the psychotic with missing parts.

A computational psychotic is sometimes able to act more like a normal person than a severe neurotic. Such a person has been caught up completely by a demon circuit, and all of the communication to this person and from him is filtered through this circuit. If the circuit is not of a type that restricts too much the activity of the mind, such a person may well be able to conduct a fairly normal kind of life. Since a demon circuit is able to make elementary computations, this person will be able to act with a slow, stumbling sort of rationality in areas which do not contradict the engramic commands which set up the circuitry. Since the current norm requires only a small area of rationality, such persons are sometimes able to pass as normal. If, as is more generally the case, the circuitry is of a type that affects most of the activity in which a person engages, the answers which are possible to the person may be so restricted that it becomes obvious that there is no real communication with his environment. Such a person will be institutionalized, but will be considered a "good" patient by the authorities at the institution: slow, dull-witted, perhaps capricious, but rarely violent.

The dramatizing psychotic is almost always recognized as a psychotic. Such a person is caught either in one engram or in a series of engrams. He will play through a literal recording of the engram on any occasion. He will switch from valence to valence during the playback of these recordings with amazing rapidity. He will pick up new valences from the people around, and will, in general, occupy any valence other than his own. His reaction to the command phrases of the engrams is literal and he is solely dedicated to carrying out these commands. The bewildering variety of the classes of psychotics is simply due to the language which is used while engrams are being formed.

The dramatizing psychotic has formed, prior to Dianetics, the most incomprehensible and the most irrational of all the classes of behavior. They form the bulk of those who are considered insane, and are generally thought to be hopeless unless they respond to shock therapy of one kind or another. A knowledge of engrams and the action of engrams is all that is necessary to enable a person of normal intelligence to understand the actions of a dramatizing psychotic. These actions are overt engrams— engrams face-to-face.

The psychotic who has part of his brain missing is not difficult to spot. He is not so much a case of irrationality, as of simply an inability to be rational. Something is missing from this person and it can be felt much more easily than it can be described. They may or may not dramatize, but if they do, it will not follow the same set kind of pattern which is followed by the dramatizing psychotic. Mostly, they simply are not able to control themselves in some fashion or another.

These persons can be helped by dianetic processing, but a complete job of rehabilitation would be manifestly impossible for them.

It is a remarkable fact that a great deal of the nervous system can be destroyed by disease or injury or surgery without making the person completely beyond help. Unless the

portion of the brain regulating bodily functions has been seriously damaged you can normally do something.

If a person is dramatizing in any way, he is dramatizing out of an engram. If the engram is there, and there is any way at all of communicating with the psychotic, you can do something about reaching the engram and relieving the tension on it.

PROBLEMS PECULIAR TO PSYCHOTICS

There are many problems in working with a psychotic which an auditor will not encounter in processing the average case. The difficulty of finding proper working conditions, for instance, is much greater when dealing with a psychotic than with an average case. Psychotics are apt to make more noise and to demonstrate much more violently than the average case, and the problems of securing a proper place for processing are thus increased. In addition, psychotics frequently must be cared for constantly, and the securing of these services in an institution which will also grant free access to the auditor is sometimes a difficult problem. Nevertheless, something can be done.

One preclear was recently released from a state institution, even though the auditor only worked during visiting hours, releasing grief and blowing locks.

Another peculiarity in working with psychotics is that an auditor cannot expect to be able to do full processing every minute of the time he spends with a psychotic. Sometimes it is necessary to spend several hours in attempted processing in order to accomplish ten minutes of actual processing. Fortunately, the ten minutes thus accomplished will have effect in the psychotic far beyond ten minutes of processing in the average person. A psychotic has so little attention available that even when a small amount is released, the effect is sometimes astonishing.

The problems of working with electric shock and insulin shock are likely to be encountered when dealing with a psychotic. This may be true even though all the information you get from the psychotic or from his relatives and friends indicates that he has never been in an institution and has never had shock of any kind. Unfortunately, there is still a tendency in the society to hide a psychotic away from the public, and to make a dark secret out of the fact that someone in a family has been a psychotic. The fact that almost all psychosis is not hereditary does not seem to alter the feeling that psychosis is something which should make all persons connected with a psychotic ashamed for him. This hiding away of information which is very much needed by anyone who attempts to deal with a psychotic is, of course, foolish and inconsistent, but it can be expected.

If your preclear is psychotic, always expect to find shock of some kind in his bank, no matter what information you are given about him. The running out of electric shock and insulin shock is quite difficult and should not be attempted except by an experienced auditor. The techniques used for this will appear in a future *Bulletin* article.

Psychotics are often subjected to hypnosis and, if so, may be stuck in these hypnotic incidents. Hypnosis, like shock, must be run before prior events are contacted.

One more problem which is more usual in psychotics is the problem of tampering by outsiders. The psychotic must be cared for by others until he can take care of himself, and these persons are, for some time to come, likely to be curious about dianetic techniques. Your preclear may be called on the carpet and grilled at some length over what was done in your sessions. He may have his data constantly invalidated. Some hospital authorities will add locks and engrams as fast as an auditor can pull them out, sometimes with the best of intentions.

One auditor arrived at a hospital to treat a psychotic only to find that the potential preclear had died before he had ever seen her. A careful and searching investigation revealed that the hospital authorities had tried to have this elderly woman in the best possible condition for the auditor, and had given her an electric shock to prepare her for processing! The woman's spine had been fractured.

Until dianetic processing has become the standard method of dealing with psychotics, such tragedies are likely to continue. Let us hope that such completely muddled thinking as brought about this tragedy will not go on for much longer. Widespread knowledge of Dianetics should quickly bring about needed reforms in the treatment of psychotics.

FAMILY RELATIONSHIPS

If the human world were built along rational lines, an auditor could expect to obtain his best support and counsel from the family of a psychotic. There are rare occasions when one or more members of a family can be relied upon to act rationally about irrationality, but in general, families are peculiarly unable to act sanely about the psychotic. The reason for this is quite obvious when you consider the probable content of the engram banks of the people who make up a family.

Most families have a great many engrams and a great many standard dramatizations in common. In other words, the same irrational patterns which occur in your preclear will also occur, in most instances, in the members of his family. Do not expect rational action from the psychotic's family. Usually, the best they will be able to do is to take another valence of the same engram. If the preclear is a paranoid, they will only be able to go over and over the other side of some dramatization: "You don't have to worry. They're not after you. Why, nobody'd hurt you. Can't you see there's nobody wants to hurt you." This, of course, was originally sound advice to somebody, but reasoning with irrationality is like catching elephants with a popcorn popper: It would be a pleasant way of doing things, but it won't work.

It's like a problem in semantics. Reason and irrationality are on different levels of abstraction. One cannot be brought to bear on the other until it is transferred to the same level of abstraction. Once you do that, the problem disappears. Either you have irrationality battling it out with irrationality, or you have rationality. Dianetic processing is a means of transferring irrational patterns to the rational level of abstraction.

The sincerely felt attempts by a psychotic's family to reason with his aberration normally drive him farther into the pattern of his irrationality. Playing through the other side of the engram in which he is held will only result in his being caught more firmly by the engram.

Even in the unusual case of a person in a family who is unaberrated enough to act rationally about a psychotic in his own family, there is still a problem of restimulation to be considered. The voice tones, mannerisms, methods of expression, emotional reactions of any member of a family will be found in the reactive bank of any other member of that family. This definitely does not preclude auditing by a member of the family, but it does mean that processing by a member of the same family is especially difficult for an uncleared auditor, and that the factor of unnecessary restimulation in the preclear must be taken into consideration.

It is one of the problems of working with psychotics, that the people who are most genuinely interested in the condition of the preclear are least able to help directly in the process. Nevertheless, it can be done. A member of a psychotic's family can successfully process the psychotic, and can achieve remarkable results. It has been done. It is being done.

ACCESSIBILITY

The major problem in processing a psychotic is accessibility. There is, at present, no established procedure for accomplishing this. It has been a recognized problem for many years, and a number of techniques have been devised, but this is one area in which the auditor must rely on his own improvisations. One factor works in favor of the auditor. He knows the anatomy of the engram, and knowing this, is able to understand many types of behavior that are utterly incomprehensible to persons who do not have this knowledge.

In addition, the degree of accessibility required for dianetic processing is much smaller than that of many other ways of dealing with a psychotic. An auditor who has once gained the attention of a psychotic for ten minutes should be able to accomplish enough in that ten minutes to make the problem of accessibility much simpler from then on. One of the most gratifying things about dealing with a psychotic is the rapidity with which he responds to processing. Even if the amount of attention released to a psychotic seems incredibly small (one yawn, a few tears) the resulting stabilization of his behavior in present time may be astonishing.

There are many tricks in gaining accessibility, but one principle underlies all of them. Get into communication with basic personality through affinity.

The simple assumption by an auditor that the psychotic is not some strange, non-human form of life, but is a reasonable human being who is operating from a frame of reference somewhere in his past life rather than in present time will do a very great deal toward

establishing this affinity. Until an auditor has had sufficient experience in Dianetics to understand this thoroughly, it is not recommended that he attempt work on a psychotic.

The approach which Homer Lane used on occasion, remarking to some homicidal maniac, "I understand you can help me!" may be found useful.

Sometimes simply taking a long walk with a psychotic, giving him exercise until he is very tired, will help you in gaining the few minutes of communication you must have with him.

It is of utmost importance that an auditor should have full confidence that something can be done for the psychotic. This point again underscores the importance of a genuine, firsthand acquaintance with the way engrams aberrate. Once the simple, mechanical point is grasped emotionally as well as intellectually that ALL ABERRATION IS DUE TO ENGRAMS it follows irrefutably that something can be done with any person who can be induced to recount his engram to a person who is in communication with him. A dianetic auditor, understanding why the psychotic acts the way he does and says the things he does, is in a position to be in communication with the psychotic. A person whose sole attempt is to try to force present-time reality on a person who is caught in a past-time event, is in no such position.

A point of note in the gaining of accessibility is that intelligence varies greatly during the day, or during a week, or during a month. This is well recognized already, and it will be possible to check this cycle with an intelligent nurse or doctor. One psychotic, for instance, was kept in a wet pack in the mornings, but in the afternoons displayed much more intelligence. This was, of course, a response to an engramic command, and once the command was lifted the wet pack in the morning was discontinued. Pick your preclear up at the highest point of his rationality and work with him at those times.

There are four types of treatment which will *not* help and should be avoided at all costs.

1. Never be a taskmaster. A psychotic is like a child in that you must deal very gently with the good reactions you get from him. He cannot be forced, and will react badly to any suggestion that processing will be forced on him. Most psychotics have had too much forced on them already. They will yield to gentle persuasion backed with genuine affinity.

2. Never, never, never punish. Nobody was ever cured of anything by swearing or beating. Nor was anyone ever cured by the more modern method of hosing down. Surely there has been enough of this in the history of mankind. Dianetics is a tool which can be used to make punishment unnecessary.

3. Do not attempt to appeal directly to the rationalizing portion of a psychotic's mind. "Now, George, you know that what you are saying just couldn't be true!" is in direct opposition to what George *knows* to be true. The words and the situations he is describing are more real to him than present time. They *are* true, but merely displaced in time. Explaining phobias never alleviated them. Reliving the incident which caused the phobia a sufficient number of times and with a sufficient part of the attention focused on the event will automatically "explain" the phobia to the individual who had it, to such an extent that any further explanation by any other individual, no matter how learned, is not only superfluous, but laughable.

4. Do not use hypnotics or depressants or attempt to work with a person under their influence. Dianetics wakes people up. It does not put them to sleep. Engrams may be contacted when a person is under the influence of a depressant, but they will not reduce or erase without the greatest difficulty.

If an auditor can secure the cooperation of a medical doctor it may be found useful to use stimulants. Follow the doctor's advice about what stimulants to try and about dosages. In the absence of a physician, strong black coffee is sometimes of assistance in waking up the analyzer enough to establish communication.

When a psychotic has reached the point where he does not talk at all, or does not hear when spoken to, other measures may have to be taken to attract attention. A strong, steady light, a flashing light, a steady monotonous noise have been found useful. Again, these are matters which require individual initiative on the part of an auditor, and, whenever possible, should be left for a Hubbard Dianetic Auditor who has had experience with other, milder types of psychosis.

PROCESSING TECHNIQUES

Psychotics run very much like an ordinary case with all the stops out. Once in reverie, there is a marked difference in the way a psychotic runs, but the difference is one of degree rather than of kind. A psychotic will frequently have every engram in the bank open and yelling for reduction. The difficulty is frequently not one of scarcity of material, but control of the huge amounts of material which present themselves. This is also true of the person who is near a psychotic break.

Once Basic Personality has been contacted, an auditor can count on a high necessity-level drive for getting rid of engrams from a psychotic. Sometimes there will be very bad tangles in the time track, but these can be handled through the ordinary techniques of running out groupers and misdirectors. In addition, the effects of the treatment of psychotics often thoroughly mix up the person in the chronological filing of the events of his life. This is always true of electric shock and insulin shock. Psychoanalysis sometimes seems to loosen up the entire bank, and a person who has been exposed to long series of psychoanalytical treatment is often an incipient psychotic who will try to run everything in the reactive bank at the same time.

Most psychotics have a tendency toward rather violent reliving. With an ordinary person it is sometimes an effort to teach the habit of allowing enough attention to go back into past events to contact the event fully enough for erasure. This problem is reversed with a psychotic. It is frequently an effort to keep enough attention in present time to cause an erasure. This should be evident from the description given of the nature of psychosis. One thing is in favor of the auditor on this score. When any attention, no matter how small, is released from its eternal circling through one engram in a psychotic, that attention is eagerly grabbed up by "I", the awareness of awareness, and immediately goes to work to stabilize the person in present time.

A psychotic who has reached the stage where present-time communication is impossible, but who is still trying to communicate some past event does not offer a serious problem in establishing communication. One technique used is based on the principle of "button pushing". Simply listen to this muttering of disconnected words and phrases long enough to catch one of the recurring patterns. Those words are your button. Push the button over and over again by repeating the words to the psychotic. This will probably draw his attention to you. In time he may get angry, cry a little, and then shrug as though those words had no more significance for him. They don't for the moment. They have lost part of their charge, and what they have lost has gone into the analytical mind, and will from that moment work for you rather than against you.

One psychotic was started on the road to recovery when an auditor discovered her talking about how no one loved her, and discovered that she had often been left alone as a child. "Poor Mary, all alone. No one loves you," brought a flood of tears and the beginning of a new life to one near-hopeless psychotic.

WORKING NEAR THE BREAK

Most auditors will be faced with the problem of working with a person who has never been classed as a psychotic, but who is very near a psychotic break. This is a ticklish situation, and should be entered only in a circumstance where the utmost care can be exercised. The working rules which are outlined below, apply equally well to a psychotic and to a near-psychotic. To work with either class of persons late at night is to ask for trouble. It is much better to place a near-psychotic in an unstimulative environment, and to give him plenty of rest and food before beginning processing. It is not the time to work when he has started down the dwindling spiral. After his necessity level has reacted and he is trying to fight his way back up is the perfect time for processing.

One aspect of changing the environment of a person near a psychotic break needs special emphasis. Not only is a person near a break usually tired and improperly fed, he usually has too many people making too many demands on him. His communication lines are strained. Do not place an additional strain on his attention by giving him one more person to try to fit into the switchboard. Take him away from too many people.

GENERAL WORKING RULES

The following working rules apply to all processing, but especially to processing psychotics or near-psychotics.

1. Do not work when you are too tired. It is better not to audit when you are below a tone three.

2. Do not work when your preclear is too tired. This is especially dangerous in a near-psychotic.

3. Do not change auditors when it is at all possible to avoid the change.

4. Do not mix any other form of treatment with Dianetics. This is especially dangerous in an institutionalized psychotic. One preclear who had neared the point of release from a hospital was thrown into a temporary spin when one of the doctors used the probing, "you're responsible" type of questioning all too common in mental institutions.

5. Keep your courage no matter how violent your preclear is. If he picks up a chair and starts to hit you over the head, simply say in an even voice, "Go back to the beginning of that, please!" Most of the time he will do so. Remember that your preclear is acting sanely within the framework of the engram he is caught in. Of course you must defend yourself, but do so with your wits and you will accomplish something by it.

6. Remember that there is only one good way out of an engram, and that is through it.

7. Get Basic Personality on your side and work with it. You will like Basic Personality, and it will like you. No human being is basically not likable. Build affinity with your preclear.

8. Never give up. Something can be done.

9. Work with a physician whenever possible. Nothing in Dianetics is at variance with the best medical thought, and Dianetics has no quarrel with the medical profession. Enlist the aid of a doctor whenever possible, always specifying that no technique other than Dianetics is to be used on the preclear. Normally, a doctor will be actually very interested in what you are doing, even though he may scoff officially. When you obtain results, he may become openly interested.

10. Do not work with severely neurotic or psychotic persons until you have had some experience with more normal preclears. Under no circumstances try a *part* of Dianetics on a psychotic or near-psychotic person. Unless you understand the simple, basic principle that engrams cause aberration, you should not process anybody, and especially psychotic or near-psychotic persons.

11. DO NOT ATTEMPT TO WORK A PSYCHOTIC WHO IS UNDER SEDATION. A psychotic has very little attention in present time even under the best of circumstances. He must be caught at his best moments, when he is most awake, in order to bring the attention loosened up by processing back into present time. Sedation will destroy the opportunity for this. Even persons who have most of their attention in present time do not work well under sedation (some sedatives make processing completely impossible), and this is even more true for the psychotic than for the normal or above-normal person.

STRAIGHT LINE MEMORY

The beginning of processing in a psychotic will be almost exclusively in straight line memory. It is unwise to attempt to do anything at all with prenatal engrams until after the psychotic has already become stable. This is not a rule which must be followed in every case, but it should be followed unless the prenatals are forced on the auditor by the file clerk.

The problem with a psychotic is one of getting enough attention units stabilized in present time so that he can begin real processing. The psychotic with attention units permanently in present time is no longer a psychotic, but a neurotic, and he will be able to live like a normal person while continuing his processing.

To work a psychotic through prenatal engrams would be merely to cause him to be stuck in more places on the time track than he had been before. All work must be directed toward getting attention into present time, and there will be more than enough attention tied up in locks to bring any psychotic back up to the current norm.

Occasionally a psychotic will go immediately to a grief incident, and this, of course, should be followed up and encouraged. More often, the auditor will have to work for some time getting small amounts of attention off irritated areas by straight line memory before the psychotic can stabilize enough for more than minor grief engrams. In almost all cases a grief engram is the only type of engram which should be attempted while a person is still psychotic.

In the psychotic as well as in other persons, the greatest amount of release of attention will normally come from the removal of grief, and after one major grief discharge, a psychotic may stabilize out of that classification. This has already happened in one case.

There are nineteen million persons in the United States who have been institutionalized for one reason or another. Dianetics offers a hope to these and to millions of others who have nearly reached the point of breaking under the dwindling spiral of aberration which has already set in, in this civilization. To ignore Dianetics without giving it an honest trial, to overlook any possibility it may contain for halting the downward spiral at this critical point in man's history, is like a drowning man refusing to climb into a lifeboat when nothing else is in sight which offers the slightest hope of saving him.

THE CREDO OF A TRUE GROUP MEMBER

January 1951

1. The successful participant of a group is that participant who closely approximates in his own activities the ideal, ethic and rationale of the overall group.
2. The responsibility of the individual for the group as a whole should not be less than the responsibility of the group for the individual.
3. The group member has, as part of his responsibility, the smooth operation of the entire group.
4. A group member must exert and insist upon his rights and prerogatives as a group member and insist upon the rights and prerogatives of the group as a group and let not these rights be diminished in any way or degree for any excuse or claimed expeditiousness.
5. The member of a true group must exert and practice his right to contribute to the group. And he must insist upon the right of the group to contribute to him. He should recognize that a myriad of group failures will result when either of these contributions is denied as a right. (A welfare state being that state in which the member is not permitted to contribute to the state but must take contribution from the state.)
6. Enturbulence of the affairs of the group by sudden shifts of plans unjustified by circumstances, breakdown of recognized channels or cessation of useful operations in a group must be refused and blocked by the member of a group. He should take care not to enturbulate a manager and thus lower ARC.
7. Failure in planning or failure to recognize goals must be corrected by the group member for the group by calling the matter to conference or acting upon his own initiative.
8. A group member must coordinate his initiative with the goals and rationale of the entire group and with other individual members, well publishing his activities and intentions so that all conflicts may be brought forth in advance.
9. A group member must insist upon his right to have initiative.
10. A group member must study and understand and work with the goals, rationale and executions of the group.
11. A group member must work toward becoming as expert as possible in his specialized technology and skill in the group and must assist other individuals of the group to an understanding of that technology and skill and its place in the organizational necessities of the group.
12. A group member should have a working knowledge of all technologies and skills in the group in order to understand them and their place in the organizational necessities of the group.
13. On the group member depends the height of the ARC of the group. He must insist upon high level communication lines and clarity in affinity and reality and know the consequence of not having such conditions. **AND HE MUST WORK CONTINUALLY AND ACTIVELY TO MAINTAIN HIGH ARC IN THE ORGANIZATION.**
14. A group member has the right of pride in his tasks and a right of judgment and handling in those tasks.

15. A group member must recognize that he is himself a manager of some section of the group and/or its tasks and that he himself must have both the knowledge and right of management in that sphere for which he is responsible.

16. The group member should not permit laws to be passed which limit or proscribe the activities of all the members of the group because of the failure of some of the members of the group.

17. The group member should insist on flexible planning and unerring execution of plans.

18. The performance of duty at optimum by every member of the group should be understood by the group member to be the best safeguard of his own and the group survival. It is the pertinent business of any member of the group that optimum performance be achieved by any other member of the group whether chain of command or similarity of activity sphere warrants such supervision or not.

THE CREDO OF A GOOD AND SKILLED MANAGER

January 1951

To be effective and successful a manager must:

1. Understand as fully as possible the goals and aims of the group he manages. He must be able to see and embrace the *ideal* attainment of the goal as envisioned by a goal maker. He must be able to tolerate and better the *practical* attainments and advances of which his group and its members may be capable. He must strive to narrow, always, the ever existing gulf between the *ideal* and the *practical*.

2. He must realize that a primary mission is the full and honest interpretation by himself of the ideal and ethic and their goals and aims to his subordinates and the group itself. He must lead creatively and persuasively toward these goals his subordinates, the group itself and the individuals of the group.

3. He must embrace the organization and act solely for the entire organization and never form or favor cliques. His judgment of individuals of the group should be solely in the light of their worth to the entire group.

4. He must never falter in sacrificing individuals to the good of the group both in planning and execution and in his justice.

5. He must protect all established communication lines and complement them where necessary.

6. He must protect all affinity in his charge and have himself an affinity for the group itself.

7. He must attain always to the highest creative reality.

8. His planning must accomplish, in the light of goals and aims, the activity of the entire group. He must never let organizations grow and sprawl but, learning by pilots, must keep organizational planning fresh and flexible.

9. He must recognize in himself the rationale of the group and receive and evaluate the data out of which he makes his solutions with the highest attention to the truth of that data.

10. He must constitute himself on the orders of service to the group.

11. He must permit himself to be served well as to his individual requirements, practicing an economy of his own efforts and enjoying certain comforts to the wealth of keeping high his rationale.

12. He should require of his subordinates that they relay into their own spheres of management the whole and entire of his true feelings and the reasons for his decisions as clearly as they can be relayed and expanded and interpreted only for the greater understanding of the individuals governed by those subordinates.

13. He must never permit himself to pervert or mask any portion of the ideal and ethic on which the group operates nor must he permit the ideal and ethic to grow old and outmoded and unworkable. He must never permit his planning to be perverted or censored by subordinates. He must never permit the ideal and ethic of the group's individual members to deteriorate, using always reason to interrupt such a deterioration.

14. He must have faith in the goals, faith in himself and faith in the group.

15. He must lead by demonstrating always creative and constructive sub-goals. He must not drive by threat and fear.

16. He must realize that every individual in the group is engaged in some degree in the managing of other men, life and MEST and that a liberty of management within this code should be allowed to every such sub-manager.

Thus conducting himself a manager can win empire for his group, whatever that empire may be.

The Problem of Sedation

From a Lecture By
L. Ron Hubbard

The first and most important thing which can be said about processing a person who is under sedation is: DON'T.

At first glance that seems to be an easy rule to follow, even though the reason for following it might not be so evident. Actually, however, a constant awareness of the possibility that your preclear might be taking light dosages of a sedative or a hypnotic is necessary if you wish to avoid the ill effects which might occur as a result of processing under sedation.

Processing should never be attempted until you have thoroughly checked with your preclear on the question of what drugs, if any, he has taken during the past week. The inquiry should not be general and routine. Many persons have become so accustomed to their daily dosage of sleeping pills or pain-killers that they do not consider their little pills as drugs.

Indeed, the prevalence of drugs in our present society is amazing to a person who has not become concerned with the problem. Luminal, nembutal, phenobarbital, et al are often treated as though they were a panacea for all ills. Too often the attitude has been: "Well, if I can't find the cause of the pain, at least I'll deaden it." In the case of a mental ill, the sentence would have to read: "Well, if he can't be made rational, at least he can be made quiet." Unfortunately, it is not recognized that a person whose pain has been deadened by a sedative, has *himself* been deadened by the same drug, and is much nearer the ultimate pain of death. It should have been obvious, but apparently has not been so, that the quietest people in the world are dead.

Aside from checking verbally with your preclear or with people who have been associated with him, the easiest method of obtaining evidence of the use of drugs is by watching the action of your preclear's eyes. Any unusual dilation or contraction of the pupil is an indication that drugs may be in the preclear's system, and a thorough investigation should be made before any processing is begun.

The suggestion that you need to investigate further into the possibility of drugs even though your preclear gives a negative answer to direct questioning is meant not only to guard against the general tendency to falsify the facts about sedatives or hypnotics, but to point out that drugs are sometimes not considered drugs, and that in some cases the preclear will be taking a sedative or a hypnotic without realizing he is doing so. This is, of course, especially applicable when dealing with a person who has recently been institutionalized. Indeed, in dealing with such a person, or with one who is still under treatment, you will often find that he has been given so much sedative that only a little more would bring him to the point of trance which is used in narcosynthesis.

It has generally been forgotten that the trance state used in narcosynthesis can be induced by simply adding to some of the drugs commonly used in sedation. The trance of narcosynthesis and the drugged state of sedation are not two different conditions, but merely two points on a spectrum. The administration of any sedative or hypnotic starts a person into this spectrum and breaks to some extent his communication with his environment. This trance, whether light or heavy, is a step away from the ultimate goal of alleviating the cause of the disorder. Not only does it render a person temporarily inaccessible for processing, but because anaten is present it also creates a secondary engram of varying intensity, depending on the amount of sedation given. This type of engram, created (as it often is) in the midst of the turmoil and confusion usually associated with conditions of such a nature that sedatives have to be given, can be very aberrative.

WHEN TO BEGIN PROCESSING

For most sedatives or hypnotics, in average dosages, a three-day waiting period will be enough to bring the preclear back close enough to his current best state of awareness to begin processing. This is not true for all drugs. Demerol, for instance, seems to have some effect on processing for almost a month after the last dose is taken, if there has been a strong addiction to it.

If your preclear has been taking a sedative or a hypnotic, find out from his physician how long *any* effect from the drug would be noticeable, add two days to his answer, and then give your preclear a short run. If you contact material easily, but this material does not reduce or erase, wait a couple of days longer. When the reduction of engrams or locks seems to be normal for your preclear, begin processing. *Be sure to run as locks all sessions where reduction did not occur.*

WHAT MAY HAPPEN—AN ANALOGY

The whole field of research in the effect of chemicals on processing has scarcely been scratched. It is a field that has enormous possibilities, and is one of the main roads that will lead eventually to a physiological understanding of what has been observed in Dianetics. At the moment, however, our knowledge of this field is strictly limited, and it is possible to say only that the mind seems to work in a certain way. The analogy which best explains the observed action of sedatives and hypnotics is an electronic one.

Sedation seems to have the temporary effect of allowing the individual memories of a person to differentiate from each other. The analytical mind possesses some way of distinguishing between past events, and between abstractions made from these events—roses are red, a horse is a certain kind of animal, a church is a certain kind of building. Some type of insulation is present which keeps the charges containing the impulses which cause these ideas separated in the brain. Sedation seems to strengthen, temporarily, this insulation between the memories of different events in the mind.

A reactive mind is, of course, all the memories soldered together. If Mr. Jones thinks of a horse he will connect this horse with other horses, other events, other facts in his mind. If the horse memories are soldered into engrams which are connected with other engrams which have church memories in them, a horse will equal a church for Mr. Jones. If Jones is an average person he will, when not anaten, merely have a vague feeling that somehow horses seem to belong with churches—old country church with horses hitched outside, etc. If he is near-psychotic, or if this chain of engrams is in violent restimulation, there will be a compulsion to think of horses and churches as being equal to each other, and he will resent any implication that this is not true. If poor Jones is psychotic, he might insist on stabling his horse in the church.

The action here is that the charge contained in the engrams was so great that the insulation which would normally exist between the ideas and the words “horse” and “church” has been blown through and burned out. What is an engram but a series of perceptics, shorted out and interconnected completely, soldered in by pain?

So we administer some drug or some herb which restores the effectiveness of the insulation in Mr. Jones’ mind. All of a sudden the memories will stand apart a trifle and you then have a person who is able to differentiate (slightly) between a horse and a church. So far, this sounds like a good thing, but let’s follow it further.

Now, since Mr. Jones is under the influence of the drug which acts as an insulator stiffener, he gives the appearance of some amount of rationality. We can talk to him and he will agree, rationally, that roses are red. He responds very well to this. He can think about it. He’s in good condition. But let the effect of this drug wear off for any reason.

A horse is a church as roses are red. A horse with red roses is a church. A rose church equals a red horse. A rose horse means a church is red, or read. A horse rose up]n the church and read. Mr. Jones will swear to it. The engrams say so.

The same identifications are made *plus* all the factors encountered under sedation. Everything is undifferentiated again. And a new engram has been added to Mr. Jones’ repertoire. And this is a permanent addition. The engram will not key out again until properly processed.

Ordinarily, if you restimulate an engram which refuses to reduce or erase, it will not stay in restimulation more than three to eight days. A late life engram may stay in pretty stiff restimulation for three to eight days, but at the end of this time it will key out again.

If you put a person under sedation, because you have added a drug factor to the whole thing, it does not key out in from three to eight days. It just goes on and on. Your preclear has another permanent, soldered-in computation in his mind.

CONCLUSION

A great deal of work needs to be done to determine the exact effect of chemicals on processing. Enough has been discovered, however, to warrant a reiteration of the warnings about sedation in the Handbook.

As for processing a person who is under sedation, one word pretty well sums up the advice which can be garnered from the research already done in this field: DON'T.

SCIENCE OF SURVIVAL

Prediction of Human Behavior

TABLE OF CONTENTS

The Goal of Dianetics	6
Introduction	16

BOOK ONE: The Dynamics of Behavior

Chapter	Column		Page
One	A	The Tone Scale	19
Two	B	Dianetic Evaluation	26
Three	C	Physiology and Behavior	29
Four	D	Psychiatric Range	31
Five	E	Medical Range	34
Six		The Basic Laws of Theta Affinity-Reality-Communication	36
Seven	F	Emotion	42
Eight	G	Affinity	45
Nine		Communication and Reality	47
Ten	H	Sonic	50
Eleven	I	Visio	54
Twelve	J	Somatics	57
Thirteen	K	Speech, Talks; Speech, Listens	60
Fourteen	L	Subject's Handling of Written or Spoken communication when Acting as a Relay Point	63
Fifteen	M	Reality (Agreement)	65
Sixteen	N	Condition of Track and Valences	68
Seventeen	O	Manifestation of Engrams and Locks	72
Eighteen	P	Sexual Behavior, Attitude Toward Children	74
Nineteen	Q	Command Over Environment	78
Twenty	R	Actual Worth to Society Compared to Apparent Worth	81
Twenty-one	S	Ethic Level	83
Twenty-two	T	The Handling of Truth	85
Twenty-three	U	Courage Level	88
Twenty-four	V	Ability to Handle Responsibility	90
Twenty-five	W	Persistence on a Given Course	93
Twenty-six	X	Literalness with which Statements or Remarks are Received	95
Twenty-seven	Y	Methods Used by Subject to Handle Others	96
Twenty-eight	Z	Command Value of Action Phrases	108

BOOK TWO: Dianetic Processing

Chapter	Column	Page
One		The Basic Principles of Processing 111
Two		The Auditor's Code 114
Three		The Auditor's Code 117
Four		The Mechanics of Aberration 120
Five		The Dynamics of Existence 125
Six	AB	General Description of Processing 128
Seven	AC	Present Time 134
Eight	AD	Straight Memory 141
Nine	AE	Pleasure Moments 150
Ten	AF	Imaginary Incidents 158
Eleven	AG	The Pre-Clear and Auditor as a Group 165
Twelve	AH	Locks 168
Thirteen	AI	Scanning Locks 174
Fourteen	AJ	Secondary Engrams 183
Fifteen	AK	Engrams 200
Sixteen	AL	Chains of Engrams 202
Seventeen	AM	Circuits 208
Eighteen	AN	Condition of File Clerk 212
Nineteen	AO	Hypnotic Level 217
Twenty	AQ	Level of Mind Alert 224
Twenty-one		Relative Entheta on Case 232
Appendix		Tone Level of Auditor 235
INSERT		Necessary to Handle Case 243
		AR How to Audit the case
		Axioms and Definitions
		HUBBARD CHART OF HUMAN EVALUATION AND DIANETIC PROCESSING

The Goal of Dianetics

A world without insanity, without criminals and without war -- this is the goal of Dianetics.

For thousands of years man has struggled forward with his conquest of the material universe but he has known almost nothing about his most important weapon, his most valuable possession, the human mind. Despite this obstacle of ignorance he has made progress, but because of this obstacle he has accumulated unto himself not only the penalties of madness and disease but more important, the threat of destruction for all his works -- modern war.

Dianetics is the science of thought. The word is from the Greek "dianoua" (through mind). The scope of Dianetics includes all valid data pertaining to thought. Far simpler than Man supposed, the workings of the human mind and knowledge itself became, in Dianetics, a body of knowledge with which any reasonably intelligent individual can work.

No civilization can progress to the stability of continuous survival without certain and sure command of knowledge such as that contained in Dianetics. For Dianetics, skillfully used, can do exactly what it claims. It can, in the realm of the Individual, prevent or alleviate insanity, neurosis, compulsions and obsessions and it can bring about physical well being, removing the basic cause of some seventy percent of Man's illnesses. It can, in the field of the family, bring about better accord and harmony. It can, in the field of nations or smaller groups such as those of industry, improve management to a point where these pitifully inadequate ideologies for which men fight and die with such frightening earnestness, can be laid aside in favor of a workable technology.

Perhaps our present generation is too benighted for a new science. It would be very sad if it were true, for atom bombs are quite destructive to people and to town and might well obliterate whole cultures. Perhaps the vendors of crack-pot ideologies and destructive therapies are too rich and too powerful and too selfish to permit a ray of hope upon our generation's stage. Perhaps it will be tomorrow -- if tomorrow is let come -- before Dianetics is used and widely applied.

Dianetics was asked to vindicate itself in 1950. It did, as you will see in the publisher's introduction. This was very tolerant of Dianetics for no existing "ology" pertaining to the human mind has ever been validated or has been called upon to validate itself. The entrenched therapies, flatly do not work. Their results are much the same as those which would have been achieved had no work been done. What sort of a society is this in which we live where pretence is accepted as validity against all opposing facts?

Dianetics works. None who have spent any time around the Foundation can doubt that. It even works in relatively unskilled hands. Daily, it does its miracles. And this is not very strange, for Dianetics is root knowledge of human activity.

But Dianetics is not a psychotherapy and it is not psychosomatic medicine. Those who want and need these things find Dianetics swiftly efficacious in these fields and so think of it as a psychotherapy. Those whose "field" it invades would love to have it outlawed before their boxes of beautiful "Snake Root Oil" have been discredited.

Preventive Dianetics means more for humanity in the long run than Dianetic processing. Group Dianetics means more for these war-torn societies than any number of arthritis cures. Dianetics is the basic science of human thought. It embraces human activity and arranges a body of hitherto uncoordinated knowledge. Dianetics has a basic goal, a good goal, a goal which should not be discounted or thrown aside because some quack will lose his income or because some revolutionary will lose his crack-pot cause. The goal of Dianetics is a sane world -- a world without insanity, without criminals and without war. If our generations live to write history, let them sadly give a page to those who, in this chaotic and dark age, sought, through

personal profit and through hate, to bring a truly humanitarian science down. The goal of Dianetics is sanity. It would be stopped only by the insane.

From Funk and Wagnall's New Standard Dictionary, Supplement No. 5: di.a.net'ics noun: A system for the analysis, control and development of human thought evolved from a set of coordinated axioms which also provide techniques for the treatment of a wide range of mental disorders and organic diseases: term and doctrines introduced by L. Ron Hubbard, American engineer. (Gr. dianoetikos - dia, through plus noos, mind) -- di.a net'.ic adj. Dianetics is the science of survival. Although it is much simpler than the physical sciences of physics and chemistry, it compares with them in the preciseness of its results. The source of psychosomatic illness and human aberration has been discovered, and in Dianetics skills exist, for the first time, with which to resolve them. An understanding of human behavior is made possible by Dianetics. The precision of science is brought by Dianetics into the broad fields of the humanities. It is actually a family of sciences, and enlarges the humanities beyond previous understanding. The present volume deals with human evaluation and with dianetic processing. With it the behavior of human beings can be estimated and predicted with exactness. Although Dianetics is a broad subject and should never be limited to the field of mental healing, any true science which embraced man's activities could not but touch upon and resolve neurosis, criminality, insanity and psychosomatic illness.

Application of the human evaluation chart contained in this volume permits the student to estimate with some exactness the behavior and reactions he can expect from the human beings around him and what can happen to him as a result of association with various persons. Additionally, the use of human evaluation permits the individual to handle and better live with other human beings.

Man has known many portions of Dianetics in the past thousands of years, but not until now has this data been organized into a body of precision knowledge. Dianetics, as a master science, embraces psychology, psychometry, psychiatry, psychoanalysis, and any other field of mental healing or evaluation but goes on, more importantly, to predict human behavior precisely and to delineate the causes of that behavior, to enhance the field of politics and to enlarge all other activities of man. Despite this scope, Dianetics is simple enough to be easily understood by the intelligent layman, and after a study of this volume many of its lesser techniques can be employed by the layman to better and increase the life potential of individuals with whom he associates.

The first law of Dianetics is the dynamic principle of existence: **THE DYNAMIC PRINCIPLE OF EXISTENCE IS SURVIVE! OR SUCCUMB!** No activity of living organisms has been found to exist without this principle. It is not meant here that survival should be in terms of barest necessity, since one of the best guarantees of survival is abundance.

In Dianetics, survival is understood to be the basic single thrust of life through time and space, energy and matter. Survival is subdivided into eight dynamics. Man does not survive for self alone, nor yet for sex, nor yet for groups, nor yet only for the species of man. Man apparently survives, as do other living organisms, along eight separate channels. These channels are called the dynamics, and these eight represent the eight fundamental urges or drives which motivate conduct.

Dynamic one is the urge of the individual to survive as himself.

Dynamic two is the urge of the individual to survive through his progeny. The second dynamic has two main subdivisions, the sexual act and the creation of children and their rearing.

Dynamic three is the urge of the individual to survive as a member of a group, whether civil, political, racial, or just a number of individuals who compose a group.

Dynamic four is the urge of the individual to reach the highest survival in terms of mankind and is the urge of mankind to survive as man.

Dynamic five is the urge to survive as a life organism and embraces all living organisms.

Dynamic six is the urge to survive as part of the physical universe and includes the survival of the physical universe.

Dynamic seven is the urge toward survival in a spiritual sense.

Dynamic eight is the urge toward survival as a part of or ward of a Supreme Being. The number eight, laid on its side, gives us the symbol -oo- for infinity.

With these various drives, all the behavior and activities of individuals or groups can be integrated, evaluated and understood. With all of these dynamics in full play in the individual, a high level of sanity and optimum conduct is obtainable.

Dianetic processing attempts to give the individual the highest possible potential of survival and the happiest possible life. Severely tested and evaluated, dianetic processing has been found to deliver, in the hands of a competent dianetic practitioner, a considerably heightened productivity and happiness to the individual, as will be shown below.

Without using hypnotism, drugs, surgery, shock or other artificial means, Dianetics unblocks the flow of these dynamics and considerably enhances the ability of the individual to act in life and enjoy it. The source of mental disturbance and psychosomatic illness and irrational conduct is one of the basic discoveries of Dianetics. This source remained unknown and unsuspected for thousands of years, although relentlessly sought by the thinkers and philosophers of all ages.

That this source is the valid source has been rigorously tested and has been proven beyond doubt by the best authorities. The source of aberration lies in a hitherto unknown submind which, with its recordings, underlies what man understands to be his "conscious" and. The concept of the "unconscious" is re-evaluated in Dianetics by the discovery that the "unconscious" mind is the only mind which is always conscious. This submind is called the reactive mind.

A holdover from an earlier step in evolution, the reactive mind is able to command the conscious mind without the individual suspecting he is being so ordered about. Hidden and mysterious impulses, obsessions, delusions and other unwanted ideas are able to manifest themselves against the conscious mind of the individual without his suspecting what is happening. These compulsions and obsessions and irrationalities greatly reduce an individual's survival potential as well as his energy and physical health. The reactive mind takes any and all of the data which it contains from moments of physical pain or painful emotion which have been experienced by the individual in the course of life. When an individual is unconscious, which is to say when he is drugged or knocked out by shock, injury or illness, the reactive mind is wide open to receive recordings.

Previously it was not known that an individual who was unconscious could and did record those things which were said and done around him. For instance, during an operation while the patient lies on the table under ether, his reactive mind records everything that is said and done around him and records additionally the physical pain and the drugged feeling of the anaesthesia. All these perceptions combine together to create what is known in Dianetics as an engram. An individual, then, has an engram for every moment during his entire lifetime when he has been Knocked out or severely injured. Everything which occurs in these moments lies dormant in the reactive mind.

Further, every moment of great emotional shock, where loss occasions near unconsciousness, is fully recorded in the reactive mind. These shocks of loss are known as Secondaries. For instance, the death of a loved one brings about a state of near unconsciousness, and everything which is said or done around a person in such a state is recorded and becomes compulsive as part of the reactive mind. The reactive mind is composed solely of these experiences.

Later on, when an individual is tired or only slightly ill, similar circumstances or voices in his surrounding may restimulate one of the engrams or secondaries and so cause him to react according to its commands upon him. This is called, dianetically, a lock and is a conscious-level irrational reaction. In the reactive mind there exists, thus, an interior world of force which acts upon the individual. This is aberration, and it is caused by what has been done to not done by the individual, during moments when he was unconscious. The eradication of the content of the reactive mind is made possible by dianetic processing. One would agree that if the entire physical pain and painful emotion of a lifetime were eradicated from his life he would be saner and happier. Dianetic processing does just this. Dianetic processing is very simple in its elements.

Several new things have been learned in Dianetics about the human mind. One is the time track. Every moment of consciousness, from an individual's earliest instant of life to present time, constitutes what may be called a track of time. During these consecutive moments in time, everything the individual has heard, seen, felt or smelled is recorded faithfully. These recordings may not be available instantly to every human being, but in dianetic processing they become available.

This time track, then, is a record not only of the life span of the individual but also of everything which has happened within that span. When something is forgotten it does not disappear from this time track but is only denied to the individual by an occlusion occasioned by some physical or emotional pain. This pain makes it difficult for the individual to reach the data without re-experiencing the pain, and so the data becomes lost to him until he is processed. Processing is done by recovering data on the time track. Wide awake, without hypnotism, drugs or other artificial means any individual can be sent down the time track to earlier moments.

The preciseness with which he will go to these moments is astonishing. Many people are held in these moments by some past physical pain to such a degree that they are actually not in present time. When an individual is somewhere on the time track other than in present time he can be said to be out of present time. He will be experiencing some of the pain and will be reacting to the commands of the moment. If you were to ask one of your friends how old he is and request that he give you the first figure that flashed into his mind you would be astonished how often that figure would not be his proper age but an earlier age. If you pursued the quest you would find, by enlarging his memory, that he had been injured or had experienced some painful event at the age which he gave you in lieu of his own. This individual would be out of present time.

It is a primary purpose of dianetic processing to bring the individual wholly into present time. Processing is simply done. The auditor (as the processor is called) directs the attention of "I" back along the time track. The preclear (the person who is undergoing processing) is wide awake, knows everything which is taking place, is in full control of himself and is able to bring himself to the present whenever he likes. In a fully returned state, wherein the auditor has directed that "I" go back to a certain moment in the preclear's life, the preclear can be seen to approximate, involuntarily, the state he was in at some earlier period of his life. There exist, however, many severely occluded cases which cannot easily reach moments on the time track and there exist people who are stuck on the time track so thoroughly that they cannot reach earlier or later moments easily.

Lighter methods of dianetic processing have been devised to free those individuals in such a way that their recall becomes much more adequate. Psychosomatic illness, as it is called

in the field of medicine, is named in Dianetics a chronic somatic, since it is not an illness and cannot be diagnosed as such but is only some former pain which is in restimulation. For instance, the individual who has what a physician may have diagnosed as arthritis of the elbow is really suffering from the restimulation of an actual pain or series of pains he has received at some much earlier time in that very elbow.

In other words, a child which breaks its elbow at the age of three may at the age of thirty experience a rheumatic pain in that elbow. The test of all dianetic processing is whether or not it works. In the case of the chronic somatic, which accounts for some seventy percent of man's illnesses, the pain and discomfort of the "psychosomatic illness" vanishes when dianetic processing reaches and eradicates the recording of the original injury or illness. No pharmaceutical, mental, surgical or other medical treatment has been able to resolve or even vaguely control psychosomatic illness -- a thing which dianetic processing does easily as routine.

That Dianetics must be vastly successful in eradicating these chronic somatics is attested by the hysterical violence expressed against it by some members of past healing arts. Dianetics relegates psychosomatic surgery into nearly the same category as bloodletting. Occasionally, chronic somatics surrender in a matter of an hour or two. However, for the most part, highly competent auditing and many hours of work are necessary to resolve things which have been classified as arthritis, sinusitis, rheumatism, conjunctivitis, or any of the thousands of names assigned to these chronic somatics. The auditor in no case diagnoses the chronic somatic as an illness and does not need to make such diagnosis to resolve the chronic somatic. Beyond the resolution of psychosomatic illness and human aberration, Dianetics, even more importantly, encompasses human behavior.

Various specific states of being are occasioned by the amount of pain or painful emotion stored in the reactive mind, as are certain set mechanical reactions in the behavior of individuals. Groups as well can be found to react in this way. These mechanical reactions to life and the environment are represented by the tone scale, a full copy of which is included in this volume. By finding one or two manifestations of an individual one can go on to predict the remainder of his characteristic reactions toward his associates and his environment. One can discover what will interest him, what will depress him, how ethical he is, and what he will do in various situations.

The reader should not confuse Dianetics with the arts of mental healing or with schools of thought on the subject of thought. Dianetics is truly a science. It is new and it is young, but it fulfils the true requirements for a science in that it is "an organized body of knowledge that has been accumulated on a subject." According to some of the best known critics in America, Dianetics is considered to be the foremost advance of man, certainly during this century. Its conclusions are derived from the discovery of natural laws concerning thought, organisms, and the physical universe, and it is a bold strike toward further knowledge and the enhancement of man. Its limitations at this time are not even vaguely known. What it can do for the individual and the world cannot be estimated. According to Walter Winchell, the creation of Dianetics is a milestone for man comparable to his discovery of fire and superior to his inventions of the wheel and the arch. Any project or any set of discoveries as vast as Dianetics cannot but challenge the citadels of conservatism, but these are easily challenged.

In the book, Albert Einstein (page 120), L. Infeld states, "In 1921, when I went to study in Berlin, I saw with amazement the disgraceful spectacle which attended Einstein's fame." Editorials attacked Einstein, and mathematics professors in one of Berlin's greatest halls told a large audience that Einstein's theory was "the greatest hoax in the history of science." From Albert Einstein we have the direct bequeathment of atomic fission. From Dianetics and the brilliant mind of its discoverer and originator, L. Ron Hubbard, we may have the sanity and salvation of our future race. The advent of Dianetics into a lethargic society last May, 1950, created a stir which spread around the world.

There were those who believed Dianetics implicitly and to whose searching minds it seemed the final answer both for their personal problems and for the problems of the entire world. To those who did not share this hearty acceptance of its revolutionary tenets it was a fad, a cult, or even a blasphemy. Loudly this faction clamored for "validation," demanding that Dianetics prove its startling claims. It did not matter to them that never, before Dianetics, had any claims concerning "cures" or remissions of mental illnesses been validated, or that no formal attempt by any psychotherapy had ever been made toward this end. They sought, for one reason or another, to make Dianetics either prove its claims of what to them were fantastic cures of psychoses, or to withdraw once and for all into the obscurity of admitted defeat. Dianetics accepted the challenge.

The ardent enthusiasts and practitioners of the new science provided a fertile field for obtaining the demanded "validation." Prospective students, flocking to the Foundation and its branches from all walks of life and all levels of mental and physical health, were required to take psychometry before attending classes. Those who appeared at the Foundation for clinical processing were likewise given psychometry both before processing began and after processing was completed. The psychometry given one and all was the standard testing of established schools of psychology under the direction of fully qualified psychologists. Dianetics had not yet developed its own batteries of tests; but even had this been accomplished at that time, it would not have been acceptable to those who sought to discredit the budding science. They would have shouted that anyone could pass a test of his own making. Thus, in one more way, did Dianetics meet its critics on their own

The Minnesota Multiphasic Test is well known among psychometrists, college and industrial personnel. It has specific advantages and disadvantages, as have all modes of mental testing, but it is popular because of its simplicity and ease of scoring, and because of the relative ease of picturing the mental state of the testee which it affords. Therefore, in picking a "scientific" standard psychometric test, the Foundations chose as one of its tests the Minnesota Multiphasic Personality Inventory. Among professional people the Wechsler-Bellevue Intelligence Scale stands in high esteem, since it reveals more about the pattern of an individual's mental functioning than do similar tests. Originally, it was designed because its author felt that other tests existing at the time were more fitting for children. Early in the war the War Department requested that this test be used for channelling recruits into the services, and the particular Wechsler-Bellevue which was used became known as Form B. Its special characteristics include the Point Scale as contrasted to others using an I.Q. scale; each item is credited with a certain number of points, and the total points determine the score.

The Wechsler-Bellevue is divided into eleven sub-tests, and it affords separate scoring of eleven types of behavior. Sub-tests are grouped into two series, one yielding a "Verbal I.Q." and the other a "Performance I.Q." This feature alone makes the Wechsler (pronounced "wex-ler") of outstanding value in the measuring of rises in mental performance and activity. In the field of testing itself a favorite method of "validating" a mental test is simply by correlation with other tests.

Dianetics has undertaken to give a broad picture of the improvement afforded in human behavior by using more than one test. Thus, it is impossible to level a finger of criticism at a specific test in order to belittle the unprecedented improvement which is brought about in an individual by dianetic processing. It must be remembered however that testing takes up a lot of valuable time. Except for this reason hundreds of tests might have been given these 88 testees, to satisfy each and every one of the critics of Dianetics.

Those who are not satisfied with the results obtained from the tests which were chosen are cordially invited to set up a testing programme of their own; to send for a Hubbard Dianetic Auditor to audit the chosen preclears, and to draw their own conclusions from the results which accrue. The results of the "befores" were quite within keeping of the general average results any psychometrist would expect from a cross-section of the population. But the results of the "afters" were completely bewildering to those dyed-in-the wool doubters who hesitate to believe evidence seen with their own eyes.

The signatures of the examining psychometrists Gordon Southon, Peggy Southon and Dalmyra Ibanez, Ph.D., Ed D., are affixed to each bank of tests, and witnessed. These psychometrists are registered professional personnel whose honesty and standing in the field of psychology is above question. In past comparative testing, it has been quite within the keeping of those conducting mental research to choose about five persons for examination, retaining an equal number as a "control" group. Dianetics has built this particular validation programme around 88 persons. Never before has such an astounding number participated in tests to show improvement in mental health, specifically in the testing of increase in mental ability and reduction of psychoses and psychosomatic illnesses. A vast backlog of psychometry has since been accumulated, many times outnumbering this original 88. Dianetics is now in a position to do the challenging, and the following charts are submitted as proof of the efficacious results of processing. Dianetics was challenged to prove the claim of increased I.Q. and that dianetic processing has as two of its by-products the relief of psychoses and psychosomatic illnesses. Had the challengers any idea that this proof could be presented they might not have been so blatant in their demands, and had they any inkling that the results would be so completely in Dianetics' favor they might have withheld them completely.

However, Dianetics has met the challenge.

The arbitrary measure of human intelligence popularly known as the individual's "I.Q." is not a measure of how well a person remembers. Neither is it a measure of how much he has learned over a period of a lifetime. I.Q. ratings are a measure of an individual's capacity for learning something new; they are scales based upon how old in years a person has become compared to how "old" he is mentally. One might be 30 years of age and yet have an equivalent mental capacity of an average 15-year-old school boy. On the other hand, a particularly adept pupil of grade school, perhaps 8 years of age, might have a mental capacity equivalent to someone ten years his senior.

It has become a cliché that an individual's I.Q. rating does not change throughout his lifetime. Indeed, until Dianetics, a gain in I.Q. scoring from one test to another was greeted with astonishment and an immediate assertion that a mistake had been made by the psychometrist scoring the tests.

When Dianetics made the statement that a person's Intelligence Quotient (I.Q.) increased remarkably following a few hours of dianetic processing, the clamor for "proof" began. The Foundation has this proof, in abundance. As shown on the bar graph one group of 88 persons was given standard I.Q. tests, and their scores plotted along the horizontal bar, regardless of whether these particular scores were 50 I.Q. or 150 I.Q. One month passed, a month in which the preclears received about 60 hours of dianetic processing. Then they were given a second I.Q. test. The score on the second test was then plotted on the vertical bar at the point which represents the points of gain or loss.

Let's call the vertical bar on the extreme right of the graph by the name John Smith. John appeared at the Foundation for training in Dianetic Auditing, and before being permitted to attend classes, was given a group of tests, among which was an "I.Q." test. He was found to have, according to the standards set forth by the originators of the test, an I.Q. of 125. He went to class, learned dianetic theory, learned to audit effectively, and during the course received 65 hours of dianetic processing from classmates. On Certification Day, he was given a second block of tests containing a standard follow-up of the I.Q. test he had taken a month before. His rating on the second test was 151. Thus, John Smith gained 26 points in I.Q. in a period of one month, and these 26 points are plotted on the graph as a vertical bar.

Among the tests in the block taken by John Smith was the California Test of Personality. Various aspects of his social and individual personality were determined by use of this test. One of his most marked improvements was in his occupational relations (he had lost job after job because he couldn't get along with his boss and fellow workers). His second greatest personality change was in his feeling of personal worth; prior to his processing he had

considered himself as incapable of handling a foreman's position, or of leading a group. The after-processing test showed that he had acquired a much deeper feeling of personal worth, and that he would rate highly with his fellow workers.

The Summary of Average Percentile Scores as shown on the Personality Bar Graph is a display of the results showing increases in the twelve categories listed. Seventy-six individuals were given before-and-after-psychometry which included the California Test of Personality, and their average is displayed in graphic form. To obtain the "average" score of all 76 persons, it is necessary to total their scores and divide the result by 76. The average scores of the 76 individuals on the first test are shown by the height of the shaded bars. The average scores of the 76 persons after they had received dianetic processing of about 60 hours each is shown by the height of the solid bars. In each case, there is an evident increase.

Two graphs display the results obtained with use of the Minnesota Multiphasic Personality Inventory test. As in the preceding graph, these show the averaged scores of a number of individuals, divided into two displays: 21 cases, all male, and 7 cases, all female.

The graphs are marked off in arbitrary scale form, beginning with 40 and ending with 100, and the averaged results of the first tests taken by the individual concerned are located where the dotted line crosses each sub-title line. The averaged results of the second tests taken after the persons had received about 60 hours of dianetic processing are located where the solid black line crosses each sub-title line.

The first sub-title, "Manic Tendencies," means that a person is to a measurable degree influenced by compulsions which cause him to feel, for example, that he has to conquer the world, as Napoleon or Alexander set out to do. The averages of both the before- and the after-processing tests came out practically at the same point on the scale, about 59. Although this indicates that as a group there was no decrease in maladjustment, a few individuals within the group may have adjusted remarkably in this category.

The second sub-title, "Schizoid Tendencies," means roughly that a person might be suffering from what Dianetics defines as a valence shift or the assumption of a second or third personality which is not inherently the individual's own. The average for the group in the pre-test was about 76 toward maladjustment. The after-processing test shows that the group as an average decreased in maladjustment or, in other words, adjusted toward gaining and recognizing their own personality.

Under the sub-title "Obsessive-Compulsive Tendencies" might be placed those who "just have to wash their hands" after every tiny chore, or those who, before they turn a written page they have just completed, are compelled to dot every "i" or else be completely unable to continue writing. Persons in this category are compelled to carry out some routine, idiotic or otherwise, regardless of what might be more important at the moment.

The remainder of the sub-titles refer to various conditions evident in individuals, such as the feeling that "everybody's against me" and the tendency for a man to feel somewhat feminine, as well as the extreme anti-socialness of hermits and pyromaniacs. Psychosomatic symptoms are evidences of bodily discomfort or disease which have no physical origin, while the Undue Bodily concern category represents the degree of obsession regarding sickness, referred to by the medical profession as "hypochondria."

Although there are hundreds of individual cases to choose from, the test results of the individual displayed in the graph entitled Typical Test Results of One Individual are average, hence typical. Case No. 446 from the California files shows that according to the results obtained from the California Test of Personality this person became very much better adjusted than he had been before processing. His social adjustment, or the manner in which he gets along with groups, became more acceptable. The third bar in the first section of the graph merely shows the average of the previous two factors and is entitled Total Adjustment.

As shown by the Mental Health Analysis test, he adjusted his liabilities toward usefulness, and increased his assets. His total adjustment is shown on the third bar column.

In the third test, the Johnson Temperament Analysis Profile, there are nine categories of test results, graded on a scale of Excellent, Satisfactory, Fair and Poor. The greatest improvement shown on this test was in the energy he evidenced in the tackling of a problem, and in his congeniality among people. His relaxation and buoyancy categories already satisfactory when he took the first test, increased to a rating of Excellent.

When this man first came to the Foundation, he was not particularly liked by his classmates and others who came in contact with him. He was often morose, sullen, uncommunicative and, as one classmate put it, "downright unfriendly." A noticeable change in his social awareness came about within the first week of his processing, and by the time he had finished his training he had reached an overall adjustment to an extent that he was congenial to everyone, and was well liked in return.

Physicians interested in Dianetics generally desire that several months of observation follow the release of a "psychosomatic illness" during the course of dianetic processing, before the results are pronounced permanent. Accordingly, the Foundation has not released information on any but remarkable recoveries (which seem to make themselves known automatically) until after this waiting period has elapsed. The cases which are mentioned in the second paragraph which follows are all, except the last case, more than six months completed.

Dianetic processing does not set out to cure any physical ailment, but it happens in the course of bringing a preclear up the tone scale that all the chronic somatics of engrams from which the preclear has been suffering will disappear -- often with startling suddenness. Since these chronic somatics account for at least seventy percent of man's "illnesses," many many people who have considered themselves ill for years have "gotten well" during dianetic processing.

Among the chronic somatic conditions from which our present available records show complete recovery are some which have been diagnosed by physicians as follows: bursitis, osteoarthritis, migraine headaches, thyroid complications, chronic headaches, chronic backaches, chronic indigestion, constant fatigue, chronic colitis, and near-sightedness. Almost every chronic condition commonly known has been relieved or alleviated during the course of dianetic processing. These are only some of the cases on which we have careful records. One gentleman had suffered from a chronic somatic which had been diagnosed by no less than 10 physicians as "psoriasis" or "psoriatic arthritis". None of them had offered him any hope of cure. For three years he was periodically disfigured by lesions which covered nine tenths of his skin area. During dianetic processing the lesions healed so rapidly that fellow employees inquired as to the reason for his sudden change in appearance. Time will tell whether this recovery is permanent, but there seems to be no valid reason for thinking that it is not.

Alcoholism is considered by some to be a physical condition and by others a mental one. Dianetics is not prepared to arbitrate the mind-body ratio of alcoholism, but the Foundation can report that alcoholism responds just as favorably to dianetic processing as any other aberration.

Aberrations which are apparently physical are easier to measure, and improvement in them is easier to judge than in mental aberrations. However, the main goal of dianetic processing is not the alleviation of chronic somatics, but the erasure of irrational components in the thoughts of the preclear. The apparently physical results are a by-product of this.

The Foundation presents this report as a brief survey of some of the work done by the Foundation during its first year of operation. Obviously, research in such a broad field as Dianetics requires time and careful, thorough planning. Studies which measure clinical improvement in individuals and groups are usually extended not over months, but over years. Even though a preclear himself can give a glowing subjective report, and though change in his abilities and behavior is easily seen by friends and family, it is difficult to measure

improvement adequately. Tests which measure all the various improvements in a preclear do not as yet exist, and those which we have used in order to meet the challenge to Dianetics are actually admittedly inadequate even within their own fields.

We in the Foundation urge scientists in all fields, particularly those working in biology and the social sciences, to test dianetic theory and technique in their own laboratories and under their own controlled conditions. Dianeticists are eager to co-operate with any worker who would like to test or explore Dianetics. Dianetic theory and technique can be applied in many areas. We wish to thank those scientists and institutions who have already participated in dianetic research and have applied it in their own fields. They have been of great assistance to the Foundation and to the science of Dianetics.

We who are working with Dianetics have seen so much of what it can do, and have become so enthusiastic about its effects and possibilities, that it is difficult to moderate our statements about it or our expressions of eagerness to see it develop further. We hope that more and more people, from all fields, will join us in our exploration and our work.

-- Editorial Staff

Hubbard Dianetic Research Foundation, 1951

Introduction

This book is built around a chart. On the many columns of this chart we find the majority of the components of the human mind and all those necessary to process an individual.

In this book we will take up these columns one by one from left to right, and explain each column. When this has been done, and you have read the book and thoroughly examined the chart, you will at least have the rudiments you need to process people. If you desire to process individuals on a limited basis, you may specialize in straight memory, lock reduction and lock scanning. This can be done to almost anyone you would ordinarily contact without any harm and with a great deal of improvement in his general tone. If you feel a little more adventurous, you can learn how to audit secondary engrams and so become proficient in discharging grief and fear from a case. Should you desire to go the whole way and feel yourself competent, you can try running engrams on a case, with a very close regard to the kind of case on which you try to run them.

For a full education in dianetic processing the elements are here. But just as you went to high school to learn algebra or physics, you should take a Foundation course in order to become a truly proficient auditor. Qualification at the Foundation, coupled with any other training you may have, will permit you to become a professional practitioner. Most people, however, take a Foundation course because they want to be better educated and to function better in their own professions, for Dianetics is not just processing. That's not a thousandth of it. Dianetics deals with thought and the behavior of men and groups; and those who know the subject thoroughly survive better.

Simply reading this book then, although it contains all the basic information, does not qualify an individual to practise professionally. But once he has thoroughly studied this book, he should be able to handle routine cases without difficulty. He should not try Dianetics on insane or severely neurotic person unless he feels himself especially gifted in understanding or unless he has taken a qualification course at the Foundation. This particularly applies to analysts and psychiatrists and medical doctors who, having concourse with the insane and the chronically ill, could achieve remarkably better and faster results with a knowledge of Dianetics. The science was made available to them in the past, and it is again urged that they take advantage of its techniques in the best interest of mankind and the advancement of their professions. Many physicians and psychologists have already been trained by the Foundation and they, experience shows, have made good auditors.

In the same vein, the layman should be very careful whom he allows to practise Dianetics upon him. Before submitting to dianetic processing, the individual should either look for the auditor's certificate on the wall and see that it is in good order or demand the right to give his auditor a test as to the various definitions contained in this volume. The individual who desires processing should not submit himself to a psychiatrist or a psychoanalyst or medical doctor for dianetic treatment in the belief that they, as practitioners, know Dianetics. Only those psychoanalysts, medical doctors and psychiatrists trained by the Foundation are fully qualified to handle the whole parade of skills necessary in an auditor. If your auditor is not qualified by the Foundation, then let him run straight memory, locks and chains of locks on you until you are entirely satisfied he knows what he is doing.

An auditor, by diligent study of this volume and by entering slowly into the use of his tools, making sure he understands each one of them progressively before using the next, can achieve great skill in processing. These cautionary remarks are addressed to those who, by haphazard reading of the volume may attempt to plunge into the whole array of skills at once. This would be like trying to take a plane off the ground before one learns where the throttle is located and how to bank. Dianetics is not as difficult as flying a plane but it is a technical subject.

You can't drive anybody mad with dianetic processing. Cases driven mad by dianetic processing do not exist. Cases do exist where reversed techniques have been criminally used on persons. Pain-drug-hypnosis can deliver anybody into a straightjacket with greater neatness and despatch than anything hitherto known. Dianetic processing, however, has nothing to do with restimulating or planting engrams.

So read what is written and get to know your chart. You will know more about men and women and their behavior when you have finished. If you feel you could stand some processing, come to the Foundation, or team up with somebody on whom you can rely, starting in with straight memory and locks and studying as you work. If possible, get supervision from a Foundation-trained auditor or take a basic or professional course. You can't know too much about this subject.

No attempt is made in this volume to be literary or academic. I would happily take off a couple of years and write you something highly polished, but we're trying to get where we're going before the atom bomb gets there, and navigating the course takes a little time. So I've just written here what I know about this chart in a way I think you'll understand. The book is organized around the chart, not around the longest words in the dictionary: this is made possible by a certain difference between Dianetics and some other subjects -- in those, the author has to make up in complication what he lacks in understanding of his subject, so the critics will be impressed.

Damn the critics, let's get down to paragraph one and open up to flank speed. There's a sane world to be won.

L. Ron Hubbard January, 1951

BOOK ONE:
The Dynamics of Behavior

CHAPTER ONE

COLUMN A

The Tone Scale

From Funk and Wagnall's New Standard Dictionary, Supplement No. 5:

di.a.net'ics noun:

A system for the analysis, control and development of human thought evolved from a set of coordinated axioms which also provide techniques for the treatment of a wide range of mental disorders and organic diseases: term and doctrines introduced by L. Ron Hubbard, American engineer. (Gr. dianoetikos - dia, through plus noos, mind) -- di.a.net.ic adj. Assuming the basic idea that the sole fundamental of existence is survival, the problems of man's behavior apparently resolve rapidly. His interpersonal relations, the operation and purposes of his organizations and groups become understandable.

Science is, to many people, a sacred cow. Actually, by definition, science is only the organization of apparently disrelated facts into a useful whole. Aligned on certain basic axioms (which can be found in the appendix) Dianetics is a useful body of knowledge by which may be resolved the puzzle of man and his behavior.

A search for an energy of life begun in 1930 has been partially resolved by the discovery of the lowest common denominator of existence: SURVIVE.

A gross error has been made by scientists in the past who sought, materialistically, to explain life on the basis of mud, chemicals and electricity. It was the contention of these individuals that matter, electrical energy, operating in space and time, combined in some incredibly lucky moment to form a self-perpetuating unit and that this item fortuitously grew and grew and one day man appeared on the scene. This child-like logic breaks down if only on the basis of the odds against it. It breaks down again when evolution, as postulated, is seen to be of only limited usefulness, being actually as full of holes as an ocarina. The main test of any "scientific" hodgepodge, is its usefulness to man. The mud-to-man theory, and it is just a crude theory, has not resolved man's behavior. These schools of thought gave man unlimited weapons such as the atomic bomb and yet failed to give man sanity enough to regulate his own affairs or use the type of energy released by that bomb for purposes other than destroying towns. So we can conclude and lay in a quiet grave any and all scientific theories which have not led to peace on earth or have failed to give us a predominance of men of good will. Of course there are lots of individuals who would like to go on having man believe he is basically mud but to those we bequeath the electric shock machine and the prefrontal lobotomy, the highest level of operation to which the mud-to-man theory led.

An examination of existence and the fondest hopes to which man has clung discovers for us the possibility that the energy of life is a different thing from the current flowing in a power line or the energy radiated by atomic fission. It is not necessary to have a vast knowledge of physics to conclude that life is something more than a mechanical contrivance rigged out of atoms and chemicals. In the first place, it follows only a few of the electromagnetic-gravitic laws and at best only vaguely parallels these. Life has its own performance rules.

A further examination of life demonstrates that it is undoubtedly made up in part of matter and that it exists in space and time. This is quite certain because a dead organism disintegrates into dust. Something has obviously ceased to be a part of this organism, however, the moment it fully died. This "something" has variously been called the human soul, the spirit, the life force. Bergson called it "elan vital."

The scientist who deals constantly with machines and chemical reactions has for some decades looked on a life organism as an oxygen-carbon motor, a heat energy machine which operated not unlike a steam locomotive. He dismissed the wild variables this introduced into any attempted solution to life and living by the expansive statement that life was simply more complicated than machines men built but that it was actually just another machine. A “too-complicated” school of thought, masquerading as science, took up this argument, seeing that it obfuscated any real explanation, or reason for one, and began to say that the human mind, being part of a machine which was too complicated for biology and biochemistry, was of course too complicated to understand. It is felt that this waving aside of the problems of mind operation, this acting on the defeatist principle that the problem could not be solved, introduced “therapies” which were “too complicated.” It took four to twelve years to get an inkling of these therapies and all evidence to hand, carefully compiled, shows that they do not work, that the problems of criminality, insanity and war still remained, with these systems of “therapy,” far out of control. The too-complicated school of life and mind operation gives us a picture of a group of demon exorcists rushing around plague-ridden London a couple of centuries ago, telling everyone they had the solution to the plague, while some hundreds of thousands of Englishmen died the black death.

Let us look for a simpler solution, one which does not require twelve years of schooling and practice to learn, one which will deliver to us a therapy and, more important, an understanding of life, man, and mind operation which can resolve the 19,000,000 insane, our millions of criminals, and international madness.

We find the first leg of this solution in considering life force, elan vital, or what have you, as an energy dissimilar to electrons and molecules and mud. The laws of this “energy,” once they are isolated and stated, are found to be parallel to, but dissimilar to the laws of the physical universe.

Let us call this life energy by a symbol in order to identify it. We will assign to it the Greek letter theta and distinguish it as an energy existing separate and distinct from the physical universe as we know it.

The physical universe would be the universe of matter, energy, space and time. It would be the universe of the planets, their rocks, rivers, and oceans, the universe of stars and galaxies, the universe of burning suns and time. In this universe we would not include theta as an integral portion, although theta obviously impinges upon it as life. From the first letters of the words matter, energy, space, and time, we can composite a new word: MEST.

In Dianetics we are dealing then with theta and MEST. Theta is thought, life force, elan vital, the spirit, the soul, or any other of the numerous definitions it has had for some thousands of years.

As soon as we separate the two entities, a host of problems heretofore quite complex resolve into simplicity. Theta, we could say, comes from the universe of theta, which is different from the MEST universe. Theta has its own matter -- ideas; it has its own energy and the characteristics of that energy; it has its own space of operation, as distinct from MEST space; and it has its own time.

There is an enormous amount of evidence to support theta as a postulate. Thought is instantaneous in the MEST universe so far as can be discovered. The flow of energy along nerves in an organism does not travel at light speed. Time and past, of the MEST universe, do not exist for theta.

Considering theta one finds that it, alone of observable energies, motivates and activates MEST matter and energy through space and time. Further, it computes, reasons, learns and retains what it learns. Men, building a computer with electronics which would do only a part of what the human mind can do would have to use enough electrical power to light New York City, enough cooling system to absorb Niagara Falls, and enough vacuum tubes, if they cost a

cent apiece, to run up a bill of a million dollars. And the apparatus so rigged, under the existing life terms of tubes, would run a split second before stopping for tube replacement. The human mind does more than such a clumsy machine, does it better, last a lifetime and, to cap it, is portable.

Now all a student of Dianetics needs to know and understand about all this is that theta plus MEST equals life; that theta and MEST have a natural affinity for each other and combine, linking the two universes, so to speak; that theta and MEST coming together too hard get into a turmoil which we call pain; and that the turbulence of theta and MEST under the duress of too much impact gives us a tone scale.

Theta crushed too hard into MEST becomes entheta. MEST crushed too hard into theta becomes enMEST. Entheta is simply a compound word meaning "enturbulated theta." And enMEST is another word meaning "enturbulated MEST."

Consider that theta in its native state is pure reason or at least pure potential reason. Consider that MEST in its native state is simply the chaotic physical universe, its chemicals and energies active in space and time.

The cycle of existence for theta consists of a disorganized and painful smash into MEST and then a withdrawal with a knowledge of some of the laws of MEST, to come back and smash into MEST again.

MEST could be considered to be under onslaught by theta. Theta could be considered to have as one of its missions, and its only mission where MEST is concerned, the conquest of the physical universe. MEST is under raid. Theta is doing the raiding.

Theta survives by conquering MEST and retaining the conquest. Theta may have numerous other methods of survival but they do not apply to this particular physical universe where we are situated.

The survival of theta depends, as it applies to this universe, on changing MEST and organizing MEST.

Life is a manifestation of theta-conquered MEST. Theta has conquered and organized with high complexity certain MEST chemicals and energies into life forms. These forms are very diverse. They progress from the lowest orders, such as the lichens and moss, through the entire vegetable kingdom, through the animal kingdom and up to man. Each form evolved from the initial impact of theta against MEST, and each form on a higher level is supported by lower-level forms.

Without the lichen and the moss to make soil, no plant life could grow. Without plant life converting sunlight and chemical into cellular food, no animal could live. Without the array of life forms below him, man could not support himself as an intelligent organism. Intelligence would be more or less wasted in lower forms. Evolution from lesser forms to greater forms exists in present time and wholly in present time. Evolution traced back along the time span is evolution traced through the MEST remaining after the theta had passed over it.

Man alone of the animal and vegetable kingdom possesses the potential power of changing MEST in wholesale lots into something theta can use. Man can, by steam shovel and dynamite, move mountains and perhaps -- who knows? -- conquer a galaxy. Theta thus evolves toward higher and higher reason and a higher and higher ability to conquer and change the physical universe -- MEST.

If we grant the cycle of re-creation, growth and decay and the postulate that theta conquers MEST by first impinging solidly into it and learning about it and then withdrawing to come back with what it has learned, we can see that theta learns by becoming enturbulated and then straightening itself out as an endless process. People have known this for a long while --

one learns, they say, by hard knocks. That would be a simple way of saying that theta gets painfully mingled with MEST and withdraws to come back for an orderly conquest.

If this is the cycle -- and this assumption solves problems which were never solved before -- then we can see that theta would have to have a withdrawal mechanism, and so it does. Death is that mechanism. Theta and MEST are attached to each other but when they become painfully mixed up, they become entheta and enMEST. Entheta rejects MEST. EnMEST rejects theta. Theta combines with theta or MEST. MEST combines with theta or MEST.

Here we have something not unlike a chemical reaction. Two chemicals reside placidly with each other until stirred up.

Stirred they blow apart. Or we could liken this to a characteristic of some energies which, when they have their wavelengths changed, reject each other. This is death. Theta and MEST get too enturbulated and the organism dies, the remaining theta rejecting the MEST body, the MEST body rejecting the theta.

There is nothing very complicated about this postulate, even though it solves a great many problems. One could say that when life becomes too painful, the body sickens and withers and the soul departs.

Man has for many ages inclined to a belief in free theta. Science became very unpopular when it sought to break down and abolish, by logarithmic decree, the human soul.

However, we do not need a human soul to explain the theta-MEST separation called death even though evidence is growing -- good evidence of a highly scientific nature on a much more practical level than parapsychology -- that the human soul does exist in fact.

Recently at a major university a group of well done experiments demonstrated that living organisms had about them a field of energy which had a point source. If the energy radiated from the cells alone, according to past theory, the picture presented would have been quite different. Free theta, then, could be postulated to exist. The usual genetic line of generations begetting generations of like organisms explains, in accepted biological terms, the traverse of theta through generations.

It seems inevitable that, as theta conquered MEST and made it into higher and more complex organisms, the problem of getting enturbulated theta and MEST separated for the next generation would be resolved, at last, on an intellectual level and within one generation; theta mastering the problem of smoothing itself out within the organism itself. Actually, at a swift glance, this is Dianetics.

The defeat of death entirely is not wholly desirable. Evolution is set up to provide better and better organisms, better able to survive. Without death, all existing planetary space would soon be glutted with life which could not be supported. Death can take no holiday. But life can be much more effective at least for the species called Man.

The cycle of conception, growth, decay, and death, according to our postulate of theta and MEST, would be the cycle of pleasure-and-pain learning by which the organism is refined so that the new generation it begets is better able to cope with the environment and conquer MEST than was the older generation. In one lifetime, there is much accumulated pain. The cells are subjected to pain by continual forceful contact with MEST as in accidents, or by collision with other life forms. The whole organism as an organism is subjected to pain with every defeat in its efforts to fulfil its purposes of survival by a conquest of MEST. By pain the cells learn new methods of construction for better survival. Out of organism pain, the organism learns new skills and methods of surviving.

The hitch has been that once an organism was subjected to pain, it accumulated some knowledge but it also accumulated some entheta and enMEST. When it had accumulated enough to be highly ineffective it died, leaving the next generation to carry on. For a man, this is not efficient. There is nothing wrong with his learning by pain and pleasure what is bad and good about existence, but there is a great deal in error with his having to carry with him an excess of entheta and enMEST which hide knowledge from him and cut down his ability to function in his proper role.

Inevitably a high form of life could be expected to resolve this entheta-enMEST problem without an intervening death cycle.

The enMEST-entheta turbulence is called in Dianetics an engram. An engram is an area in time when theta and MEST have come forcefully together and have intermingled “permanently.”

A small boy falls and hits his head. He is for an instant unconscious. As soon as he gets up he may think he has a complete memory of what happened to him. But there is an instant which is occluded from his consciousness. That instant contains a turbulent area of entheta and enMEST. A tiny bit of his theta and a small portion of MEST have become a part of his unreasoning mind. This moment is an engram.

There are two minds, for our purposes. One is the analytical mind, the other is the reactive mind. The analytical mind is where theta coordinates and reasons for the organism. The reactive mind is where theta and MEST have become enturbulated. The analytical mind operates by reason. The reactive mind operates by reaction.

The reactive mind, having a different polarity than the analytical mind, has the capacity of compelling or inhibiting the organism in regard to certain of its actions. Lower forms of animals have this as their main method of thought.

The reactive mind was once called the “unconscious” mind. It is a tough, rugged mind which is alert during any moment of life, regardless of the presence of pain, and which records everything with idiotic faithfulness. It stores up the entheta and enMEST of an accident with all the perceptics (sense messages) present during the “unconsciousness” resulting from the accident. Thus the small boy who hit his head on the rock knows analytically that he fell and hit his head, perhaps, but he “knows” better with his reactive mind. Suppose the smell of dust was present in the accident. The reactive mind has stored the perceptic of the smell of dust. The boy one day happens to be weary and to smell this identical smell. He becomes a little nervous. This is the reactive mind telling him to react and get out of here because when this smell is present, one gets a bump on the head. That is not logical, but that is the way the reactive mind operates. If the boy does not leave the area and the smell of dust, the reactive mind turns on the pain, in an effort to force him to leave. Finally, the boy learns to avoid the smell of dust because when he is tired this smell makes his head ache. He does not like the smell of dust, because to the reactive mind the smell of dust equals a bump on the head.

With an analytical mind, the organism can think complex thought and is aware of being alive. With the reactive mind, the organism reacts in accordance with data received during the highest threat to survival -- unconsciousness.

So long as the reactive mind functioned in organisms which had not evolved language it was a very workable mechanism. When an animal was injured, his reactive mind picked up all the perceptics regarding this injury -- sounds, smells, tactile, sights -- and whenever these appeared in the environment of the animal his mind would make him run or fight. Thus he was safeguarded by past moments of pain. It is a sort of shotgun method and has a thorough workability which, while it would deny the animal pleasure at times, at least kept him alive in a tooth and claw environment. When man evolved his analytical mind into a high enough level of action to need language, trouble set in, for the reactive mind could also contain words. Words heard during moments of unconsciousness, such as those spoken during operations or

around a very ill or severely injured person, are faithfully recorded along with their pain. Like hypnotic suggestions, these recordings can be brought into play by a similar word or environment and cause the individual to act as though in the presence of danger. Restimulated by the environment, these past moments of physical pain and unconsciousness force the individual into obedience.

Engrams, these moments of pain and unconsciousness stored in the reactive mind, act like hidden command posts in the mind, forcing the individual into patterns of thinking and behavior which are not called for by a reasonable appraisal of the situation. For the engram is not reasonable. It is simply a recording which has the sole purpose of steering the individual through supposed but usually non-existent dangers.

Until Dianetics, the engram was not suspected for it was well hidden as an entity. The word, engram, is an old one, borrowed from biology. It means simply, "a lasting memory trace on a cell." It may be engraved on more than the cell. But, up against dianetic processing, it is not very lasting.

Here, then, is a piece of entheta-enMEST -- the engram. MEST and theta, coming together too forcefully, as in an impact or injury, or getting enturbulated through illness, are stored in the reactive mind and from there mechanically enturbulate the theta of the analytical mind into compulsive or obsessive action or enturbulate the MEST of the body into pain, deformity or psychosomatic illness (chronic somatics, as they are called in Dianetics).

Accumulate enough entheta in the reactive mind, and the analytical mind becomes aberrated enough to commit suicide or to undertake non-survival activities in order to remove the organism from the world of organisms and let another generation take up the work. Let enough enMEST accumulate in the reactive mind and the MEST of the body will enturbulate into pains and illnesses which will kill the organism and serve the same purpose.

This, then, is the basic assumption on which we are operating in Dianetics. The assumption is a workable postulate in that its application produces very advantageous results. The relatively sane person becomes more sane. The psychosomatically ill become well. The unhappy become able to obtain pleasure and lead happy lives, and we have a chance to bring about enough sanity amongst men to stop the mass murder of war. We can resolve the usual problems of behavior and set up a better organization.

The person undertaking to process another individual dianetically is seeking only to raise the "tone" of that individual -- in other words to increase his survival potential. In order to do this, the processor simply regains for the other the theta involved in the reactive mind as entheta. Theta is restored to the analytical and, the reactive mind is left without its destructive store of turbulence and the individual being processed becomes a dianetic release or clear.

Column A on the chart is graduated as a tone scale. Actually this scale has many more heights and levels than those we can now measure and use. How high it actually goes we have no way of knowing at this time. For our purposes, it is put to use here between the levels of -3 and 4.0.

It is different from other MEST only in that it has been organized by theta into new chemicals and compounds, for MEST is evolved into new complexities by theta just as organisms are evolved by theta.

At -1, for a short time after death, we have body cells alive. Some of these cells live for as much as a year after organism death, according to some investigators. This is, in any event, the band of cellular life, as different from organism life.

At 0.0 we have death at the moment the theta withdraws from the organism.

From 0.0 to 2.0 we have the band of operation of the reactive mind. Between these points on the tone scale, the reactive mind is in command of the organism. The reactive mind, in this band, directs the organism according to stored engrams and the analytical equivalent of the engram, the lock.

From 2.0 to 4.0 we have the band of operation of the analytical mind.

Above 4.0 we could postulate other mind levels such as the aesthetic mind, through other minds, to the free theta mind, if such things exist.

This tone scale shows the current level of survival of the organism. It shows also the potential of survival in terms of longevity of the organism (unless processing intervenes, of course).

The higher the individual is upon the tone scale, the better chance he has of obtaining the wherewithal of living, the happier he is, the healthier his body will be.

Actually a person fluctuates on this scale from hour to hour and day to day. He receives good news, he goes momentarily to tone 3.0. He receives bad news, he may sink for a moment to tone 1.0. He falls in love and for a month he is at level 3.5. His girl leaves him and for a week he is at tone 0.5. When he is very young he rides around tone 3.5. As he grows older his tone drifts down to 2.5. As an old man he may drift down to 0.0 and death either slowly or swiftly.

We are interested in the average level for the individual for the period of life we are addressing. The average is fairly constant. An individual's average place on the chart can be gauged by inspecting the other columns. Thus he may be an average 2.7 on the tone scale and yet reach 3.5 on occasion, and yet sink to 0.5 on other occasions but only for a short time.

The constant position on the tone scale is determined by three factors. The first is the accumulated entheta in the person -- how much of his theta is enturbulated in engrams and analytical locks and so strikes back against him, forcing him into non-survival activities or compelling him or inhibiting him in environments containing imagined dangers.

The second factor is the amount of theta the person has as life force. This would be his volume of theta. It is another dimension on the chart. Terror is fear with lots of volume. One person has more volume of theta than another and can thus stand to have more enturbulence, more engrams. One may have so little native theta that half a dozen engrams will convert it all into entheta, leaving the person insane. Another may have so much theta that thousands of engrams still leave him with enough actual theta to go on living a productive life in the 2.0-plus zone.

The third factor is a ratio between the analytical mind and the reactive mind. An individual may have a reactive level of 1.0 and an analytical level of 3.5. The result is that when he is in a restimulative environment he may be covertly hostile but in a more favorable environment he may be analytically very productive. These two minds average out to a constant. All the person doing processing -- an auditor, he is called in Dianetics -- needs to know about this tone scale is that it gives the percentage of theta of the case which by engrams and locks has become chronically entheta.

To raise a person on this tone scale it is only necessary to recover or convert theta from entheta. Remove, in other words, the stores of turbulence from a person's life or render them unstimulated.

An auditor is not trying to cure anything. He is simply raising tone. Incidental to a raised tone, psychosomatic ills commonly vanish and aberrations disappear. But this is incidental. The task is to make a human being happier, more effective, better able to accept responsibility and aid his fellow man. That the person being processed gets "well" in the period and stays "well" is a bonus. Anything which raises a person's tone can be considered

legitimate processing. This includes, of course, nutrition, environment, and education, as well as processing. Simply taking the person to see a movie he wants to see may raise his tone. Processing achieves permanent rises in tone. If it is illegal anywhere to process people, then it must also, sequitur, be illegal to make people happy.

CHAPTER TWO

COLUMN B

Dianetic Evaluation

The goals of dianetic processing form a graduated scale. Actually this scale is also the scale of sanity, for there is a parallel between the amount of life force (theta) in the individual available for his survival and the amount of sanity he displays. Turbulence of this life force decreases not only his sanity but his level of survival. The life expectancy of the individual is also proportional to his physical well being (absence of factors which predispose him to illness) and his mental well being. In other words, dianetic processing is directly concerned with increasing the ability of the individual to survive, with increasing his sanity or ability to reason, his physical ability, and his general enjoyment of life.

As we look at this scale, we are also looking at the emotional tones of the individual as he reduces an engram. There is a very direct relation between this scale and natural performance. As the individual reduces an engram under processing, he may begin in an apathy tone; as he recounts it the second or third time, he is found to be hostile to the personnel in the engram but will not express that hostility. Then he begins to get angry with the personnel who have done this to him. The anger fades to antagonism. Then he becomes bored with the whole thing. Further recounting brings him into a cheerful frame of mind about it and finally he simply laughs over it. It was this sequence of behavior, of an engram being reduced with processing, which gave the clue to the existence of these points on the tone scale. At the top of the chart we have levels of possible well being which we have not yet explored and which, while we have hopes, cannot at this time be reached. Our technology does not extend as far as derivation and observation say the individual may be able to go. In this range from 4.0 to 40.0 on the tone scale lie many possible states of being. What is the theta being? How much can man attain toward spirituality? How can full theta perceptics be best uncovered if they actually exist? These are some of the questions. The technology may possibly be developed which will permit man to reach a higher state than he can now attain by our current techniques of dianetic processing.

The highest point we can at this time reach with dianetic processing is what is called here the MEST clear. There are probably several kinds of clears and several conditions of being clear. A MEST clear would be an individual who no longer retained engrams or locks, these having been erased by dianetic processing. The erasure of all engrams and locks in an individual restores to him a full play of his endowment of theta. His store of theta may or may not be increased by other means. That would be a matter for solution above this level on the tone scale.

A clear in Dianetics, then, is simply one whose engrams and locks are erased and who does not become confused, obsessed or impelled by past moments of physical pain. This goal is far, far beyond anything envisioned by such investigators as Freud. There may be goals far beyond the state of MEST clear.

Currently a clear will do. Psychometry and all tests for aberration demonstrate the clear to be unaberrated. His recalls are excellent. His mental stability is very good since environmental circumstances cannot cause him to act irrationally by reason of aberrations. His emotion and ability to enjoy life is free. By becoming clear the individual attains an intelligence quotient far in excess of what he enjoyed before processing. A clear does not instantly grow wings or sprout a ten-kilowatt aura. He is not superman. But he has his advantages. He has fewer accidents, and none because of his own doing. He is healthy. His education and experience are available for his use as he needs them. He acts on reason and he reasons swiftly. His reaction time is about half the normal. What his longevity is we have no way of knowing at this time but we can only suppose that it is higher than if he had remained aberrated.

A general tendency is to regard a clear as a sideshow piece. True, he is better than men have ever been before. But too much emphasis has been laid upon mental tricks a clear may be able to do, his ability to recall accurately, his ability to see again anything at which he has gazed. In the business of living these things are not important.

Happiness is important. The ability to arrange life and the environment so that living can be better enjoyed, the ability to tolerate the foibles of one's fellow humans, the ability to see the true factors in a situation and resolve problems of living with accuracy, the ability to accept and execute responsibility, these things are important. Life is not much worth living if it cannot be enjoyed. The clear enjoys living to a very full extent. He can stand up to situations which before he was cleared, would have reduced him to a shambles. The ability to live well and fully and to enjoy that living is the gift of the clear. Anyone looking for tricks can best find them in vaudeville.

The clear has the advantage of not retaining, hidden from himself, pain and painful situations in his past which, being restimulated by the environment, enturbulate his reason and sicken his body. The clear is produced by simply erasing all the engrams and locks -- the pain and painful moments of the past. He is the current technical goal of dianetic processing.

He is called a "clear" because his basic personality, his self determinism, his education and experience have been cleared of aberrative shadows.

Actual experience demonstrates that man, once socially imposed controls and domination by others have been cleared away, is basically good. He is evil only when he is aberrated. Reduction of his aberrations discovers man to be well intended toward his fellows. The highest reason, in this world of complex interdependencies, depends upon the highest cooperation of the individual with his fellows and his environment and a constructive attitude toward life. The more aberration (engrams and locks) cleared from an individual, the more independent and the more cooperative he is. There are four valid therapies, if we wish to use the term loosely. First there is dianetic processing. This rids the individual of the pain and painful emotion which aberrates his reason. Second there is education. This indoctrinates the individual with the culture in which he lives and gives him the skills of survival, better enabling him to survive. The third is changing his environment into one which is less restimulative, is happier for him and in which he can better survive. This would include nutrition, medical care, and recreation. The fourth is regulating the amount of MEST which the individual should control. He can be given less if he has too much, he can be given more MEST if he has not enough for his ratio of theta, or the MEST which he is trying to control may be changed for him into another kind of MEST (sublimation).

All four of these therapies do the same thing: they enhance the survival of the individual by giving him better tools of survival, better conditions in which to survive, better reasons for surviving. Any of these do one basic thing: they raise the individual on the tone scale. The reward of survival being pleasure, for instance, giving the individual pleasure raises his survival level. However, the last three of these are relatively ineffective if the individual has aberrations against pleasure or changing his environment or learning from life, and so we come to the conclusion that the first step toward a higher survival level would be ridding the individual of his aberrations. Within reasonable limits the rest should follow.

The auditor who is doing processing regularly and has been trained for it will use any method to raise the tone of his preclear*, for when the tone is raised, processing is easier. About all one can do with a thoroughly apathetic person is raise his tone by one of the last three methods; that done, he can be processed.

Thus we have the current final goal of processing: the clear. This is the long range goal. It is not swiftly reached. It is reached, evidently, only by very good auditing and in the hands of an auditor who is somewhat higher on the tone scale than the preclear.

A considerably nearer goal is the dianetic release. The release has reached a point where he no longer has psychosomatic illnesses, where he has good stability and where he can enjoy life. If one simply took all the secondary engrams off a case, one would have a dianetic release.

The dianetic release is very high above normal and, itself, has not been attained before by any past known methods of therapy. The psychometric testing of the usual dianetic release shows him to be in very superior mental condition. An even nearer goal to the start of processing is the very high normal. By this is meant a person who is well above the current level of average intellect and behavior. One attains, in processing, levels one is capable of reaching by reason of genetic endowment, education, and current physical potentials. One becomes the best that can be made of what one is natively. Thus, a moron by genetic endowment would reach the level of moron when processed -- but he would have been, by reason of aberration, around the level of idiot when he started. An average intellect, by processing, reaches a level of stability and capability very high above the average. Hence, to reach a very high normal, one would have had to be not too much below average to begin. The use of the term "average" or "normal" is susceptible to considerable misunderstanding. It simply means the average of the population's intelligence and ability. It is remarkably low in the United States compared to what it could be. But the United States' average is considerably higher than that, for instance, of Panama.

The next level is boredom. This is borderline between what is called neurotic and what is called normal. Moderate but unused ambition, a state of mind toward life which is not discontented nor yet contented, a purposelessness in living, these mark this stratum. It is a rather sorry stratum, actually, but is so superior to what lies below it that the auditor who can get an anger case up to boredom considers he has done very well indeed, and so he has.

Below this we have the level of overt hostility. Here is the occasional grouch, the complaining individual who yet makes no mistake about what he finds wrong. The "blunt, honest" type who tactlessly tears up the tenderer feelings of his companions is found in this band.

At 2.0 we cross the borderline between the reactive mind and the analytical mind control. And just below this we get the anger band. Here is the person of rather continuous hatred. Here we have impulsive and destructive action.

Below anger we go into a slightly sorrier level, covert hostility. Here is the person who hates but is afraid to say he hates, who deals in treachery and who yet expects to be forgiven. At the lower end of covert or hidden hostility we have the continually frightened person, the individual ridden by fears, the person who is afraid to be or to own anything. A far more serious level is the apathy level. Here is the suicide. Here is the person who has lost so much in life that he cannot rise to any situation but simply gives up about everything. If the auditor can bring the apathy to covert hostility he has accomplished a rise in tone. But overt acts by the auditor are likely to drive the apathy case down toward complete paralysis or death itself. This is a very dangerous state of mind, bordering next door to death.

Finally we have the lowest band of organic life, pretended death. Some animals have developed pretended death into a survival mechanism. Pretended death says, "I am not dangerous. I am dead. Go away and leave me alone." The soldier on the battlefield who suddenly becomes paralyzed is using this mechanism. Some races, the Chinese in particular, descend into this stratum and actually die as a form of suicide self-willed. The auditor who can get a pretended death case to open and close its eyes is achieving remarkable results. Finally we have the band below death and the MEST body and on these we can do nothing, of course. The rightest right a man can have is to survive to infinity. The 0.0 level is death. How wrong can a person be? Dead!

The higher a person can rise on this scale, the righter he is in terms of reason, in terms of survival, and in terms of general well being. The higher he is, the happier. The lower he is, the sadder. The whole intent of processing is to raise the individual from lower to higher strata on this scale.

CHAPTER THREE

COLUMN C

Physiology and Behavior

Under this column we have data which is considerably more complex than any other section of this book but which is of considerable interest to biologists and other scientists. The auditor need not suppose he needs to know it by heart, or even understand its terms.

What one should understand about this column is that it gives a clue to behavior and to physiology in an individual or, in reverse, permits the auditor better to locate his preclear on the chart -- which, indeed, is the purpose of many of these columns.

There are three main actions by which life handles itself and MEST. These are 1. Attack, 2. Retreat, 3. Neglect. These are broken down into their relative positions on the tone scale.

Tone	Behavior	Physiology
4.0	Motion toward, swift approach	Full control of autonomic by cortex, both cranio-sacral and thoracolumbar systems of autonomic functioning at optimum under direction of cortex; muscle tone excellent; reactions excellent; energy level high.
3.5	Motion toward, approach	Moderate control of autonomic by cortex; cranio-sacral functioning well, thoracolumbar slightly depressed; muscle tone good; reactions good; energy level moderate.
	Motion toward, slow approach	Autonomic functioning independent of cortex; cranio-sacral functioning well, slight activity in thoracolumbar; muscle tone fair; reactions fair; energy level fair.
3.0	No motion, stay	Autonomic independent of cortex; cranio-sacral functioning well, but no activity in thoracolumbar muscle tone, reaction time, and energy level poor.
2.5	Motion away, recede slowly	Autonomic begins to take over control; cranio-sacral inhibited, thoracolumbar up; slight restlessness, heightened activity, wavering attention.
	Motion away, recede quickly	Increased activity thoracolumbar, cranio-sacral more suppressed; increased restlessness, wavering of attention, inability to concentrate.
2.0	Motion toward, slow attack	Increased activity of thoracolumbar; inhibition of cranio-sacral; irritability; increased heart action, spasmodic contractions of gastro-intestinal tract, respiration increased.
1.5	Motion toward, violent attack	Full autonomic mobilization for violent attack complete inhibition of craniosacral, thoracolumbar in full action; respiration and pulse fast and deep; stasis of gastro-intestinal tract; blood to peripheral vascular system.

1.1	Motion away, slow retreat	Autonomic settles down to chronic rage reaction, inhibition of craniosacral; imperfect gastro-intestinal action; increased peripheral vascular circulation; increased pulse and respiration.
0.9	Motion away, violent flight	Autonomic mobilization for full flight reaction; laxity of gastro-intestinal tract; all blood to peripheral vascular system, especially muscles for rapid flight; breathing and pulse rapid and shallow.
0.5	Slight motion, agitation in one place, suffer	Autonomic mobilized for cry for help, grief; cranio-sacral on full; thoracolumbar, inhibited; deep, sobbing breathing; pulse hard and irregular; discharge of tears and other bodily secretions.
0.1	No motion, apparent death	Shock reaction; thoracolumbar inhibited; cranio-sacral full on, gradually decreasing as organism approaches death; breathing shallow and irregular; pulse thready; blood pooled in internal organs; muscles limp, lacking tone; pallor.
0.0	Death	Cessation of organic function.

CHAPTER FOUR
COLUMN D
Psychiatric Range

The auditor should know three psychiatric terms, the only psychiatric terms he will find used in Dianetics as they are used in psychiatry.

These terms are: 1. Psychotic, 2. Neurotic, and 3. Psychosomatic.

Psychotic is really not a noun but an adjective. However, psychiatry uses it as a noun to mean an individual afflicted with psychosis. A psychosis is any major form of mental affliction or disease. In other words, a psychotic, so far as we are concerned, is an individual who cannot handle himself or his environment well enough to survive and who must be cared for to protect others from him or to protect him from himself.

The psychotic state which receives the most interest is that one which threatens the survival of the individual himself or of those around him. Such a psychotic is placed in an institution -- when there is room for him. Otherwise, he roams the town or country. However, many other persons are psychotics but are not sufficiently alarming as a menace to themselves or others to be placed in an institution.

The next classification is simply a matter of degree. The neurotic individual is one who is afflicted mentally but can perform some reasonable function or other.

The term, psychosomatic, has meant an illness caused by or notably influenced by -- the emotional state of the patient." Actually, more practically, one could say that it is an illness caused by the mind. About seventy percent of man's ills are psychosomatic.

In Dianetics we use these terms as follows: Psychotic: A person who is physically or mentally harmful to those about him out of proportion to the amount of use he is to them. Neurotic: A person who is mainly harmful to himself by reason of his aberrations, but not to the point of suicide.

Chronic somatic: A psychosomatic illness, since it is discovered that psychosomatic illness is only the restimulated somatic of some engram and goes away when the engram is contacted and reduced or erased.

This current chart gives a scale by which psychosis and neurosis can be accurately classified and described for the first time. Dianetics does not need a more complex terminology than it has. Definition of individual tone level by numbers, plus the citing of obviously manifested engrams, give adequate clue to what should be done for the preclear.

The individualities of psychosis and neurosis are occasioned by the engrams of a particular psychotic or neurotic. These peculiarities of behavior have as their root certain engramic commands -- words contained in past moments of pain and unconsciousness. An engram can bring about a manic state wherein the individual declares hysterically and continually that he is happy or strong and yet is very low on the scale. Such a condition is brought into view by the auditor's inspecting the chart for various other manifestations of the preclear. Any one column or characteristic of the chart can be altered by a pattern of engrams or severe education, but the other portions of the chart will remain constant for that level. For instance, as in the case of a manic engram, the individual appears to be happy at first glance, even says so repeatedly. But further inspection demonstrates that this person is very shy, that he gives presents to buy people off, that he is given to suspicion and hurtful lies about people. The manic engram demands a tone 3.5 be manifested, but this does not alter the position of the preclear on the chart.

This is not very complicated and it is very important. To establish the level of sanity on the chart, the auditor must only locate the level which contains a majority of the manifestations of the preclear. Almost every case will have a place on the chart which does not hold true on the chart for the majority of characteristics named. In other words, look for the majority of characteristics, the level where the preclear is found in most of the columns. Do not be upset if the preclear fails to hold true in one or two columns. A chain of engrams may command a manic or a depressive aspect in the preclear for a particular subject or column. Engrams which command, for one subject on the chart or one characteristic in life, a tone lower than the actual tone of the preclear may be hard on the preclear but they have a certain safety factor for the auditor. It is the manic, which commands by engrams a higher tone in one or two columns than the actual tone, that is dangerous; for then the auditor may try to use a level of processing too high on the chart for his case. If in doubt, work the preclear a tone or two lower than you estimate him by the chart. The potential manic-depressive psychotic can be hammered into a psychotic break by being worked too forcefully too high on the chart. A saving grace in diagnosis is that a manic-depressive is not always a manic or above tone but is often depressive and well below tone. None but a qualified auditor has any business working with a psychotic. The danger in handling psychotics is very great. This danger did not originate with Dianetics. From the beginning of man's efforts to solve the riddle of insanity, the psychotic has been a great liability to the practitioner. The percentage of psychotics who commit suicide during ordinary treatment is vastly larger than the percentage of suicides of psychotics during dianetic processing. The conclusion one reaches is that psychotics commit suicide easily. They commit suicide oftener when in the hands of other practitioners than in the hands of those who know Dianetics.

When a person drops below the 2.0 level he has so much entheta compared to his theta that a sudden shock may simply enturbulate the remaining theta and send him into a psychotic break. When all the theta is enturbulated, its reaction is to kick apart theta and MEST, in other words, cause death and remove the organism from the path of other organisms. Suicides are assisted normally by engrams which specifically demand suicide. But suicide is a natural manifestation, apparently, a fast means of separating theta and MEST and gaining death quickly. Suicide is always psychotic.

People below the 2.0 level, no matter their avowed intention, will bring death or injury to persons, things and organizations around them, if in the anger bracket, or death to themselves, if in the apathy bracket. Anyone below the 2.0 level is a potential suicide. The fascist, for instance, is almost always, in the face of any severe reverse, a sure suicide, fascism being below the 2.0 line.

A psychotic is a threat of death for somebody or something, if not for himself. A manic-depressive, sometimes cheerful and apparently only neurotic, is actually very low on the scale and may suddenly commit suicide without any real warning.

The psychotic is a definite liability to the auditor, not so much because of processing or what unskilled processing may do, but because some factor may come suddenly into the environment of the psychotic which causes him to commit murder or suicide. This can then be laid to the processing. Every such action on the part of psychiatric patients is forgiven psychiatry as a natural consequence of handling psychotics. Handle one gently and keep him out of a non-survival environment and the psychotic may be very successfully treated by Dianetics. But do not be amazed if your preclear seems cheerful today and goes into a psychotic break tonight and commits suicide tomorrow, after murdering the family. Below 2.0 on the tone scale we have theta and MEST trying to kick apart and bring about death.* * One of our most brilliant instructors, David Cary, in the Los Angeles Foundation, had married, long before Dianetics, a psychotic girl. He went into Dianetics first trying to help her. He persuaded her to take a course with him at the Foundation. He tried in every way he could to give her processing but as she was actually there under protest she would not accept processing from him. Cary went on to become an instructor, having an excellent background for teaching and a skill in it, while she separated herself from him. She was not obviously psychotic, although the training department at Los Angeles had refused her as far below student calibre on the grounds

of her psychometry and a former suicide attempt and was only persuaded to take her as a favor to Cary. Some time later, in an effort to bring her some relief, Cary took a leave of absence and went home. There he was murdered by his wife, who then committed suicide. His devotion and his efforts to assist her had been mistakable. She had been intensely inaccessible. He had been told many times by his friends in Dianetics that she was dangerous. But that danger was hidden. Cary's devotion cost him his life and cost Dianetics a brilliant instructor and a man well-loved by all who had a chance to know him. This footnote is included here not simply as a memorial to David Cary, but as information which will give pause to husbands or wives who are seeking to assist a psychotic spouse. Husband and wife is difficult at best, the partners being usually very restimulative to each other. As husband and wife they will do better to make an arrangement for auditing with another couple. If one of them is psychotic, they should seek the best professional auditor Dianetics can give them.

In treating psychotics, always remember that one is working with minimal theta present and maximal entheta. Thus, a sudden shock may so restimulate an engram that the remaining theta enturbulates and vanishes, leaving a lock composed of entheta. There goes sanity. Approach the lock gently and turn it back into theta with great care and caution.

No mixture of Dianetics with old treatments or practices of any kind are recommended to the auditor. Electric shock has been found to lay a severe engram into an already overcrowded reactive mind and is not successful in any way, other than making a few patients so apathetic that they are barely acceptable to society. Psycho-surgery, removing pieces of the brain, has long been acknowledged an entire failure so far as any actual "cure" is concerned. Free association is a long drawn-out procedure which is, at best, of very questionable value. Restraints and cold packs only succeed in shocking the patient into a deeper state of lethargy. Do not condone such methods nor permit them to be used on your preclears, for the simple reason that they do not work.

Handle the psychotic gently. Respect his rights to a whole brain and a future. Do not consider that he is your toy or your experimental animal. Above all, when you are auditing, be a civilized human being. Don't try to punish your patient because he "refuses to get well." His engrams and general turbulence make your preclear very hard to reach. His basic personality is in there trying to help you. Smooth out entheta and make theta out of it and do it as gently as you can. Don't lose your temper or resort to drastic methods. Be civilized. Man can be handled only with reason, not by Hitlerianistic force. You can't beat a man into sanity. If you feel so exasperated by a preclear that you would like to scold him or hit him, stop the session and go cool down. Don't fill him full of sedatives or put him in restraints. By being as gracious and serene as you possibly can be, you will greatly increase your success in treating your fellow man. And you have to be first cousin to a saint to get the best results with psychotics. Any effort made to hammer a patient or scold a patient into sanity will meet with failure. The proof of that is the 19,000,000 insane, institutionalized or at liberty, in the United States alone. Don't be convinced that you have rights of ownership or life-and-death powers over your fellow man. Leave that to the accomplished authoritarians, of whom we, unfortunately, have so many.

Be a human being and you'll get good results.

CHAPTER FIVE

COLUMN E

Medical Range

The medical doctor a short time ago seldom thought of his patients in terms of mental disorder. Recently he realized that some seventy percent of man's ills are of mental origin -- which is to say, psychosomatic illnesses account for a high majority of sicknesses.

In addition to those commonly listed as psychosomatic illnesses many others must be suspected, because of another factor. Bacterial infection itself is assisted by the presence of engrams. Thus the percentage is possibly higher.

The engram assists bacteria and viruses in this fashion. The physical injury (the enMEST of the engram) resides in a certain portion of the body, that portion which was injured. Let us say an engram is received by reason of a severe chest injury. This engram may not become active for many years. But keyed-in then, it brings about a chest weakness in that the blood and endocrine fluids tend to avoid the area as though it were just now injured. Into this weakened area may come bacteria of one kind or another such as those of pneumonia or tuberculosis. This is a temporary infection. But now the area is restimulated by the pain of the infection and so the engram is further keyed-in and reinforced and the area of the chest cannot become resistant enough to throw aside the infection. Thus we get the chronic infections, the lasting illnesses.

Technically one can say there are three phases in a disease: 1. predisposition, 2. precipitation, and 3. perpetuation. The engram accounts for these in that it renders an area of the body, or an organ such as the heart, weak, then by the key-in of the engram brings about the illness and finally, because the keyed-in pain keeps on being restimulated, makes the illness continue.

As far as injuries are concerned, engrams apparently cause the accident prone. The engram may command the person to injure himself or others. One such engram restimulated in a preclear caused him to "unwittingly" injure his hand severely three times in one week. The engram was found and reduced and the preclear has not since injured that hand. Thus accidents of major and minor character may be chalked up to engrams. A command in an engram such as "I always have to hurt myself" will cause the individual to do just that.

The endocrine system is very sensitive to thought and is under the control of thought. A doctor who attended a series of lectures on Dianetics at length came forward and, rather disturbed, said, "For forty years of study and practice I have been using the standard concept that structure controls function. I finally see what you are saying. It is the other way around. Function controls structure. Now maybe we can solve a few more problems."

Endocrine imbalances such as reduced thyroid, over-weight, reduced sexual capability, sterility, and numerous others are monitored by engrams. The proof of this is simply that when engrams are reduced the glandular imbalances tend to correct themselves. Also, engrams reduce the acceptance by the body of artificial hormones, for when engrams are reduced artificial hormones can be administered with benefit.

There is a direct index between the amount of entheta in an individual and his physical health. This is manifest when one examines the state of health of the psychotic. A pretended death case is almost impossible to keep alive. Apathy cases starve and develop illnesses and cannot resist the smallest infections, just as grief shocks are so often followed by illness. The covertly hostile individual is usually a hypochondriac, is continually developing illnesses which even he knows to be false. The anger case suffers from all manner of ills, particularly arthritis and other illnesses which settle as chronic somatics and develop deposits, which enlarge

glands, which alter the condition of the heart, and so forth. From there on up the scale, the less entheta and the more theta, the greater the physical health of the individual.

As an example, a young girl was in a hospital recovering from appendicitis. She was running a fever, a very serious thing in such a case. An auditor was called in and by a few questions found out she was stuck on the time track in an earlier mumps engram. He brought her up to present time and the temperature dropped to normal within the next ten minutes and recovery then proceeded uneventfully.

A usually well but temporarily ill person slides down the tone scale because of temporarily restimulated engrams. Getting him into present time will often materially shorten any course of illness.

Another part of Medical Dianetics is the dianetic assist. Any very recent engram can be run with impunity. Picking up engrams of injuries which have just happened demonstrably shortens the term of recovery and increases life potential threatened because of the accident. Shock occasioned by operations and accidents is rendered less dangerous, according to observation, by the dianetic assist.

In preventative Dianetics, the first rule is to maintain silence around an injured or ill person. This prevents the engram from having words in it and reduces its dangerousness markedly. Several hospitals now practice this. Doctors in other hospitals would find their work much easier and more successful if they would simply make standard the practice of complete silence around operating tables.

It should not be overlooked by the auditor, regardless of his ability to do near miracles in the face of physical malady, that virus, bacteria and broken legs still exist. The auditor would do well to recognize the function of the medical doctor as a primary necessity in a society. When an artery is pumping the life of the patient out upon the ground, the engram being received is the least important part of the circumstance. The important thing is to inhibit the artery. Picking up an engram will not heal but will only assist the healing of broken bones. While most surgery, by the admission of surgeons themselves, is unnecessary, only surgery can effect emergency repairs. The field of the medical doctor is evidently the field of the acutely ill, and it is a wise auditor who works smoothly and harmoniously with medical doctors in the full recognition that medicine is often the only means of preserving or extending life. The auditor's job is to shorten the course of any illness, to assist the healing of any injury, and particularly, to bring people up the tone scale to a level where they will seldom fall victim to accident or illness.

CHAPTER SIX

The Basic Laws of Theta

Affinity - Reality - Communication

There is in Dianetics a triangle of great importance. Theta, the energy of thought and life, has as primary manifestations affinity, reality, and communication.

This is the peculiarity of theta: in lieu of the cohesion, matter, and force laws of the physical universe (MEST), thought (theta) has to have affinity, reality, and communication to survive. MEST requires certain laws to survive -- or obeys those laws in the business of surviving. Energy and matter in space and time hang together in a certain fashion, governed by certain laws. The discovery and use of those MEST laws make up the science of physics. Theta also hangs together in a certain fashion, and the discovery and use of those laws make up the science of Dianetics.

We do not know nearly as much about theta as we know about atoms and electrons, the probable parallel entity in the physical universe. Electrons, protons, neutrons and various other parts of physical-universe energy flow at certain speeds and, in various combinations, exist and function in the physical universe. There is, for instance, the speed of light; there is the composition of atoms and molecules. Theta probably has various similar laws, and at this time we do not know much about them; but we know enough to know that there is a difference between theta's laws of function and those of the energies in the physical universe.

Primary amongst the laws of theta is that it has a fundamental Goal, the changing of MEST. It changes MEST by constructing it into mobile units we know as life organisms and, through those, making MEST into various forms and objects or destroying those forms and objects.

Theta uses an evolutionary scale in present time. Lower forms of life support higher forms of life. We have thought of evolution in the past as something stretched back along the eons, as a graduated scale of various species which changed as the ages progressed down to our present life forms. This concept of evolution has many limitations and gaps and is not very workable. In Dianetics, using the theta theory, we see that all theta is actually in present time and that no action is possible except in present time and that present time is a continuing series of instants in which, moment to moment, theta goes on changing MEST. It is not very complicated to see that right here in present time we have evolution operating. The lichen and moss convert crude MEST ash and rock into soil. On this soil higher forms of plant life can grow.

Vegetable life, however, is not very mobile. Theta animates organisms which are composed of theta and MEST. But trees change very little MEST. Thus, following up the scale, we find theta involved with making animals and insects. And the larger animals, unable to live on soil and sunlight, live on vegetable forms which are themselves the converters of soil and sunlight into comestibles for higher forms.

As soon as we get up to the very complex forms of life such as the mammal, we find a very large amount of MEST being converted. When we arrive at the level of man we begin to see that theta can create or destroy vast forms of MEST.

A man damming a river and installing a hydroelectric plant is, for his own survival, changing MEST. Another man turning a switch and lighting an electric bulb, is shifting and altering MEST.

Theta, on this chain of evolution right in present time, exists in a state which can change a very great deal of MEST. As we learn more and more about MEST we can change more

MEST. And as we learn more about theta we can control and Change more MEST. The atom bomb is a case of changing a great deal of MEST in a direction which defeats a great deal of theta -- thus we consider the bomb wrong. It fails to enhance survival.

Man can reasonably change large amounts of MEST. Therefore he can be considered a sort of intermediate goal. Lower life forms cannot change MEST on any grand scale. Man, potentially, can build or blow up planets. Man will evolve into more than man, probably. Educationally, he evolves a long distance when he begins to understand something about his own purpose of being.

The cycle by which theta understands MEST is a very simple one. Theta impinges heavily against MEST. This causes a turbulence. But from that confusion theta extracts some tiny law of MEST and withdraws to apply to MEST this newly learned law for the conquest of MEST. No knowledge exists without a

primary enturbulation. MEST is conquered by theta's taking successive laws of MEST and turning MEST against MEST to change it.

Theta, with this mechanism of turbulence, can learn much about MEST. But if theta is going to be embroiled with MEST in a disorderly fashion, then theta must have some means of becoming unenturbulated so as to profit by what it has learned through the confusion. Theta has to be able to withdraw in order to come back for an orderly conquest of MEST, using the laws of the physical universe to conquer the physical universe.

The basic mechanism theta had in the past was death. The cycle of creation, growth, decay, and death was one and is one which applies to a species as a species, to an organism as an organism, or to a group of organisms. The only way theta could get free, evidently, was through death.

With the advent of a science of thought, whereby some of the natural laws of theta are understood, man can in one lifetime disenturbulate his theta and MEST and benefit from the experience gained by the enturbulence. What Dianetics does to longevity has not even been surveyed, but it certainly upsets the evident purpose of the death cycle.

In Dianetics we have much to do with affinity, reality, and communication. Whatever the accuracy of the basic postulates, it becomes evident to the auditor as he uses these three points of the triangle that he has a highly useful tool.

The triangle of affinity, reality, and communication could be called an interactive triangle in that no point of it can be raised without affecting the other two points and raising them, and no point of it can be lowered without affecting the other two points. The postulated reason for this is that affinity, reality, and communication are component parts of theta, and thus affinity, reality, and communication are three manifestations of the same thing.

This has a very high usefulness to the auditor. For instance, when his preclear has a very thorough sonic shutoff the auditor knows that he can regain some sonic either by increasing the present-time affinity of the preclear or by raising the level of reality of the preclear. Likewise, if the affinity of the preclear is markedly low, the auditor can raise that affinity by bettering the communication and reality concepts of the preclear. And finally, when the reality of the preclear is low, it can be raised by increasing affinity and communication.

This is highly useful because often the auditor cannot directly discover the suppressor on one point of the triangle. By blowing locks on the other two points he can make this suppressor accessible.

Whether or not one either understands or agrees with the theta-MEST theory of Dianetics, the affinity, reality and communication postulate which derives directly from it is of infinite use.

It is very difficult to suppress the affinity of an individual, his capacity, that is, to receive or give love, without also suppressing his communication and reality factors. Likewise, one cannot suppress the communication factor without also suppressing the affinity and reality factor. And finally, one cannot suppress reality without suppressing affinity and communication. For instance, a mother telling a child that she does not love it is also forbidding the child to speak and is blunting the child's reality, since the child normally expects to be loved. To tell the child to keep quiet is also to reject the child and is to offend the child's concept of what the real world should contain. Contradicting one of the child's statements or beliefs, which is to say his reality, is also to break affinity with him and suppress his communication. One cannot touch this triangle at any point without affecting the other two points; and yet each point is highly specific and has its own characteristics.

One must also consider in a discussion of theta that theta is measured on a gradient tone scale from 0.0 upwards to 40.0. At the highest range, theta could be considered to be in a pure state. It would be a clear, even-flowing river. It would be reason at its highest. It would be complete rationality. It would be complete reality. It could accomplish complete communication in its own level. And it would be pure affinity.

Descending down the tone scale, greater and greater dissonance could be considered to be introduced into theta. The stream, so to speak, becomes more and more tumultuous, more and more fixed within narrow banks, flowing over heavier rocks and then shoals. As a musical analogy, one could say that the note was becoming less and less a pure and harmonious vibration and was becoming more and more off-key from itself.

Descending down the tone scale, affinity, reality, and communication form in themselves a dissonance one with the other. Also, theta is in more and more tumultuous confusion with MEST. Instead of an orderly and harmonious conquest of MEST by theta, one sees, as the tone scale is descended toward death, greater and greater turbulence.

The sudden impact of theta and MEST together could be considered a turbulence which creates dissonance in theta. This is registered and recorded as pain. Theta and MEST so impacted together, the characteristics of the theta are changed, according to theory and observation, and theta below 2.0 on the tone scale can be considered enturbulated theta -- theta which has been confused and chaotically mixed with the material universe and which will lie in this confusion until death or some other process disenturbulates it. Theta below 2.0 we call entheta.

The mechanism here is a simple one. MEST, in a life form, is an orderly array above 2.0 on the tone scale; below 2.0 MEST is considered to be confused and enturbulated and is referred to as enMEST.

We could draw a diagram which would show theta and MEST appearing above 2.0 and entheta and enMEST appearing below 2.0. From 2.0 upwards, theta and MEST are more and more orderly mingled until MEST is left behind entirely and theta exists in its pure stage. Below 2.0, entheta and enMEST are more and more enturbulated in the life form until the point of death and below is reached.

We could consider that theta gradually reverses polarity as it descends the tone scale toward 0.0. We could consider that MEST reverses its polarity when it rises up the tone scale from -3. Entheta has a very repelling effect upon theta and MEST. EnMEST has a repelling effect upon theta and MEST. Below 2.0, MEST and theta are at best turbulently united. Above, they are united more and more smoothly as they rise up the scale, the MEST more and more under the influence of theta, the theta more and more able to do things with the MEST. Below 2.0, the theta is less and less able to do anything with the MEST. Entheta becomes as chaotic as MEST in its pure state.

Here is the mechanism of death, then: entheta and enMEST driving out from the organism the remaining theta and MEST. This is an important postulate in Dianetics, since from this can be derived the entire tone scale and all the manifestations.

It may occur to someone to ask "What is the difference between MEST and enMEST, if both are without order or plan?" The answer is both simple and important. Pure MEST may be said to be virgin chaos, entirely innocent of plan. An organism at tone 4.0 may be said to contain MEST harmoniously planned and organized by theta. But enMEST is neither of these: it is neither organized nor virginal it is confused and embroiled with entheta in a twisted disorganized plan of human behavior and aberrations. These postulates are what an engineer calls a highly workable truth -- for to all engineer, truth is not the absolute of the metaphysician; it is simply something which has a relatively high workability.

From the theta-MEST theory also may be derived an explanation of faith healing -- which is more than an explanation, being a very workable tenet for the auditor. It has been many times noted in the course of man's adventures in the realm of mental and physical healing that one individual or another, merely by his presence, or an area, by its sanctity or the belief of people in it, could accomplish the nearly entire de-aberration of mentally or physically ill human beings. In South America there is a church outside of which stands a small mountain of crutches cast away by cripples who became well merely by approaching the altar; and in Bethany, some years ago a man named Lazarus came forth from his tomb.

It is an axiom in Dianetics that a sufficient quantity of theta brought into proximity with entheta will disentrurbulate the entheta and convert it into theta. This is important enough to form the basic axiom of processing. It explains to the auditor why he cannot take a psychotic who has practically no remaining theta and successfully send that psychotic into the entheta of an engram. The remaining theta of the psychotic would itself merely become entrurbulated, not being sufficient in quantity, and the psychotic could theoretically become worse. Thus the second axiom: Entheta in sufficient quantity brought into proximity with theta will entrurbulate that theta.

Here we have a matter of quantity. When there is a great deal of theta present a lesser amount of entheta will disentrurbulate and become theta. But when we have more entheta than theta, the theta is likely to become entheta. This is the contagion factor of aberration. Theta itself could be called reason; entheta could be called unreason. Reason in sufficient quantity brought into the presence of a lesser quantity of unreason will cause reason to prevail. Unreason in sufficient quantity brought into the presence of a lesser quantity of reason will cause that reason to become unreason. Hence the restimulative character of processing to the auditor. Hence also the various kinds of processing which must be used on various cases.

The purer the theta, the more MEST will be attracted under it. Theta attempting a conquest of enMEST will become in itself entrurbulated. Entheta applied to MEST will make it into enMEST.

Entheta will tend and act in the direction of death. EnMEST tends and acts in the direction of death. Theta tends and acts in the direction of survival; and MEST tends and acts in the direction of survival when it has been conquered in an orderly fashion, in an organism or by a theta organism.

As an example of entheta consider the thief. A thief is chiefly entheta and prefers enMEST to MEST. A thief will make enMEST out of the MEST he steals, which is to say cloud its title and possibly injure its form or substance. EnMEST, possessed by theta, has a tendency to entrurbulate the theta. Thus, an honest man attempting to own a confused and dishonest property will himself become entrurbulated. A whole series of axioms and optimum conduct codes can be derived from these principles.

It is also observable that a high-theta-volume individual can conquer and handle more MEST than a low-theta-volume individual or an entheta individual. The psychotic, for instance,

will ruin any MEST he contacts; whereas the highly reasonable man will enhance the MEST he contacts.

Here also we apparently have some small clue as to what "luck" is. MEST moves in automatically under good theta. MEST moves out from under entheta.

When we speak of affinity, reality, and communication we are talking about the three component parts of theta. These three quantities in combination playing upon MEST give us the manifestation we might call computation, or understanding. One has to have some affinity for an object, some communication with it, and some concept of its reality, before he can understand it. His ability to understand any thought or object depends upon his affinity, his communication, and his reality. All mathematics can be derived from affinity, communication, and reality playing upon MEST.

Because affinity, reality, and communication are three component parts of the same thing, namely theta, it would be difficult to increase one component without increasing the other two.

The physical universe and what we have called the theta universe are each based upon the principle of survive and succumb. So far as life is concerned, everything above the 2.0 level is survive, and everything below the 2.0 level is succumb. Above the 2.0 level, the organism tends toward life; below the 2.0 level, the organism tends only toward death. The dynamics could actually be considered as theta applied to various subjects and in different manifestations. Any individual, even an aberree, has occasional moments of functioning as a clear. When he is not restimulated -- when his engrams, locks, and secondaries are not forcefully restimulated by his environment -- the theta gradually disenturbulates, and he becomes possessed of a higher level of reason. Most people reach 3.0 part of the time, as a normal course of events. Some rare people behave and reason like MEST clears. Hardly anyone has failed to have moments when he approximated the condition of clear. Being clear is a state of being possessed of all available theta, which in an aberree would be partially trapped in engrams and locks. The ordinary person, with his engrams and locks, is rarely in the happy and reasonable state of a release or a clear. The release or clear is in that desirable state rather constantly; but this does not mean that the release or clear are not, in the presence of an overwhelming amount of entheta in the environment, susceptible to enturbulation, for they are. They, however, do not greatly retain the enturbulence, and as soon as they are free from such an entheta environment they restore immediately to a cleared state. Further, they do not sink very far down the tone scale. This case is very different from that of an individual who has relatively little theta left to enturbulate and who in even a mild entheta environment sinks rapidly down the tone scale. It is a question of resilience and recovery ability, as well as the ability to reason constantly and clearly in most situations.

The chart should be read with the understanding that nearly everyone who does not have to be put away in a sanatorium, wholly bereft of his senses, has some available theta. There are many persons possessed of a high volume of theta but whose aberrations bring them down chronically below the level of 2.0, who can yet function, having some theta available. These people enturbulate rapidly. There are many people who are not classified as psychotic ordinarily, who demonstrate considerable quantities of theta, and who yet, on some slight set-back, enturbulate rapidly down to 1.1 or 0.5 on the tone scale and remain there for some time after the enturbulence. These people, rested, and not in immediate contact with the restimulative situation, regain some of the theta from the turbulent area.

The strength of the dynamics of an individual could be considered to be determined, first, by the native volume of theta possessed by the individual and, second, by the impeding effect of his engrams, as restimulated in the environment. One could, then, have a very high dynamic individual who yet has been so thoroughly aberrated that on the least set-back he would fall rapidly down the tone scale below 2.0. People like this, having high dynamics, attempt naturally to conquer a great deal of MEST, but in the process of conquering it are enturbulated by the MEST, the society, and the environment, so that they accumulate enormous

quantities of locks. And if such a person has hidden within him many engrams these will rapidly become charged, and the person will become highly concluded and intensely aberrated, but will yet be able to function sometimes on a creative and constructive level. The system of dynamics is a method of subdividing the theta of an individual to show how much theta he has available in any one sphere of activity. These divisions could be made as follows: First: the dynamic of self, the urge for individual survival, reason toward individual survival for one's self;

Second: the dynamic of survival through sex and children; Third: the urge to survive through groups, as a member of the group, or for the survival of the group itself; Fourth: the urge of the individual to survive for mankind, or the urge of all mankind to survive; Fifth: the urge of the individual to survive for life, or of life to survive for itself,;

Sixth: the urge of the individual to promote the survival of MEST, either for his own benefit or for the benefit of MEST itself (manifested in the preservation of property, as such, no matter to whom it belongs); Seventh: the urge of theta to survive, the urge of the individual to promote the survival of theta and to survive through the survival of theta. Any of these dynamics can be broken down into the three component parts of affinity, communication, and reality. On the first dynamic, one has the affinity for self the concept of the reality of self and the ability to communicate with memory of self.

The second dynamic would concern itself with the affinity for a mate or children for the future of a race, the communication with a mate or children, and a concept of the reality of these.

In the third dynamic lies the affinity of the individual for the group, or the affinity of the group for itself; the ability of the individual and the group to communicate; the general reality or agreement existing in the group and between the individual and the group.

The fourth dynamic, as ARC, would mean the affinity of the individual for all man, and of mankind for the individual; it would include the communication of man with man, and the reality concepts or agreements of men with mankind.

The fifth dynamic would include the affinity of the individual for life, or the affinity of life for other life; the ability of life to communicate with life, or with the individual; and the concept of agreement and reality of life.

The sixth dynamic would include the affinity, communication, and reality of MEST as itself within its own laws as expressed in the physical sciences; but more important for our purposes, the feeling of the individual for MEST, to know it, to use it, and to preserve it. The seventh dynamic would be that of theta itself which is composed in its component parts, according to our postulates, of affinity, reality, and communication.

CHAPTER SEVEN

COLUMN F

Emotion

Emotion could be called the energy manifestation of affinity. They are listed in two columns because emotion may be treated as a subdivision of the more general subject of affinity.

Emotion is not synonymous with life energy but is evidently only a part of one of the points of the triangle of affinity, communication, and reality. Emotion, however, furnishes an obvious index to the psychic state, and is the quantity most easily observed by the auditor. As used in Dianetics, emotion could be called the index of the state of being.

The development of a new science naturally means the development of many new terms; and as new data is discovered, old definitions are often found to be inadequate. Thus it is with emotion. In the English language "emotional" is often considered synonymous with "irrational." One often hears the statement, "Don't be so emotional, be reasonable." This would seem to assume that if one is emotional one cannot be reasonable. No more unreasonable assumption could possibly be made.

Engrams have, each one of them, their own emotional tones, just as each engram has a somatic. This is false emotional tone which is foisted upon the aberree in lieu of natural and reasonable emotion. Because emotion has a strong manifestation and because the less desirable kinds of emotion are displayed by people in highly tense states, emotion has been clouded as a desirable quantity.

A fully reasonable human displays the emotion called for, rationally, by the circumstances with which he is confronted in present time. Thus if the present time circumstance requires grief a rational and reasonable person is apt to display grief. If the present-time situation demands anger, the rational human being will display anger. Irrational emotion could manifest itself irrationally for any given situation. If the present-time circumstances required grief yet the individual displayed no grief this would be irrational. If the present-time situation seemed to indicate, because of happy circumstances, happiness, and yet the individual remained apathetic, this would be irrational.

Emotion, then, is neither rational nor irrational except as it is displayed. An aberrated person seldom displays the type of emotion rationally called for by any given circumstance. To describe this we would actually need a new word, perhaps "misemotional." Such a word would indicate that a person did not display the emotion called for by the actual circumstances of the situation. This would indicate that his aberrated condition caused him to display an emotional reaction inappropriate to the present-time situation. Being misemotional would then be synonymous with being irrational. Being emotional, however, would indicate, if the emotionality agreed with current circumstances, a rational state of being.

One can fairly judge the rationality of any individual by the correctness of the emotion he displays in a given set of circumstances. To be joyful and happy when circumstances call for joy and happiness would be rational. To display grief without sufficient present-time cause would be irrational.

Engrams, and the generally aberrated state of a being, generally deny emotion. Happiness and cheerfulness being the very trademark of survival, one could expect with considerable justification that as an individual became more and more aberrated he would be less and less able to be happy. Such is the case. From happiness, at the top, down the dwindling spiral through anger, grief and apathy to no reaction whatever would run not only

emotion but the life potential of the individual. And thus live have a direct index of measurement of the aberrated state of the person.

One must remember that even a very aberrated person, in relatively unenturbulated present-time moments, has considerable free theta. The fact that a person enturbulates readily, for instance, to the 1.1 level and thus reacts along that level does not mean that every waking moment finds him reacting on such a level. Until he is entirely psychotic in the face of present-time enturbulation, he quite ordinarily demonstrates a great deal of free theta. The danger of his condition does not lie in the fact that he is always psychotic; it lies in the fact that when he becomes enturbulated, his existing free theta, which itself is capable of happiness and reason, will enturbulate down the tone scale to 1.1. As this individual lives longer and becomes more aberrated, when a trying situation confronts him, a situation which enturbulates his free theta, he will drop not only to the 1.1 level but below that, to the 0.5 level. Once the dwindling spiral has set in, from year to year the environment of the aberrant remaining more or less unchanged, he can be expected, when enturbulated, to drop lower and lower on the tone scale. Dianetics can interrupt this dwindling spiral; it can restore free theta to the mind, it can erase the traps which wait for the individual when his free theta is enturbulated. Thus, a person who is a dianetic release or a MEST clear is extremely resilient. Trying present-time circumstances do not form heavy locks. He has no irrational reasons to experience grief or fear, but when present-time circumstances strongly call for these emotions, he will display them, and yet soon afterwards be fully recovered. The only thing which can enturbulate his theta and cause him to drop any distance down the tone scale momentarily is some circumstance in the immediate environment strong enough to influence and affect him. A person who has been freed of engrams, secondaries, and locks should not be expected to remain in a state of idiotic cheerfulness in the face of any and all circumstances. This in itself would be a very aberrated type of conduct. There are certain manic individuals who do this, and they, unfortunately, are quite insane.

One of the primary things which dianetic processing does is free the emotions of the individual so that he can experience emotion ranging from happiness, eagerness, and exhilaration, down to anger, fear, and grief when these emotions are called for by present-time circumstances.

Emotion is a primary index of the tone scale. This does not mean that emotion is all there is to theta. Emotion is used as a primary clue to the auditor of the preclear's position on the tone scale because it is so easily recognized. The two gradient systems, however, on the margin of the chart, one from zero to 1000, and the other from -3 to 40.0 are both arbitrary number systems. The zero-to-1000 scale exists so that psychometric percentiles can be computed on the chart. The -3 to 40.0 scale is the original tone scale of Dianetics. This original scale is preserved because it is handy for the auditor to use and is a basic part of dianetic terminology. One quite commonly hears auditors speaking of a "1.5 case," meaning a case of chronic anger or one which enturbulates easily into anger. Or one may hear an auditor speak of a "2.5 case," which tells his indoctrinated listener that this case is rather bored with the whole thing, but is fairly well advanced and comes up easily to what is known as "false four."

The tone scale is not a derived scale, but one which has been constructed after observation of many preclears. An auditor can very easily observe this. Suppose he discovers his preclear to be in an anger tone as he runs an incident. The auditor can expect that the anger will generally, on one recounting, abate; and on the second recounting, that the preclear will begin to express resentment; on the third recounting, or fourth, or fifth, the preclear may come to boredom; then to indifference; and on subsequent recountings, rise up to perfect cheerfulness about the incident. If the auditor were to discover an incident where the preclear was in the deepest apathy, the tone of the preclear would be seen to rise during auditing through the whole span of the tone scale, step by step.

First, the preclear would be in very deep apathy, not knowing or caring whether this incident would resolve or not. He would then go up the scale to apathy, then to grief. He would express some fear and apprehension. He would become sullen. Finally he would

become angry. Then he would express resentment, and through boredom, would gradually rise up to "false four."

Not all incidents, of course, find the preclear going up the scale step by step. He follows exactly the same scale, but he may skip or omit various stages of the emotion. Starting an incident at grief, the preclear may come to boredom, and thus to complete carelessness about the incident. Thus, the tone scale is based upon observation. It is a very valuable index to the state of an engram. If the preclear enters the engram in anger -- is made angry by it, that is -- the auditor knows that the incident will be relatively easy to run on up the line. But if the preclear is found to be in very deep apathy, the auditor knows that he has a long way to travel with this incident before he can bring the preclear entirely out of it up the tone scale.

Finding the preclear in deep apathy in an incident should alert the auditor to the fact that he must handle this situation with the greatest care, that he must request subsequent recountings very gently, so that the apathy will gradually rise, with repeated recountings of the incident, up to grief; so that the grief can release and so bring the preclear up to the top of the scale, concerning this incident.

The emotional tone scale introduces something else as an auditor's tool. When the auditor discovers he cannot run grief out of a case, he should examine the preclear's bank; little more carefully to discover what emotional tone he can turn on in the preclear, since he can turn on at least one emotional tone. If he cannot turn on grief, he may be able to turn on anger; and once he has taken some of the anger off the case perhaps he can run some of the lower levels such as fear. Having run several incidents which have fear in them, the auditor may discover that he can run grief off the case.

Sometimes a case will fall so easily into apathy that the auditor has to be very alert in order to unburden some of the higher-level emotions before he attempts to run the incidents of deepest apathy which he finds in the case.

As a working rule, an auditor can always find some emotional tone to run on a case. He should make it his business to discover what emotional tone is easiest to run on the case and run some incidents of that tone. There have been instances when merely running happy incidents on a case recovered theta from the lower strata of tones of the scale that sufficient attention units were made available to turn on sonic and visio. This trick of running pleasure moments is easily the best way to get a preclear up to present time. One runs the pleasure moment just as though it were an engram, and the attention of the preclear can be attracted to this incident so strongly that attention units are recovered from other incidents in the past.

Emotion is an integral part of every engram; but it will stand by itself in what is called a "secondary engram." There are actually three kinds of secondary engrams: affinity break or enforcement engrams; reality break or enforcement engrams; and communication break or enforcement engrams. These are called secondary engrams because they do not contain physical pain but depend, for their permanence, on a physical pain engram earlier in the bank. Thus the words, "secondary engram," mean a highly charged moment in the analytical mind of the preclear which depends for its force on a physical pain engram lower in the bank. In running secondary engrams, or painful emotion, the auditor must develop considerable skill. One cannot, for instance, bluntly demand grief; nor can one bluntly demand fear. Skill and tact are required to reach the necessary incident to resolve the case.

It is a working rule of the auditor that a case must always be unburdened of some emotion. Only cases in a very high range of the tone scale can have physical pain engrams run on them without running some secondary engrams. If one could run off a case all painful emotion -- all unexpressed resentment, anger, fear, grief and apathy -- one would have a dianetic release whether he touched physical pain engrams or not. This is theoretically true but practically almost impossible, since, when he starts to run various secondary engrams, the auditor will often find the case sliding back into the supporting physical pain engram, which must then be run.

Running the painful emotion off a case produces the most signal improvements that are obtained in dianetic processing.

CHAPTER EIGHT

COLUMN G

Affinity

In view of the fact that the word “love” has at least two outstanding meanings in the English language, a misunderstanding could result if it were employed to represent this factor in theta.

“Affinity” is a broad term and means simply a sympathy of feeling, an affection, the feeling of one person for another, as we use it in Dianetics. Affinity, in the theta sense, dianetically, might be compared to cohesion and adhesion in the physical universe, as applied to energy. There are degrees of affinity, according to our definition, as represented by the tone scale. These range from a feeling of well being along all the dynamics down the various stages of emotion to severance of feeling from any and all of the dynamics. Affinity broadly includes emotion.

The tone scale of affinity, as represented on the chart, refers to the reaction of the individual at any particular time to just one or to a small number of people. But as affinity is suppressed repeatedly, the individual will begin to take on an habitual level on the affinity scale, an habitual reaction to almost all people. This is also true of the affinity scale of groups, and one can find on this scale the tone level of any nation or, indeed, of mankind for any given period, which would be the averaging out of the general reaction of mankind to mankind.

At the top of the scale around tone four, the individual experiences love, strong and outgoing; he experiences friendliness, this is an extroversion of affinity. One commonly finds this in children, who when growing older and receiving rejections and rebuffs, first from one or two people and then from many, will gradually experience the blunting of their affinity.

Around tone three, we have the individual experiencing tolerance, without much outgoing action. The individual at this level will accept advances offered but does not readily make such advances himself.

Around 2.5 the individual begins to neglect his own person, or people in general. He may even dislike them as a general rule and attempt to get away from them.

At the level of tone 2.0, the affinity is expressed as antagonism, a feeling of annoyance and irritation caused by the advances of other people toward the individual. Love is received with suspicion; it is seriously questioned, and may gain as its return distaste.

Around 1.5, affinity has almost reversed itself. Its dissonance has become hate, which can be violent and is so expressed. Love offered to such a person may excite him into violent acts of repulsion. Here, actually, we have a factor of enttheta repelling theta, since theta itself contains, as one of its components, love.

Around 1.1, we reach the level of covert hostility. Here the hatred of the individual has been socially and individually censured to a point where it has been suppressed, and the individual no longer dares demonstrate hate as such. He yet possesses sufficient energy to express some feeling on the matter, and so what hatred he feels comes forth covertly. All manner of subterfuges may be resorted to. The person may claim to love others and to have the good of others as his foremost interest; yet, at the same moment, he works, unconsciously or otherwise, to injure or destroy the lives and reputations of people and also to destroy property. Below 1.0 we reach fear, which is expressed on its highest level as acute shyness, stage fright, extreme modesty, being tongue-tied among other people, being easily frightened by proffered affection. Here also we reach the strange manifestation of the individual attempting to buy off the imagined danger by propitiation. We have an interesting example of this in processing.

Cases which are far down on the tone scale will, when they reach 1.0, quite commonly offer the auditor presents and attempt to do things for him. A crude description of this was once contained in the idea of transference. At this level we have withdrawal from people. At 0.5, we reach the level of grief, wherein we have supplications by the individual, his pleas for pity, his desperate efforts to win support by tears. We may even have at this level extremely strange perversions of truth intended to achieve the pity and support of others. For instance, the rejected sweetheart, reaching this level of grief may invent all manner of odd and peculiar incidents of cruelty on the part of the last lover in order to win the sympathy of those around her.

Sinking below grief, one reaches apathy, wherein affinity is expressed by complete withdrawal from person or people. There is, in apathy, no real attempt to contact one's self and no attempt to contact others. Here we have a null point of dissonance which is on the threshold of death.

The auditor has a handy measuring stick with the affinity scale, since he can, by observing the preclear, establish the position of the preclear on the chart. Further, by watching preclear's attitude toward people or groups he can see the improvement of the relations of the preclear. With others and, he can see the gradual rise in tone of the case.

CHAPTER NINE

Communication and Reality

The overall subject of communication covers far more than the exchange of intelligence. Basically, communication could be called the science of perceptions. As general semantics is organized on the subject of words and ideas; so can be organized, and so has been organized in Dianetics, the entire subject of perception.

Everything which we know of the physical universe and, possibly, anything which we can know of theta universe, allowing that it exists, could be said to be embraced by perception, computation, and imagination.

By perception we mean the perceiving of entities or existences. We achieve what we know of reality by perceiving entities and existences in the physical universe, and possibly the theta universe, by combining these perceptions and computing or imagining results not in disagreement with the results obtained by others.

The channels of our perception of the physical universe are twenty-six in number. The most important of these are sonic, vision, tactile, olfactory, kinesthesia, thermal, joint position, body position, moisture, organic perceptions, and, adding one more discovered in Dianetics, perception of movement on the time track. It is with these that the auditor most vitally concerns himself as it is through these that we learn the most of the physical universe.

With sonic we perceive, by mental mechanism, the sound waves of the physical universe, and by comparison and experience, both genetic and environmental, interpret them. With visio we perceive light waves, which, as sight, are compared with experience and evaluated. By tactile we perceive the shape and texture of surfaces and compounds. With olfactory perception we perceive the minute particles of matter which register as smell.

By kinesthesia we perceive motion through space and time.

By thermal we perceive temperature, hotness and coldness, and so can evaluate further our current environment by comparing it to past environments. By perceiving joint position we can measure space and the size of objects and know more about our physical situation. By perceiving body position we sense our relationship with our immediate environment. Moisture perception permits us to sense the dampness or dryness of the atmosphere and so judge further our environment.

Through organic perceptions we perceive the states of our own bodies, internally.

These and other sense messages combine to make up a body of experience. Just how much of this experience is genetic and how much of it is carried in the theta body, if that exists, we cannot at this time accurately measure. In our environment, however, by the various sense channels we gain experience and can act in the present-time environment or plan for the future. It might be said that we have potentially a sensory reception mechanism for every type of sense message which can be radiated or delivered to us from the physical universe, and from the theta universe. Thus, we have hearing because there are sound waves which can be registered and interpreted; we have sight because light waves exist to be registered; and so forth. A very interesting paper could be prepared upon the probable evolution of our senses. Theta, combining with MEST to make life, reaches out in its conquest of MEST, via the sense perceptions, to exist within and control the environment and to some degree regulate the future -- and, particularly in man, to adjust the environment to the organism, the species, or the race.

Just what theta-universe perceptics are is a subject at this time so diffuse that one cannot even be sure there is a theta universe. Such manifestations as extra-sensory perception, intuition, clairvoyance, clairaudience, and others make up a body of quasi-knowledge which is

normally relegated to the field of psychic phenomena. The existence of God and spiritual manifestations could be classified as theta universe; contact with these would be considered a use of theta perceptics. Oddly enough, in Dianetics considerable evidence, whether we wish it or not, is accumulating in favor of not only a theta universe and a theta body but of theta perceptics, as well.

This has proceeded far enough to contain some evidence that certain techniques of application, already partially formed, exist by which the theta perceptics can be cleared, raising the prediction potentiality of the individual, amongst other things. Judging solely on the evidence at hand, one would say that more evidence existed in favor of the theta universe, the theta body, and theta perceptics than existed to deny them. This evidence has accumulated to a sufficient extent to cast extreme doubt on the "scientific" postulate that all man would ever know was the physical universe.

Indeed, science was unable to resolve mental problems and forecast behavior and invent better human technologies so long as it assumed that life and man rose from compounds and clay of the physical universe, with no other ingredient. This line of reasoning led to no advances in technology and, indeed, permitted the physical sciences to outstrip all knowledge of human behavior. This would seem more or less inevitable, however, if one considered that the primary mission of theta was to conquer the physical universe, at least insofar as the branch of theta which ourselves is currently concerned. With such a mission, the physical would, of course, become the best-known sphere of reality. Perhaps theta is now in a position where it can understand more of itself. By this one does not urge upon the reader that Dianetics concerns itself vitally at this time with psychic phenomena, but it is mentioned in passing that in the course of investigation data continues to accumulate against the idea that man is a creature of the physical universe alone.

The auditor, working case after case, cannot but run upon evidence strongly in favor of a relatively timeless theta body existing as a personal identity, running parallel to the genetic line of species; and if he ignores this he may bog down some of his cases. Specifically, I refer to the continuing and growing volume of reports from auditors on the subject of past deaths and past lives. This subject needs to be warily and thoroughly examined; but it remains that the auditor who runs into a past death and does not reduce it properly by standard procedure will find his case thoroughly bogged down; and, indeed, some cases cannot be run and will not move on the time track until these factors are taken into consideration. Some of this data has been known for two years, but a diffidence to comment upon it until the evidence was overwhelming has suppressed and continues to suppress the knowledge.

As it develops, Dianetics more and more seems potentially able eventually to contact the often-postulated but never thoroughly sensed, measured, and experienced human soul. The subject of past deaths and past lives is so full of tension that as early as last July (1950 -- Ed.) the board of trustees of the Foundation sought to pass a resolution banning the entire subject. And I have been many times requested to omit any reference to these in the present work or in public for fear that a general impression would get out that Dianetics had something to do with spiritualism.

Further, the view has been many times expressed that in view of the fact that prenatales are so "controversial" the introduction of past lives and past deaths into Dianetics, even as an experimental investigation, would permit old schools of therapy to persist in their delusion that all is delusion. This would hardly be a scientific way of handling a science. A true scientist boldly and fearlessly reports that which he finds. A famous writer told me, a short time ago, a story about Thomas Carlyle, who upon hearing that an American lady writer named Margaret Fuller had said, "I accept the universe," said only, "By God! she'd better!" The auditor who runs his preclear down the track and suddenly finds the preclear possessed of strong somatics and a visio of 1210 A.D. scenery had better reduce the incident as an engram. Failing to get a proper reduction, the auditor had better ask for the incident necessary to resolve this weird manifestation. If the auditor is dull indeed he will invalidate the incident to the preclear and pass up running it, at which point his preclear will bog down.

There are evidently three kinds of these experiences: (1) those which are dub-in and which occur only in cases which dub in in the present life; (2) fantasies built upon reading and imagination, but without somatics; and (3) what seem to be valid and real experiences. If this data of past lives and past deaths in the theta body continues to stand up and becomes susceptible to exacting proof, it certainly threatens to alter our culture radically. At the present time all we can do is gather evidence. The Foundation would be glad to have any and all such evidence which auditors may discover and care to submit. Never invalidate a past life of a past death, and never fail to run such somatics as actual experiences: failure to observe this enjoinder may seriously harm the case. I have given you this information because I do not believe that helping the auditor to audit and helping cases to run can seriously hurt Dianetics. To unburden a case to the point where the individual is a MEST clear it is only necessary to work with the avenues of perception to the physical universe.

What we conceive to be reality is actually agreed upon perception of the physical universe. There is an endless philosophic wrangle as to whether or not our perceptions perceive anything, or whether or not our perceptions are merely an illusion themselves. True enough, the physical universe can be reduced down to zero mathematically. Matter, energy, space and time could be said to be the result of certain motions. The moment we go off into the by-road of wondering whether the physical universe is real or not we come rapidly upon many philosophic imponderables. What we know as reality, however, is an agreed-upon conception of the physical universe in which we live. You and I agree that a table exists in the center of the room; we can see it, and feel it, and when we rap it with our knuckles we can hear that something is there. You and I have agreed upon the reality of the table, mainly because each of us agrees that he perceives it via his senses. Should someone come up and say that not a table but a black cat stood there, you and I would consider the man mad. Indeed, by a sort of natural selection we remove such "madnesses" from our society. When someone is in disagreement with the majority as to the sense perceptions of the physical universe, the first reaction of the majority is to have this person pronounced mad and locked up. Locked up, he does not procreate and so breaks the genetic line. This happens often enough to select out of the human race those who do not agree on the nature of the physical universe via sense perceptions. Many amusing and entertaining postulates can be formed on the subject of reality.

Certain it is that by communication -- by the group of sense perceptions which make up communication -- we know reality. Our affinity with that reality -- our admission that we are a part of that reality, and our acceptance of our participation in it -- is necessary to our communication with it, and thus we have the triangle of Dianetics: affinity, reality, and communication. One cannot stand without the other two. There cannot, for instance, be communication and affinity alone; these two things would result in an agreement of some sort, which agreement would be reality. If communication exists, some agreement can be reached, and as soon as an agreement is reached between two people or by a man with himself, there is some affinity. If affinity and reality exist, then a communication must ensue or must already exist in order to act as a channel of expression and recognition of the agreement. An auditor, knowing the trio -- affinity, reality, and communication -- can use any point of the triangle as a point of attack in order to enhance the other two corners of the triangle. The overall subject of communication, as we have seen, contains all avenues of sense perception: sonic, visio, tactile, olfactory, and the rest. It includes, as well, the perception of too strong a contact with the MEST universe -- pain, which is itself less directly, a form of communication. The receipt of perceptions of the real universe and the purpose of theta come about as a computation. Computation creates ideas concerning reality, and this creation of ideas leads to the type of communication which is commonly and ordinarily classified as communication -- conversation, messages, and other methods of exchange of ideas.

The auditor must appreciate the value of communication; since if his preclear cannot communicate with his own past he cannot make an accurate adjudication of his own present and he certainly cannot compute his own future. When a man is unable to contact the reality of the present or appreciate it, and when he cannot compute his own future and act upon that computation, that man is considered in varying degrees neurotic or psychotic. The auditor, then, does well who knows this subject thoroughly.

CHAPTER TEN

COLUMN H

Sonic

By the word sonic in Dianetics is usually meant sonic recall, rather than hearing sounds outside the body. Sonic means hearing the sounds which have been remembered. Those sounds which the individual has heard in the past are all recorded, either in the analytical standard memory bank or in the reactive bank. Those which were recorded in the analytical standard memory bank are all available to the recall mechanisms of the individual -- to his "I." Those which have been recorded in the reactive bank have been received by the individual while he was unconscious -- in a hypnotic state, while drugged, while delirious, while unconscious from a severe injury, or even while unconscious momentarily because of a light injury. Such perceptics as sonic were not thought, before Dianetics, to be recorded at all during a period of unconsciousness. One of the basic discoveries of Dianetics was that these perceptics were recorded during the periods of unconsciousness of an individual, and that this material was available for recovery, and that this material, so recorded, had an aberrative effect on the individual.

Whether the sound has been heard while the person was awake, or asleep, or unconscious, that sound is available to the recall mechanism of I. The fantastic storage capacity of the mind has no structural explanation at this time. But every sound, whether a voice, an auto horn, the click of table ware, footsteps, the wind, every sound which the individual has heard in his lifetime is recorded. Thus recorded, it is available to the "I" of the individual. Dianetic technique sends the individual back through his life, and by the perceptics of sonic, visio, and so forth, enables him to recover information which has been occluded from him.

There are very many gradations of the quality of sonic. A case on which there is much grief and other types of charge may or may not have sonic recall. A case which is generally occluded from one end of the track to the other may be so occluded by charge, valence trouble, sonic command shut-offs or being stuck out of present time, that it has no sonic at all. This condition may be so bad that it renders the individual unable to remember anything that has been said even shortly after it has been uttered, as well as back along the time track. The charge, valence troubles, and command shut-offs of sonic may be relatively light, under which circumstances the individual will receive what are known as sonic impressions; he can get impressions of the voice tones in which the words are being uttered, as he travels along the track, but he does not hear the sounds clearly. The case may have, however, so little sonic shut-off, valence trouble, and charge that clear sonic, just as it was heard in the first place, is available as the person travels on the time track, as well as near present time.

Sonic shut-off may be quite selective: the individual may be able to hear sounds but not voices; he may be able to hear an entire symphony orchestra and yet be unable to hear again what his wife asked him to bring home for dinner. Selective shut-offs are caused both by charge on the case and by selective sonic shut-off commands, such as "You cannot hear your wife," or "You pay no attention to me."

A primary concern of the auditor is the turning on of sonic; therefore he must know what turns it off. According to present theory, which works out relatively well in practice, the most severe source of sonic shut-off is being stuck on the track: in that the individual cannot move on the track, he cannot, of course, move through incidents and hear them. The next most severe interference with sonic comes from valence shifters; the person's identity is confused with that of another person; he is not in his own valence, and he is off his own time track. The next most severe source of sonic shut-off is the command phrase which says specifically "You can't hear anything," "You never listen to a word I say," "You have to keep still," "I'm as deaf as a post," etc., etc. Sonic is additionally affected somewhat by grief and charge on the case,

but not as much as might be expected, since cases which have enormous grief and charge on them in general yet retain sonic recall in the absence of valence shifters.

The most severe sonic shut-off would be that caused by a combination of factors, which would include not only being stuck on the track in an engram but also having the track itself collapsed by groupers. There are cases which have fake sonic -- sonic dub-in. According to theory, this dub-in is caused by demon circuits which is to say, heavily charged portions of the analytical mind which have been captured by the reactive mind and do its bidding, walled-off by charge into separate entities. These are very easy to spot, however, since dub-in sonic usually is inane. Furthermore, when the individual with dub-in has gone through an incident once, he cannot return through the incident with the same words. One should not regard a dub-in recall case as something hard to detect; it is very simple, even for the beginner to detect dub-in, since it will not repeat or bear repetition but alters markedly, and it is not particularly sensible, and it does not run at all like an engram. The dub-in sonic case, after it has been worked for a short time, can be expected to lose the dub-in, once the circuit causing it is contacted or when the tone of the case rises. A non-sonic case results. This should not be confused with a case which has sonic but which has experienced severe auditor code breaks, has had engrams run partially but not reduced and has had groupers triggered so that the time track is collapsed. The way to differentiate these is that the case which had dub-in that has turned off will still run as easily and ably on the time track as formerly; from a non-sonic condition, as valence shifters and sonic shut-off commands are run out of the case, sonic impressions will become available, and then sonic itself should return. The subject of sonic recall is one which requires an enormous amount of study before final adjudication can be made by anyone as to its total ramifications. Experience in Dianetics has demonstrated that recalls in general are very fully recovered by the clear, and this is true of sonic. As may be seen on the chart, the gradient scale of sonic does not show it to be a phenomenon by which the position of the preclear on the chart may be established, save only in the broadest sense. The clear, at the top of the scale, has, ordinarily full sonic recall. But such may have been his aberrated condition that over large areas of the track his analytical memory bank has received no adequate or sharp recordings. From the moment a person is clear or nearly clear, on forward in his life, he will have sonic recall; during his period of aberration, however, he may not have registered sounds here and there on the track.

There is much misunderstanding about sonic and vision recalls in the state of clear. These recalls are not eidetic in all cases, as photographic or phonographic recall are a matter of training, and a person not trained into them will not necessarily register sights and sounds with sufficient concentration to have all the material available for immediate recall. A very large number of tests must be undertaken on the whole subject of recalls and a great number of cases must be observed before we can clearly and scientifically evaluate recall potentials in every individual when cleared. The recalls, however, are good in those cases so far observed but are not necessarily eidetic. A person may have sonic recall of an accurate nature at any place on the tone scale, providing the person can move freely on the track and is in valence. Ability to recall in sonic is not an index of neurosis or psychosis. Sonic recall is affected by factors which, in themselves, are not such an index. The amount of free theta available for analytical perception and computation is itself actually the only index.

However, in the lower portions of the tone scale one ordinarily expects the reasonable person not to have sonic recall or any other recall and one expects the true psychotic or neurotic individual to have sonic recall. This has misled practitioners and authorities in the past into believing that sonic recall was only to be found in idiots and morons, an entire falsity based on limited observation.

The influencing mechanism on sonic recall is whether or not the mind has sufficient power (structurally, most likely) to cut off and wall up charge and the general results of engrams and still reserve a portion of the analyzer for free thought with the remaining free theta. The psychotic or neurotic individual does not have the power to reserve for clear thinking some portion of the analyzer, and so, when enturbulated by engrams but still in valence, becomes analytically completely and wholly enturbulated, with no reserved portion of

the analyzer not subject to that enturbulation. Where a person has a psychosomatic illness and sonic recall one should expect to find a near-psychotic individual, the psychosomatic illnesses telling of many engrams and the sonic recall stating that the analyzer has not the power to wall up unhappy and painful memories. Where one finds psychosomatic illnesses and a sonic shut-off, one may find a person who is potentially low on the tone scale but who yet has enough free theta to respond on a high analytical level -- and yet who may perform in life in a very aberrated fashion, for all this.

The thinking on this subject in the past has been entirely too short. The strange belief has been held in the past that a great deal of aberration meant a

great deal of thrust and drive and, therefore, that an individual who was neurotic could be expected to perform in the arts and in other directions more ably than a person who was sane. This, by derivation and observation and much experience, is an outright fallacy. The individual with a great deal of free theta is apt to be more robust than his fellows. He may or may not have more engrams; but he tries, from his earliest days, to take in more area than his fellows and to adjust his environment to him rather than follow the sheep-like course of trying to adjust himself to the environment. He is, therefore, continually rebuffed, and his engrams will gradually charge up, by the process of affinity, reality, and communication breaks, until he responds rather neurotically to his environment. Such a person is, normally, rather thoroughly shut off so far as sonic and visio are concerned. His theta, what is left of it in a free state, operating in what small portion of his analyzer is still available, is still greater than the theta available to the average human being. When we take this individual and dianetically process him and turn the entheta into theta, he becomes more and more powerful and able to cope with and adjust his environment. He will not have sonic and visio until he reaches a released or a cleared state. Such individuals are difficult to process only because the mind has so expertly walled itself in from the charge on the case. However, such an individual is very worthwhile to process, since when the auditor has finished, or even if the auditor never does finish, one has left a strong, creative asset to the society. The auditor who, because they seem easy, works near-psychotic or psychotic cases which have sonic, may have when he is through an individual who, no matter if structurally intelligent, is yet possessed of so little theta that his worth to the society is small. These conclusions are highly generalized, but have been borne out in a large number of cases.

Cases exist in which the individual is so unaberrated that, though he is endowed with enough free theta to make him a tremendous asset to the society, he still has sonic and visio, being already at the 3.5 range on the tone scale. It is far from true that a person, to be of worth to the society, must be highly aberrated and must have his recalls cut off; since in such an aberrated state he is likely to be so low on the tone scale that his positive worth to the society, which would be realized were he at 3.0 on the tone scale or above, becomes a liability, and his aberrations violently affect his environment and bring about his destruction. Such persons are the dictators who lead their countries to ruin through war; the artists who, through their grossness and vulgarity, destroy the more's of a race, and so destroy the race.

What the auditor should know, principally, about sonic recall is that it makes a case easier to run, and that a case without it, properly processed, will eventually pick it up. The auditor should never despair of sonic recall shut-off cases; impressions will get stronger; and sonic recall will eventually turn on. But the individual has to be very high on the tone scale before he regains sonic, if he began with complete shutoffs. Further, there is a technique, which sometimes turns on sonic, known as running pleasure moments.

Pleasure moments can be run on a case just as the auditor runs engrams, going through the moment over and over again. Attention units are attracted to the pleasure moment, since it is one of the missions of the mind to attain happiness and pleasure along the various dynamics. By returning the preclear to a moment of pleasure and running that moment, the auditor will be able to regain a few attention units out of areas of enturbulence; this will make it a little easier for the preclear to move on the track, and in so moving he may pick up sonic recall. In any event, the running of pleasure moments is highly beneficial to a case.

The running of future pleasure moments sometimes tunes up the perceptics. These are actually imaginary incidents, so far as can be told. The tone of the individual goes up when running moments of pleasure, and so when moments of pleasure in the future are imagined, the tone of any individual may be expected to rise.

Affinity breaks often depress sonic; so that a preclear who has sonic on Monday and a quarrel with his sweetheart on Tuesday, may be found to have much less sonic recall on Wednesday. Further, when the sonic recall of an individual is invalidated, his reality is depressed, so the recall reduces. ARC locks and secondaries markedly influence sonic or any other type of recall. Heightened affinity, reality, and communication may, by themselves, turn on sonic.

CHAPTER ELEVEN

COLUMN I

Visio

Recalling a scene by seeing it again is called, in Dianetics, visio, by which is meant visual recall.

There are two kinds of visio which the individual may encounter. One is imaginary visio, by which is meant the scenery imagination constructs. The other is actual visio, by which is meant recall of actual and authentic scenes. In dianetic terminology, visio usually means valid recall of past scenes; the word dub-in is used to characterize visio which is imaginary.

Visio may occur in present time, of past scenes, which would be the process of visually remembering. Or it may occur as the preclear is returned on the track, seeing again in recall scenes which he has recorded in his past. Dub-in visio may work in much the same way.

Possibly the most exact borderline between sanity and insanity would be that between knowing that one was imagining what had happened and not knowing that one was imagining. All recalls can become short-circuited through the imagination, so that the "I" is led to believe that it is recalling an actuality when really it is having furnished to it from the memory banks an imaginary sequence. When ARC is very low on a case, usually below the 2.0 range, the condition obtains with the case that many of his recalls, no matter how authentic "I" considers them, are imaginary. As an example of this, consider the person in an anger state who is recounting a conversation or a quarrel he has had. People who are angry almost never tell the truth. People who have sunk to the covert hostility range become so confused between reality and imagination that even their small talk is utterly untrustworthy, and yet these people may believe they are telling the truth. This is a case of recall being short-circuited through the imagination and "I" being furnished imaginary data which is yet labelled as authentic data. Possibly the most flagrant breach of truth occurs in the apathy range or slightly above it, where fear, mingled with grief can cause the wildest perversion of recall.

The best example of dub-in visio would be the scenery which the preclear gets when he is returned on the track into the prenatal area. He may get very clear and active, but exteriorized, pictures of the scenery around his mother -- which views and scenes are entirely false and are not to be attributed by the auditor to extra-sensory perception. They denote a 1.3 to 1.0 position on the tone scale. Circuitry, about which much will be said later, is the cause of this visio. When the case has been unburdened of many secondary engrams this visio will cease, and the actual visio of the pre-natal will take its place. Actual pre-natal visio, of course, is black, except at such times when a light may be entered into the area for surgical purposes, at which times the light is sometimes recorded. A person who is found to be on the tone scale between 1.5 and 0.5 should not be expected to have accurate visio -- or any visio at all, as in the occluded case.

Visio and all other recalls follow the same pattern as sonic, and in considering any recall the data which is given on sonic may be used interchangeably.

In the 4.0 range the individual, when in present time, sees what he remembers, and when returned on the track, gets accurate and clear pictures of the scenery just as he saw it when he was looking at it. He is inside himself which is to say, in valence, and does not get a view of himself as a part of the scenery. The condition normally obtains down to the 3.0 band. Here we begin to get occlusions and exteriorizations in areas which contain highly-charged engrams which themselves contain command phrases that shift the person out of his own valence, such as "I can't be myself around you," etc. Around 3.0 the person is, in most cases, on the track; he can get visio on pleasure moments, and he is able to be inside himself except

when in secondary engrams. Around 2.5 the occlusion becomes marked. Large areas of the track may be missing because of charge and valence-shifter engrams.

From 4.0 down to 2.0 it is relatively easy to run out occluded areas and discharge secondaries so that visio returns easily. Below 2.0 the auditor begins to get into trouble and must use a great deal of patience with his preclear, because the visio may be either absent or exteriorized. The auditor, when working such a case, should be very careful at all times never to call any of these oddities to the preclear's attention, as this would be an invalidation of the preclear and would do him much damage. The trouble with a preclear from 2.5 down is that life has invalidated him too often. When the auditor, who is attempting to maintain high ARC with the preclear, seems to rank himself with those factors in life which have already suppressed and hurt the preclear, what little visio has survived may very easily fold up, so that the auditor causes himself a great deal of work in rehabilitating the ARC and getting the visio or other recalls back.

Around the anger band we begin to enter the potentially psychotic area. This does not mean that a person who is at 2.0 is a psychotic. It means that when the free theta of the individual enturbulates momentarily, he finds himself easily along the 2.0 band, and that he conducts himself generally, in his reactions toward life, along this band. It is possible for a case to be in valence all the way down the track and to get good, moving visios and still be in the 2.0, 1.5, 1.1 band, and be thoroughly psychotic. Here again we have an individual whose structural mechanisms are insufficient to bar out existing charge on the case; thus the person's theta is continually and entirely enturbulated, having no free portion of the analyzer in which to operate. His theta is always under the influence of the charge on the case because he has made for it no protecting partitions. By partition, compartmentation, and occlusion are not meant valence walls; these are something else. The valence wall can actually exist in the individual to a point where he can be either one of two persons, himself and another person. In the very highly-charged case, in the case of the obvious psychotic, these valence walls are so well defined that the auditor can almost watch the person click from one valence to another. The schizophrenic of psychiatry -- the person who shifts from one identity to another -- is called in Dianetics a valence case. And when these valence walls are so well defined that a whole new personality emerges with the shift, we have a person, of course, below the 2.0 band. Such people ordinarily "run" (undergo processing) in Dianetics quite noisily and are called screamers. The visio of such people is normally present for the valence in which the preclear is at the moment. If he is in father's valence, he will get the same view of the scenery that father would get. Or he may be in mother's valence, in which case he would have a view of the scene just as mother would see it. Or he may be in a synthetic valence, the valence of no actual person, which might give him a view of the scene looking down from the ceiling. Such cases almost never have their own point of view.

Even valence walls are a sort of protective mechanism by which the charge of the case is compartmented to permit the individual to work at least some of the time. The truly low power individual merely continues to accumulate charge until he is suppressed to the near bottom of the scale without ever developing a mechanism to overcome the charge. As far as his recalls are concerned, he is continually in his own valence.

Just as in sonic, visio manifests itself all the way down to the bottom of the case when the mental structure is insufficient to compartment off for the use of "I", any portion of the analyzer.

Dub-in visio actually has two subdivisions: (1) where the actual scenery is approximated, and (2) where entirely new scenery is substituted. The first is caused by valence shifts; the visio the person gets of the scene when he is being acted upon by a valence shifter, highly charged up as in any secondary engram, is exteriorized -- which is to say, he sees himself as part of the scene; he may be in the valence of another person, or he may be merely out in the blue, looking at the scene. When the charge is run off of this particular scene by repeating it over several times (providing any release takes place in the first four or five recountings) the engram on which this secondary is depending and which, of necessity if it creates such an illusion, must contain a valence shifter command, loses some of its charge, and

the individual is then able to get inside himself and get a view of the scene as he saw it at the time. Any engram in which the preclear is exteriorized cannot be fully discharged until the visio is restored to the scene as it was viewed by the preclear. In other words, if the preclear continues to be exteriorized, the whole charge is not off the engram. However, if any charge at all can be gotten off a secondary, the auditor should run it to exhaust all possible charge.

If visio persists in being exteriorized in spite of many runnings of the incident, there is usually later charge on the case, a later secondary which has to be tapped and discharged first; since physical pain runs from early to late, and secondaries have to be discharged from late back to early.

Imaginary exteriorizations are most chronic around 1.1. In such cases the auditor may sometimes use the mechanism of running the preclear on somebody else's track, which is to say, on father's track or mother's track or grandfather's track, in order to contact scenes. In such cases it is as if the person's track had been swallowed up, leaving available only the tracks of other valences around the individual. This mechanism is of very limited use. In any apathy secondary the preclear may commonly be found to be outside himself until the charge is off the incident, at which time he becomes interiorized. There is always a valence shifter somewhere in a physical pain engram which creates this illusion. Charge itself will not cause a person to be exteriorized, as evidenced by people who have highly charged tracks and who yet remain in valence all the way to the bottom of the scale.

In the very occluded case, visio is the most notably absent thing. The preclear may think that visio is necessary for him to scan locks; but this is not true. He can scan through locks "in the dark," with no visio whatever, and yet bring to his consciousness phrases or incidents which can be run. The auditor must not make the mistake of believing that visio is necessary for the individual to move on his track.

Very little is known of the reasons for visio, and no large body of observation exists to determine the state of visio in all persons that have been cleared of their engrams. This much has been observed, however, that visio does return in a clear; and any effort to palm off as a clear an individual who does not have an interiorized visio on his track is a dishonest one.

Most children have visio, for the simple reason that their engrams are not yet charged up to a point where secondaries can be formed and so occlude visio or thrust the child out of valence. In a case which has many valence shifters, affinity, reality and communication secondaries will bring about a chronic exteriorized visio. In a case which has an analyzer sufficiently able to block off charge, visio starts to disappear in the presence of repeated secondaries. After a major ARC break, such as the loss of a sweetheart, visio may cut out, in such a case, entirely. Also, in the case of an individual who is stuck in a prenatal engram, visio is blocked off by the simple fact that the prenatal visio of black is present through all of his memories. He is not, of course, moving on the track, and so cannot pick up the scenery of any incidents but those in which he is stuck.

Visio is not a good test of the tone level of a case except in the generality that when visio is present and accurate, and other columns on the tone scale agree, the person can be said to be above the 2.0 line. But in view of the fact that visio can exist all the way down the track, such a test must be considered only cursory.

Note: Discussion of reactive exteriorization phenomena as found here should not be confused with exteriorization as a theta activity, which is covered in Scientology 8-8008 (1953) by L. Ron Hubbard, and later works.

CHAPTER TWELVE

COLUMN J

Somatics

The word somatic means, actually, bodily or Physical. Because the word pain is restimulative, and because the word pain has in the past led to a confusion between physical pain and mental pain, the word somatic is used in Dianetics to denote physical pain or discomfort of any kind. It can mean actual pain, such as that caused by a cut or a blow; or it can mean discomfort, as from heat or cold; it can mean itching -- in short, anything physically uncomfortable. It does not include mental discomfort such as grief. Hard breathing would not be a somatic; it would be a symptom of misemotion suppression. Somatic means a non-survival physical state of being. It is distinguished, on the one hand, from a nonsurvival mental state of being and, on the other hand, from a physical action or pro-survival perceptic, such as kinesthesia or tactile, or visio.

An engram has several component parts: the two main components, of course, are entheta and enMEST. Free theta has come into collision with MEST, with resultant enturbulation. In a living organism, the enMEST component would be the manifested somatic.

The chief difference between the analytical and reactive minds, aside from their functions, is that the reactive mind registers pain, and the analytical mind merely records the fact that pain exists. This gives the reactive mind an additional perceptic; this perceptic is called a somatic.

In the presence of any physical pain the analyzer goes off. Even if the pain is very mild and brief there is still a moment of analytical shut-off. In Dianetics this is called anaten, an engineering type of abbreviation for "analytical attenuation." The anaten buries the somatic, and, unfortunately, buries with it all the perceptics present when the somatic was received. It may be difficult to realize that anaten is present with every somatic, until one has mildly injured his finger, for example, and has gone back over the incident a few times. He will discover that there was an incident during the injury which became occluded because of anaten; and by running the incident two or three times, he will find some additional perceptics which he may not before have noted. Thus the somatic is buried by this mechanism of anaten. This is a workable mechanism in a life organism which is not analytically capable of recovering pain and running it out; but it is not workable in a rational organism possessed of considerable analytical power, since the perceptics of the painful moment can then react back against the analytical power, and the organism is then victimized by its somatics rather than trained into the avoidance of danger by the avoidance of pain--the evident primary use of somatics. A severe physical pain causes considerable analytical attenuation, shutting off the analyzer thoroughly for a period of time. This, technically, is an engram, although any incident, painful or not, contained in the reactive mind and occluded by anaten can be considered an engram.

Once an engram exists, analytical experiences can restimulate it by approximating its perceptics or breaking the dramatization demanded by the engram. These analytical moments are called locks, and they charge up the engram. There are, technically speaking, two types of such locks: those which merely restimulate the engram, which is then dramatized by the individual; and those which break the dramatization. The first type are not as severe as the second type; since the second type, by making it impossible for the individual to obey the "mandates" of the engrams, cause the physical pain to turn on, and the individual gets what has been known as a psychosomatic illness.

A psychosomatic illness, according to dianetic findings, is the somatic side of the engram, turned on by continual suppression of the dramatization. Thus, in Dianetics, psychosomatic illnesses are not regarded as such but are called chronic somatics, since they disappear once the engram and its locks are discharged from the case.

Another manifestation than anaten occurs with regard to a physical pain. The somatic enturbulates theta, and if the analytical incident which forms a lock on this engram contains considerable misemotion, as caused by fear or loss, the presence of the physical pain earlier in the bank makes it possible for a secondary engram to be formed. Misemotion is actually a conversion of physical pain, according to dianetic findings. There is much more that could be discovered about this mechanism or conversion of physical pain to, for instance, terror or grief or apathy; and the discovery probably lies in the field of further examination and understanding of free theta; but it is certain that secondary engrams, with their misemotion, occlude somatics. When the misemotion is discharged, the engram itself then becomes available.

Indeed, so intimate is the relationship between misemotion and physical pain, that the case is run by "layers." One may discover, early in the case, many physical pain engrams which easily discharge when recounted. This brings to light a long series of secondary engrams, later in the case. One is unable to find any further physical pain engrams until one has discharged these secondaries of their fear, grief and apathy. Having done this, the auditor will find that he has a new series of physical pain engrams available for running.

A somatic, then, may be said to be buried beneath anaten and beneath misemotion or secondary engrams. Thus, somatics in a case can be seen to "hide."

Somatics can be turned on by dianetic auditing only when the anaten and the misemotion are not too heavy for the particular somatic the auditor is trying to reach. A very heavily charged case (by which is meant a case with a very heavy burden of secondaries) may be found to have no somatics available for auditing. A very occluded case, in which the mind has compartmented off charge, will also have blocked off the majority of the somatics.

The case which is stuck thoroughly on the time track may have in constant restimulation the somatic which was present at the moment he received the engram in which he is stuck. The characteristic of the psychotic is that the entheta side of the engram is in constant action and that the somatic side of the engram is not particularly active.

The case which was formerly referred to as the psychosomatically ill case would be said to be one in which the entheta side of the engram is suppressed and the somatic side of the engram is in restimulation. These chronic somatic cases are usually found to be cases which have been subjected throughout life to breaking of each and every dramatization, cases, in other words, which have been denied the MEST control irrationally directed by the engrams, as well as the MEST control rationally directed by theta. The tone scale of somatics could begin, at the top, with the MEST clear at 4.0, who would have no somatics left to be run. This is the technical definition of the MEST clear, that each and every incidence that contained physical pain, during his entire lifetime from conception forward to the present time, has been erased, thus freeing the theta which has been held as entheta in the bank by freeing the body of pain or potential pain. This does not mean, by the way, that the clear cannot receive new pain and new engrams. It does mean that new incidents of pain will have much less effect on him than they would were he not a clear; and he can ordinarily run out such incidents by himself unless he has been from the start a very low theta-power individual.

In the 3.5, 3.0, and 2.5 bands, somatics are sharp and readily available to the auditor. Almost any engram on the case can be run, providing the basic on its chain and other preceding engrams have been erased before it. Slightly over 2.0, engrams begin to be suppressed by charge and anaten on the case.

In a heavily occluded case, who is yet in the 2.0 band, somatics may all but be absent. In a less occluded case in the 2.0 band somatics may be very light. In a case which is in valence, and yet in the 2.0 band, and which can move on the track, somatics are available and can be run.

Around 1.1, the heavily occluded case will have no somatics available. The auditor must here work solely for the discharge of locks and secondaries before he can find somatics

on the case. In the less occluded case, however, some extremely light somatics will be found available. And in the un-occluded case, which is yet at 1.1, somatics will be found to be light, and, again, will not discharge adequately until locks and secondaries are run.

At the 0.5 level, somatics in the occluded case, the partially occluded case, or the wide open case will be found to be so light as to be practically non-existent, according to usual experience.

Below this level somatics do not exist at all.

The auditor should very thoroughly recognize somatics for what they are -the physical pain of past injuries. He should recognize, further, that it is the somatic, in the first place, which makes locks and secondaries possible. And he must further realize that somatics are buried beneath anaten and misemotion, when these are present. He must not believe, however, that just because somatics make locks and secondaries possible, his primary mission is to run somatics off the case, but where somatics are not easily available he must be very chary of trying to find them, and should devote himself to locks and secondaries rather than somatics. He will discover that by discharging locks and secondaries he can very often relieve what have been called psychosomatic illnesses.

Running somatics is the act of putting the case into permanent good shape. Running locks and secondaries is a much more rapid way of raising the tone of the case; however, that tone can fall again so long as engrams remain. It is theoretically possible to bring a case up to 3.0 or 3.5 without ever running a somatic; but this is not possible in common experience, and one has to run physical pain engrams when they offer themselves, save in those cases where so little free theta is available that by running a somatic the remaining free theta may become enturbulated and involved with the engram, forming a new lock in auditing. Such an act can take the borderline psychotic down into the psychotic band. This is prevented by addressing locks and secondaries on the borderline case, rather than somatics. The auditor should not try for specific somatics in the case in the hope of relieving chronic illnesses. He can best address a specific chronic somatic by running locks and secondaries involved with that somatic.

Merely by running the preclear through various parts of his life, up and down the track, the auditor may relieve enough anaten and misemotion from the case to permit somatics to occur. This was once upon a time known as "greasing the track." However one should not run a preclear into a somatic unless one intends to reduce it or to discover the basic on the chain and reduce that. Once somatics are contacted they must be reduced; if they do not easily reduce on a few recountings, an earlier engram or a chain of locks or a secondary should be found which inhibits the somatic from reducing.

It is the somatic which predisposes a case to illness. An old physical pain in an area of the body weakens that area, to the extent that there is a remembered injury in it; body fluids approach the area with caution. When that old injury is restimulated, the approach of body fluids is inhibited even more, and so the area is denied, more and more, the nourishment, support, repair, and protection which the general flow of fluids in the body is designed to bring about. Bacteria are then able to enter the area and maintain themselves, and an illness can result, according to theory and according to what has been observed while working with Dianetics on many people. If the somatic in the area is heavy, the presence of bacteria may further restimulate it, and so the illness is perpetuated and becomes a chronic infection. In the case of a simple pain -- known to doctors as "strange, bizarre pains" -- or of rheumatoid arthritis, it may only be that the somatic itself is restimulated, and the reduction of the somatic is often attended by the sudden loss of the psychosomatic illness. This is not to make the claim that removing the somatic cures a psychosomatic illness: such a claim is specifically forbidden by law, as applied to past healing arts. Clinical experience, however, law or no law, demonstrates this to be a workable theory in practice. Any law which would seek to force people to remain ill when they might be well would be an evil law. Furthermore, the laws of man have never been able to do much to suppress the laws of God.

CHAPTER THIRTEEN

COLUMN K

Speech, Talks

Speech, Listens

Probably the most accurate index for the auditor of the preclear's position on the tone scale is speech. Here is a generalized manifestation of perceptic communication.

Engrams can induce, by specific command, too much talking, too little talking, too much listening to other people, or too little listening. Throughout the chart there is this liability that the individual is operating upon compulsive or obsessive commands regarding one or more of the columns. The average position on the columns is the most important. A manic, telling a person to talk continuously, or a suppressive engram, requiring a person to do nothing but listen, will produce such behavior; but unless a person talks openly and listens receptively he cannot be considered very high on the tone scale. There are double boxes in the speech column: one set referring to talking, the other to listening. It may not have occurred to some people that communication is both outgo and income. An observation of how a person both listens and talks will make it possible to form an opinion as to whether or not the person is operating on an engramic command either about listening or about talking: because usually one or the other, talking to or listening, will be an accurate indication of his position on the tone scale. A person who is not operating on engramic commands which deny or enforce either talking or listening, will talk and listen more or less equally. Mind operation being what it is, as a person drops lower and lower on the tone scale his affinity potential, his reality potential, and his communication potential also drop. Thus, by entirely mechanical means, we get reduction of visio, sonic, somatic recall, all other perceptics, and talking and listening. The highest level of the scale contains the faculty of communicating completely and withholding nothing; also the ability to communicate with complete rational selectivity, also the ability to be conversationally creative and constructive.

At this high level of the scale, the individual is able to listen to everything which is said and evaluate it rationally. He can listen to entheta communications without becoming severely enturbulated. He can receive ideas without making critical or derogatory comments. And, while receiving another person's ideas, he can greatly aid that person's thinking and talking.

At the level of 3.5, the individual is capable of communicating deeply-felt beliefs and ideas to others and can communicate with others selectively, which is to say, he can cut off entheta lines, and hold back or give forth conversation according to the rational or pleasant circumstances of the moment. The individual at this level can listen without becoming critical and can aid and assist others in conversation, but he is apt to become enturbulated slightly if given entheta conversation.

Between 3.5 and 3.0, the ability of a person to talk to others decreases to a tentative expression of a limited number of beliefs and ideals and borders on the conservative. He may have a very conservative reaction toward people who have highly creative and constructive ideas. He is critical of flagrant irrationalities. In other words, from 3.5 down to 3.0 we are in a band where injury from life has created a defensiveness on the part of the individual.

At 3.0, the speech of the individual becomes more casual and reserved. Here is the level of small talk, about weather and good roads. At this level the individual has a resistance toward ideas which are too massive. An analytical fear is expressed here of being not quite at ease. At 2.5, we have the level of indifference to conversation with others, a "let's not argue about it" attitude, a dismissal of communication, a carelessness as to whether one's conversation is being received or is even understandable. Between 2.5 and 2.0 we have a level where communication from other people is refused, and where one does not like to talk.

At 2.0 we reach a level of antagonistic conversation. The individual is apt to nag or to make derogatory comments to invalidate other people. On this level the individual can only be roused by nagging, nasty cracks, invalidations, and other antagonistic communication.

At the 1.5 tone level, we have a shutting off of other persons' conversation, a complete refusal to listen, and efforts to destroy incoming conversation. The conversation which is given forth by an individual at this level is forthrightly destructive and is given without any thought of the possible retaliation which may result from this destructiveness. Conversation on this level could hardly be called conversation, as it is a forward motion toward destruction and a refusal to accept anything which might prevent that destruction.

Below this level, before we reach 1.1, the individual sinks into stubborn silence, sulks, refuses to talk. He will not listen to any communication of any kind from other people, except that which encourages him in his attitude. At 1.1, we have lying, to avoid real communication. It takes the form of pretended agreement, flattery, or verbal appeasement, or simply a false picture of the person's feelings and ideas, a false facade, an artificial personality. Here is the level of covert hostility, the most dangerous and wicked level on the tone scale. Here is the person who smiles while he inserts a knife blade between your vertebrae. Here is the person who tells you he has stood up for you, when actually he has practically destroyed your reputation.

Here is the insincere flatterer who yet awaits only a moment of unguardedness to destroy. The conversation of this level is filled with small barbs which are immediately afterwards justified as intended compliments. Talking with such a person is the maddening procedure of boxing with a shadow: one realizes that something is wrong, but the guardedness of a 1.1 will not admit anything wrong, even as, all the while, he does his best to upset and wreak havoc. This is the level of the pervert, the hypocrite, the turncoat.

This is the level of the subversive. From such a person one should never expect an outright frontal attack; the attack will come when one is absent when one's back is turned, or when one sleeps. Any luckless person married to a 1.1 is, literally speaking, in danger of his life and sanity; for such a person is incapable of any real affection; such a person is so introverted that any demonstrated affection is a hectic sham. Such a person will opportunistically take any avenue which leads to his own security and will leave in the lurch anyone he has pretended to call his friend.

A 1.1 is the most dangerously insane person in society, and is likely to cause the most damage. Because of the covert nature of this insanity, it is completely beside the point whether such a person is pronounced insane by any agency. On this level there is no concept of honor, decency or ethics; there is only desperate, death-bent thought of self and of damage to others. Society can handle the angry man; it knows what to expect from him. Society can handle the apathy case; his insanity is obvious.

But the 1.1 is a skulking coward who yet contains enough perfidious energy to strike back, but not enough courage ever to give warning. Such people should be taken from the society as rapidly as possible and uniformly institutionalized; for here is the level of the contagion of immorality, and the destruction of ethics; here is the fodder which secret police organizations use for their filthy operations. One of the most effective measures of security that a nation threatened by war could take would be rounding up and placing in a cantonment, away from society, any 1.1 individual who might be connected with government, the military, or essential industry; since here are people who, regardless of any record of their family's loyalty, are potential traitors, the very mode of operation of their insanity being betrayal. In this level is the slime of society, the sex criminals, the political subversives, the people whose apparently rational activities are yet but the devious writhings of secret hate. A 1.1 can be accurately spotted by his conversation; since he seeks only to enturbulate those around him, to upset them by his conversation, to destroy them without their ever being aware of his purpose. He listens only to data which will serve him in his enturbulations. Here is the gossip, here is the unfaithful wife, here is the card cheat; here is the most undesirable stratum of any social order.

No social order which desires to survive dares overlook its stratum of 1.1's. No social order will survive which does not remove these people from its midst.

The 1.1 is so low on the tone scale and yet so active mentally, as a rule, that he is very difficult to process. The longest and most arduous course of therapy may still leave the auditor baffled by a mind which is so full of circuits that no real desire for improvement on the part of the preclear can make itself felt. The auditor may feel that only an offer of an obvious present-time advantage, like being let out of confinement, would tempt this preclear into genuine cooperation. The auditor may feel that this case is just not salvageable. But if, in the case, the auditor can manage to remove some of the circuits or destimulate them he may be able to make progress. It takes a very clever Dianetician to do anything with a chronic, computational 1.1.

The 0.5 talks dolefully and hopelessly in terms of bad things which are happening and will happen and for which there is no remedy. He listens only to such conversation. He cannot be heartened or cheered up but will slump immediately into his apathy. Here is hopelessness. At 0.1, we have an inability to talk, and an individual who is completely unresponsive to conversation.

It is interesting to note that the auditor can, with this column conduct what we call a "two-minute psychometry" on the preclear. The trick is simply to start talking to the preclear at the highest possible tone level, creatively and constructively, and then gradually drop the tone of one's conversation down to the point where it achieves response from the preclear. An individual best responds to his own tone band; and an individual can be lifted only about half a point on the tone scale by conversation. In doing this type of "psychometry" one should not carry any particular band of conversation too long, not more than a sentence or two, because this will have a tendency to raise slightly the tone of the preclear and so spoil the accuracy of the test.

Two-minute psychometry, then, is done, first, by announcing something creative and constructive and seeing whether the preclear responds in kind, then, giving forth some casual conversation, perhaps about sports, and seeing if the preclear responds to that. Getting no response the auditor starts talking antagonistically about things about which the preclear knows -- but not, of course, about the preclear -- to see if he achieves a response at this point. The auditor may then give forth with a sentence or two of anger against some condition. Then the auditor can indulge in a small amount of discreditable gossip, and see if there is any response to that. If this does not work, then the auditor dredges up some statements of hopelessness and misery. Somewhere in this range the preclear will agree with the type of conversation that is being offered -- that is, he will respond to it in kind. A conversation can then be carried on along this band where the preclear has been discovered, and the auditor will rapidly gain enough information to make a good first estimate of the preclear's position on the chart.

This two-minute psychometry by conversation can also be applied to groups. That speaker who desires to command his audience must not talk above or below his audience's tone more than half a point. If he wishes to lift the audience's tone, he should talk about half a point above their general tone level. An expert speaker, using this two-minute psychometry and carefully noting the responses of his audience, can, in two minutes, discover the tone of the audience -- whereupon, all he has to do is adopt a tone slightly above theirs. In Italy and Germany, where an entire people were at the level of 1.0 or slightly below, two death talkers, Mussolini and Hitler, were received by great crowds with wild enthusiasm. A powerful saint could have come forth and talked to these people in the most creative and constructive terms and would have had no response from them at all. This phenomenon has led historians to believe erroneously that individuals were created by the moment and that the moment was not created by the individual. Some instinct prompted these extinct leaders of Europe to seek and find the point on the tone scale at which they could most rapidly seize the attention of their audiences. It so happens that anyone in the 1.5 band will bring about disaster regardless of his stated intentions. A death talker can bring an entire people up to anger and hold them there long enough to destroy them, as did Mussolini and Hitler during the second phase of World War I.

CHAPTER FOURTEEN

COLUMN L

Subject's Handling of Written or Spoken
Communication when Acting as a Relay Point

As in speech, it is a mechanical fact that a person at a certain position on the tone scale tends, unless affected by engrams specifically demanding different action, to follow a definite pattern in handling messages when acting as a relay point.

This is mentioned here partly because it is important to organizations, but mostly because it is a good diagnostic point for the auditor. What does the subject do with letters he is given? Does he answer them, or does he put them away? When you give him a message to give to somebody else, does that other person receive the message which you wanted him to receive, or is it twisted or altered in some way, or is it not delivered at all?

The handling of messages approximates the ability of the individual to contact his own standard memory bank -- which is to say, he will handle in the external world various communications from one person to another just as his own circuits handle information between his standard memory bank and himself. At the highest level of the tone scale we have complete communication, and at the lowest level we have no communication at all.

At 4.0, the individual passes communications freely, contributes to them, normally, and rather tends to cut entheta communications -- which is to say, lines he knows are vicious or slanderous he is not likely to assist.

At 3.5, the individual passes communications, but resents and hits back at entheta lines -- by "line," of course, is meant communication line, which is any sequence through which a message of any character may go.

At 3.0, we begin to get a breakdown of the communication line on which our individual is acting as a relay point, because an individual at this level is likely to be slightly suspicious of 4.0 construction and creation and is likely to tone down the message considerably. Here we have conservatism; and conservative communications are most rapidly relayed at this level. Here the individual does not readily lend himself to either an entheta line or to a heavy theta line.

At 2.5, the individual devaluates emergencies. He is not likely to believe a very highly constructive message or a destructive message. He handles communications above or below his level poorly, but passes communications which are at the boredom range.

An individual at 2.0 deals mostly in hostile or threatening communications. He lets only a small number of constructive communications go through, tends to select out theta communications, and tends to pass entheta communications -- which is to say he will make himself a party to slander but will not make himself a party to high endeavor unless it happens to fit his own antagonistic purposes. Here we have a very poor relay point but one which, when pressed, will function.

At 1.5 we run into a relay point level which is a dangerous one in any organization, or nation, or family, since here all good, constructive, theta communications are stopped or perverted in some way. Suspiciousness and other entheta elements are added to the communication before it is sent through. This level favors and most readily passes angry communications which will cause destruction. Giving a communication to such a person to give to someone else will most certainly bring about different results than one intended, when that communication has been relayed.

At around 1.3, all theta communications are cut, and malicious communications are most readily relayed. Communications that are passed are twisted and perverted.

Around 0.9, we have an individual who tends to cut communication lines and who, on one pretext or another, will not relay communications. At this level we have the individual who specializes in secret communications and is apt to give the classification of secret or confidential to the most banal matters.

At 0.5, the individual takes very little heed of communications. He cannot see the necessity of passing anything to anybody -- it's "hopeless" anyway, and so there is "no point in doing anything about it." At 0.1, of course, the individual is unaware of communications of any kind and so does not relay them.

This subject is much more exhaustively covered in the field of Group Dianetics, since it applies, with enormous importance, to the conduct of business, governments, armies, and other organizations. One might safely say that ninety-five percent of an executive's trouble is with communication lines. This index on the tone scale will give him some idea of what to expect from certain of his subordinates. If any executive is surrounded by individuals who will not pass communications or who pervert communications, he can be very certain of trouble in the organization, caused by this point alone.

The auditor can establish his preclear's position on the tone scale by observations and inquiries about his preclear's handling of written and spoken communications when acting as a relay point. He may best do this by giving the preclear a message to relay to someone else, in order to see what happens to that message -- the preclear, of course, thinking not that this is a test, but that it is a sincere effort to relay a communication.

CHAPTER FIFTEEN

COLUMN M

Reality
(Agreement)

As has been said in earlier chapters of this book, the quality known as reality exists, so far as we know, mainly because we agree that it exists. The entire physical universe, according to the tenets of nuclear physics, is reducible to near-zero, if we think in terms of an actuality that can be sensed, measured, or experienced. Matter and energy exist in space and time; but matter is composed of energy; and energy seems, at best, to be a motion rather than a substance. For a motion to take place, one sees that space and time are necessary, but that space and time are themselves such strange entities, according to Einstein and others, that they are also reducible and expandable and are not sharply defined entities. Much could be said on this subject, all more or less of a confusing and indecisive nature. Philosophers for many centuries have been debating over the reality of reality, and each one has come to the final admission that man agrees that he perceives something with his various senses and that man has agreed to call this reality.

For our purposes, the lowest common denominator of reality could be called, then, agreement. If you and I both agree that we are gazing at an automobile, then that automobile has reality for us. If another person comes forward and says that it is not an automobile but a barrel of olives, then you and I are apt to suppose him crazy. Majority opinion rules, where reality is concerned. Those who do not agree with the majority are commonly pronounced insane, or are exiled, and thus we have a sort of continuous natural selection which gives us a social order that has agreed upon certain definite realities. Anyone who seeks to alter those realities in any way is attacked, unless the strength and force of his reason are such that they carry into the minds of men a new reality on which those men can agree.

There are, actually, two kinds of reality. There is the reality which can be sensed, measured, and experienced in the physical universe. This MEST reality is so thoroughly constructed into a human being genetically and is so uncompromisingly consistent in its behavior, as in the science of physics, that man finds it unwieldily consistent and so works, as in the science of physics, to discover certain natural regularities of behavior of the physical universe. When new data about the physical universe is discovered to compare favorably with what the current age is accustomed to sense, measure, or experience, a high order of agreement is attained. A second type of reality is postulated reality, which is brought into being by creative or destructive imagination. This reality borders over into the still unexplored field of aesthetics. There are men, usually in the fields of the arts and philosophy, who postulate new realities for the social order. Social orders progress or decline in ratio to the number of new realities which are postulated for them. These postulates are made, usually, single-handedly by men of imagination. Social orders are normally very conservative and seek to hold hard to old realities. The reason for this is a simple one. In the absence of wide communication networks by which new realities can be generally offered it takes considerable time for the new reality to become known. Indeed, a new reality postulated by some individual becomes known in direct ratio to the velocity and magnitude of the idea. There undoubtedly exists a formula for the speed and advance of ideas. For example, a man named Ibsen, by writing a few plays, wildly altered single-handedly the entire cultural aspect of Scandinavia within a few years. Ideas, and not battles mark the forward progress of mankind. Individuals, and not masses, form the culture of the race. On a lesser scale actors and other artists work continually to give tomorrow a new form. Hollywood makes a picture which strikes the public fancy, and tomorrow we have girls made up like the star walking along the streets of the small towns of America. A Hollywood interior decorator dresses a set which takes the eye of the American audience, and tomorrow that set is seen in the apartments of Miami Beach and other resorts. A culture is as rich and as capable of surviving as it has imaginative artists, skilled men of science, a high ethic level, workable government, land and natural resources, in about that order of importance.

One might postulate two more realities. The first is that of the Supreme Being. No culture in the history of the world, save the thoroughly depraved and expiring ones, has failed to affirm the existence of a Supreme Being. It is an empirical observation that men without a strong and lasting faith in a Supreme Being are less capable, less ethical, and less valuable to themselves and society. A government wishing to deprave its people to the point where they will accept the most perfidious and rotten acts abolishes first the concept of God; and in the wake of that destroys the family, with free love; the intellectual, with police-enforced idiocies; and so reduces a whole population to an estate somewhat below that of dogs. A man without an abiding faith is, by observation alone, more of a thing than a man. Modern science, producing weapons for the annihilation of men, women, and children in wholesale lots, has solidly run itself aground on the reef of Godlessness. Modern science has gone so far as to advocate the rise of man from mud and clay alone; has denied to him even a semblance of a soul; and so has not only solved none of the problems of the humanities, but has aided and abetted Godless totalitarian governments which seek nothing less than the engulfment and enslavement of all men and the extinguishment of every spark of decency in the breast of every human being. These two tracks which have led away from the affirmation of the existence of a Supreme Being -- modern science and totalitarianism -- are bringing man into a machine-like state of being where the ideal has become a lump of muscle, greasy with sweat, or a grimy mechanic serving a howling monster of steel. The arts, the humanities, and the decencies are fallen away from, until they are like tiny stars shining across a great, black void. The abandonment of the admission of a Supreme Being as a reality, intimate to the life of man, makes prostitution the ideal conduct of a woman; perfidy and betrayal the highest ethic level attainable by a man; and obliteration by treachery, bomb, and gun the highest goal attainable by a culture. Thus, there is no great argument about the reality of a Supreme Being, since one sees, in the failure to countenance that reality, a slimy and loathsome trail, downward into the most vicious depths.

The theta universe is a postulated reality for which there exists much evidence. If one were going to draw a diagram of this, it would be a triangle with the Supreme Being at one corner, the MEST universe at another, and the theta universe at the third. Too much evidence is forthcoming in research to permit us to overlook this reality. Indeed, the assumption of this reality is solving some of the major problems of the humanities and fills in many gaps which existed formerly in the theory of the engram. It has long been considered beneficial in psychotherapies for a person to be able to face reality. However, none defined what reality was, and so the individual found this rather difficult.

There would be two realities with which the individual was most intimately concerned. The internal reality, of his own existence and past, and the external reality, of his present-time environment. To this could be added, of course, his future reality.

The reality tone scale on extroversion-introversion would be, at a glance, that around tone 4.0 the interior world was sufficiently comfortable so that the individual's thought and perception was mainly directed toward the exterior world and his computation had to do with present time and the future. And as one descended the tone scale, one could see the gradual involvement of free theta with enMEST, with less and less concern with the exterior world and the future and more and more involvement in the interior world and the past, until the majority of the theta was enturbulated and death ensued. There would be, then, an extroversion-introversion scale which would mark very sharply the position of the person on the tone scale. The position of the person would, of course, be determined by the amount of free theta with which he was endowed and the percentage of that theta which had become entheta. Yet another reality scale could be postulated on the basis of the theta perceptics, but that is beyond the scope of this work. The general attitude of the individual with regard to reality, as shown on the tone scale, would be as follows:

At 4.0, the individual would be creatively and constructively inclined toward reality. He would be more likely to adjust reality to him and to postulate new future realities than he would be to adjust himself to existing realities. He would search for different viewpoints and

changes in reality in order to broaden his own reality. He would have a complete flexibility and understanding in relating and evaluating different realities. At 3.5, the individual would have the ability to understand, relate, and evaluate realities, regardless of the difference in viewpoint; moderate flexibility about realities brought to view, without eager search for new ones. A little lower on the tone scale, the individual would be involved with attempts to reconcile his own reality with conflicting realities, and he would have a limited flexibility. At 3.0, the individual would possess an awareness of the possible validity of a different reality without relating this to his own reality.

At 2.5 would ensue an indifference to conflicting realities, a “maybe -- who cares?” attitude. Below this would be a refusal to match two realities, rejecting conflicting realities.

At 2.0 would be found verbal doubt, defense of one’s own reality, and attempts to undermine the reality of others. Here is the critical level, and criticism intensifies from here down to 1.0 and then dies out.

At 1.5, the individual is mainly concerned with the destruction of opposing realities, wrecking or changing them, knocking apart the realities of other people. The environmental reality would be attacked, with destruction in view. The only change that would take place would be a destructive change.

Below this would be doubt of the opposing reality, a nonverbal disbelief a refusal to accept the disbelief of others, a refusal to accept conflicting realities without trying to fight back.

At 1.1 on the tone scale would ensue doubt of one’s own reality, insecurity, and attempts to gain reassurance. In the sphere of MEST realities there would be appeasement of gods or elements.

At 0.5 we would have shame, anxiety, strong doubt of one’s own reality with a consequent inability to act within it. If the person is to act at all he must be told what to do. He is afraid to act of himself since he has no way to assess the consequences.

Below this is a complete withdrawal from conflicting reality and a refusal to recognize the existence of any reality but one’s own, in which one is rigidly locked.

At tone 0.0, the only reality is death.

CHAPTER SIXTEEN

COLUMN N

Condition of Track and Valences

Everyone has a time track. To some preclears, this may not be immediately apparent.

The time track consists of all the consecutive moments of "now," from the earliest moment of life of the organism to present time. Actually, the track is a multiple bundle of perceptics; and it might be said that there is a time track for each perceptic, all tracks running simultaneously. The track might also be considered as a system of filing recordings made of the environment and the organism, filed according to time received. All the perceptions of the environment and the organism during the entire lifetime, up to now, or present time, are recorded, faintly or deeply, upon the time track.

It was not generally known, before Dianetics, that the time track existed for an awake and conscious person and that the individual could move upon it. In the field of hypnotism something was known of the phenomenon, but it had been indifferently studied and was thought to be available only to a hypnotized person. Experiments conducted by experts in hypnotism have demonstrated that the person, awake, moves more readily on his time track than a person in a hypnotized state.

There is actual perception of movement on the time track, if the individual is moving. Present time is an ever extending moment; and a person who is free on his time track is generally in present time, moving forward through the consecutive moments of time.

A primary concern of the auditor is to keep the case of his preclear in such good condition that the preclear can continue to move upon the time track and contact locks, secondaries and engrams in order to recount them at the place they occur a sufficient number of times to reduce or erase them. It is possible for the auditor, by failing to conduct his preclear properly through locks, secondaries and engrams, to cause the preclear to stick upon the time track in some moment of the past. When this happens the preclear is not able to move upon the time track, and the auditor should make it his first concern to return mobility to the preclear.

Various things can happen to the preclear with relation to the time track. The most upsetting of these is when a grouper, a phrase such as "pull yourself together," "it all happens at once," "everything is against me," "it all comes down to this," and other action phrases which would tend to bunch all incidents in one place, creates the illusion that the time track is collapsed and that all incidents are at the same point in time. A case must be heavily charged and the action phrases in the case must have considerable effectiveness with the preclear before this can happen. The auditor can detect its occurrence rather easily, and at the first difficulty with the time track, the auditor should suspect a grouper.

The question of how early the time track goes has not been completely resolved. The auditor, in the absence of such resolution, should take into account the fact that considerable experimental evidence exists that the time track continues into the past earlier than the life of the present organism. There is a possibility that the time track is a portion of what we call the theta body rather than of the organism itself. There could be a genetic time track which would go back through the generations preceding the organism, but experimental evidence has not borne out this possibility uniformly, as it has the existence of the theta body. Thus, the auditor should be prepared to discover some astonishingly early incidents; and if and when he does discover them he should be very careful to run them and to erase or reduce them, or if they will not reduce, to find an earlier incident which can be erased or reduced, in order to relieve them. It is not in the province of the auditor to question the data of the preclear in any way; it is in the province of the auditor to reduce any and all engrams which he recovers in the case.

In addition to the grouper, there can be other troubles with the time track. The most common of these is for the preclear to be stuck in an incident of the past. A holder (a phrase like “stay here”) existing in an engram has seized him at some earlier age, and he is not in present time but is locked in an earlier period of his life, which also contains pain and unconsciousness or heavy grief of fear charges.

Lock scanning or running earlier engrams generally remedies this condition. This condition is checked for very simply, by the use of the flash answer. As will be covered elsewhere, the auditor uses the file clerk of the preclear. The file clerk uses automatic response mechanisms which are not “thoughtful” mechanisms but instantaneous replies, the first thing that flashes into the preclear’s mind at the snap of the auditor’s fingers. The auditor asks the preclear for a date, and snaps his fingers; the preclear may not give the present-time date; if he does not, he is giving the date of the moment where he is stuck on the track. Simply asking various people around you their age will give you considerable data on this mechanism. Tell these people to give you the first number that comes into their heads when you snap your fingers, and then ask them “How old are you?” (snap !). In a number of instances you will get ages much earlier than present time. Asking them to remember what happened at that period will very often bring them up to present time, where they may not have been for years. An auditor could walk through any sanatorium and simply tell patient after patient “come up to present time,” and he would find that some very small percentage of the “insane” people would come up to present time and would begin to be sane: this has been done several times, with some astonishing results. This is mentioned to give the auditor some idea of the importance of having the preclear in present time and the importance of being in present time. Flash answer checks can also be done by the following mechanism: the preclear is asked to give the first answer that flashes into his head, yes or no, to each of the following questions; the auditor then says “Hospital?” to which the preclear answers yes or no; the auditor then says “Nurse?” and the preclear gives him a yes or no. When the preclear is unable to recall anything having happened at the age he gives in lieu of his present-time age, by flash answer, this yes-or-no check will serve to tell the auditor the nature and character of the incident in which the preclear is held. The preclear’s memory can then be more ably directed toward discovering whether it was an accident, an injury or an illness in which he was concerned and who gave him the holder which keeps him in the incident. Sometimes merely remembering the incident will free the preclear so that he can come to present time. Sometimes in a case which has been non-sonic there is sonic at the exact moment where the preclear is held, and the sonic phrase is the holder by which the preclear is held.

Simply directing the preclear’s attention to a pleasure moment and running him through it many times, over and over, particularly one in which the preclear was victorious as himself, will often snap the preclear out of an engram in which he is held and permit him to come to present time. It is common procedure to end all sessions by running the preclear through some pleasure moments in order to bring him easily and completely to present time.

Another mechanism which gives the auditor trouble in bringing the preclear to present time or moving him on the track is the call-back. Such phrases as “come here,” “come back,” and other action phrases which would, in present time, cause the preclear to move back to another position in space, act, when contained in engrams, to pull the preclear down from present time into the engrams. It often happens that the auditor tries to bring the preclear to present time and every time the preclear nears present time he is pulled back down the track to an earlier age. This is caused by a call-back.

Another mechanism which keeps the preclear early on the track is the down bouncer. This type of phrase is one which tells the person to “get down” or “get back” and keeps the preclear below the actual incident in which he is held.

Another difficulty on the track is the bouncer. The preclear may be in an engram and yet be bounced into present time. This creates a situation in which the preclear seems to be in present time but is actually under considerable tension being held in an engram.*

Another difficulty with the time track is the misdirector. This would be a phrase which, when the auditor sends the preclear in one direction, makes the preclear go in another direction. Such a phrase as “you do everything backwards” causes this situation. When the auditor tells the preclear to come up to present time, if such a phrase is active the preclear may go back to basic-basic (the first engram in the case). Any case in which phrases are this active is a highly charged case, and it will be necessary for the auditor to get rid of many locks and secondaries before he can run engrams.

Another difficulty which affects the time track, but is not exactly a time-track difficulty, is the matter of valence.

A valence is a false or true identity. The preclear has his own valence; then there are available to him the valences of all persons who appear in his engrams. A valence-shifter is a phrase which causes the individual to shift into another identity. The phrase “you ought to be in his shoes” and the phrase “you’re just like your mother” are valence-shifters, which change the preclear from his own identity into the whole identity of another person. There are, then, many valences open to the preclear. The valence is a whole identity.

In the handbook issued in 1950 (DIANETICS: The Modern Science of Mental Health, by L. Ron Hubbard), there was an error (pg. 283) in the omission of quotation marks around the phrase “stuck in present time.” It is not possible for an individual to be stuck in present time. He is always stuck in an engram. Some people who find it very difficult to move on the track seem to be stuck in present time, but they are not. Lock scanning or the running of a secondary or the location of the actual engram in which the preclear is stuck will serve to get the preclear moving on the track. to have all the troubles grandfather had and most of the peculiarities and characteristics. These characteristics do not have to be contained in engrams themselves; they are simply part and parcel of the valence. The preclear may be in several valences at once, in a synthetic valence, or in no valence at all. Or he can be in his own valence. If the preclear is not in his own valence, every effort should be made in the course of processing to cause him to find his own valence. Running pleasure moments very often brings the preclear into his own valence.

Being out of valence is a primary cause, evidently, of sonic, visio and somatic shut-offs. The auditor may be running an engram in which the preclear has sonic, visio and somatics which suddenly disappear. The first thing he should suspect is a valence-shifter. He asks for a yes-or-no flash answer as to whether a valence-shifter is present, and if the answer is yes, he asks for the wording of the valence-shifter, and when he gets the words he has the preclear repeat them, and the preclear will go back into his own valence and visio and sonic will turn back on. Most cases which are occluded are out of valence.

Valence is a survival mechanism, one of the means used by the mind to escape too painful an existence; therefore, in order to get the preclear into his own valence much of the charge has to be unburdened from the track. Locks can be scanned with the individual out of valence. In most secondaries, where terror and apathy are present, the preclear will be found to be out of valence. It is necessary to run such an incident several times before the preclear can get into his own valence and so get a proper discharge of the grief fear, or apathy.

On the tone scale we see that we are, again, involved with two different types of cases. The first is the case which is wide open, in valence, with sonic and visio, although highly charged; being too weak structurally to cover up charge, this case stays in its own valence though that valence is too painful to bear. The other type is the one in which the mind has the ability to get out of valence and so occlude painful moments in the past. The mind ordinarily chooses winning valences. Valence-shifters, however, can force the individual into the valence he abhors. Continued repetition by a parent that the preclear is “just like grandfather” but that he “must not be like grandfather” because “grandfather is detestable” will bring about a conflicting situation in which the preclear is forced, by valence shifters, to occupy a character he feels is abhorred. This is the primary mechanism which causes an individual to “detest

himself; he actually does not detest himself at all; he detests the valence in which he has been forced to live.

The chart is self-explanatory for the occluded case. It goes without saying that in a wide open case the person is in valence from top to bottom, wherever he is on the tone scale. From this it should not be adjudicated that it is either desirable or undesirable to be a wide open case; such cases are relatively easy to work. The occluded case, when finally in his own valence, with sonic and visio, and with most of his engrams gone, is in excellent condition, with a very high mental potential.

The condition of the track is normally regulated by the factors of charge, valence-shifters, and action phrases. In view of the fact that action phrases are not active unless there is heavy charge on the case, it actually comes down to the fact that the condition of the track and of the valence of the preclear is regulated by charge. By charge, of course, is meant anger, fear, grief or apathy contained as misemotion in the case. This form of entheta (there is other entheta, in the form of communication and reality secondaries, as well as misemotion secondaries) charges up the track so much that the action phrases act. The charge must be very heavy on a case before engram action phrases -- action phrases contained in engrams themselves -- can be active. The charge must be much heavier for action phrases to be active in secondary engrams, which are those containing misemotion and communication and reality breaks and enforcements. The charge on the case must be extreme indeed for action phrases to be active in locks.

Thus it can be seen that the condition of the track and valences is mainly a matter of charge. In the wide-open case, a tremendously heavily charged track brings the individual into a psychotic level. The inability of the mind to occlude and encyst charge gives us the strange picture of an individual who can move on the track and who can run through engrams and who has sonic and visio but who is psychotic. These people are relatively easy to work; but the primary target should be the removal of charge, regardless of the temptation to run engrams, because such people will lock up on the track if the auditor makes the mistake of running engrams because they are easy to reach.

CHAPTER SEVENTEEN

COLUMN O

Manifestation of Engrams and Locks

Human conduct, in the absence of engrams, can be considered to be good, from the viewpoint of the individual and his group, as modified by the education and environment of that individual. The individual without engrams seeks survival along all of the dynamics, in accordance with his breadth of understanding.

This does not mean that a Zulu who has been cleared of all of his engrams would not continue to eat missionaries if he were a cannibal by education; but it does mean that he would be as rational as possible about eating missionaries; further, it would be easier to re-educate him about eating missionaries if he were a clear. Being a clear does not mean being a reeducated or a re-environmented or a re-geneticized individual; but it does mean that all possible free theta in the case can be brought to bear on the problems of the environment and the future and that all the data in the analytical memory bank is available for the solution of those problems. Engrams and their secondaries and locks inject unalterable conclusions into the mind, so that computation becomes much on the order of trying to add two and two when an unseen hand is always adding another two to the column, unknown to the computer. An engram makes it impossible for a person adding two and two to get four; furthermore, it makes the individual do strange and irrational things, which is to say, it makes him act along non-survival lines and causes him to do things although he "should know better."

The engram, with its secondaries and locks, alters behavior by inhibiting action or thought or imagination or by causing the individual to dramatize.

So long as an individual can actively dramatize an engram, however, the engram does not become particularly charged. When the engram commands such non-survival activity that the environment censures or brings further pain to the individual, that engram begins to charge up. If an engram commands an individual to walk three times around the block every morning for his health, the engram may be effective but not troublesome so long as the individual is permitted that walk. Let him, however, move into an environment such as the army, where he is not permitted to take this "constitutional" every morning, but must stand muster instead; the dramatization is broken and, as a consequence, the action potential of the individual is observed by his analytical mind to be cut down, and the individual feels reduced in scope. When an engram in a thief commands that he steal, he may be cheerful and happy so long as he can go on stealing; then the law may step in and jail him because he steals; this breaks the dramatization and reduces him in scope and well being.

There are two sides to an engram: entheta and enMEST. So long as the thought can be dramatized, the enMEST remains quiet; but when the dramatization is broken, the enMEST, or physical pain, turns on in an effort to force the individual to do what the engram commands.

Engrams monitor individuals in this unseen way. In lower organisms than man there is a survival value to this type of reactive action. In the environment of a lower organism, the receipt of pain normally comes about because the organism is not following a survival course; therefore, if the organism attempts to do the same thing again, the pain threatens to turn on and the organism is forced into another course of action which, presumably, is better survival.

Much more could be written about human behavior and about the engram as the cause of aberrated behavior, but what the auditor wishes to know is how to audit his preclear and how to find his preclear on this chart so that he will know what type of entheta to address in the case, whether to run engrams, secondaries, or locks, and how to run them.

An engram is a moment of physical pain and unconsciousness. A secondary is a moment of misemotion where loss is threatened or accomplished. A lock is an analytical moment in which the perceptics of the engram are approximated, thus restimulating the engram or bringing it into action, the present time perceptics being erroneously interpreted by the reactive mind to mean that the same condition which produced physical pain once before is now again at hand. Secondaries contain only misemotion and communication and reality enforcements and breaks. Locks contain mainly perceptics; no physical pain and very little misemotion. These are all types of entheta. Secondaries and locks charge up engrams; it is usually not possible to run engrams in a case which is very heavily charged with secondaries and locks.

By observing his preclear, the auditor should be able to establish fairly rapidly what the preclear does with locks. In surveying the case, he may find that the preclear acts very aberratedly on the subject of religion, and yet all he can find as a cause is a scolding by a minister when the preclear was a child. The human mind is a very tough mechanism, and this is insufficient cause for aberration in a sane person. If the conduct is remedied merely by running this lock, the auditor can see that this preclear will dramatize locks, which is to say, he will act as though locks were engrams. This denotes a very highly charged case.

The auditor may discover that the preclear dramatizes secondaries, which is to say that the preclear may be a "coffin case," which lies in the position of a dead man, with arms folded. This is a grief engram having to do with the death of some loved one, and with the preclear in the valence of the loved one. The auditor will see many examples of the "coffin case." This means that the preclear will dramatize secondaries and that the track is very heavily charged, but less heavily charged than that of the preclear who will dramatize locks.

Finally we have the preclear who will dramatize only engrams. He is fairly high up the scale; is more or less normal.

The column on the chart about the manifestations of engrams and locks is self-explanatory if one understands these basic principles.

There are three types of locks: broken dramatizations, restimulations, and ARC locks.

It is a principle of theta that it desires to carry to completion any cycle of action once begun. When such a cycle is interrupted as in the breaking of a dramatization, turbulence is entered into the theta, and entheta is produced.

The restimulation lock merely brings to the person perceptions which approximate those of an engram. If the individual is tired or weary, these perceptions, sights, sounds, smells, or whatever they may be, will restimulate the engram which has similar perceptics; and the incident becomes a lock on the engram and charges it to some small degree.

The third type of lock results when affinity, communication, or reality is forced upon the individual by the environment when he does not want it, when it is not rationally necessary, or when one or more of these is inhibited or denied to the individual by others in the environment.

Some of these ARC locks which occur in a person's life are so intense and cause so much charge to enter into the engram that they are considered secondary engrams.

CHAPTER EIGHTEEN

COLUMN P

Sexual Behavior
Attitude Toward Children

This is the column devoted to the second dynamic. This dynamic would normally be called sex. In Dianetics, one considers sex to be divided into parts: the sexual act; and the produce of sex, children.

Any dynamic can be considered to be a flowing line of theta. The power of theta along any dynamic varies from individual to individual. Engrams can be considered to lie across the dynamics in such a way as to cause dispersion. When the engrams are removed the dispersion, which would be theta turning into entheta and the inhibition of the flow of free theta, disappears and the natural flow of free theta can begin again.

One sees this dispersion and entheta effect most markedly on the second dynamic. It is so clear cut that some psychotherapies, in the past, placed the entire emphasis of aberration on the second dynamic. Naturally, these psychotherapies were not very workable, since they left out the other seven dynamics, and were, indeed, severely criticized by their contemporaries for not being sufficiently comprehensive. Sex however, is an excellent index of the position of the preclear on the tone scale. It is the excellence of this index which probably brought so much attention to the second dynamic. In this current culture, sexual aberration is very high. Anything which is hidden and highly regulated in a culture will become aberrated. There is considerable confusion in the American and European cultures about sex; since there was so much perversion and promiscuity and maltreatment of children the erroneous conclusion was reached that the remedy for this lay in further regulation; whereas, in reality, it was the regulation which caused the derangement of the dynamic.

It will be noted, in observing the behavior of human beings, and on this chart of the tone scale, that promiscuity, perversion, sadism, and irregular practices fall far down the line. Free Love falls, also, in this very low band; since man is relatively monogamous and since it is non-survival not to have a well ordered system for the creation and upbringing of children, by families. A society which falls into this 1.1 band of the tone scale can be expected to abuse sex, to be promiscuous, to misuse and maltreat children, and to act, in short, much in the way current cultures are acting. It is of vital importance, if one wishes to stop immorality, and the abuse of children, to de-aberrate this dynamic for the whole group of the society, to say nothing of individuals.

At the highest MEST point of the tone scale, 4.0, one finds monogamy, constancy, a high enjoyment level, and very moral reactions toward sex; but one also finds the sexual urge acting to create more than children, and so comes about a sublimation of sex into creative thought. At 3.5 on the tone scale, we have a high interest in the opposite sex, and constancy, but we do not have so great a sublimation. At 3.0 on the tone scale, we have some falling off in sexual interest, but we have an interest in procreation and children. At 2.5, we have some disinterest in procreation, not for any reason beyond a general failure to be interested in much of anything. The sexual act can be adequately performed, given the physical ability. At the band of 2.0, we begin to get a disgust for sex, a revulsion toward sex, mostly when irregularly practised. At the 1.5 band of the tone scale, we find sex appearing as rape; we find the sexual act being performed as a punishment.

At 1.1 on the tone scale we enter the area of the most vicious reversal of the second dynamic. Here we have promiscuity, perversion, sadism, and irregular practices. We have no enjoyment of the sex act but a hectic anxiety about it. The sex act cannot truly be enjoyed whether performed regularly or irregularly. Here is Free Love, easy marriage and quick divorce, and general sexual disaster. People at this level on the second dynamic are intensely

dangerous in the society, since aberration is contagious. A society which reaches this level is on its way out of history, as went the Greeks, as went the Romans, as goes modern European and American culture. Here is a flaming danger signal which must be heeded if a race is to go forward.

At 0.5, we have impotency and anxiety about sex, with only occasional efforts to procreate. On the second dynamic we get occasional resurgences, from 0.5 up the scale, which quickly relapse.

It is interesting to note here the application of the principle of the dwindling spiral to the second dynamic. On any of the dynamics and on any column of this chart, when the individual sinks below the 2.0 level, the dwindling spiral rapidly carries him down through 1.5, 1.1, 0.5, to death. This is particularly evident on the second dynamic. The 1.1 individual, engaged in frantic pseudo-sexual activity today, will in a very near tomorrow, much nearer than he suspects, find himself or herself at the 0.5 level of impotency and anxiety.

The organs of sex, at the 0.5 level, become relatively useless; indeed, this second dynamic tone scale is closely applicable to the endocrine activity of the individual and the form and condition of the physical body. The woman who in her teens was at the 1.1 level of the scale will not have a well enough developed pelvic structure or endocrine system to permit her bearing children with ease. Difficult births are a normal result of too long a residence in a low band of the tone scale during the formative period of the body. Easy births can only be expected with women who are relatively high on the tone scale.

It is noteworthy that the 1.1 to 0.5 area of the tone scale finds the muscles, particularly the sexual muscles, without tonus. The nymphomaniac and the satyr are extremely slack-muscled, and the tonus around 0.5 is almost non-existent. In the pretended death band there is, of course, no effort to procreate. Along the -1 band, where the organism as an organism is dead but the cells still survive, it is interesting that ejaculation and sexual activity occasionally take place immediately after the death of the individual, which gives some index of the strength and force of this dynamic.

Life is defined, in cytology, as an unending stream of protoplasm from the beginning of life itself until now. Down through the ages as a continuous genetic stream, this protoplasm is modified by natural selection and environmental conditioning, as well as by what seems to be outright planning, from generation to generation. Because life is so dependent upon this lifeline, it is very easy to place too great an emphasis upon the sexual act, the thing which keeps this lifeline in a continuous stream.

The second part of this dynamic concerns itself with children, the product of sex. There is a gradient of reaction toward children, from the top to the bottom of the tone scale, which the auditor can use in order to place his preclear properly on the chart.

At 4.0 there is an intense interest in children, which extends to both the mental and physical well being of the children and the society in which these children will live. Here are efforts to add to the culture so that the children will have a better chance for survival.

At 3.5, we have a love of children, a care of them, an understanding of them.

At 3.0, we have an interest in children.

At 2.5, we have a tolerance of children, but not a great interest in their affairs.

At 2.0, we have nagging of, and nervousness about children.

At 1.5, we enter the band of brutal treatment of children, heavy corporal punishment, the forcing of the child into a mould with pain, breaking his dramatizations, upsets about his noise or clutter.

At 1.1 on the tone scale, there may be two reactions to children. There may be an actual and immediate desire for children, as a manifestation of sex. But we also may have the use of children for sadistic purposes. And we may find both of these in the same individual. We have a long-term general neglect of children, with an occasional sporadic interest in them; we have very little thought for the child's future or the culture in which the child will grow up.

At 0.5, we have mainly an anxiety about children, fear that they will be hurt, fear of this and fear of that concerning children, and a hopelessness about their future.

At 1.1, a mother will attempt the abortion of her child; and any woman who will abort a child, save only if the child threatens her physical life (rather than her reputation), lies in the 1.1 bracket or below. She can be expected to be unreliable, inconstant and promiscuous; and the child is looked upon as evidence of this promiscuity.

At 0.5 we have abortion with the specious reasoning that the world or the future is too horrible to bring a child into. With the parent at 0.5, all the natural gaiety and happiness of the child will be suppressed, and we have as unhealthy an atmosphere for childhood as one could postulate.

At 0.1, there is not even awareness of children.

It is notable, as one glances down this column, that an interest in children includes an interest not only in the bearing of the child but in the child's well being, happiness, mental state, education, and general future. We may have a person on the 1.1 level who seems very anxious to produce a child; very possibly this person is following an engram command to have children. Once the child is born we may have, in this 1.1 bracket, an interest in it as a plaything or a curiosity, but, following this, we get general neglect and thoughtlessness about the child and no feeling whatsoever about the child's future or any effort to build one for it. We get careless familial actions such as promiscuity, which will tear to pieces the family security upon which the child's future depends. Along this band, the child is considered a thing, a possession.

A half tone above this, in the anger band, the child is a target for the dramatizations which the individual does not dare execute against grown-ups in the environment -- a last ditch effort to be in command of something. Here we have domination of the child, with a constant warping of its character.

The whole future of the race depends upon its attitude toward children; and a race which specializes in women for "menial purposes," or which believes that the contest of the sexes in the spheres of business and politics is a worthier endeavor than the creation of tomorrow's generation, is a race which is dying. We have, in the woman who is an ambitious rival of the man in his own activities, a woman who is neglecting the most important mission she may have. A society which looks down upon this mission, and in which women are taught anything but the management of a family, the care of men, and the creation of the future generation, is a society which is on its way out. The historian can peg the point where a society begins its sharpest decline at the instant when women begin to take part, on an equal footing with men, in political and business affairs; since this means that the men are decadent and the women are no longer women. This is not a sermon on the role or position of women: it is a statement of bald and basic fact. When children become unimportant to a society, that society has forfeited its future. Even beyond the fathering and bearing and rearing of children, a human being does not seem to be complete without a relationship with a member of the opposite sex. This relationship is the vessel where in is nurtured the life force of both individuals, whereby they create the future of the race in body and thought. If man is to rise to greater heights, then woman must rise with him, or even before him. But she must rise as woman and not as today she is being misled into rising -- as a man. It is the hideous joke of frustrated, unvirile men to make women over into the travesty of men which men themselves have become. Men are difficult and troublesome creatures -- but valuable. The creative care

and handling of men is an artful and a beautiful task. Those who would cheat women of their rightful place by making them into men should at last realize that by this action they are destroying not only the women but the men and the children as well. This is too great a price to pay for being “modern” or for someone’s petty anger or spite against the female sex.

The arts and skills of woman, the creation and inspiration of which she is capable and which, here and there in isolated places in our culture, she still manages to effect in spite of the ruin and decay of man’s world which spreads around her, must be brought newly and fully into life. These arts and skills and creation and inspiration are her beauty, just as she is the beauty of mankind.

CHAPTER NINETEEN

COLUMN Q

Command Over Environment

It may be postulated that the mission of theta is the conquest of MEST. The organism controls as much MEST as it has theta with which to control the MEST.

One could envision command over the environment, for a man, or for a group, as a series of concentric circles. The widest circle would demonstrate the individual's or the group's considered belief in its ability to have an effect on the physical universe. The next circle, just inside, would be the individual's or the group's belief in its ability to affect all of Earth and life. The next circle inside would be the individual's or the group's belief in its ability to affect a section of life, a nation or a smaller group. The next circle would be the belief of the individual or the group in its ability to affect some other species and the men in its environ. The next inside circle would be the belief the individual or the group has in its ability to affect a few people or a small portion of its environment. The next circle would have to do with the individual's and the group's belief that it could affect the individual and the group. The next inside circle would be the individual's or the group's inability to affect self. One cannot say what would be the normal command area, but certain it is that when the command area comes to the point where the individual can barely affect the individual and the group can barely affect the group we reach a point where the only MEST (and for their purposes, as a matter of viewpoint, the individual and the group often consider life and life forms as MEST, subject to their control) which can be changed by theta is the MEST of the individual or group. Here psychosomatic illnesses set in, theta acting only within the organism, to destroy it. A group at this stage will tear itself apart. It is just slightly wider than this circle that we enter the 2.0 area of the chart. The wider areas could be said to be those where theta could act freely enough to be constructive and creative within those spheres of influence; and very close to the center of the spheres would be where entheta exists. A much more complex system which would possibly tell us a great deal about theta and MEST, could be worked out on this gradient scale, and probably should be.

The auditor is primarily interested in spotting his preclear on the chart. In order to do so he should establish what the preclear thinks he can control in terms of life, MEST, people, and groups add what the preclear thinks he would do with these if he could control them. If the preclear has constructive and creative plans in mind for the sphere he outlines, one can see that he is above the 2.0 band and that one is working with the amount of theta the individual has as his endowment, since not all men believe they can control the entire universe but should not necessarily be suspect of being psychotic should they entertain such a notion, even though it is a manifestation of psychosis to have grandiose ideas because of manic engrams. Men have existed who could control enormous spheres and be creative and constructive within those spheres, but these were not men of the sword; they were men of ideas.

Should the preclear postulate for himself a rather wide sphere and then appoint for it a destructive end, one can be sure that one is dealing with a preclear below the 2.0 level.

The auditor should keep in mind the axiom that all creation carries with it a small amount of destruction; just as one may not be able to construct an apartment building without destroying the tenement which sits there; just as one may not be able to publish a newspaper without destroying forests to obtain newsprint. It is the ratio of creation to destruction which counts. In view of the postulates laid down in this chapter, the column on the chart is self-explanatory. Some comment, however, should be made on the political ramifications contained in this column. It will be seen that the democratic area -- where one deals with Jeffersonian democracy -- lies in the bands at 3.0 and above. This postulates a belief in the goodness of men and the good sense of men in council. It postulates the belief that men should be free to decide

things for themselves. It outlaws tyranny as undesirable, and relegates government to the service of the group rather than the group to the service of the government.

One has to go well down the tone scale in order to find the next stopping point for politics, and here he locates fascism as existing between 2.0 and 1.5. Fascism is an absolute control for destructive purposes, of an environ, with forthright and strong-armed means employed in seeking that control. There are intermediate stops between democracy and fascism, such as monarchy; they are not of major interest in the world at this time, and are not within the scope of this work but belong in Group Dianetics, which will be covered completely in another volume. In today's world, the next stop down the tone scale politically is the subversive, who belongs in the 1.1 to 1.3 bracket. Most theoretical subversion pretends to be very high on the tone scale, and so has had its appeal to the liberally inclined individual; but there is a wide gap between theory and practice, and the unthinking person confuses the theory with the practice. He finds himself keeping company with 1.1's. Communication lines are cut; affinities are flagrantly used and perverted; reality is twisted; the level of truth as seen in subversive propaganda, compares with lowest gossip; and the treatment of human beings is without any regard to the respect an individual human being should have.

Subversion receives its main support from such individuals as lie in the vicinity of 1.1, and the reason it gains so many volunteer agents in lands which it wishes to overrun lies in the desire of the 1.1 to have good cause and reason to flout flagrantly and place himself "above" existing morals and the laws of the land in which he operates. He gains through his warped philosophy a very fine excuse to believe himself above such things as law and decency, and it is very possibly this appeal alone which brings so many recruits to the ranks of subversive organizations.

Editorial Note: In this column on the tone scale chart brief reference is made to certain political philosophies and attitudes in the world today. While this subject will be taken up at length in Group Dianetics, the present chart would be incomplete if it did not show that these political systems have their own tone positions and that their general methods of operation can be seen to conform with the methods and operations of individuals at these levels.

At 3.5, we have the liberal. The liberal reasons well, accepts wide responsibilities, and is guided by high ethical principles. He is eager to seize upon any new idea which will improve the society, and he is not suggestible, being swayed this way and that by any propaganda, but reaches conclusions extremely rationally. He has a high regard for individual freedom, for property, and for the right of the powerfully productive person to be allowed to contribute to the society without hindrance, spontaneously and efficiently.

At 3.0, we have the person who is democratic, but who is somewhat more conservative in his attitudes and more given to social regulations, being more in need of them. The term "democratic" is a somewhat loose one, but at this level it signifies the individual or system which allows personal freedom and has moderate regard for property and productive ability but is not particularly inventive or enthusiastic about refining and improving and enriching the social order along all of the dynamics.

The next familiar political level is the 1.5 level of fascism. The activities of Hitler and Mussolini and the social orders they produced are, of course, the examples which come to mind. The open declaration of intention to conquer, kill, and control by the most obvious and forceful methods is the mark of fascism. Justification is limited to the bluntest most bald-faced lies. Invalidation of other persons and social orders is straight-forward, angry, and lacking in any subtle pretense of reasonableness or moderation.

The next political level is the 1.1 level of Communism. The literature of Communism, particularly in the works of Lenin, sets the tone of secret, flexible, deceptive operation which is observable in the methods of Communism throughout the world. In its strongholds such as the Soviet Union, in times and sections where it is not threatened, Communism will sometimes rise for brief periods to the level of 1.5, but in its normal action it partakes of all of the characteristics of the 1.1 level as they are outlined in this present work. The willingness to

devote an unlimited amount of time to accomplishing secretly a destructive action which the fascist would accomplish immediately by force is implicit in Communism. Communism has an endless patience in tearing down by subtle propaganda a society or an idea which it never openly opposes in all that time, and an unwillingness ever to use open methods which would betray interest or activity. Communism, like the individual 1.1, makes an initial pretence of giving great assistance and help, and it keeps up this pretence in the face of any and all contradictory evidence, blandly giving forth soothing justifications and assurances of the most sincere and deeply-felt interest in the good of all.

The reader who will examine these various political manifestations in the light of the tone scale chart will find, undoubtedly, that the sometimes mysterious actions of various political factions will become predictable and understandable.

CHAPTER TWENTY

COLUMN R

Actual Worth To Society Compared
To Apparent Worth

In Dianetics we have some means of establishing the worth of a human being. In the past, the worth of individuals or groups was judged by the amount of MEST they owned. If a man had money, he was said to be worth so much money; if a group had control of property, it was said to be worth so much control of property. However, this is a non-survival definition. Whereas every individual should be entitled, unconditionally, to whatever he can earn in a society, since this is a blunt measure of his value to the society, and one should never make the mistake of believing otherwise; and by means of inheritances and strange effects to which money can lend itself it can become badly perverted as a yardstick. When it becomes perverted, men of money begin to be damned by a society and are sought out as the scapegoats for all its ills; whereas a goodly number of them are the very pivots on which the society is turning.

Subversive political movements appeal to the indigence and poverty which is the lot, unfortunately, of a majority of populaces in these days of poorly advanced culture by promising to murder every man of property once a land is taken. The whole cult of anti-Capitalism is something less than a sound philosophic postulate and rather more than a gross appeal to those who have no property and no hope of attaining any. As this philosophy has no concept of any individual worth of whatever kind, and rather tends to operate on the maxim that "five morons make a genius," it can afford to overlook any means of evaluating any human being and would rather not do so, since its practice when entering a country is to corral and murder every man of worth to that country and leave it pauperized as a race.

In the handbook, an equation was written which caused people some puzzlement; it was to the effect that potential value was equal to intelligence multiplied by the dynamics of the individual to a certain power. This might be restated as meaning that the potential value of any man was equal to some numerical factor, denoting his structural intelligence and capability, multiplied by his free theta to a power. This was written in the handbook in an effort to encourage some psychologist to discover what the power of the dynamic might be and conclude some means of establishing potential value by psychometry. Actual worth, then, of the individual would be his potential value as modified by the direction that potential value took with regard to the survival of his group or of himself. One might have an individual of very high potential value who yet, by education and engrams, was a distinct liability to himself and his group.

In this column on the chart, anyone, regardless of his potential value, below the line of 2.0 as evaluated by other columns, has a negative value to the society. Anyone above this line goes in a positive direction.

This whole scale is postulated on the fact that the brain and brawn of an individual serve the other dynamics. The remark has been made that social orders are carried upon the backs of a few desperate men. If the social order were being carried forward toward higher levels of culture by these few desperate men, they could be considered and, indeed, upon inspection would be found to lie well above the 2.0 level. When the desperation is expressed in terms of death and destruction, the individual lies below this 2.0 level and, regardless of what his actions are, will bring the society lower on the tone scale. The auditor's main interest in this column lies, again, in the estimate of the preclear's position upon it; and this column makes it possible to estimate position by examining both the actual worth and the potential value of the preclear in his environment. If the preclear normally injures -- makes enMEST out of -- those things which he seeks to control or which he owns, he can be said to lie below the 2.0 line; and if he is fairly successful in his use of MEST he lies above that line.

This column is otherwise self-explanatory.

As a member of his own social order, the auditor should take into account, when deciding which of the people around him he will take as preclears, the actual worth of those people to their family, group, and society. He will do well to spend his efforts upon those who show the highest promise, in terms of current activity while aberrated, even though these may not be the easiest cases to work. While all men are created with equal rights under the law, an examination of the individuals in the society rapidly demonstrates that all men are not created with equal potential value to their fellows.

CHAPTER TWENTY-ONE

COLUMN S

Ethic Level

The whole subject of ethics is one which, with societies at their present low position on the tone scale, has become almost lost.

Ethics actually consist, as we can define them now in Dianetics, of rationality toward the highest level of survival for the individual, the future race, the group, and mankind, and the other dynamics taken collectively. Ethics are reason. The highest ethic level would be long-term survival concepts with minimal destruction, along any of the dynamics. A reasonable examination of this subject demonstrates immediately that dishonest conduct may serve, on a short-term basis, the advantage of an individual or a group, but that a continuous line of dishonest conduct will bring the individual or the group down the tone scale. Thus, dishonest conduct is non-survival. Anything which is unreasonable in the conduct of interrelations among men could be considered unethical, since those things which are unreasonable bring about the destruction of individuals and groups and inhibit the future of the race. The keeping of one's word, when it has been sacredly pledged, is an act of survival, since one is then trusted, but only so long as one keeps one's pledged word.

To the weak, to the cowardly, to the reprehensively irrational, dishonesty and underhanded dealings, the harming of others and the blighting of their hopes, seem to be the only way of conducting life.

Unethical conduct is actually the conduct of destruction and fear; lies are told because one is afraid of the consequences should one tell the truth; thus, the liar is inevitably a coward, the coward is inevitably a liar. The sexually promiscuous woman, the man who breaks faith with his friend, the covetous pervert are all dealing in such non-survival terms that degradation and death commonly ensue. A "love" clandestinely conducted and based on lies which will bring harm to others denotes a cowardice low enough to bring nausea to any decent man. Thus, one has the ethical or unethical aspect of sex.

In the modern dictionary we find that ethics are defined as "morals" and morals are defined as "ethics." These two words are not interchangeable. Morals should be defined as a code of good conduct laid down out of the experience of the race to serve as a uniform yardstick for the conduct of individuals and groups. Such a codification has its place; morals are actually laws. The origin of a point in a moral code comes about when it is discovered, through experience, that some act is more nonsurvival than pro-survival. The prohibition of this act enters into the customs of the people and may eventually become a law. This is the natural process of creation of all law. Morals are, to some degree, arbitraries, in that they continue beyond their time. This far from states that laws are bad, as uniformity and regulation are vital to the conduct of all groups, but only that laws become outmoded now and then and need to be revised. Many things which were moral in the past were moral only because they were hygienic; and, indeed, as has been said, all morals originate out of the discovery by the group that some act contains more pain than pleasure.

In the absence of extended reasoning powers, moral codes so long as they provide better survival for their group are a vital and necessary part of any culture. Morals, however, become onerous and protested against when they become outmoded; and a revolt against morals normally has as its target the fact that the code no longer is as applicable as it was before; although revolts against moral codes actually occur because individuals of the group or the group itself has sunk on the tone scale to a point where it wishes to practice license against these moral codes, not because the codes themselves are unreasonable.

If a moral code were thoroughly reasonable, it could, at the same time, be considered thoroughly ethical, but only at this highest level could these two be called the same. Theta, in its action against MEST, is reason itself; and the ultimate in reason is the ultimate in survival. In the light of the above, the column on the chart is self-explanatory, but the additional comment should be made that at the level of 2.0 and below, destructive arbitrariness, called for lack of a better word “authoritarianism,” sets in; and that all laws made at this level, and on down the scale, will have non-survival results.

Criminals lie in the band from 2.0 down the scale, as a generality; but most criminals are found from about 1.3 downward. There is nothing very glamorous about the criminal, the breaker of his pledge, the betrayer of his friend or group. Such people are simply psychotic. This does not say that individuals who lie potentially along tone bands from 2.0 down are actively criminal, chronically, or that they are actively unethical, chronically; but it does say that during periods of enturbulence they are unethical and immoral, and refrain from being so only in ratio to the amount of free theta they still have available. They normally enturbulate easily and often, however, and while for days and weeks together they may appear to be rational, insofar as the current normal is concerned, they are a serious liability to any employer, mate, family, or group. Here again we have the condition of the acute psychotic state as opposed to the chronic psychotic state; in the acute psychotic state the person becomes temporarily insane for short periods; in the chronic state, he remains insane. If a person can enturbulate easily down to a level below 2.0, and has not enough free theta to refrain from aberrated action, he should not be given more freedom in the society than the chronic psychotic, since he is as thoroughly psychotic in his acute state of enturbulence as any constantly insane individual. Society, recognizing that the greatest danger from an individual lies in the band from anger down to 1.1, has sought to safeguard itself by suppressing these people permanently into an apathy level; this control mechanism, however, is as unworkable as it is widespread, since individuals in the apathy strata can rebound sporadically up into the active strata and so are still thoroughly dangerous. The only answers would seem to be the permanent quarantine of such persons from society to avoid the contagion of their insanities and the general turbulence which they bring into any order, thus forcing it lower on the scale, or processing such person until they have attained a level on the tone scale which gives them value.

In any event, any person from 2.0 down on the tone scale should not have, in any thinking society, any civil rights of any kind, because by abusing those rights he brings into being arduous and strenuous laws which are oppressive to those who need no such restraints. And particularly, none below 2.0, chronically or acutely, should be used as witnesses or jurors in courts of law, since their position in regard to ethics is such as to nullify the validity of any testimony they might essay or any verdict they might offer.

This does not propose that depriving such persons of their civil rights should obtain any longer than is necessary to bring them up the tone scale to a point where their ethics render them fit company for their fellows. This, however, would be a necessary step for any society seeking to raise itself on the tone scale as a social order. A fundamental of law already provides for this step, since sanity, in law, is defined as the ability to tell right from wrong. The rational, and therefore, the ethical state of persons acutely or chronically below the point of 2.0 is such that it is impossible for them to judge right from wrong. Thus, by bringing forward a simple definition not only of right and wrong but of ethics, the existing fundamental can be put into effect, should it happen, by chance, that anyone care whether our social order is drifting. It is simpler to do psychometry on one-hundred and fifty million people than to bury a culture for which we and our fathers have striven these past hundred and seventy-five years.

CHAPTER TWENTY-TWO

COLUMN T

The Handling of Truth

The metaphysician was concerned with absolute truth and considered that it transcended the limits of human experience. The social orders of his day must have been not much better than our own.

Truth is actually a relative quantity; it could be said to be the most reasonable existing data about any body of facts. Truth, as a manifestation of human conduct, would be the holding or voicing of facts as one knows them and refusal to utter or hold statements contrary to what one knows.

Creative and constructive imaginings about the future are not untruths but are postulated new realities. Few mothers there are who do not have untruths and imaginative postulates thoroughly confused, thus suppressing the necessary imaginative instincts of the child and, in fact, burdening the child with a confusion about the truth itself.

Truth may also be confused with tactlessness. A 2.0 will give forth numerous factual but destructive statements. Many 1.1's blatantly "pride themselves" on their "honesty," and so license themselves to make destructive statements "for the good of" somebody else which are actually lies. There is an ethic about the handling of truth. While it may be true that something is undesirable or that a person is bad, if it serves no good purpose to make the statement, the issuance of this "truth" is in reality the establishing of an enttheta line. The highest concept of truth, then, has a certain aesthetic about it, in that it is creative and constructive. In common human experience we all know something about the truth and we know that we cannot deal in a black and white breakdown between the truth and lies. Truth is concerned in the issuance and acceptance of data about facts. Some people favor constructive facts; some favor facts which are not so constructive; some prefer to twist facts; some prefer to hide facts; and some prefer to lie about facts. Some favor high and powerful facts; and some favor only apathetic facts. As one examines this whole subject, one then discovers that the tone scale itself from 4.0 down to 0.0, postulates the selection of various types of facts; and that the most reasonable facts are the most constructive ones; and that, as one falls away down the tone scale, the facts selected are less and less rational and more and more contra-survival. It could be said that life was made to be lived, not died out of; and that facts which encourage a high level of living would be, for man, the most truthful facts; and that those which encourage his demise would be the most untruthful facts. Those things which are truest for man are, then, those things which most powerfully aid his survival, in theta, life, and MEST.

This column of the tone scale might also be considered the column of preference of facts. At 4.0 we would have a preference for creative and constructive facts. Around 3.0 we would have a preference for conservative and less inspiring facts. At 2.5 we would have a carelessness of facts. At 2.0 we would have a preference for facts which were twisted well away from truth in order to serve antagonisms. At 1.5 we would have a preference for destructive facts, twisting all true facts which were constructive so that they would become destructive facts. At 1.1 we would have a preference for artfully twisted facts which hid a desire to destroy. At 0.5 we would have a failure to select facts, to evaluate them one way or the other, but a preference for hopeless facts. Below this level there would be no reaction.

The auditor can locate his preclear on the tone scale simply by discovering the type of fact which the preclear likes best, or by discovering what the preclear does with facts.

The individual accepts or gives forth truth or untruth according to his position on the tone scale. If you know, from other columns, the probable position of the preclear on the tone scale, regardless of his convincingness or even his ability to "prove" what he is saying by rather

artful “evidence,” you can correctly and properly evaluate the facts he gives you or the facts he will receive. The rather horrible part of this is that it admits of no great variation. A man at 1.5 deals in destructive facts and twists them so as to make them more effectively destructive; his data cannot be believed; and, indeed, any data from individuals at the 2.0 level or below has discard value only.

At 4.0, the individual has a high concept of truth and prefers constructive and creative truths. He seeks for new truths.

At 3.5, the individual is truthful but prefers not to deal in entheia facts.

At 3.0 we begin to get an onset of conservatism, a cautiousness about receiving or uttering truths, and in our society a short-sighted programme of social lying in order to “avoid hurting people’s feelings.” One should, by the way, beware of placing in charge of anything people who are “afraid of hurting other people,” for this is not a virtue but a form of cowardice and propitiation and denotes a fear of people; people are not so easily hurt as such persons believe.

At 2.5 we have insincerity and carelessness of facts. The modern American newspaper exemplifies this level on the tone scale.

At 2.0 we get the first wilful twisting of facts to suit purposes, and here facts will be twisted to suit antagonisms the person holds.

At 1.5 we achieve the ultimate reversal in facts; any white fact will be turned into a black fact; here we have blatant and destructive lying. Did you ever hear an angry man tell the truth?

At 1.1, truth receives her severest drubbing; for here truth is confused, upset, used, twisted and hidden for fear somebody may make retaliation, until one understands that data from this level on the tone scale has only two purposes: to wreak the most harm upon others, and secure the greatest safety for self. Here we have lies used to hide lies amid the most frantic protestations of honesty and a noisy advertising campaign about the ethics of the speaker. Beneath the facade of honor, honesty, ethics, and “one’s sacred word” one is apt to find a writhing cesspool of vicious and malicious lies calculated to do the greatest possible damage. Early in the studies of the tone scale which resulted in this chart the lengths to which the 1.1 would go in advertising his virtuous character, while performing his knife-in-the-back tricks, were not wholly understood. Because such persons said so often that they were honest and ethical, it was, for a while, accepted that a person could be at a low level on the tone scale in other columns and still be able to tell the truth. Experience demonstrated that, whatever the advertisement of honesty, the 1.1 is completely incapable of truth, but lies out of some horrible mechanical compulsion. Not one of the people for whom this allowance was made succeeded in being worthy of it; but each was discovered to be so deeply enmeshed in chicanery, all the while appearing honest, that the depths to which aberration can suppress man were for the first time clearly understood. Bluntly anyone takes his life and his reputation in his hands when he believes a 1.1, no matter the evidence. In this band we have fantastically accomplished actors, who may weep and plead and decry with contempt and disdain, asserting their honesty and their sincerity, and demonstrating them with such consummate conviction that even the most critical observer may be unable to detect the slightest falsehood; and yet, in the 1.1, a deep and exhaustive inspection of motivations and goals reveals a snake pit of lies and insincerities, of pretenses and unrealities. Such people can turn on tears and other emotions at will and use the language of highest honor to serve the most despicable ends.

At 0.5, we have no less dangerous but certainly more obvious levels of untruth. Just as fear drives the 1.1, grief drives the 0.5; and while the grief itself may be perfectly honest, the facts and evaluations which it collects to itself certainly are not. Since here we have an individual who is making a cry for help, supplications, pleas for pity, all facts stand magnified. The dead are found to be suddenly, utterly, without faults; the lover who abandoned the

sweetheart is found to be a blackhearted villain. The 0.5 may be given sympathy, but not believed. People who are commonly in this band of the tone scale and are yet able to reason somewhat, to carry on some of the routine of life, are perilous to be around, since they demand enormous quantities of affection, and at the slightest rejection, fancied or real, dive in the direction of death, perhaps only as a demonstration of how badly they need aid, but, nevertheless fatally. Such dives toward death inevitably affect others, since this individual has no responsibility of any kind toward other human beings and is so thoroughly introverted that however pathetic he may appear he only absorbs and never responds. He is an ever-thirsty sponge for sympathy, and he is a chronic potential suicide. The tendency toward death will communicate itself toward all the aspects of life around this individual; he will make enMEST out of any MEST; he will prefer sordid and squalid quarters; he will drive ancient and rickety cars; he will dress only in the most ragged clothes. All these things are pleas for pity. When audited, this case, like the 1.1, commonly dubs in. The auditor must be particularly careful of the 0.5; not to run too much dub-in; not to give too much sympathy; not to give too little sympathy; and not to make an error in auditing which will depress the preclear's tone, since the 0.5 has but a little distance to go to attempt death, either by sickness or by actual violent self-destruction. The 0.5 is near the end of the road and by contagion he much more markedly enturbulates the free theta of those around him than does even the 1.1. or the 1.5.

The validity of engrams run and the preclear's concept of truths are in direct ratio. The auditor can be guided thereby. But the auditor should never be critical of the facts the preclear brings forth; he must only attempt adroitly to guide the preclear toward running the highest level of fact the preclear can attain. Cases which are very low on the tone scale achieve their best advance, not by running data, but by running off charge, through boil-offs, yawns, false-fourings, and other mechanical unburdening. The data the individual runs when below 2.0 may be interesting but it is quite often untrue, and it is less and less true the lower the individual drops on the scale.

The lowest point on this scale for a life organism is, of course, pretended death; and here is an untruth among untruths; for the organism is obviously alive and it is saying that it is dead. But the untruth is here modified by the fact that the organism requires but the slightest thrust to be dead in actuality.

CHAPTER TWENTY-THREE

COLUMN U

Courage Level

Courage might be considered the theta force necessary to overcome obstacles in surviving.

One has as a definition of happiness the process of overcoming not unknowable obstacles toward a known goal, or the momentary contemplation of the completed task. It can be seen that this is a definition for happiness; and indeed this definition works. But courage is necessary if the individual is to be happy. And so it works out on the tone scale; the more free theta an individual has, in comparison to the theta he has enturbulated, the happier that individual can be, and the more courage he will demonstrate in his forward actions in life and in the face of adversities.

The courage level of an individual is actually a direct index of the free theta-enturbulated theta, or the theta-entheta, ratio of that individual. The courage level is also an index of the safety with which one may associate with a person or a group. A person of high courage is a valuable associate and group member, but a coward is a dangerous liability as a friend.

There is a strange mechanism in some men, an aberration of a decadent age, which causes them to seek out and help and protect the pitiful and weak amongst women. The reverse is sometimes found amongst women, a woman of strength seeking out and defending a weak and pitiful man. In either case, a failure is postulated at the beginning of such an association. However much the weak member may be raised on the tone scale by this association, the person on the higher level is inevitably lowered. Indeed, when two people occupy different positions on the tone scale and yet are in association with each other, the person at the higher point on the scale will become somewhat enturbulated to a greater or lesser degree by the person at the lower point on the scale; and the person at the lower point will become unenturbulated to a greater or lesser degree. People, then, who are low on the tone scale instinctively seek out people who are high on the tone scale; and if the people who are high on the tone scale have any thought for their own survival and efficiency, they will take adequate steps to understand the liability which they are incurring and to prevent themselves from being lessened in substance by such an association.

The auditor, in processing, is continually encountering entheta in any preclear. Thus it is necessary for the auditor, if he is doing constant processing, to keep himself adequately processed, elsewhere. Otherwise, the auditor will find himself coming down the tone scale in a dwindling spiral, until he is at last unable to handle the entheta he is encountering in cases.

Courage level has a great deal to do with auditing. The auditor who has a low courage level is apt to let the preclear get into such a thing as a fear or terror engram and, justifying the action as sympathy, let the preclear out without having run the incident. This will most rapidly and certainly snarl the case. The auditor of low courage level who encounters for the first time a "screamer" and who fails to persevere in the face of the obvious and shrill agony of the preclear will make the preclear very sick. So far as courage level is concerned in auditing, any auditor must have the courage to take anything from the preclear and run a preclear through anything without quailing. A coward has no business in the auditor's chair, and if he is so placed, the preclear can expect to have his case ruined. In a later column on the chart you will see the tone level required of the auditor in order to handle preclears; the data most pertinent to this is courage level.

There are three ways of handling a problem: one is to attack it, directly or indirectly; one is to flee from it, directly or indirectly; and one is to neglect it. It is a matter of reason which method the individual selects to handle which problem. Continuous attack, bluntly and

directly, on a problem is not necessarily a courageous address but may only be an angry and destructive address. A persistent address to the problem, however, requires courage since one of the components of courage is duration of effort.

At 4.0, we have the high courage level of free theta itself.

At 3.5, we have courage displayed at reasonable risks.

At 3.0, we have a conservative display of courage where the risk is small.

At 2.5, we get neither courage nor cowardice but a definite neglect of danger.

At 2.0, we have blunt, undisguised, unreasoning thrusts at danger.

At 1.5, we get what would normally pass as "bravery," as distinct from courage. Here we have the hammering, destructive rush at danger. This often results in damage to self and to the cause for which the person is fighting.

At 1.1, we have reached fear, on the tone scale, and when the individual rises above fear we have underhanded displays of action. If the individual is suddenly addressed by danger, however, we have cowardice.

At 0.5, we have complete cowardice, no attack upon any problem, no reason, and only defeat.

In fighting, the best tactic is to strike such a sudden, unexpected and hard blow that one's enemy is instantly shot down the tone scale to apathy. Japan, receiving an atom bomb, descended instantly into apathy and surrendered. Hard but long drawn out blows or shocks harden resistance as in the bombing of London or Madrid. Shock and courage level are immediately connected.

CHAPTER TWENTY-FOUR

COLUMN V

Ability To Handle Responsibility

There is no more certain index of the theta-entheta ratio and of the free theta endowment of an individual than the ability to undertake and execute responsibility. By responsibility is meant the area or sphere of influence the individual can rationally affect around other people, life, MEST, and the general environment, as represented in column Q, Command over Environment. The emphasis should be placed on "rationally," since engrams are perfectly capable of placing a person in a manic state which causes him to believe he can handle a larger sphere than his capabilities permit, but when this is the case the effect of the individual on the sphere of influence betrays the fact that an engram is acting, because the sphere of influence will be affected destructively; this might have been called, in older terminology, a superiority complex.

The word responsibility is seen, then, to have a finer definition. If it is to be used it must include the shading that a truly responsible person works toward the survival of his environment, which would include action along any and all of the dynamics, himself his children, his family, his group, mankind, life, MEST, theta, and the Supreme Being. Where he falls short in advancing and aiding the purposes of any of these dynamics he is falling short of his responsibilities. The operation of free theta would be the complementing of its component parts in others and in the remainder of the dynamics, since each individual has, as the components parts of his own free theta, all of these dynamics. A high affinity level is necessary, then, in any individual, by which is meant his partnership with the dynamics as existing in others. Where the individual has had many affinity breaks with the other dynamics (and an engram is an affinity break between the theta universe and the MEST universe) the concept of partnership reduces, and the individual is more and more concerned with responsibilities which are nearer and nearer at hand, until he can barely be responsible for himself. This narrowing of the sphere of responsibility is analogous to the descent down the tone scale. When the individual cannot be responsible for himself any of the time he is a chronic psychotic and is institutionalized. When he cannot be responsible for himself except part of the time he is an acute psychotic and passes in this society for normal.

It is not the magnitude of the sphere of responsibility of the individual which should take the auditor's eye as he attempts to evaluate the individual on the tone scale, but it is the quality of responsibility along each of the dynamics. The fully responsible individual bears certain definite marks which are unmistakable.

On the first dynamic, he takes good care of himself; he gives a well-kept appearance in accordance with his means and pursuits; his personal effects are tidy and in reasonably good condition. On the second dynamic, he attempts to give adequate support and assistance to his mate and to provide the future with a happy and successful new generation. He is loyal to and takes good care of his family. On the third dynamic, he takes orderly care of his own affairs as related to his group and members of his group and seeks to increase the survival potential of his friends and group. On the fourth dynamic, he is concerned for the survival of man, within the limits of his education.

On the fifth dynamic, he demonstrates an affinity with other life forms. He will be found to engage himself, given opportunity, in raising plants or animals and will prefer to have living things in his vicinity. He will not be given to wanton destruction of life, but will use life for his own sustenance. The individual who will not kill for food he needs is actually on the propitiation level of the tone scale, since it is a natural arrangement that higher forms of life have to support themselves by the ability of lower forms to translate sunlight and chemicals into the food required by the higher forms.

On the sixth dynamic, the individual will encompass MEST in ratio to his endowment of free theta, his property will not have confused titles, the inanimate objects around him which are meant to serve him will be in good repair, he will have an accurate idea of how much MEST he encompasses, in terms of matter, energy, space and time. He may or may not have some consideration in the direction of theta, this depending upon his own advancement. He will ordinarily be considered to have a reverence and respect for a Creator.

As the individual drops down the tone scale, the orderliness in the various dynamics decreases. One by one his concept of affinity between himself and these dynamics decreases; and so decreases his responsibility in the fields of these dynamics. At 4.0, we have an inherent sense of responsibility on all dynamics, and a care for the entities on those dynamics.

At tone 3.5, the individual is capable of assuming and carrying on responsibilities along the various dynamics but may show some short-sightedness of responsibility along one or more of them.

At tone 3.0, the ability to handle responsibility along the various dynamics has decreased markedly, but responsibility is demonstrated, if in a slipshod fashion. Above this level the individual will execute orders given to him in as reasonable a fashion as possible, but at this level the individual accepts and executes orders only if they are enforced by blunt threats of punishment which are unmistakable. However, at this level, one or more of the dynamics may remain quite free, and responsibility may be full along this dynamic. At tone 2.5, the individual is very careless and not trustworthy, although one may find that the individual takes good care of himself so far as his dress is concerned. He falls markedly short in his concept of what is required of him in order to maintain a high survival level. The manifestation of this level is only that of carelessness, however, and not that of revolt, as it is on the lower levels. At tone 2.0, we find the individual not executing responsibility for its own sake but assuming responsibility only when self or group interest can be served. We have the individual executing responsibility not reasonably toward creativeness and construction, but exercising responsibility on a punishment drive basis. The individual orders things to be done in threatening tones.

At 1.5, we have the individual assuming responsibility much more often and more widely than he can possibly manage, in order to bring about destruction along the dynamics. He will play one dynamic against another. He may talk as if he is saving something or give very preservative motives for his actions, but no matter what he does the end result will be destruction. This is a phenomenon which has been too little understood in the past. Here is the death-talker who is going to save something from destruction by creating great havoc. This person will not listen to a creative and constructive plan unless he can see ways and means of using it to destroy. Warmongers and dictators are markedly in this band, but one finds 1.5's in all business organizations. When the amount of theta with which an individual is endowed is high, and when more of that theta is enturbulated than remains unenturbulated (according to the 0.0 to 4.0 ratio, the midpoint of fifty percent enturbulated theta and fifty percent unenturbulated theta being at 2.0) the thought and action of the individual begins to partake of the nature of MEST force. He will use MEST force for hammer-like actions and blasts of destruction. He will oppose reason with MEST force. Such an individual assumes responsibility for the purpose of destruction by giving out dour and terrible news. Even though he has good news to give forth he will not give it, but prefers to broadcast tidings of alarm and death. His is the assertion that all is about to be destroyed and that destruction alone can prevent destruction from taking place. Unfortunately, it is all too often true that suppressors to a creative action must be removed before construction and creation takes place. Any person very high on the tone scale may level destruction toward a suppressor. The individual at 1.5, however, does not add any creation or construction into his computation except as a pretence, to trump up further power to destroy. The rather horrible thing about this particular band is that it is above the current band of civilized societies around the world; and societies will not be led by governments more than half a point above the general social tone.

At 1.1, the attitude towards responsibility is capriciousness. The individual is irresponsible and incapable. The responsibilities assumed by a 1.1 are surface manifestations only. The individual may seem to be carrying out a programme and may seem to be useful, but the end results of all these programmes and responsibilities will be disastrous, since underneath this veneer so many cross-currents and cabals exist that chaos will result. A 1.1 with a superiority engram which demands that he take responsibility may make an excellent show and be very convincing, but the show he is making and the conviction he seeks to implant in others are not the things intended, and a glance below the surface will discover an entirely different programme aimed solely toward malicious destruction.

At 0.8 - 0.5, to talk of anything like responsibility is nonsense unless one begins to change the direction of responsibility. From 2.0 down the individual seems to have a "responsibility" toward death. It is a duty, we might say, for persons from 2.0 down to cause death, failures or disaster or to die. And it is an additional "responsibility" to mask this "duty" with apparent constructive goals or merely denial of that "duty." The "minions of the Devil" and the "Devil and his dark angels" are descriptions of persons engaged on 2.0-down activity. The concept of sin as destructive practice containing more pain than pleasure stems from observations of the activity of low-tone persons. How real these concepts become to one who is himself enmeshed with another who is responsible to death and not to life. Death is such a blunt, if hidden, taskmaster!

CHAPTER TWENTY-FIVE

COLUMN W

Persistence On A Given Course

Another index which the auditor can use to place his preclear on the chart is the persistence of the preclear along any given course of action toward a goal.

It has been advanced that there are two kinds of individuals, so far as persistence is concerned. The individual who has sufficient theta endowment and sufficient structural ability to keep his free theta and his enturbulated theta relatively separate may have a good persistence level even when the factors and conditions in his environment are such that they continually hammer him away from his given course of action. The other type would be the person who is knocked by life from one course to another and who will persist on any given course only so long as no new factor introduces itself. This is characteristic of the potential psychotic. The persistent individual keeps going toward his goal; he may go slower and slower, and he may die en route, but he does not deviate. The potential psychotic, on the other hand, is not very apt to have a goal in the first place but is apt to follow any course which comes into view, and then only so long as no environmental factor enters to make him deviate from that course.

One must recognize that the exterior world of the environment, in its action on the individual, and the interior world of the inmost obsessive engrams are working on the same "I" and that if the individual is not deviating very markedly on his course toward his goal even when confronted by heavy environmental factors which seek to move him in other directions, neither is he reacting heavily to his engrams, in proportion to the severe reactions he might manifest were he less persistent. An individual may be known by his persistence; but this index is not a sharply defined one, since there are, evidently, two types of personalities, in general, or one might even say, two types of mental structure.

The persistent individual who normally carries forward toward his goal despite environmental suppressors and deviators, in the absence of processing and during the normal course of life because of the dwindling spiral will drop down the tone scale. More of his free theta will become enturbulated and the balance will gradually shift until, most likely, there is far more enturbulated theta than free theta. The persistence of this individual may continue, but the methods he uses to gain his goal will match the various points on the tone scale on the way down. The individual may begin with a highly enthusiastic thrust and may through experience become less active and open about his creative and constructive efforts and may assume conservatism and caution. He may enter a stratum where he is bored with the goal and may dawdle on his way toward it. Lower than this he becomes antagonistic toward factors which do not permit him to reach his goal. Below this he becomes angry and destructive toward suppressors, and although he is still apparently going toward his goal, the majority of his time is absorbed in combating suppressors. Losing here and there in his battles, his tone will drop, and he will become more and more covert, even to the point of pretending that he is not any longer persisting toward his goal, while at the same time continuing to do so. Only when he reaches the level of apathy will he give up. When a man has been defeated too often, and too many of his dreams have been broken, he sinks into the apathy band and thereafter no longer struggles toward his goal. Truly enough, he dies with the last of his dreams.

The individual who has a low theta endowment and seems structurally incapable of concentration when at a low point on the tone scale, may yet increase his persistence to the point where he can win the minor goals of life with great ease when he has been released or cleared.

It is an observed fact that an individual's attitude toward Dianetics and an individual's attitude toward life in general are parallel. When the auditor takes a preclear who is at the apathy level, all too common in this present social order, he can expect the preclear to depend

exclusively on the auditor for any persistence as to the processing of the case. The auditor must take the responsibility of doing the processing. As the preclear comes higher on the tone scale and reaches 1.1, the auditor can expect the preclear to propitiate him by giving him presents or being very flattering. Ordinarily, however, the preclear is operating on mechanisms which tell him he is not supposed to go anywhere or get well, and the auditor must be even more persistent, since the only persistence toward the goal of getting well or cleared will still be from the auditor, regardless of what the preclear is saying. Women, by the way, reaching this level of the tone scale, may propitiate by offering sex and are very easy to seduce. An auditor who is a wise auditor will steadfastly refuse sexual relations with a preclear. The auditor who yields to temptation at this level finds himself in a bad situation because his preclear is on the way up and will shortly pass this propitiative level and achieve more honorable levels of the tone scale. Auditors who, knowing this, permit themselves such actions are themselves at the 1.1 level and have no business auditing. None but a despicable cur would seek to benefit from this phenomenon; none but a chronic or acute psychotic would find enjoyment in it. The person who does this, by the way, usually stops or discourages all processing beyond this point, realizing that as the tone of the preclear rises some honesty will come into the preclear's reasoning. When you spot the sudden cessation of auditing, the barring of a person from auditing or a refusal to audit, you can be certain that the person responsible for this cessation of auditing or the refusal to permit or encourage it has a selfish profit to make or is hiding something. A person like this is such a menace to himself and to others around him that auditing is much too good for him; he should be shot.

Every case has to get angry before it can get well. The auditor must never discourage a case when it begins to breathe fire and destruction towards its enemies. It is quite common for a preclear to go through a phase of desiring murder or sudden death for both parents for what they have done. The auditor who discourages this anger is inhibiting the ability of the case to get well. This phase will pass; and the auditor should take care, during it, to prevent the preclear from making overt acts against his enemies for which he will have to apologize a few weeks later when the anger phase has gone away. Nevertheless, the anger phase must be encouraged. The hypnotist who implants suggestions to the effect that one must treat one's fellow man kindly is actually driving his client down toward apathy.

Rising on the scale, at 2.5 the preclear finds it difficult to concentrate on the force and fury of engrams and is liable to be slack in persisting on his case. He is apt to be too busy about other things. This is a difficult period in any case; but there is so much to be gained above it that somehow the preclear must be raised even higher on the tone scale. There is only one way to do this: not by suppressing the preclear back into anger, but simply by getting enough locks and other brica-brac off the case to bring the preclear up to 3.0.

At 3.0, for the first time the preclear will begin to demonstrate self-determinism. Self-determinism should never be confused with refusal to cooperate or wilfulness in nonsurvival directions. At 3.0 the preclear is willing to proceed in the most orderly possible fashion toward a thorough and complete swamp-up of his case. At 3.5, the persistence of the preclear is such, ordinarily, that he begins to knock out engrams in chains.

At 4.0, the persistence of the individual will be the persistence with which he is natively endowed; all the theta that he possesses will be free.

As a word of caution, authoritarian auditing, rather than affinity auditing, will not produce any marked rises on the tone scale even though many incidents be run, since the hammering auditing itself keeps the preclear so thoroughly enturbulated that free theta is not able to manifest itself. The preclear must always be coaxed through affinity, communication, and reality into being processed. This is the reason why auditors who are low on the tone scale do not achieve good results; their very position on the tone scale demands that they use forceful methods, apathetic methods, or spurious methods.

CHAPTER TWENTY-SIX

COLUMN X

Literalness With Which Statements Or Remarks Are Received

It is an aspect of theta that the more it is enturbulated the easier it is to enter enturbulence into it.

The highest level of reasoning is complete differentiation. The lowest level of reasoning is complete inability to differentiate; which is to say, identification. On the highest levels, the individual can understand that the thing is not its name, and that objects are similar to each other but never equal to each other. In the reactive levels, from 2.0 down, the individual more and more identifies, until finally all things are the same thing, and this is complete inability to rationalize. Rationalization is, in essence, differentiation; reacting is, in essence, identification. The literalness with which the person receives statements is an index of the amount of enturbulence in the case.

At 4.0, we have high differentiation, good understanding of all communications, as modified by the clear's education.

At 3.5, we have a good grasp of statements made and a good sense of humor -a

sense of humor depending, to a large degree, upon the individual's ability to differentiate and to see and reject situations which do not fit.

At 3.0, we still have good differentiation of the meaning of statements made, but here orders have to be explained a little more carefully, since less reason is going to be applied to them.

At 2.5, the individual accepts very little, literally or other wise. The sense of humor of this individual is liable to be very literal, dealing to a large extent in puns rather than in situations.

At 2.0, there is no sense of humor that one could call a sense of humor, but there is laughter over the misfortune of others, which is a demonstration of antagonism. This individual will accept remarks which are antagonistic remarks literally; but he will reject remarks which are lower on the tone scale and be able to differentiate on those remarks. He does not pay much attention to remarks higher on the tone scale, and if remarks are made to him from persons higher on the tone scale he is apt to interpret them into antagonism, if they can literally be so construed.

At 1.5, the individual accepts alarming remarks literally, and when statements on higher tone levels are made he will alter these statements to his own understanding so that they are alarming or destructive. The sense of humor, again if it can be called such, of individuals at 1.5 consists of laughter at very painful misfortunes.

At 1.1, we have a lack of acceptance of any remark. The individual is likely to seem to have difficulty in hearing; he corrects remarks made to him; he is very concerned sometimes about the rightness of words in remarks. The sense of humor at this level is forced, to counteract the tendency to accept remarks literally.

Here is a continual nervous necessity to reject almost any remark for fear that it will register literally and be a command, hence anxiety or fear of conversation of a serious nature. Rather underhanded efforts are made at this level to knock apart serious statements or plans from higher levels on the tone scale. At 0.5, we have an individual who literally accepts any remark which matches his tone, and ignores remarks of any other tone. Apathy statements

made to this individual have the force of hypnotic suggestions. Anything at all which is said to a person at the 0.1 level is recorded directly in the lowest strata of the reactive mind.

CHAPTER TWENTY-SEVEN

COLUMN Y

Method Used By Subject To Handle Others

The means used by the preclear to control or live with the people around him make an easy and accurate index of the preclear's position on the tone scale. This is, unfortunately enough, a precision column. No matter the guise used on the lower level of the tone scale, observation indicates that individuals at these levels use these methods uniformly, to the considerable harm and detriment of their families, friends, associates, and the entire social order. If any column on this tone scale chart should carry more emphasis than the others from the standpoint of human behavior, this column would be so marked.

The auditor can expect to be treated by the preclear according to the preclear's position on the chart.

The methods of handling others could be assigned to three general categories. The highest category would be one of enhancement, where the individual seeks by example and good reasoning to lift the level of those around him to the point where they will partake of the projects of living with him. This would extend from 4.0 down to 3.0. The second category would be that of punishment drive, or domination. Here the individual uses alarm, threats, and the general promise of pain unless compliance is given by the others around him. This area extends from 2.0 to around 1.3. The third category is that of nullification, wherein the individual seeks to minimize individuals, to be more than they and so to be able to control them. This category would rather see a man sick than well, because sick men are less dangerous than well men according to the "thinking" that takes place in this band.

The unfortunate part of the conduct of the lower levels of the tone scale toward others is that it has as its invariable end the lowering of the tone of the family, associates, friends, and society of the subject. Yet the subject by no reason or education below the point of 2.0 could use any other means. Forcing the subject to use other means only drives him down the tone scale, and as he descends he uses the means of the lower levels to which he sinks.

Here we have the dwindling spiral at work upon the environment of the subject and upon the subject's associates, friends, and social order. It is not danger by violence from the low-toned individual about which the social order or the family should worry; it is this insidious adoption of domination and nullification methods. This enturbulates the theta of the individuals in the subject's environment and brings them down the tone scale gradually, hardly noticeably but nevertheless inevitably.

From 2.0 down, the individual uses a great deal of justification. He has to explain his acts, since the social order normally questions the rationality of many of these acts.

A 3.5 operating in good order may be offering nothing but good to a 1.5 in his vicinity. The 3.5 will yet find himself the target of anger which has no cause in the conduct of the 3.5 but is simply emanating from the 1.5 position of the other on the tone scale. The 1.5 would act this way toward the 3.5 regardless of anything the 3.5 might do.

The 3.5 in the vicinity of a 1.1 may find himself descending down the tone scale toward anger without any apparent reason. The 1.1's efforts to nullify are so well veiled and so carefully calculated to annoy that no target is available to the reason of the 3.5. As reason fails, the 3.5, continually subjected to nullification which he cannot locate, will eventually become angry. The 1.1's reply to this anger will not be a return argument or anger, but an apparent continuation of the status quo, while at the same time he does everything possible which can still remain veiled and hidden to reduce and nullify the 3.5. These hidden efforts will become stronger and stronger until nullification or destruction takes place. Or the 1.1, quailing before

the anger, will drop into apathy and so use every ally available anywhere who can be coaxed or deceived into supporting the 1.1's efforts to destroy the 3.5. The reasonable man quite ordinarily overlooks the fact that people from 2.0 down have no traffic with reason and cannot be reasoned with as one would reason with a 3.0. There are only two answers for the handling of people from 2.0 down on the tone scale, neither one of which has anything to do with reasoning with them or listening to their justification of their acts. The first is to raise them on the tone scale by un-enturbulating some of their theta by any one of the three valid processes. The other is to dispose of them quietly and without sorrow. Adders are safe bedmates compared to people on the lower bands of the tone scale. Not all the beauty nor the handsomeness nor artificial social value nor property can atone for the vicious damage such people do to sane men and women. The sudden and abrupt deletion of all individuals occupying the lower bands of the tone scale from the social order would result in an almost instant rise in the cultural tone and would interrupt the dwindling spiral into which any society may have entered. It is not necessary to produce a world of clears in order to have a reasonable and worthwhile social order; it is only necessary to delete those individuals who range from 2.0 down, either by processing them enough to get their tone level above the 2.0 line -- a task which, indeed, is not very great, since the amount of processing in many cases might be under fifty hours, although it might also in others be in excess of two hundred -- or simply quarantining them from the society. A Venezuelan dictator once decided to stop leprosy. He saw that most lepers in his country were also beggars. By the simple expedient of collecting and destroying all the beggars in Venezuela an end was put to leprosy in that country. The methods used by individuals on various levels of the tone scale in order to live with their fellows are as follows:

At 4.0, the individual uses enthusiasm, serenity, confidence, and his personal force to inspire those around him to reach up to a constructive level of action. Indeed, the presence of a 4.0, or above if the theta endowment of the individual is high, unenturbulates an area.

The 3.5 begins to employ communication and reasoning in order to invite the participation of others but still believes in bringing people up to a level where they will work with him.

At 3.0 we have the level where conservatism begins to enter the reasoning and where persuasion and social graces begin to be employed to invite the participation of others. Safety, security, and somewhat better survival conditions are the arguments used along this level of the tone scale. At 2.5, the individual is relatively careless of the participation of others in his projects.

At 2.0 we begin to enter the domination band, which extends downwards to about 1.2. Here theta force can be seen to be distinguishable from MEST force. Theta force is reason; and MEST force is simply that -- force. Here we have efforts to hammer and pound and dominate by physical strength, threats, anger and promises of vengeance. Here compliance is commanded, and lack of compliance is stated to mean death. Here we have emergencies being more important than constructive planning. Here we have all manner of undesirable things which, indeed, seem to be the primary business of men and nations today.

Nullification actually begins with domination but becomes very pronounced at about 1.3. A 2.0 might demand of another that he demonstrate enough "guts" to carry forward a project, but from 1.3 down, the modus operandi is any and every effort to convince another human being "for his own good" or "for the good of others" that he has neither the force nor strength to be dangerous. By rendering the individual undangerous, these levels seek to dominate him with the pitiful strength which still remains to the 1.3 and down. The 1.2 and down is most comfortable around sick people, around people who are in apathy, since he mistakenly believes these people not to be dangerous because they are obviously weak. This is so far from good reasoning that the results are catastrophic -- but little if any reasoning is done from 2.0 down. In its stead are excuses and justifications.

Here in a social culture from 1.2 down is the welfare state at its worst, the creation of indigence in the populace to make it easier to control, the nullification of strong individuals in the society, the removal of all constructive persons, and the preservation of the idle, the hopeless, the helpless and the weak. This is actually a social or an individual mechanism to accelerate death. The 1.1 wife who has a strong and able husband keeps on living so long as he keeps breathing the force of life into her. At her position on the tone scale, her direction is toward death. Every action she takes, regardless of its surface manifestations, will tend toward nullification of any life source in her vicinity. Every conceivable mechanism is used in this area of the tone scale to make nullifications of others seem valid, to make them stick. Here we have raillery against people who refuse to accept criticism "for their own good." Here we have painstaking efforts to "better people" by showing them their faults. Here we have attempts to "educate" people into adjusting themselves to their environment -- in other words, to stop being vital and active and go somewhere and lie down, where they will be no menace. Here we have confusions introduced into any situation which are given the most adequate "reasons" and which are yet only nullifications.

From 2.0 down to 1.2, efforts to change people or dominate them are recognizable as such. From 1.2 down, all forthrightness vanishes, and the most devious and insidious and complex methods are employed to nullify. The individual in this area of the tone scale very often has a complete belief in his or her superiority, which is a justification for using the methods he uses. Such people commonly fasten themselves on strong personalities well up the tone scale and then continue to assert their superiority without ever giving, of course, any demonstration that the superiority exists, until the higher level becomes nullified. The individual in this area seeks death not only for himself and his own projects but also for his entire environment. At this level we have murder, by slow erosion, of individuals and the culture, each harmful action being masked with voluminous "reasoning." Here is the snake pit of human behavior, and from this area comes the venom which will gradually destroy any individual or culture. Heretofore, people in this area have not been seen to be dangerous, and the word "psychotic" has been used to designate only those who were helpless or overtly destructive. However, this area never becomes overtly destructive, tending if anything toward suicide and rarely toward murder, save on a long-term basis of murder of the personality or the projects of others. Yet this area of the tone scale is far more dangerous than any other.

Here we have perversion of anything and everything, so that the surface manifestation will never match the undercover purposes. In sex we have no facing of the purpose and use of sex as something to be enjoyed and for the creation of children, but we have all manner of anxieties and irregular practices which do anything but tend toward the creation of children. And though we may have in such a person a hectic obsession with the performance of the act and an avowed interest and enjoyment in the act, we have actually no enjoyment of it. Sexual efforts tend not towards enjoyment but toward the pollution and derangement of sex itself so as to make it as repulsive as possible to others and so to inhibit procreation. Here is the promiscuous woman, the inconstant lover, the pervert and the sadist. With a great deal of advertisement about sex there is only an effort to destroy sex. In this area of the scale we have avowal by the individual at times that sex is free and must be enjoyed, and a continuous stream of accusation toward others that they believe sex to be a hideous thing and that their attitude must be reformed. Sex is stained and soiled under the guise of being protected. Here we may have an advertisement as to the proper attitude toward children, and strange practices concerning children.

In handling people around them, persons in the 1.2-down bracket deal in reversals of fact. One can take it as a rule of thumb which is too often workable to be ignored that whatever this person says he is doing, he is actually doing something else. Whatever this person says is true, is actually false. Whatever this person says is false is actually true. Making allowance for the fact that much of such a person's conversation is without purpose, one can beware of this contrariness between manifestations and actual purpose.

In keeping with the avoidance of any surface statement of what is actually going forward, we have here the hypnotist. The hypnotist normally ranges from around 1.8, where

he uses it as straight dominance, to around 0.6, where apathy has become strong enough to prevent active efforts to dominate or nullify others. Hypnotism never has and never will raise an individual on the tone scale. A manic hypnotic suggestion making one feel that he feels better and is better could be implanted. But the act of hypnotism actually enturbulates the free theta and it can be easily shown by tests that a manic implantation leaves the individual less able than he was before, regardless of its content. Hypnotism is the entering of the hypnotist's personality and desires below the choice level of the individual. It is non-survival save only when used as a temporary anaesthesia for an operation and picked up and run out in processing immediately after the individual is well -- not to pick it up would be equivalent to continuing a general anaesthetic forever after the operation. Civilized cultures of today are unaware of the widespread use of hypnotism. It is the favorite tool of the pervert and the sexually deranged. An individual at this level of the tone scale may very well have the permission of a partner for the sex act but will actually prefer to accomplish the act in an undercover fashion, as provided by hypnotism. Hypnotism is used in some base religions, and is commonly employed in obsolete mental "therapies," which should make plain the level of those on the tone scale.

When a "therapy" on this level of the tone scale (1.3 to 0.6) is employed it is only to render the individual under treatment more tractable, less "liable to be harmful to others," and to wreck self-determinism in the individual. This is the exact reverse of what it takes to make people well and sane. Empirical evidence should have demonstrated long since that such methods do not work, but this level of the tone scale is not much given to reasoning. Here is the pre-frontal lobotomy, the trans-orbital leucotomy, electric shock, insulin shock, directive therapies, and all the rest of the unworkable claptrap with which modern civilization has been victimized. True enough, an individual by such methods can be made less dangerous to his fellow men and easier to handle, since he is made into more MEST and less theta. But it is equally true that this treatment decreases, often permanently, any ability of the patient to be of service to his society.

The processing methods which raise a person on the tone scale are so very simple to apply that one wonders, or perhaps does not wonder, at the continued insistence on destructive "therapies" in institutions. These institutions often use sedatives, and yet one of the worst things that an individual who is in a disturbed state can be given is a sedative; it makes him quieter and less dangerous but it also makes him less able. Furthermore, an individual under sedation receives sounds and sights in his environment as positive suggestions and therefore is continually receiving new locks and more enturbulence, although it may appear momentarily that his condition is better. A preclear must never be audited under sedation. This is a strong injunction, since preclears audited under sedation or under the influence of alcohol become worse, and a psychotic treated when he is under such influence (as in narcosynthesis) may very well have all of his free theta enturbulated and so be sent into a "permanent" break. The auditor should be very careful when working with anyone to ascertain whether or not that person is taking any drugs, since medical doctors will very often issue sedatives to patients without telling the patient that he is taking a sedative.

Sedatives have been around for many thousands of years. They have certain uses, in light doses, but such uses are extremely temporary in duration. Continuous application of sedatives to an individual, as they make him more suggestible -- make it easier for him to receive locks -- wreaks considerable harm upon his mind. This, however, can be remedied unless it has gone to a point of no return.

Politically, the area of 2.0 to 1.4 is the area of fascism. where dominance of others is continually preached, where safety and safeguarding are continually stressed and where destruction and threats of punishment are used to force others.

From 1.3 down to 0.6 we have the general area of the subversive, who promises a people freedom and equality and gives them a slaughter of their best minds and cultural institutions, to the end of a totalitarian dominance. Because subversion exists in this tone band, the subversive leader can use as his personnel only people in this tone band; if this tone band were to be removed from a society he would have no recruits. To such people the perfidious

and twisted practices of subversion have an enormous appeal. It gives them the “right” to practice Free Love and general promiscuity and, by destroying the Church and other institutions or by holding these as nothing, sets them above any necessity to conform to an existing social order. Thus the recruit is exhilarated by having a new justification for doing on a wide scale what he has been doing on a narrow scale, nullifying by hidden and insidious means all the strong and the orderly in the environment. In any relatively low-toned social order the idea of having the right to do hidden and vicious things for a “glorious cause” is so attractive to persons in this area that they automatically support this political idiocy. As reason is absent in this area of the tone scale it never occurs to these recruits that the most zealous amongst them will be the first to go down under firing squads, since even a totalitarian regime, in attempting to run any kind of a state, must compel severe conformity to its own “codes” no matter how depraved these “codes” might be; and the recruit in the land which was about to be conquered was selected because of non-conformity. Thus, immediately after a complete totalitarian conquest of a country we invariably witness an extensive slaughter of individuals. One can select with ease the individuals marked for liquidation in the consolidation of the conquest. The selection is not made according to the position the individual occupies but by his individualism, his strength, and his reasonableness, or by his continuing revolutionary desire not to conform to set and regimented patterns. A considerable percentage of the people slaughtered in any new conquest consists of the agents and tools used by the conqueror to soften up the country before the conquest took place. The morbid fear of any totalitarian regime is counter-revolution, because they best of all understand how perfidious revolution can be. The 1.1 may take a 1.1 as a bedfellow and political mate and may form a 1.1 group, but this group has to continue to be faced by a strong and dangerous foe to remain consolidated. This is the condition of a subversive cell. These people continue in association with each other only so long as they are in the presence of and are busy undermining a worthy opponent. Because a 1.1 will act in handling people only as a 1.1, however, the cell, once the pressure is taken off it, devours itself.

If the auditor is processing anyone known to have been in continual association with a 1.1, he can readily and rapidly assemble the pattern of aberration of this unlucky preclear, since it will consist of the surface display by the 1.1 that all was being done for the preclear’s good and a continual and insidious underhanded campaign to hit the preclear at his weakest points.

The apathy band of the tone scale is only less dangerous to the social order than the 1.1. The apathy band has a definite procedure for handling people and the environment. Apathy is attempting to tend toward death; here is the suicide. And the apathy case will actually thoroughly enturbulate those around him in an effort to cause death along the other dynamics. There was once a whole political philosophy about apathy, Zeno’s Apatheia, which was embraced in the last death throes of the Roman Empire. The apathy case will try to discourage anyone from doing anything. Hopes and dreams are destroyed merely by claiming that they are hopeless and impossible. It has been fashionable to “feel sorry” for individuals on this band of the tone scale. This is exactly what this band of the tone scale demands of associates in the environment. Here we have cries for pity, supplication, and any and every means to gain sympathy. These are actually enturbulative mechanisms rather than real requests for help. The entheta of the apathy level does not want to be helped but merely wishes to enturbulate further and to die, causing at the same time as much death as possible in the environment. Nearly any human being confronted with the loss of a friend or loved one dives momentarily into the grief level, and the acute state of apathy is thus seen commonly, if sporadically, in the society. This state can be easily remedied by processing when it is a momentary, environmental restimulation. The chronic apathy case is a different matter and is intensely dangerous to the environment. It is fashionable to feel sorry for the apathy case, and yet the apathy case never feels sorry for anyone. Despite all the tears and moaning, the apathy case, on a substratum is quite cunning and attempts to produce through tears the maximum enturbulation possible. The 1.1 will twist past experiences in the telling, reporting cruelty where there was only abruptness. The apathy case will declare all past kindnesses to have been the most sadistic cruelties and the cruelties to have been kindnesses. Facts are not simply distorted by an apathy case; they are reversed. By reversing all visible evidence and declaring everything to be the exact opposite of the reality, maximal enturbulation can be produced. The apathy case, by insisting that every

white is black, so tries the reason of others in his vicinity that they, lost in this confusion, also become apathetic, since there seems to be no possible method of reasoning.

Apathy is more than hopelessness: it is death in a very forthright form. The apathy case talks about death, threatens personal death, and will actually attempt suicide. There is not enough courage on this level usually to attempt openly the death of others, but by enturbulation the apathy case can effect this and will do so if not understood. The apathy case quite commonly sets an example of death by fake suicide in a vague effort to be mimicked by another and so bring about another's death. The apathy case that is threatening suicide, however, cannot be disregarded, since a sudden enturbulence may actually bring about an attempt. Here, the command over the environment is recognized by the apathy case to be limited to the individual's possessions and body alone. We get various types of neglect of possessions which quietly and undramatically lead to their destruction. Here we get neglect of the feelings of other people and their concerns. Here we have neglect of person (self) which may, dramatically or undramatically, tend toward the destruction of person. The apathy case is so reversed on reality that he will declare things, which are normally ugly and horrible, to be beautiful, and things which are beautiful to be ugly and horrible. An insidiousness is present at about 0.7 wherein the apathy case seems to support beautiful things and art but in so supporting them spoils them for others in the environment. There is a gruesome obscenity in the admiration such people give to beauties in life.

Below 0.7 there is not enough activity to lend active support for any purpose save the attainment of death for self and others. Valuable objects, assets, and projects are in considerable peril in the vicinity of an apathy case even though the apathy case may not seem to be very active. It is this inactivity which is deceptive. A slight surge in tone can cause an apathy case to despoil anything in the vicinity which is normally considered survival. Apathy cases have destroyed great works of art, organizations and individuals for the most specious and spurious reasons. The apathy case is so self-centred that it is very difficult for the auditor to gain any cooperation. Indeed, every effort the auditor makes to invite hopefulness will be rejected. It will not be so thoroughly rejected that the auditor is rebuffed, but will be met with new reasons why the auditor should feel sorry for the apathy case. Most of these reasons are outright lies, and the apathy case commonly runs floods of dub-in as well as spurious tears. Auditors, and indeed a society, not understanding the true motives of apathy are placed in considerable peril since a natural desire exists in the higher levels of the tone scale to aid and support one's fellows. The apathy case is actually perverting and destroying this desire by inviting it toward unworthy causes. This is a death action intended to destroy the mechanism of cooperation. The self-centredness of the apathy case is appalling to any reasonable being once he examines it. A great deal of the conduct of the apathy case is, knowingly unknowingly, pretence or act. At the 0.6 level, one may even occasionally catch an apathy case peering hawk-like but covertly from under the veil of tears to be sure that the show is still receiving the attention of the audience.

Much experience with apathy teaches the auditor that there is nothing very noble about grief or apathy. The actual grief should be run out of a case as soon as possible. But when he is auditing an apathy case the auditor will find himself running a great deal of specious incident all of which contains grief. The invitation for sympathy knows no bounds. The demands for pity will become, even to the most patient, trying beyond endurance. Although one may at first feel an active urge to help an apathy case, when one has penetrated the depth of speciousness of the data, an impulse toward contempt and ridicule will result, for no reasonable man finds an impulse toward death a reasonable thing, and the apathy case has no other impulse. The cry for pity, and the supplication for aid seem to require the assistance of others. Actually these are demanding the enturbulence and death of others. No apathy case wants to be helped but will use any and every means to keep from being helped. As courage is absent, the apathy case will dodge any incident which contains real force, just as the apathy case will dodge any factor in the environment which contains real help or aid and will go inevitably toward environmental factors which are destructive. The apathy case, thus, avoids any good auditing and will actually seek out and encourage very bad auditing.

It is a certain mawkish sentimentality in our current society, encouraged by generations of literary men who were attempting only the strongest impact and thus the greatest sale for their works, which makes us brook, tolerate and countenance the apathetic. Perhaps because each of us feels his importance demands that someone feel sorry for him when he is hurt or dead we countenance a continuing grief in others. By dianetic processing this grief is very easily dispensed with, and anyone who has long experience in the handling of apathy cases would be more likely to feel sentimental about running sores or venereal disease than to feel long and enduring sympathy for apathy.

As an admonition to auditors: never give support to the whims and ideas of an apathy case, and do not give the apathy case sympathy, but give it gentle processing. Do not believe the data obtained from an apathy case, but work mechanically with the case, actively getting as much free theta as possible to raise the case on the tone scale at least to covert hostility. Apathy cases enturbulate one very easily, because one can so easily feel that grief over lost ones is something which should be supported and assisted as a worthy mechanism. An apathy case will say or do anything to gain sympathy. Utter immorality is present. The apathy case will surrender his or her body as readily as anything else as a price of a little sympathy. The "love" one receives from an apathy case is actually the extreme depths of propitiation, and the "loving" apathy case will deliver one up to the hangman with as little compunction as he or she would feel in drinking a glass of water. No reason, no codes, no ethics, no decency, no truth, no life are the hard and fast rules of the apathy case. And because a narrative can be given forth by the apathy case wild and alarming enough to justify his condition, one is often tempted to accept this propitiation as actual affinity, when actually it is an invitation to be killed. Because this propitiation can be mistaken for love, one is often tempted, out of sympathy and a desire to assist, to become closely associated with an apathy case, but one should be apprized that his name on a marriage certificate coupled with that of an apathy case constitutes a death warrant more certain than that of a court of law. His home, if he ever manages by strenuous effort to assemble one, will be a shambles. His position will be lost and his dreams will be shattered. His self respect will be slaughtered and his concepts of morals and decency will be destroyed. These statements are made without compromise after long and close observation of apathy at work in an individual. Apathy is only half a point above death, and apathy will bring death to anything and everything in the environment.

A social order in the apathy band will take any unreasonable course which leads towards death. It will follow any leader who claims that life is not worth living and that things and people should be neglected until they cease to live. Here is no outright destruction of entities. Here is insidious destruction through neglect, over-use, and accelerated decay. The American Indian, for instance, when pushed by defeat into the tone band of apathy adopted programme after programme which was acclaimed as a salvation programme but which was always a death programme. There was the matter of the ghost dancers, who avidly received the falsity that their cotton shirts could stop bullets. There was the wave of dog killing, whereby it was asserted that the buffalo would come back if all the dogs were dead.

The body itself cooperates in the apathy band by becoming sick from any slightest cause, by involving itself in accidents of devious and various kinds, and by failing in endocrine function. One can expect the apathy case to become ill from bacteria even when bacteria are not present.

One should be extremely chary of using any authoritarian or violent means on cases from 2.0 down, since such cases are very easily driven into the apathy level. Apathy is apparently, and only apparently, more tractable and easier to manage, since the apathy case to some degree is in a permanent hypnotic trance and will listen to and believe anything said no matter how ridiculous it may be. This is a highly dangerous state and will result not only in the suicide of the person, on occasion, but also in the death of the concerns and persons of others in the environ of the apathy case. This is the reason why there are so many suicides pursuant to the practice of hypnotism and other crude techniques. These, by asserting control over the individual, depress him down the tone scale. The apathy case is capable of such thorough

lying, that the individual may even claim to be better and appear to be better, until one morning he is found a suicide. The apathy case can be very deceptive.

The auditor should be warned not to employ any authoritarian methods in processing. We in Dianetics are only interested in raising people on the tone scale. The auditor should be careful not to enturbulate persons below the 2.0 line any further than they already are, but should be as non-directive as possible. For, if the auditor permits his preclear to drop into apathy he has on his hands a much more difficult and much longer case than a 1.1 or a forthrightly howlingly angry 1.5. Remember too that in this social order people from 2.0 down the scale are accepted commonly as sane so long as they can perform any seemingly rational acts in the environment.

At 0.1 or 0.3 the individual also has a method of handling others around him. This mechanism is based upon the reasoning that if one disavows all possible dangerousness the dangerous people in his vicinity will go away and leave him alone. As a matter of fact, hunters and soldiers rationally employ this mechanism as a last resort, and the mechanism occasionally works. Certain animals have this built in as a habit pattern. By an abandonment of all appearance of life they hope to arrest the urge of the attacker to produce death.

The death of James Forrestal, who had been driven into apathy by overwork, is an illustrative case not only of what happens when authoritarian methods and incarceration are used as "treatment" but of the complete deceptiveness of which the apathy case is capable. Forrestal had not seemed so pleasant and relieved for some months as he did an hour before he threw himself from the tower of the Bethesda Naval Hospital and fell sixteen flights to his death on the concrete and glass below. Thus perished one of the most brilliant managers and champions of the United States Navy. And other suicides, great and not so great, stack like cordwood before the back alleys of authoritarian "therapy."

One should realize that all individuals below 2.0 have a tendency to look upon family friends and associates as menaces to life or aids to death. Real affection is impossible, but propitiation and pretence of affection are mechanisms by which one invites pity or disclaims dangerousness. People from 2.0 down live in an atmosphere, according to their own viewpoint, of potential death and murder. At 1.5, the mission is to cause the death of the "dangerous" entities by forthright acts of destruction. The 1.1 considers the family, associates, and environ even more potentially deathly and so, seeing greater danger in them, uses more covert and devious methods to cope with and disarm these "dangerous" entities, and puts forth a smokescreen of helping and doing good for family, associates, and environ. Here also one finds the mechanism of championing the underdog. The underdog is not dangerous and may be an ally one can use against one's very deathly environment. Anyone championing the underdog is projecting himself into the underdog and is making a covert plea for the rights of the underdogs to live, in the usually not realized hope that he as an underdog will be permitted to go on living regardless of his acts against others.

Following this ratio of the dangerousness of the environment as viewed by the individual, the environment to the apathy case is literally crawling with death threats. Every person, every object, and every act is considered to have in it a death intent. The kindest word, though apparently accepted by the apathy case, is yet received deviously in the "full understanding" that death lurks but a small distance behind that proffered help. This encourages the apathy case to act in a murderous fashion and seems to him to give him license to pay no attention to any moral code or feeling of decency. The apathy case lives in a cesspool of impending slaughter and interprets anything done for him or her as something to be accepted warily. The apathy case quite commonly speaks of being killed, either of killing himself or of being killed by others. His attention may be so fixed in its unreality that he chooses but one murderer who is about to kill him; or his concentration may be so scattered that he chooses many men, organizations or things as potential murderers.

The pretended death case has come to a point where he considers the environment so fraught with menace that nothing in the environment has any intent save to kill him and that

death is immediate. He has insufficient energy or reason remaining even to appeal for help and, indeed, he considers that there is no person or object to which he can so appeal, and so he attempts to demonstrate to anything in the environment that it has won and that he is already dead. By posing as dead he imagines he can survive at least long enough to die a little less painfully than he considers he will die if he moves. Old and decadent races are commonly found to have the practice of willing death. An individual merely goes and sits on the edge of his grave until he dies and falls in. One can find such people any day on for instance, Coal Hill, near Peking.

The pretended death case has abandoned even trying to find any one menace and considers everything a menace. This state has the peculiarity of being unfixed. Possibly the most signal effect to rouse this case can be made by concentrating the attention of the individual upon a single and definite threat of death. Indeed, observing an honest and active source of death raises the necessity level and brings anyone up the tone scale at least for a brief time. Thus in war, cities which are under sporadic bombardment show a lower incidence of psychosis than cities which, far behind the lines, only read about the deaths in newspapers. The source of death has been pinpointed as artillery and bombardment planes, and the source is so dramatic that attention can be fixed upon it. The source is also so simple that it requires very little effort to comprehend it. Further, such destruction brings with it many dead and disabled over whom the erstwhile psychotic can loom and so cease to occupy the tail end of the procession as target number one for all dangerous entities in the environment. For in treating wounded and dead he can observe without having to reason very much that he is more dangerous to them than they are to him. An additional reason for this sudden upsurge of a city under threat is the uniting towards a common goal of resisting or overcoming a common menace. Nations which engage in war so unify their populaces, and this is an immediate revelation of the position on the tone scale of those nations which suppose they have to resort to war. For any reasonable and active nation need not engage in MEST destruction to secure the cooperation of another nation: this is an insanity, brought about by a position of 2.0 or below on the tone scale.

The text corresponding to this column is long because it is actually a coverage of interpersonal relations. The rough rule regarding interpersonal relations, from which other matters may be deduced, is that reason and cooperation exist in an increasing quantity from 2.0 up and that the direction of effort is toward Survive. From 2.0 down domination and control, overt or covert, are employed in handling people, and the direction of effort is toward Succumb. People above 2.0 on the tone scale suffer from any and all association with people at 2.0 and down on the tone scale. And people from 2.0 down benefit, so far as surviving is concerned, from any association with people above 2.0. But the purposes are crossed, since individuals from 2.0 up do not wish to be made to succumb and will combat any effort in that direction. And the individuals from

2.0 down do not wish to be made to live or create, and so resist any effort in that direction. Where reason will not swiftly resolve an argument between two human beings, an inspection of the position each of those two occupies on the tone scale will probably demonstrate that one is arguing to survive and the other is arguing to succumb, or one is arguing to create and construct and the other is arguing to destroy or neglect. Because a person's position on the tone scale can be acute or momentary due to enturbulence in the environment or can be chronic due to entheta "permanently" (except for dianetic processing) enturbulated, one can observe in people below 2.0, when less enturbulated, efforts to survive, and one can observe in people above 2.0 occasional efforts to succumb.

It is worthy of note that the environment of the individual has its own position on the tone scale. His school, the office in which he does business, his family, may occupy as a group a certain position. This position of the environment on the tone scale comes about because of the influence of certain persons or the nature of the organisation or the existing state of culture, and it cannot be neglected in estimating both the personality of the preclear and the methods he will use in handling others.

Actually there are three kinds or conditions of theta below the 4.0 line. The first is free theta. The next is temporarily enturbulated theta which, left alone for a short time, will unenturbulate. And the third is frozen entheta, which is held in place in the case by the nature of engrams, secondaries, and locks. Environmental impacts, of course, charge up the engrams in the case and keep any person, unless a great change in environment takes place bringing much better survival factors, continuing on down the tone scale throughout his lifetime. The environment impacting upon the individual thus alters free theta "permanently" into frozen entheta, but this is a gradual process, cumulative and deadly though it may be. As a child he may have a very large number of engrams, but the environment has not acted upon him with sufficient impact to charge these engrams up with entheta in secondaries and locks. When he is an old man the track is almost completely entheta, in the usual case.

There is another kind of enturbulation. The free theta is enturbulated by the environment, and although the majority of the free theta may become temporarily enturbulated, only a small portion of it freezes into the locks, secondaries, and engrams. Thus a person, because of the enturbulation of free theta on a temporary basis, can be moved up and down the tone scale by his environment. It is this surface manifestation and volatility of misemotion which has masked the nature of free theta. The environment impacting against the individual may, for instance, inflict 1.5 factors on him to such an extent that he becomes momentarily 1.5. If the quantity of free theta remaining to him is great he will rather rapidly unenturbulate and regain his high position on the tone scale. Free theta can only be enturbulated downward, and the case can only be enturbulated downward on the tone scale. The 1.1 does not go up to 1.5 because of enturbulation, he goes down to apathy. The apathy case, when his free theta is enturbulated, flashes quickly into pretended death, or may even die, his margin of operation is so slight.

The environment, then, has a marked effect upon the individual, from hour to hour and day to day. An individual who lives in a family which has a chronic tone of 1.1 may himself be potentially a 3.0 and outside the family may manifest the qualities of a 3.0, but in the family his enturbulation is so constant that he is little by little losing free theta into lock, secondary, and engram entheta and will gradually decline down the scale. The only thing which would remedy this would be having at the same time another environment, higher on the tone scale than he, which would tend to unenturbulate the free theta that becomes enturbulated in the vicinity of the family.

Thus is it important to the auditor that his handling of the preclear has as high a tone level as possible, and he should attempt to arrange the preclear's environment so that it has as high a tone as possible. An auditor who is attempting to work a preclear who is being mishandled by a 1.5 environment will find himself working day after day with nothing but temporarily enturbulated theta, and he will make very small progress with his case. It is necessary for him to get this case out of the 1.5 environment so that the free theta can unenturbulate and thus be available to free the frozen entheta in the locks, secondaries, and engrams, in order to add constantly to the preclear's free theta and not just keep it from becoming less by daily environmental enturbulation.

It is also of interest to the auditor and to people in general that education has its own positions on the tone scale. Education designed to inhibit and restrain, to create conformity to the social order, has the unfortunate effect of reducing the individual on the tone scale. This would be authoritarian education and would be from 2.0 down. Education which invites and stimulates reason and seeks to accelerate the individual toward a successful and happy level of existence and has enough faith in individuals to assume the good usage of the education raises the individual on the tone scale. One can, by reviewing the education of any individual, discover much supportive evidence for this, since it will be found that those subjects in which the individual is able will be those which were taught by methods from 2.0 up, and those subjects in which the individual is poor, lacking accuracy or self-determinism, and failing in his reason with them, were taught by methods which would be found from 2.0 down on the tone scale. As a society declines, it more and more resorts to authoritarian teaching and attempts increasingly to impress upon the individual that he must adjust to his environment and that he

cannot adjust his environment to him. The educational process becomes one of semi-hypnotically receiving doughy masses of data and regurgitating them upon examination papers. Reason and self-determinism are all but forbidden.

When we speak of people using various methods to handle other people we must also speak of the methods which have been used to handle our preclear. We are interested in Dianetics in what has been done to an individual, not what the individual has done. This is not an effort to escape or alter moral standards but is simply a statement of fact; the auditor who becomes interested in his preclear's motives and makes evaluations of his preclear's reasoning is not only wasting his time but is trying to perform authoritarian therapy. What has been done to a person educationally is of very great concern to the auditor, since education can be so thoroughly suppressive that it and it alone, given engrams to charge up on the case, can move the individual considerably down the tone scale, as witnessed by the many vapid, will-less and idle graduates of our universities.

Knowing that education can be such a strong factor in the aberrating and suppressing of the human being is helpful, in that by lock scanning the auditor can pick up and de-intensify an education wholesale, with a resultant rise of his preclear on the tone scale and without touching anything which could be dignified as locks, secondaries or engrams. The whole of a person's education may be a lock. No words bitter enough or strong enough could be levelled at authoritarian educational systems, which even though they witness in their parades of graduates destroyed artists, hopeless and apathetic women, stupid and dull engineers, yet have made no great effort to establish and remedy the cause -- their own authoritarian methods of education. Fortunately, a college education can be picked up out of a preclear who is in fair working condition in ten or fifteen hours. Waste-basketting this enormous and onerous effort on the part of mentally constipated straw men and would-be Little Caesars on their lecture platforms would, of course, be an enormous benefit to the whole society, but in the absence of this highly desirable measure the auditor can at least regain the free theta which has been tied up in the individual's education.

The college is not the only destructive element in the educational system. High school systems are as bad, but they have as their subjects people who are still well enough up the tone scale to be able to resist, since youth is resilient. Grade school educations, particularly in their first years, are very likely to be authoritarian, and as they form the basis of formal education they should also be addressed.

Entheta is best freed out of locks and secondaries from late to early, so that one should actually address present time and then earlier times and then earlier and earlier in his scanning and running of locks in order to arrive at the earliest possible times. Complete recall of childhood is so reached, and efforts to reach childhood without treating the rest of the life by scanning are normally defeated. By treating childhood alone, out of the mistaken reasoning that it was a highly aberrative period (an aberration which was planted by amateur philosophers and therapists half a century ago), one sends the preclear against the occluding force of the late locks and secondaries without giving him a chance to reduce them. One should not expect to be able to run a case by addressing the early portion of the case first, unless the preclear is in such condition that he can get to basic-basic and reduce it with most perceptics on. Education, then, must be run from last to first in order to recover it. Now, one does not ordinarily think of parental training in terms of education, and yet the whole business of gaining experience could be lumped under the heading of education. Common usage of the word denotes formal instruction, but it is no less education that mother, father, nurses and other people in the home administer to a child. It is in the early portion of life that the most checks and the strongest authoritarian measures are used, since the child, through lack of data, is least capable of reasoning.

These restraints compound continually, and much free theta becomes frozen "permanently" in locks during early childhood. This is along the educational line and is best cleared up by picking up the instruction closest to present time and lock-scanning it thoroughly, then picking up an earlier period of instruction such as college, then picking up an earlier one

such as high school, then an earlier one such as grammar school, and finally parental training. In such a way one will recover the general restraints imposed upon children and the general unreasonableness of most adults toward children.

You can discover the way your preclear was handled as a child by investigating the way he handles children, but this has a limited value since he is normally, if he had a bad childhood, in an ally's valence and the methods he uses may be those of the ally rather than the overall methods of the family. But in many cases the preclear is following the advice of doing unto others as has been done to him and, this is true in other things than childhood.

Educational systems which have been used on your preclear had their own positions on the tone scale and tended to freeze the individual at those same positions on the tone scale. Thus we could have a child whose home life made him a potential 3.0 but who was educated in a 1.1 school. The education would tend to bring the individual down the tone scale to 1.1. The values he has been given for various facts and actions of other people and the methods he has been taught to use in the handling of other people have been educated into him by some educational system. Thus, if you attempted to clear an individual and bring him up the tone scale without giving a thorough address to his education you would have, even with the bulk of his engrams and secondaries gone, an individual who hung very low on the tone scale. It requires very little work to correct this, and the work should not be neglected. Otherwise, your individual will continue to handle people and to act in his environment along the tone level where he was educated. It is a question whether any preclear exists in the civilized world today who has been educated by a system above 2.0 on the tone scale.

In keeping with this educational theme, its aspects in processing, and the way it influences the preclear in his handling of other people, one should carefully scout every case for the lowest-toned individual in the environment of the preclear at any time during his life and find any later individuals who approximated the earlier individual. Scan out the later individual, then find and scan out the early individual, and much will have been done to increase the tone of the preclear. Association with persons low on the tone scale is always depressing, and a long and continuous association creates many severe locks.

You will have as one of your better indexes of how your preclear is progressing the changes in his handling of those around him.

The auditor would do well to examine his own general method of handling people with a highly critical eye and adjudicate for himself where his auditing is likely to lie on the tone scale, and by the educational process of knowing the consequences and knowing how to get results, simply raise his necessity level up to a point where he achieves a more desirable attitude, if he thinks one is necessary. If the auditor should happen to find himself in that band of the tone scale where one is afraid of hurting people he should be very wary not to demonstrate any lack of courage in running the case.

The preclear should examine his auditor for his position on the tone scale, and if he finds his auditor in the apathy or covert hostility range, he had himself better work the auditor or else he will render himself liable for inevitable "mistakes" in the handling of his case, sudden and unexpected affinity breaks, and a general confusion. The moral of this column is that auditors should not audit and preclears should not permit themselves to be audited unless they are certain of an above-2.0 handling of the case and of people in general.

Two persons can co-audit each other, step by step up the tone scale, but unless a parity is maintained, one of them will suffer, and a good release or a clear will be impossible to attain -- which is thought to be the difficulty so far experienced in Dianetics, where the making of clears is concerned.

CHAPTER TWENTY-EIGHT

COLUMN Z

Command Value of Action Phrases

The subject of action phrases has been covered earlier in this book. Action phrases are those which seem to order the preclear in various directions. If the preclear were standing in a room obeying orders, and if he had means of raising and lowering himself, action phrases would act on him as follows. If he were told to go up, he would go up; if he were told to go down, he would go down; if he were told to go in two directions at once, he would become confused; if he were told not to move, he would not move; if he were told to pull himself into himself, he would try to shrink; these, in essence are action phrases.

The action of the individual on his time track, back through his past, is sometimes directed by action phrases appearing in his engrams. He does not have to obey these phrases in order to be processed; indeed, the auditor should discourage him from obeying them; it is not necessary to prove the validity or value of an engram by proving that one can react to an action phrase.

The action phrases are: bouncers, such as “get up,” “get out”; holders such as “stay here,” “don’t move”; misdirectors such as “don’t know whether I’m coming or going,” or “everything is backwards”; down-bouncers, such as “get under” or “go back”; groupers, such as “everything happens at once,” “pull yourself together”; call-backs, such as “come back,” “please come”; and one other, the denier, which states that the engram does not exist, such as “there isn’t anything here,” “I can’t see anything.” There is also the valence shifter which shifts the individual from his own identity to the identity of another; the valence-bouncer, which prohibits an individual from going into some particular valence; the valence-denier, which may even deny that the person’s own valence exists; and the valence-grouper, which makes all valences into one valence. These are all the types of action phrases. A dictionary of these phrases could be made up and might be of some use, but with a little experience the auditor will learn what these phrases are. It is mandatory that he understand what these phrases are, since when he finds his preclear doing strange things on the track while running an engram, he had better remedy the condition rapidly by asking the file clerk for the type of phrase, and then asking for the phrase, and then getting the preclear to repeat the phrase in order to lessen its effect, so that the preclear can continue moving on his track in the proper fashion.

At 4.0, there are no engrams. Present-time phrases have no reactive value.

At 3.5, if a whole chain of incidents remains in a case, the action computation of the chain may be effective. Individual phrases are mildly effective sometimes in very severe engrams.

At 3.0, the action phrases in severe engrams are effective on the preclear.

At 2.5, phrases in engrams and in secondary engrams cause the preclear to respond.

At 2.0 engrams, secondaries, and chains of locks all contain phrases or computations which produce action in the case as the preclear runs on the time track.

At 1.5, action phrases in engrams, secondaries, and locks matching the tone of the preclear are very effective, and control phrases are very effective. The individual is usually still dramatizing his circuit control phrases, seeking to control others.

At 1.1, action phrases in engrams, secondaries, and locks are very effective, and valence-shifters are very effective. Down to this point valence-shifters are not very effective,

but at this point they become extremely effective, unless one is running a wide open case, which normally has few if any valence-shifters.

At 0.5, present-time action phrases -- that is to say, action phrases just heard in the environment -- are effective on the preclear to some slight degree; engram, lock, and secondary action phrases are all effective, of course.

At 0.1, groupers are particularly effective and one can expect the track to be in a collapsed condition. Indeed, groupers are possibly effective anywhere on the scale, being just another type of action phrase; however, from 1.5 up, the time-track will not collapse because of a grouper; from 1.5 down, it may do so. The use of this column is apparent. After a short run, the auditor will see how the preclear behaves toward action phrases, and this will help him to determine the preclear's position on the tone scale.

BOOK TWO

Dianetic Processing

CHAPTER ONE

The Basic Principles of Processing

In practice, in Dianetics, the auditor is doing a very simple thing. He is recovering theta which has become confused with MEST by reason of physical pain and emotional shock. He is by dianetic processing converting entheta to theta. A fundamental axiom of Dianetics is that life is formed by theta compounding with MEST to make a living organism. Life is theta plus MEST.

Another axiom is that theta conquers MEST by first becoming enturbulated with it and then withdrawing, possessed of some of the laws of MEST, and returning over the MEST for an orderly conquest.

Another axiom is that theta, in its conquest of MEST, has followed the cycle of contact, growth, decay, and death, repeated over and over, theta each time using the data gained during the cycle to better adapt the organism for the further conquest of MEST.

Theta is thought, an energy of its own universe analogous to energy in the physical universe but only occasionally paralleling electro-magnetic-gravitic laws.

The three primary components of theta are affinity, reality and communication.

Theta has the strange power of animating and directing MEST and bringing it into an orderly, mobile, and self-perpetuating unit known to us as a life organism.

Dianetics is that branch of Scientology that covers mental anatomy.

Theta and MEST in a disorderly collision bring about enturbulation in both the theta and the MEST which actually changes or reverses the polarity of the theta and the MEST. This reversed polarity permits the rejection of theta by enMEST and of MEST by entheta, so that death can ensue and a new organism can be begun.

Theta acting upon MEST with affinity, communication, and reality takes on an aspect known as reasoning or understanding. All mathematics can be derived from ARC acting upon MEST.

Theta may have considerable residual knowledge of its own, but the knowledge in which an organism is interested is information concerning theta and MEST laws as applied to the organism, and each and every organism develops in the ratio that it utilizes and understands these laws. In the cycle of the organism, from conception to death, theta and MEST are many times brought together in disorderly collision. This creates the phenomenon known as physical pain. Perception of threats to survival and dwindling position on the tone scale "charge up" these moments of physical pain as a mechanism to force the organism into, at first, greater survival activities and then, these failing, into death activities in order to free the theta from the MEST to begin a new cycle. The break point, where the organism is no longer driven upward toward survival but begins to go downward toward death, is 2.0 on the tone scale.

Death has been a vital mechanism in theta's conquest of MEST, since in no other way could the theta become sufficiently unenturbulated to be able to use the information received through enturbulence to create and construct new organisms or new species. Inevitably through this evolution theta, seeking according to theory wider and wider conquest of MEST, would construct an organism which by force of reason could actively handle large quantities of MEST. Man is such an organism. No lesser organism can rationally arrange any large quantity of MEST exterior to the organism, although many lesser organisms have genetic habit patterns which do permit the handling and altering of small amounts of MEST. All learning springs from disorderly enturbulences where theta has impinged too suddenly and sharply upon

MEST. All reasoning is done by freed theta returning over the MEST for an orderly conquest, utilizing the lessons learned in the disorderly conquest. This applies not only to the formation of organisms but to all adventures of man, according to observation.

It is possible that Dianetics, if these theories continue to prove correct as they have in the past, forms an evolutionary bridge which minimizes death as a mechanism for new learning and conquest and maximizes the conversion of entheta to theta, or disorderly experience to reason, within one life span. Should this prove to be the case, the acceleration of conquest of MEST by man should be very marked. Indeed at this time it can be observed that through a past lack of knowledge of the humanities his social orders have been for some time on a dwindling spiral, even though his knowledge of the physical laws increased. Man, according to these theories, could be said to have learned a great deal about the physical universe without learning enough about theta.

An interesting series of experiments recently done by the Foundation seems to bear out the theory that heightened reason-ability is contained in theta which has been newly recovered from an enturbulence with MEST. Individuals were given a test for a few minutes in order to measure their existing intelligence. They were then sent back down the track into an engram by an auditor and the engram was thoroughly restimulated. Immediately afterwards, the engram not reduced, these experimental subjects were ordered to do a second test. In this condition of stress the second test was taken, and it was found that the score on the second test was uniformly higher than that gained on the first test. Considerable additional experimentation must be undertaken, and these results are very far from conclusive, but they would seem to indicate validity in some of the theta-MEST postulates. Other explanations can, of course, be found for the results of these experiments. However, the theta-MEST postulates have permitted new dianetic processes to be derived and have markedly increased the ease of processing and have decreased the length of time necessary to bring about a dianetic release. Further, the theta-MEST postulates shed much light on the third dynamic, and with them it was possible for me to bring into being a new technology of groups which, when tested on pilot projects with groups, was found to have a uniform workability.

To learn anything about MEST, theta must become enturbulated with it, but to utilize the changes in it caused by the enturbulation, the theta must be freed from MEST in order to accomplish a reasonable conquest of further MEST. Death has been an answer, of sorts, but is not satisfactory to the unit organism. Dianetic processing offers a much less drastic theta recovery.

Inspecting a time track at the beginning of a case one ordinarily finds many occluded areas about which no reasoning can be done. It could be said that these areas, as in engrams themselves, contain entheta. Any of several processes which can free this entheta and convert it into theta will increase the reasonability of the individual, as witnessed by many long series of psychometric tests taken before and after dianetic processing. The restoration of recall of the areas hitherto occluded, in that the data contained in these areas is valuable as experience and information, could, of course, be said to increase the health and reason of the individual. But the recovery of the theta which could be said to lie in these areas as entheta could also be postulated to increase the reason of the individual.

The tone scale is actually a chart of the ratio of free theta and entheta in the individual. Above the 2.0 line, the individual could be said to have more theta than entheta. Below the point 2.0, the individual could be said to have more entheta than theta. Simply by converting entheta to theta the auditor can cause the individual to rise on the tone scale.

It will readily be seen that the ideal condition would be all theta recovered and no entheta remaining in existence in the individual. The attainment of this ideal is called in Dianetics a "cleared" state. This would be, at this time, the end goal of processing. Just how often it can be completely attained by skilled or unskilled auditors is open to question. That it can be neared and that cases grow markedly better under processing is not open to question, since regardless of any wonder about the cleared state none who have associated with the

Foundation or who have practiced Dianetics with any knowledge at all have the smallest doubt of the ability of dianetic processing to improve cases many times more than was ever before possible. If clears cannot be created easily and swiftly, dianetic processing is still very far from invalidated. Actually, clears have been and are being produced, but their total potentialities remain relatively unexplored.

The dianetic release is more understandable than the clear and has been produced and studied in sufficient numbers to admit of little doubt about the desirability and stability of the state. This is a nearer and more easily obtainable goal. The simple alleviation of pain, worry, and general unhappiness is routine to the dianetic auditor. He can accomplish that goals in anything from a few hours to a few weeks on most preclears. These are much more easily obtained goals, and are quite ordinary in the vicinity of the Foundation, so that these, which some say might have been considered miracles two years ago, hardly cause comment. Occasionally some Foundation auditor is startled into advertising a result to his follow auditors in a processing unit, but these successes are generally taken for granted.

Just as we have the ratio of theta to entheta establishing the sanity or insanity of the individual, so we have the ratio of free theta in the auditor to the free theta-entheta ratio in the preclear establishing the swiftness with which the entheta can be unenturbulated in the preclear.

An examination of this theory will demonstrate that there are three valid processes.

The first and the simplest of these processes consists of changing the environment of the preclear. His old environment possibly contains many restimulative objects and persons, so that his free theta is in continual enturbulence by reason of the restimulation. Shifting the preclear to an unrestimulative environment permits him to "settle out," which is to say, permits the temporarily enturbulated theta to disenturbulate and the "frozen" entheta to convert, in some minute quantity, to free theta. Part of the environmental change process would be, of course the bettering of affinity, reality, and communication in the environment of the preclear. This by itself could produce a rise in his tone. Falling in love, being an increase of affinity, can make a well man out of a sick man. Being rejected or falling out of love, being a decrease of affinity, can make a sick man out of a well man. Bettering a person's communication, even if only by giving him a new pair of glasses, will also raise his tone. Validating his realities which were in question can raise his tone. All these things could be considered environmental changes. A special part of environmental change would be changes in health, by reason of nutrition or better living conditions. This process must not be overlooked, since it has been our experience that some preclears who were not doing as well as could have been desired were deficient in their nutrition. The preclear who lives on coffee and sandwiches does not do as well during processing as one who has an adequate and balanced ration with proper vitamin supplements. Good physical exercise can by itself markedly increase the individuals position on the tone scale and a whole therapy to aid psychotics could easily be worked out along the lines of exercise alone.

Probably the worst thing that can happen to a Psychotic is to be placed in the atmosphere normally provided for him by the state. Only a sane, healthy environment where he gets proper exercise and where he has unrestimulative individuals around him could do much to improve his condition. The psychotic will sometimes improve if he is given command over more MEST and, indeed, a fundamental in the production of psychosis is denying the individual a command over MEST.

No better method of tailor-making psychotics could be devised than the usual institution, and it is probable that if the normal person were placed in such an institution, in such an atmosphere, he would become psychotic. Indeed, the incidence of psychosis overtaking attendants and psychiatrists in attendance in such institutions is alarmingly high. This is second only to psycho-surgery and shock treatment in the worsening of psychotics in a psychotic state. Rather than give psychotics such treatment it would be far kinder to kill them immediately and completely, and not partially as does psycho-surgery and electric shock.

The second process which is valid in producing results is education. Education, if defined as the process of making new data available to the individual and causing his mind to attend to and use that data, itself brings reason into the case. Education usually provides new areas of concentration in the environment of the individual and translates many of his unknowns into knowns. Unreason could be classed in two categories: too wide a zone of attention, and too fixed a zone of attention. In the first, the mind wanders over large areas unable to select pertinent data. In the second, where the mind is fixed, it cannot wander far enough to find pertinent data. In neither case can the mind resolve the problem about which it is concerned, due to the absence of data. Superstition is an effort, for lack of education, to find pertinent data in too wide a zone or to fix the attention upon irrelevant data. Personal experience in one's environment gives one what might be called personal education. A man has become embroiled with MEST, has freed himself, solved problems, has become embroiled again, has drawn back and solved problems anew, so that he has accumulated a fund of personal data about his task of living. Education might be said to be the process by which the individual is given the accumulated data of a long span of culture. It can, no less validly than personal experience, solve many of his problems. Free theta, confronted by too many problems, can, just by this, become enturbulated. Good education can in this way convert some of the entheta of an individual into theta, with a consequent rise on the tone scale. A very sharp proviso, however, must here be entered. Authoritarian teaching, by which the facts are impressed upon the individual and his self-determinism in his utilization of those facts is suppressed, can reduce the free theta in the individual by involving it in a fixed state in the memory bank. Theta is reason. Fixed theta is entheta. Many a man with a college education hammered home by authoritarian professors has been reduced so far down the tone scale that he behaves in life more or less like an automaton. His self-determinism, and hence his persistence and ability to handle responsibility are so reduced as to unfit him for his role in life. Further, concentrating on educational processes past the mid-teens, after which a person should be solving problems of living, has an inhibitive effect upon the mind. An artist specifically is hindered by authoritarian education, since his must be the highest self-determinism if his work is to have any value. Authoritarian education has more or less the same effect upon the individual as hypnotism, depressing him down the tone scale, and indeed, at this time most education is levelled as hypnotic commands rather than an invitation to reason. An education which invites reason and the comparison of taught data with the real world can raise the individual on the tone scale.

The third process which can be considered valid in raising the individual on the tone scale is individual processing, by which is meant any method which will turn his entheta into theta by addressing him as an individual.

It seems to be one of the characteristics of theta that when the theta present exceeds to a very high degree the entheta present, the entheta will tend to dis-enturbulate and become theta. In other words, if we considered these matters in terms of polarity and energy, a positive field if sufficiently strong would inhibit and then convert a negative field near it. A

very large magnet placed close to a small magnet will change the poles of the small magnet. When a very large amount of entheta is placed in the vicinity of a lesser amount of theta, the theta may rapidly become entheta. When theta and entheta exist together in more or less equal amounts, or when the disproportion is not large, a relatively stable condition exists, the theta tending to remain theta and the entheta tending to remain entheta. An example of this in the group is the phenomenon of mass hysteria, where one or two members of the group become enturbulated and very rapidly the remainder of the group becomes enturbulated.

This is the basic law of the contagion of aberration. Entheta will enturbulate theta. Misemotion will change emotion into misemotion. Poor communication will change good communication into poor communication. Poor reality will change good reality into poor reality. The engrams in a case enturbulate theta into the entheta of secondaries and locks.

Amongst people one sees this exemplified when a person who is relatively insane enters a group which is relatively sane. The relatively sane may attempt to raise the sanity level of the

relatively insane person, and it may occur in this group that the relatively insane person becomes more sane. At the same time, however, the relatively sane people become less sane, unless they have some means or technology for preventing this phenomenon from occurring.

In the case of a husband and wife, it is easy to observe that the mate who is higher on the scale will during the marriage association drop lower, and usually the mate who is lower on the tone scale will come slightly higher as a result of that association. As a further example, the mate who is lower on the tone scale will demand more affection and give less than the mate who is higher. The mate who is lower will demand more communication and give less, and will assert more reality but will actually have less. It can thus be seen, as represented in column AQ on the chart, that the auditor must have a higher ratio of theta to his entheta than has the preclear. A condition must exist where much more theta is available than entheta. An auditor whose theta-entheta ratio is around 2.5 could, with skill, handle individuals lower on the tone scale by not more than one point. A 2.5 auditor attempting to handle an apathy case would find his already badly enturbulated condition worsened so much by the case that the case, having very little free theta, would not get much better. A 2.5 auditor attempting to create a clear begins to work uphill as soon as his preclear reaches 2.5, and the hill very rapidly becomes too steep to climb. The ideal auditor is the one who has a very high endowment of theta and who is at 4.0 on the tone scale. Thus, at the beginning of Dianetics, where we have the usual auditor operating between 2.5 and 3.0, we find it very simple to pull preclears up to 2.0 or 2.5, more difficult to bring them up to 3.0. Where auditors are being heavily employed in processing people they tend to neglect their own processing, and being constantly in the vicinity of and handling entheta, they begin to encounter difficulties with a preclear as soon as the preclear reaches 2.5. It is incumbent upon the auditor to keep himself continually processed and keep his own tone coming up the scale. Where a co-auditing team exists, one person auditing the other, it is considerably more than a fair exchange for each to give due attention to the state of the other's case, for the moment one begins to appropriate the bulk of processing his own case will slow down in its progress.

Dianetic processing, then, by the theta-MEST theory, attempts only one thing: the recovery and conversion of entheta into theta. Any processing which does not accomplish this in an orderly fashion is therefore not valid dianetic processing.

Theta is many things. For a description of it as it applies to the MEST organism you need only read the 4.0 band of the tone scale chart. Theta is reason, serenity, stability, happiness, cheerful emotion, persistence and the other factors which man ordinarily considers desirable. Any practice which enturbulates theta suppresses the case. The auditor's code is actually a list of the things one must or must not do to preserve the theta-ness of theta and to inhibit the enturbulation of theta by the auditor.

Where the preclear has a small amount of theta and a large amount of entheta, the auditor must be particularly careful not to enturbulate the existing theta, since it is in the proximity of so much entheta that it enturbulates rapidly. The auditor mishandling such a case, using invalidations, hypnotism, brute force, sadism or devil worship, can send the free theta still in existence down the track and lock it up in an old secondary or engram and so find himself with a temporarily completely enturbulated preclear on his hands. To avoid this danger, one should mark the preclear well on the chart and be guided accordingly. This gives the auditor an estimate of the amount of free theta he has with which to un-enturbulate the existing entheta in the case. It may happen that so little theta exists in the case that the auditor must use the lightest and most pleasant methods of which he is capable in order to make enough theta available even to start down the time track.

The percentile column (the scale from zero to one thousand) is an index of the amount of organism theta available to work the case. At 4.0, one hundred percent is available. At 2.0, the amount of theta and "permanent" entheta are more or less equally balanced, but environmental enturbulation leaves the preclear with very little free theta. Below this point is the death zone, and here as the tone lowers increasingly, more danger exists that all the remaining theta will suddenly at one fell swoop become entheta, thus changing the occasional

psychotic into a chronic psychotic, at least until rest, good food, and exercise permit the not seriously enturbulated portions of the entheta to become theta again. It takes very poor auditing to accomplish this, and the danger is hardly a danger at all if one follows the chart. The more closely processing can approximate the mechanics of mind operation, the better that processing is. The least forceful processing produces the best results. As dianetic processing evolves it becomes less and less directive, the preclear being allowed more and more latitude in his actions. This should not go so far as to permit the preclear to free-associate or ramble on endlessly and uselessly, but it does go as far as never driving a preclear hard when he balks, unless he is in the middle of a secondary grief or terror engram and is refusing to go on through with it when if the auditor permits him to leave it the possibility exists that much skilled auditing will elapse before the auditor will have this preclear back into the secondary.

The auditor might liken his job to removing the rocks and shoals from the hidden depths of a turbulent river and making of it a smooth-flowing and powerful stream. The auditor is not changing the preclear's personality or attempting to improve the preclear by evaluation and suggestions. He is simply making it easier for the mind to do what basic personality naturally wants the mind to do. This might be said to be the total end and goal of processing.

CHAPTER TWO

The Auditor's Code

The first thing any auditor should know and know well about processing is the auditor's code. This has been called the code of how to be civilized. Much more important than knowing mechanical techniques is knowing well the attitude one should have toward a preclear. This is not for courtesy but for efficiency. No preclear will respond to an auditor who does not adhere to the auditor's code.

It must be remembered that the mission of the auditor is not to reduce engrams, not to run out secondaries, not to eradicate psychosomatic illnesses, psychoses or neuroses, but to raise the preclear on the tone scale. It happens that these incidentals of removing neuroses, psychoses and psychosomatic illnesses as well as increasing the persistence and general responsibility of the individual follow in due course so long as the auditor attends closely to his primary mission of raising his preclear on the tone scale. If he does not give this his first attention, he is not freeing theta and converting entheta, and if he does not do this he cannot efficiently accomplish the other goals. The index of how well he progresses with the preclear's case is the tone scale. Mechanical, lackadaisical, and careless auditing can actually remove psychosomatic illnesses and yet not raise the preclear on the tone scale. This may be paradoxical, but what happens is that the entheta in the engram causing the psychosomatic illness is converted into another type of entheta which is not physically painful to the preclear. It is, nevertheless, entheta, and the preclear is not raised on the tone scale. Thus, the auditor must closely attend to every means which will raise the preclear on the tone scale and should disregard the immediate and short-term goals of the eradication of specific "illnesses," bad habits, neuroses, psychoses, obsessions, and compulsions. The auditor must remember that even such a degraded practice as hypnotism can, by the implantation of positive suggestions, suppress certain physical and mental disorders. Though these are suppressed in one quarter they will manifest themselves as something entirely different. A person is saner to have "psychosomatic illnesses" than he is to have mental aberrations. Hypnotism can in a small percentage of cases eradicate the "psychosomatic illness" but will produce in its stead a lowered tone in the individual. Electric shock and psychosurgery may alter the behavior pattern of the individual and may suppress him into some tractable condition, but the result is inevitably harmful to the ability, efficiency, and general worth of the subject, with the further detraction that they cause damage to the brain from which the individual never completely recovers.

Simply by addressing processing from the viewpoint that one is changing entheta to theta and freeing up all available theta in the case one will make the most rapid progress with the preclear. Experience in the field has demonstrated that irascible, authoritarian auditing can continue for as long as five hundred hours, that actual "psychosomatic illnesses" can be removed and that some small improvement can be seen in the general tone of the preclear and yet that neglect of emphasis on raising tone might permit such a case to continue on another thousand hours without producing a clear, the entheta being transferred from one part of the bank to another, endlessly.

The auditor should give attention to the environment of his preclear. Cases have been observed in which the preclear was in the vicinity of a marital mate who produced such constant tension, so many invalidations, and who had so little thought for or belief in any possible gain for the other that the processing was only of small benefit and the auditor was wasting ten hours of auditing time for every one which was effective. In such a case the auditor has every right to recommend a change of environment for the duration of the processing. The auditor should not draw back from educating his preclear, so long as the education is not on a command basis but is done as an invitation to the self-determinism of the preclear to manifest itself, an invitation to the preclear to reason things out on a basis of his own adjudication. This is particularly beneficial with children. Indeed, children are surrounded by such ordering about and restrictions that their self-determinism is often too slight to cope with anything like their personal situations. In such a case it is definitely the role

of the auditor to invite the child to think things out for himself, occasionally redefining words or situations for the child. Actually, an auditor can take two or three preclears and form an educational group wherein mutual discussion of their own problems will result in a rise of tone in the preclears.

The third method of processing, of course the most lasting method, is auditing, or individual processing, wherein the auditor concentrates on freeing all available theta in the case and converting as much enttheta as possible to theta. The auditor's first step towards accomplishing this, should he consider the environmental situation compatible, is to promote affinity, communication, and reality with his preclear and to found a group of two -- himself and his preclear.

The auditor must recognize that he is dealing with a person, in every case, whose conduct is not as good as it will be. Thus, the auditor must practice much self-restraint and must form an example for his preclear. To do this the auditor must never under any circumstances or for any reason break any part of the auditor's code with the preclear. Breaking the auditor's code, at first glance, may not appear to be a very great sin. But an auditor has undertaken to aid a fellow man, and his dedication to that purpose must be sincere to the point of sacredness. An auditor, by misusing his position through what he knows about the human mind, can bring havoc upon an unsuspecting preclear. Carelessness alone, if it is backed with good intention, can seldom do much harm. But malicious intent, wherein an auditor expects to "gain" heavily by use of deception and misuse of the sacred trust he has taken unto himself in helping his fellow man, can cast a preclear far back down the tone scale.

If one does not feel that he can keep the auditor's code wholly and completely, he should not under any circumstances audit anyone, nor should he permit himself to be persuaded to audit anyone, and any preclear should be very wary of permitting himself to be audited by anyone who potentially would break the auditor's code. The preclear who finds himself confronted with an auditor code break should instantly and finally terminate his processing with that auditor and should find another who can keep the code. A man who will break this code once will break it many times, and the preclear should never persist in the arrangement out of the argument that he can get only one auditor. Anyone who breaks this code is under 2.5 on the chart and should not be auditing but should be in process of being audited himself.

An open-hearted and sincere effort to practice Dianetics, after a thorough study of the principles contained in this book, should the student adhere to these principles, will produce marked and beneficial effects upon human beings never before attained in man's history. To produce these effects the auditor must embrace the auditor's code and keep these principles as sacred as if they were the vows of priesthood. The auditor conducts himself in such a way as to maintain optimum affinity, communication and agreement with the preclear.

The auditor is trustworthy. He understands that the preclear has given into the auditor's trust his hope for higher sanity and happiness, and that trust is sacred and never to be betrayed.

The auditor is courteous. He respects the preclear as a human being. He respects the self-determinism of the preclear. He respects his own position as an auditor. He expresses this respect in courteous conduct.

The auditor is courageous. He never falls back from his duty to a case. He never fails to use the optimum procedure regardless of any alarming conduct on the part of the preclear.

The auditor never evaluates the case for the preclear. He abstains from this, knowing that to compute for the preclear is to inhibit the preclear's own computation. He knows that to refresh the preclear's mind as to what went before is to cause the preclear to depend heavily upon the auditor and so to undermine the self-determinism of the preclear.

The auditor never invalidates any of the data or the personality of the preclear. He knows that in doing so he would seriously enturbulate the preclear. He refrains from criticism and invalidation no matter how much the auditor's own sense of reality is twisted or shaken by the preclear's incidents or utterances. The auditor uses only techniques designed to restore the self-determinism of the preclear. He refrains from all authoritarian or dominating conduct, leading always rather than driving. He refrains from the use of hypnotism or sedatives on the preclear no matter how much the preclear may demand them out of aberration. He never abandons the preclear out of faint-heartedness about the ability of techniques to resolve the case, but persists and continues to restore the preclear's self-determinism. The auditor keeps himself informed of any new skills in the science.

The auditor cares for himself as an auditor. By working with others he maintains his own processing at regular intervals in order to maintain or raise his own position on the tone scale despite restimulation of himself through the process of auditing others. He knows that failure to give heed to his own processing, until he himself is a release or a clear in the severest meaning of the terms, is to cost his preclear the benefit of the auditor's best performance.

This is the auditor's code. It has been discovered that the two most important aspects of the code are the preservation of the preclear's sense of reality and the trustworthiness of the auditor. An invalidation of the preclear's data, no matter how outrageously that data may assault the auditor's own sense of reality, can be severe and will go so far as to shut off the preclear's sonic and visio, all in a moment. Most preclears are uncertain enough in the presence of their own past. They quite commonly invalidate themselves, a practice from which they should be discouraged. When the auditor invalidates the preclear's data the shock to the preclear can be very great. In the matter of trustworthiness, the auditor must never take advantage of the preclear, either in using his data or in using a temporary state of apathy, propitiation, or restimulation in order to possess himself casually of the preclear or to gain materially.

Any two people in constant association who will conduct themselves according to the auditor's code will soon find not only that they are clear or almost clear as a group of two but also that their knowledge of, and joy in human relationships have been immeasurably increased.

CHAPTER THREE

The Mechanics of Aberration

According to the basic theory of Dianetics, theta, by which is meant the life force, life energy, divine energy, elan vital, or by any other name, the energy peculiar to life which acts upon material in the physical universe and animates it, mobilizes it and changes it, is susceptible to alteration in character or vibration, at which time it becomes enturbulated theta or entheta.

A description of pure theta acting in a harmonious control of MEST is to be found along the 4.0 band of the chart. Here we see theta with an affinity very high in all spheres of attraction, capable of high communication both perceptually and with ideas, and with a high sense and appreciation of reality. An individual whose theta is unenturbulated in his current environment, whose education is not enturbulated by poor data and bad teachers in an unreasonable culture, and from whose life has been deleted all the physical and mental pain, given an average genetic background, would be a very high order of clear. The things which reduce the individual down from the state of clear and bring him lower on the tone scale would be a turbulent and unhappy environment, a poor and unreasonable education in a not too rational culture, poor physical endowment, and what is most important to the auditor, theta trapped as entheta in moments of physical pain and further theta trapped as charge as later consequences of that physical pain.

So far as the immediate address to the case is concerned, the auditor might conceive of a case as potentially relatively pure theta, though modified by environment, education, and physical endowment. But this theta has in past moments of pain and sorrow become, at least some portion of it, converted to entheta which is held at various moments of a person's past. By methods of processing, the auditor frees the entheta, which automatically converts to theta and becomes available to the individuals general action in life and so raises him automatically on the tone scale.

Physical pain could be said to be the alarm reaction to theta that the organism has been too heavily impinged upon MEST. Physical pain is an abrupt and sharp warning of non-survival. Without a mechanism of physical pain no organism could be warned of physical dangers through experiencing pain, and so no organism could survive, since no organism would have a perception of destruction. Thus, physical pain is actually a perceptic, just as sight and sound are perceptics. Physical pain as a perception mechanism lies immediately behind every other perception mechanism, since too much light can cause pain, too much sound can cause pain, too much motion can cause pain, and so forth. MEST, which is to say the physical universe of matter, energy, space and time, is perceived by the theta of the organism through the various perceptions of sight, sound, motion, organic state, and so forth. The moment any of these grows too intense, theta's orderly and harmonious control of MEST undergoes a shock of interruption. The theta and MEST brought too closely together in turbulence thus form entheta and enMEST.

Every individual has a time track. This is simply all of the perceptions of a lifetime from conception to present time -- the organism time track. Every moment of now -- present time -- finds the organism registering by perception some portion of the physical universe. These perceptions are stored in what is called the standard memory bank if they are analytical and not physically painful or in the reactive memory bank if they contain physical pain. Thus, these perceptions are stored in an unending continuation from the first moment of cellular life forward to present time. The time track is a consecutive series of nows, through day and night, week, month, and year for all the lifetime.

Each time the perceptions by reason of severe turbulence record as physical pain, the theta present could be said to be converted and held there static by enMEST. Every physically painful recording is missing from the time track so far as standard memory is concerned and is

filed instead in the reactive bank. Each time this occurs less theta is apparently available to the analyzing and conscious portion of the person's being and becomes a debit on the entheta side of the ledger. So long as the individual possesses proportionately more theta than entheta he is fairly well up the tone scale but when the trapped entheta begins to outweigh the theta the individual is brought down the tone scale to a non-survival level. The position of the person on the tone scale determines not only his potential for happiness but also his longevity. Immortality can be measured in many ways. The higher a person is on the tone scale the more he tends towards immortality. The lower a person is on the tone scale the more he tends toward death. The amount of theta in the case determines the amount of survival potential of the individual and the amount of entheta in the case determines the amount of non-survival potential.

The auditor, by processing, frees the entheta from the case, thus increasing the survival potential of the individual. The processes which free entheta and convert it into theta may be formidable in theory but in practice are quite simple and may be done by rote, since it is the nature of theta readily to convert back to its free and un-turbulated state when given simple assistance.

It should be thoroughly understood by the auditor that according to theory, confirmed by observation in practice, no entheta exists unless it has as its basic cause physical pain.

It should be no less well understood that theta contacting smaller quantities of entheta converts the entheta into theta. This is a two-way conversion. Entheta, in proximity to theta, makes entheta out of it. From this we have the contagion of aberration. It was once thought that insanity was inherited. It is true that a genetic endowment in terms of structure or an endowment of too small a quantity of theta may predispose one person more than others to insanity, but only in the vicinity of entheta. Of course, there can be the insanity of malformed brains, where some of the perception and computation mechanisms are absent, but this type of insanity results only in inability to think, not in aberrated thinking. It is not true, then, that insanity is hereditary. Insanity, apparently, comes about wholly by contagion. An enturbulated culture or environment can keep an individual in a continuous state of turbulence, but, lacking engrams, that individual would cease to be enturbulated as soon as he removed himself from the source of the turbulence. People who are insane bring those around them markedly down on the tone scale and could be said to be responsible for all the existing insanity in the race. If one associates with badly aberrated individuals one will himself, in consequence, become badly aberrated, if only while in the vicinity of the badly aberrated associates.

There is an apparent family line of aberration. It was previously thought to be carried genetically, but this is evidently not the case. It is carried on the thought channel of the family. The confusions of domestic life get into the moments of physical injury of the child, and the child as a consequence becomes liable for the family aberrations and will manifest them.

The principle of the contagion of aberration is broad in scope. One can observe in any group of men that one or two may be much more aberrated than the others. One can make the simple experiment of removing the one or two aberrated Persons from the group, and he will then see that the general tone level of the group will rise, since the source of the group's main turbulence has been removed.

By examining the life of any preclear, his case history, and without examining any of the preclear's own aberrations, the auditor can make a good estimate of many of the preclear's aberrations simply by discovering what manner of people the parents were. It is an inexorable fact that these aberrations, one way or another, will manifest themselves in the preclear.

The auditor should fully understand the principle of contagion. Fortunately, the conversion works in both directions. Sanity is also contagious. Thus, by observing the auditor's code and providing a sane environ for his preclear, the auditor can bring some of the

entheta in the preclear's case back into the state of theta without any processing. This is particularly valuable in the treatment of psychotics.

There could be said to be three divisions of entheta. Basically, the only way entheta comes into being in any life form is through physical injury, but after the physical injury is present the entheta in it contagious into the theta involved in circumstances that approach or approximate those of the physical injury. When this happens we have another kind of entheta: locks formed by restimulation. The shocks of conscious moments, the griefs and sorrows, the fears and angers, the breaks of affinity, communication and reality which one has with life would be the third kind of entheta, which would be temporary entheta if it were not for the presence of physical injury and its entheta in the case. To make this plainer, first there is the engram. This is physical pain, enMEST and entheta held at a specific point on the time track. This might never become serious but for restimulation by the environment. When this engram becomes restimulated it makes much of the existing free theta in the organism turbulent. Some of this turbulence remains as additional frozen entheta, some of it un-enturbulates and becomes theta again.
