In North Africa they had the Arab with the gun and whip. He could force people to do things with a gun and a whip and he accomplished a tremendous amount of extermination, but he certainly didn't advance that civilization very much. In South Africa they had a bit of the whip but everybody just gave up. The South African native is probably the one impossible person to train in the entire world—he is probably impossible by any human standard. I'll give you an example. A South African native is being shown how to sow crops and he has a basket, and he's got some seed, and he's walking along back of the harrow disc—and he is supposed to throw seed out this way: seed out this way, seed out that way, seed out this way. A white man is riding a little tractor that's pulling the disc and scraping the soil for the seed. And this scene was enacted and was witnessed and was told to me with considerable hilarity as some kind of an idea of learning rate. The white man was sitting on the little tractor pulling the harrow, the native along behind him, sowing the seed straight down in handfuls on the ground. The white man got off the tractor, came back to the native, took the basket away from him, put his hand in the basket, threw it to the right, put his hand in the basket, threw it to the left, and gave it back to the native. And the native waited, the white man got on the tractor, drove along, and the native took a handful out of the basket and threw it straight on the ground. So the white man got off the tractor, came back, took the basket away from the native, showed the native, throw it to the right, throw it to the left, gave it back to the native, took his seat again on the tractor, the native followed along behind, took handfuls and threw it straight on the ground!

And this went on for a very long time. The native never did throw any handfuls of seed to the right and left. Never did. That is farming in South Africa.

Now did anything ever come along and change that? Yes. Man had to cease to be Homo Sapiens and had to become Homo Scientologicus in order to accomplish any action that was anywhere near efficient in South Africa. And we have had some auditors in South Africa who have actually succeeded in training natives easily and well and have successfully managed large organizations there. That's certainly something. Now with these people it was still possible to get something done. But what had this native done? Was this native what we think of as primitive stock? No, we make a great many mistakes. We say a child is in a "native state." A native is in a "native state." People are in a barbaric condition and then they grow up and become civilized. How do we know that this barbaric condition isn't a retrogression from a highly civilized condition back to an Only One category? How do we know that isn't true? How do we know that that native didn't at one time achieve a great civilization of culture which then collapsed on him and he went back into a state of being a barbarian?

But the point is, is this true that a native is in a clearer state, and is it true that it requires Livingness to advance somebody in that crude state up to a condition of ability? No, that is not true. The child, the primitive, the native, are in retrograded states. They are worse off than somebody who is at a civilized or thinking or analytical level.

I will give you an interesting example of this. If you can tell the difference between a lot of little kids you run into, and psychos, I'll give you a medal. Now the funny part of it is that little kids have something to hope for. They have the future to grow up into. And that's their only asset. Almost everything else is on the debit side of the column. Here is this poor devil who has been slugged, he's just lost a body, he's been put into a state of anxiety, here he's got another body, is it going to get along right or isn't it? He's got the hope that it will grow and that alone can carry him forward and color the world brightly for him, but at the same time he is suffering from death shock. And because he is suffering from death shock, he is coming along very timidly with his learning. Now that is the condition a little kid is in, and when you KNOW that a little kid is in that condition, boy! can you handle him! You don't label him with this omnipresent overused term "insane," or "psychotic," you don't do that. This person is having a terrible time trying to adjust himself to his environment and control a body which is suffering from many responses he does not understand, and he is at his wit's end. The delusions of children and death delusions are quite similar. When a person dies and starts to pull out of that body, he generally snaps in on himself a torrent of facsimiles of one kind or another. He has all sorts of weird things that go "boomp in the night" present themselves at that moment.

And very often you get a preclear who is suffering merely from the death shock. And he is psychotic, he's crazy, he doesn't know whether he is coming or going. Why? Because he's surrounded by things he cannot understand—and that is the common denominator of all lack of orientation, of all aberration. It's being surrounded by things you cannot understand. And a child, surrounded by these things he cannot understand, therefore can produce what we call childhood delusions. But I can't find any real difference between these childhood delusions and the delusions being suffered by a person about to die or a person in an asylum.

When the kid gets worried, he's worried. Now who can handle him? Mamas and papas across the face of Earth today, particularly in America, have just about given up.

We have a whole philosophy—we hardly dignify it with the name of Science or even really dignify it with the name of Philosophy—which tells us that the child must be permitted to express himself, that you let the child do anything he pleases in any direction that he pleases and he will be all right—now that is modern psychology at work with children, and it is not true.

A child requires understanding and a child requires assistance in controlling the environment around him which is already too big, too strong, and is moving much too fast on him. He has to be set a good example of 8-C. I am not now talking about heavy discipline. I'll

show you the shortness of discipline. How many people have told you to be a good boy or a good girl, and when you were a good boy and a good girl, they never came to you and said, "Thank you for being a good boy or a good girl." I almost startled little Quentin out of his wits a couple of evenings ago. I told him to be a good boy now and go to sleep. He was feeling upset. "Stay in bed, now, get some rest." He was very quiet for half an hour. I went downstairs again and noticed he was still awake, and I said, "Thank you very much for being a good boy." He smiled, looked sort of dazed—it really shook him. And ever since then he's been saying—he always says it with enthusiasm, but with this he just about bursts the walls—"HELLO, DADDY!" He is really in communication. Probably the first time it's happened to him in seventy-six trillion years. You get the idea! Somebody did give him an order and then did finally acknowledge that he had executed it. But there is a common lag on the executing of such an order as "Be good," or "Go to sleep," and there is never an auditor there to say "Thank you," never an auditor there to say "You did it." So life is furnished with these tremendous numbers of unfinished cycles.

If one is bad, it gets acknowledged, confirmed and pushed around, but if he's good, it's sort of neglected. That is an interesting factor right there. But all I am telling you is that children, South African natives, and now the entirety of this world in which we are living, present to us an auditing problem. We are rich in being able to understand what is happening in our environment and we are rich also in knowing exactly how to handle such a circumstance or condition. Nobody knew before. That is factually true here on Earth.

More Confronting

L. Ron Hubbard

That which a person can confront, he can handle.

The first step of handling anything is gaining an ability to face it.

It could be said that war continues as a threat to Man because Man cannot confront war. The idea of making war so terrible that no one will be able to fight it is the exact reverse of fact—if one wishes to end war. The invention of the longbow, gunpowder, heavy naval cannon, machine guns, liquid fire, and the hydrogen bomb add only more and more certainty that war *will* continue. As each new element which Man cannot confront is added to elements he has not been able to confront so far, Man engages himself upon a decreasing ability to handle war.

We are looking here at the basic anatomy of all problems. Problems start with an inability to confront anything. Whether we apply this to domestic quarrels or to insects, to garbage dumps or Picasso, one can always trace the beginning of any existing problem to an unwillingness to confront.

Let us take a domestic scene. The husband or the wife cannot confront the other, cannot confront second dynamic consequences, cannot confront the economic burdens, and so we have domestic strife. The less any of these actually are confronted the more problem they will become.

It is a truism that one never solves anything by running away from it. Of course, one might also say that one never solves cannonballs by baring his breast to them. But I assure you that if nobody cared whether cannonballs were fired or not, control of people by threat of cannonballs would cease.

Down on skid row where flotsam and jetsam exist to keep the police busy, we could not find one man whose basic difficulties, whose downfall could not be traced at once to an inability to confront. A criminal once came to me whose entire right side was paralyzed. Yet, this man made his living by walking up to people in alleys, striking them and robbing them. Why he struck people he could not connect with his paralyzed side and arm. From his infancy he had been educated not to confront men. The nearest he could come to confronting men was to strike them, and so his criminal career.

The more the horribleness of crime is deified by television and public press, the less the society will be able to handle crime. The more formidable is made the juvenile delinquent, the less the society will be able to handle the juvenile delinquent.

In education, the more esoteric and difficult a subject is made, the less the student will be able to handle the subject. When a subject is made too formidable by an instructor, the more the student retreats from it. There were, for instance, some early European mental studies which were so complicated and so incomprehensible and which were sown with such lack of understanding of Man that no student could possibly confront them. In Scientology when we have a student who has been educated basically in the idea that the mind is so formidable and so complicated that none could confront it, or perhaps so bestial and degraded that no one would want to, we have a student who cannot learn Scientology. He has confused Scientology with his earlier training, and his difficulty is that he cannot be made to confront the subject of the mind.

Man at large today is in this state with regard to the human spirit. For centuries Man was educated to believe in demons, ghouls, and things that went boomp in the night. There was an organization in southern Europe which capitalized upon this terror and made demons and devils so formidable that at length Man could not even face the fact that any of his fellows had souls. And thus we entered an entirely materialistic age. With the background teaching that no one can confront the "invisible," vengeful religions sought to move forward into a foremost place of control. Naturally, it failed to achieve its goal and irreligion became the order of the day, thus opening the door for Communism and other idiocies. Although it might seem true that one cannot confront the invisible, who said that a spirit was *always* invisible? Rather let us say that it is impossible for Man or anything else to confront the nonexistent and thus when nonexistent gods are invented and are given more roles in the society, we discover Man becomes so degraded that he cannot even confront the spirit in his fellows, much less become moral.

Confronting as a subject in itself is intensely interesting. Indeed, there is some evidence that mental image pictures occur only when the individual is unable to confront the circumstances of the picture. When this compounds and Man is unable to confront anything anywhere, he might be considered to have pictures of everything everywhere. This is proven by a rather interesting test made in 1947 by myself when it was discovered that if an individual could be made to "run a lock" of something he had just seen, run another lock on something he had just heard, and run an additional lock on something he had just felt, he would at length be able to handle much more serious pictures in his mind. I discovered, although I did not entirely interpret it at the time, that an individual has no further pictures when he can confront all pictures; thus being able to confront everything he has done, he is no longer troubled with the things he has done. Supporting this, it will be discovered that individuals who progress in an ability to handle pictures eventually have no pictures at all. This we call a Clear.

A Clear in an absolute sense would be someone who could confront anything and everything in the past, present and future.

Unfortunately for the world of action, it will be discovered that one who can confront everything does not have to handle anything. In support of this is offered that Scientology process, Problems of Comparable Magnitude. In this particular process the individual being processed is asked to select a terminal with which he has had difficulty. In that the definition of a terminal is a "live mass" or something that is capable of causing, receiving or relaying communication, it will be seen that terminals are quite ordinarily people in the problem category of anyone's bank. The person is then asked to invent a problem of comparable magnitude to that person. He is asked to do this many, many times. It will be found midway in the process that he is willing to do something now about the problems he is having with that person. But at the end of the process a new and strange thing is found to occur. The individual no longer feels that he must do something about the problem. Indeed, he can simply confront or regard or view the problem with complete equanimity. Now an almost mystic quality enters this when it is discovered that the problem in the physical universe about which he has been worried often ceases to exist out there. In other words, the handling of a problem seems to be simply the

increase of ability to confront the problem and when the problem can be totally confronted it no longer exists. This is strange and miraculous.

It is hard to believe that an individual who has a drunken husband could cure that individual of drink simply by processing out the problem of having a drunken husband, and yet this has occurred. I am not saying here that all the problems of the world could be vanquished simply by running Problems of Comparable Magnitude on a few people, but neither am I saying that all the problems of the world could not be handled by Problems of Comparable Magnitude on a few people, and indeed I am at this time undertaking an experiment in this direction on the subject of the atomic bomb. It is an oddity that the longer this experiment is continued, the less responsive these bombs are to test firing.

Perhaps it could be said, however, that if there existed one person in the entire universe who could confront all of the universe, the problems of the universe for all would deintensify enormously.

Man's difficulties are a compound of his cowardices. To have difficulties in life, all it is necessary to do is to start running away from the business of livingness. After that, problems of unsolvable magnitude are assured. When individuals are restrained from confronting life they accrue a vast ability to have difficulties with it.

There are many other things about confronting which are intensely interesting but these we will take up in a later issue.

An earlier issue of *Ability* carried in it a full resume of Training 0, the name of which is Confronting. This drill, done for a great many hours, will be found intensely efficacious in the handling of life. A wife and a husband whose way has not been too smooth would find it extremely interesting in terms of resolution of domestic difficulties to co-audit with this training drill alone, each one running it upon the other for at least 25 hours. This would have to be done, of course, on a turnabout basis of not more than 2 hours on one and then a switch from "coach" to "auditor."

To run Confronting in this fashion and with considerable gain, it would be necessary to have some understanding of what a "coach" is and, in one of these co-auditing teams, what an "auditor" is. A much fuller understanding of this will be contained in the *Student Manual*. The team sits in straightbacked—preferably uncomfortably upright—chairs. The coach and auditor sit facing each other a short distance apart. It is the task of the coach to keep the auditor "on the ball." The "auditor's" feet must be flat on the floor, his hands must be in his lap. His head must be erect and he must not use any system or method but must simply confront. A twitching muscle, a jittering finger alike would be reproached by the coach. The coach has several terms he uses. The first of these is "Start," at which moment the "session" begins. Every time the auditor falls from grace, does not hold his position, slumps, goes anaten (unconscious), twitches, starts his eyes wandering, or in any way demonstrates an incorrect position, the coach says "Flunk" and corrects the difficulty. He then says "Start" again and the session goes on. When the person in the role of "auditor" has been extremely successful over a period of time the coach can say "Win" and then again "Start." When the coach wishes to make some comments or give some advice the coach says "That's it," straightens up this point and then again says "Start."

In the coaching itself only these terms are employed: "Start," "Flunk," "Win," "That's it." Anything else the coach does or says is disregarded by the "auditor" unless the coach has said "That's it" and has then advised on a point and then has started again. The coach would be at liberty to do anything he wished, short of physical violence, to make the auditor nervous or upset him. The coach could say anything he wished between a "start" and another command as above, and the auditor would flunk if he paid any attention or did otherwise than simply confronted.

Ordinarily all the coach does is make sure that the auditor goes on confronting. However, it should be understood that the drill can be toughened up considerably. The coach can do anything to throw the auditor off the simple business of confronting. If the auditor so much as twitches a smile, looks embarrassed, clears his throat or in any other way falls off from plain and ordinary confronting, it is, of course, always a “flunk.”

It should be understood that *drill sessions* are *not* auditing sessions. In a drill session the entire session is in the hands of the coach, who is only in a vague way the “preclear” of the session. In an auditing session the entire session is in the hands of the auditor.

There is a basic rule here. Anything which the “auditor” or “student,” as he is called in the drills, is holding tense, is the thing *with* which he is confronting. If the “auditor’s” eyes begin to smart, he is confronting with them. If his stomach begins to protrude and becomes tense he is confronting with his stomach. If his shoulders or even the back of his head become tense, then he is confronting with the shoulders or the back of his head. A coach who becomes very expert in this can spot these things at once and would in this case give a “That’s it,” straighten the auditor out on it and would then start the session anew.

It is interesting that the drill does not consist of confronting *with* something. The drill consists only of confronting; therefore, confronting *with is* a “flunk.”

Various nervous traits can be traced at once to *trying to* confront with something which insists on running away. A nervous hand, for instance, would be a hand with which the individual is trying to confront something. The forward motion of the nervousness would be the effort to make it confront, the backward motion of it would be its refusal to confront. Of course, the basic error is confronting *with* the hand.

The world is never bright to those who cannot confront it. Everything is a dull gray to a defeated army. The whole trick of somebody telling you “It’s all bad over there,” is contained in the fact that he is trying to keep you from confronting something and thus make you retreat from life. Eyeglasses, nervous twitches, tensions, all of these things stem from an unwillingness to confront. When that willingness is repaired, these disabilities tend to disappear.

Of course, tumultuously married couples may encounter some knock-down and drag-out moments in doing this confronting drill. However, it should be kept in mind that it is the coach in these training drills who is bound by the Instructor’s Code and that the only harm that can result would come about if the “auditor” were permitted to “blow” (leave) the session without the coach, even with manhandling, getting the auditor back into the drill. It will be found that these “blows” occur most frequently when the person being coached, in other words the “auditor,” is being given too few wins and is being discouraged by the coach. Of course, things he does wrong should be flunked, but it will be found that the way is paved to success with wins; therefore, when he does it well for a period of time, the “auditor” should be told so. Go into this drill expecting explosions and upsets and simply refuse to give up if they occur and you will have it whipped in short order. Go into it expecting that all will be sweetness and light and everyone should be a little gentleman and a little lady and disaster will loom.

Neither I nor the management are responsible for cuts, contusions, violent words, or divorces resulting from attempts to run confrontingness drills by husbands and wives on each other.

May you never be the same.

HCO BULLETIN OF 9 SEPTEMBER 1957

PROCESSES TO BE RUN ON HGC PRECLEARS FROM THIS DATE

The following processes are to be run on HGC preclears from this date until otherwise notified.

ON PRECLEARS WHO HAVE POINTS BELOW THE ZERO LINE OF APAs: Very brief rudiments. Then CCH 1, CCH 2, CCH 3 and CCH 4. These processes are not run on a basis where each is killed dead before the auditor goes on. Each is run to a flat spot and then bridged to the next. It would be amazing to run one of them more than a couple of hours except perhaps CCH 4 Book Mimicry, but even this is only run to a mediumly flat spot. As soon as the auditor has gone through these four processes once he goes over each one again, possibly using now CCH I (b), Don't give me that hand, instead of Give me that hand. It will be noted that each one of these tends to unflatten the other three. Further a pc may get no response at all on CCH I until he has run CCH 3 and CCH 4. Hence to grind on one only is folly of the first order.

The object of these processes CCH 1-4 is to get the person under control, by which is meant the body. Only when that is done can an auditor hope to go on with success.

Once the person is under control it is quite easy to put attention under control. This is best done by TRAINING 10 Locational Processing. It is to be noted on a low scale case that TR 10 can be enforced. Thus the pc does not fly out of control.

ON PRECLEARS WHO HAVE MOST POINTS ABOVE THE ZERO LINE OF AN APA: Here again we have to hit the CCH steps but in this case we first handle rudiments with the following thoroughness:

1. We clear help. Can the auditor help the pc. Can the pc help the auditor. Do people ever help people. Etc. On a two way comm basis break this down until the pc comes through any compulsive help or wasting help.

2. We clear pt problem making sure again that the pc can invent a problem of some sort about something. We run pt problem on a terminal only, never on a condition. Further, we run this until the pc is willing to let the pt problem ride. We don't want him to be "willing to do something about it". But we NEVER let this process occupy 15% of an intensive. Why? Because havingness is the clue to problems and a person obsessively has problems when he doesn't have havingness. If a problem takes too long to clear, the auditor blundered by running pt problem and should come off of it at the first logical spot and return to it AFTER he has later run havingness.

3. Goals are then cleared in full. It doesn't matter if this takes the rest of the intensive. The questions are formally audited as follows: "Tell me something that you're absolutely certain will be there in ---," "Tell me something you would really like to have in -." The times are one minute, five minutes, one hour, one day, three days, one week, one month, three months, six months, one year, two years, three years, ten years. These times are not absolute, but may be changed by the auditor. But they are close to pat as given. The auditor does not figure out for the preclear the dates on which these times will occur. The pc's figuring out the date is part of the process.

From here the auditor selectively shoots up APA by running old-time Trio with all three parts. In this he knocks out “remain” and “dispense with” as well as “have”. He runs this Trio as follows. He runs many haves, then bridges to many remains, then bridges to many, many, many dispense withs. Then he bridges to haves, then runs many, many, many remains, and bridges to many dispense withs. Then he bridges to many, many, many haves, runs many remains (into which he bridges), and then bridges to many dispense withs. He can keep this up in this order. Each one of the legs of Trio tends to unflatten the other two legs. All three have to wind up flat. This is run first inside and then, if being concentrated on, outside. Goals can be run again as above if desired for then will run differently.

If the auditor has any suspicion that he does not have the pc under control he runs the early CCH steps briefly and accomplishes it.

If the foregoing basic things are done, then many other things can be done. An analysis of a profile will tell us a few things about a preclear and while we do not yet have every point on an APA taped, we do have several.

Foremost is the point “nervous-depressed”. When this is low, the pc doesn’t have any reality on anything. No stable datum. The first stable datum the pc gets may well be achieved by the oldy ARC STRAIGHTWIRE gone through just a few times. That’s cracked plenty of people’s cases. The early CCH steps are all aimed squarely at that point. “Look at me who am I?” also hammers at that point. When I see a before and after with no change on nervous-depressed when it was low (always about -90) I think, “The pc never found the auditor”. Actually it’s lack on any stable datum of any kind. The auditor may be found only after the pc has gotten hold of some very minor stable datum, “Something that’s really real in the room.” “Recall a moment that is really real to you.”

The second point we have even better established through test is the CRITICAL. When this is low, the pc is on obsessive change and will LET NOTHING REMAIN. Getting him to let just one thing remain (and to be still) can shift this critical. Letting things remain is the key to a low critical.

IQ is another big win for us now since we know what IQ is all about. IQ is the ABILITY TO WITHHOLD OR GIVE OUT A DATUM ON A SELF DETERMINED BASIS. Incidentally we also shoot valences with WITHHOLD. It is run the same way whether shooting valences or raising IQ. One finds the weak valence from which the pc could withhold nothing and finally gets the pc to be able to withhold things from that valence.

EXTERIORIZATION is accomplished by “Recall a moment of loss”. When a pc gets this flat he can then be run on old S-C-S routine (not Stop-C-S) and he will exteriorize easily.

Psychosomatic difficulties have been vanished rather easily on withhold. “Look around here and find something from which you could withhold that-----” skin-rash, leg, whatever.

EYESIGHT can be shifted by CONTROL TRIO with emphasis on Disappear.

THE FAILED CASE is a case in which thought can always be overpowered by Mest. The pc’s ability to make his thinkingness prevail against Mest has failed too often and cannot change. Only Mest changes, therefore. This is usually the below zero on the APA pc. Making him think things and do things doesn’t much change him because he is too weak in thinking to prevail against Mest. “Look at it and tell me something about it you could handle” or “Think a thought that would be all right for you to think”, and other approaches, done by a clever auditor, can crack this sort of thing up on an even gone case. This is a point which occasionally needs attention, particularly when we have a pc who is not changing on APA or IQ. If an intensive didn’t change him, he can’t think against anything. The oldest workable remedy known is “Spot something around here that isn’t thinking”.

After being trained in the TRs it is necessary to run a student on the remain button of Control Trio or Trio and upon withhold processes to up his test.

I have turned out this bulletin rapidly for use in the HGC and on students in training. This bulletin will only be modified when necessity becomes apparent. Nothing in this bulletin will overcome sloppy, yakkeyety, wiggly or can't-confront auditing.

I trust you will get good results with the above.

Best,

Ron

CONTROL TRIO

Now thinkingness in general should not be suspected of being under anybody's control, much less the auditor's, but it is probably more under the auditor's control than it is under the preclear's control. When I say to you "Do you think that thinkingness is under control?" you should be aware of the fact that it is less under the preclear's control at any time than under the auditor's control. That's one the boys don't get always. They think, "Well, can I get the preclear's thinkingness under control?" Well, you can do it better than the preclear, but that is horribly bad, and when you get this clear you will see that you have to get the body under control and get attention under control before you aim at thinkingness.

Therefore, a condition to running Trio is this: Is the person of the preclear under control, is the attention of the preclear under control—those are two conditions necessary to run Trio. Now to assume the power of choice is also under the preclear's control—much less thinkingness—is, of course, pretty grim. It moves Trio outrageously high. So you could say, then, that there are two versions of Trio, and I have been fishing around for one of them; I've been doing some work on this for the last several weeks and I finally got this thing taped—I do mean taped.

All right. Trio would just be Trio just the way it is. But there is an undercut in Trio; Trio could be a directive process, and it would be prefaced by "**Get the idea of having that clock,**" "**Get the idea of having that picture**" (indicating picture on wall), "**Get the idea of having that sofa,**" "**Get the idea of having that chair,**" "**Get the idea of having that table**"—do you see this? Now that is highly directive, isn't it? Now that would keep thinkingness under control in the kind of a case who was having a rough time with it.

All right. Now let's take the second version. "**Get the idea that it would be all right for that clock to remain as it is.**" "**Get the idea that it would be all right for that wall to remain as it is.**" Got that? Just an indicating process.

All right. Now here comes the clincher! Instead of dispense with, or not-know, we run into actually a brand-new process. Its rationale is much higher; it's "**Get the idea of making that clock disappear.**" "**Get the idea of making that chair disappear.**" "**Get the idea of making that ceiling disappear,**" etc. Small objects are much easier for the preclear to make disappear than large ones, but you haven't told him to make it disappear, have you? You have told him to get the idea of making it disappear. They usually interpret you literally and try like mad to make it disappear, and it usually does for a short time.

Now this process is restimulative, too. Anyway, we've got a point, and that is simply this: that this as a process all by itself is probably one of the killer processes of all time. I have solved this enigma: Why doesn't a preclear exteriorize easily and stay exteriorized? And we ask this question and we ask this accompanying question: Why does a preclear get sick when you ask him to conceive a static? Now obviously we'd have to get somebody to conceive a static

before he could himself stay comfortably outside. What keeps a preclear from conceiving a static? It's because he associates a static with loss, and he says, "All right, if there is nothing there I've lost it." Don't you see? "I've lost something if there's nothing there, therefore I'd better not conceive a static." Conceiving a static is therefore painful. Well, the truth of the matter is, whenever he lost anything, something disappeared. All right.

The funny part of it is that he never noticed that he didn't lose totally every time. He still had other objects. He lost his tie-pin—well, heavens, he's still got his tie. He's still got the floor, the room, this universe, space, but he never realizes this in these instances, and so that's why we've been running this process here on "**Recall a moment of loss,**" just to see if we couldn't accustom someone to conceiving a static very directly on loss, and whether or not the individual would exteriorize just as such, on the process.

Now that was a test that was made. The test process, "**Recall a moment of loss,**" sandwiched in with Havingness, then, has been run with the expected result that we would get this fellow concentrated on exteriorization and a little more able to conceive an exteriorization, certainly. Now final figures from this are probably not available from testing yet; they aren't, but regardless of that, here is the rationale. An individual cannot conceive a static if he associates a static with loss, if loss is painful. So we have to cure him of the painfulness of loss, consideration of, before we can exteriorize him easily.

Now how do we do this? We have to go back to automaticity. The universe has been taking things away from him. It has become an automaticity and we find that the universe has an automaticity known as time, and time itself is a consecutive series of losses. All right. So we have to cure this fellow of losses before we can get him to appreciate time, otherwise he's so afraid of losing it that he parks himself on the track, and this is "stuck on the track" phenomena. All right. The process which is aimed at this, the experimental process "**Recall a moment of loss,**" sandwiched in with Havingness (Trio now handles it on this—"Control Trio" it had better be called, and its third command is "**Get the idea of making that (object) disappear**")—well, this gets him to take over the automaticity of all the losses which he has experienced unwillingly, you see that. It's the universe that's been taking the things away, and an individual, then, just by spotting objects and getting the idea that they are going to disappear or are disappearing, of course then does take over this automaticity of losses, and he becomes accustomed to it after a while and he should come out of the woods on it.

Now all of these invisible masses that preclears have around them are actually simply symptoms of mass - loss, mass- loss. Now when an individual has no visio, has never seen anything, couldn't see anything, the only thing he's looking at is a stuck loss. Got the idea? He's looking at the nothingness of something that was there. All right, you take over that automaticity with this third command on Control Trio. Therefore, you have a highly directional, a highly workable set of processes, and each part of that Trio would be run relatively flat and go on to the next part, and I would say you'd probably run it something on the order of, oh, certainly not a hundred commands each—you'd try to stay in that order of magnitude, and you could just run it round and round. It's "get the idea of."

Well, what would be necessary before you got to that process? It would be necessary to get an individual's body under control, which takes the early steps of CCH. And then put his attention under control; a great many processes can do this. Chief amongst them has always been locational processing, and if you were to just run the ordinary locational processes, you would eventually get his attention under control.

The auditor taking control of somebody's attention actually puts the preclear into more control of attention than the preclear ordinarily is, which is one of the freak things. People look at this and they say, "Well, we must be running the fellow out the bottom," and we wouldn't be running the fellow out the bottom.

Well, we leave Trio in its time-honored style and so on just as it has always been, but we do have this low-cut Trio and it's rather a killer. You take somebody with glasses, his eyesight will do more tricks in less time on this third process of Control Trio. Things will go black—well, why do things go black? Well, blackness makes things disappear, doesn't it, and you take over the automaticity of using blackness to make things disappear. Night grabs, the way of the universe, once in every 24 hours on earth here. This is the one we've been looking for to turn on visio.

Now if you wanted to turn on sonic with this you'd have to go down to a noisy part of town and just run Trio on sound, but you wouldn't dare do this—run Control Trio on sound—you would not dare do this, of course, if the preclear did not already have Trio on objects flat. Obviously, visio would turn on before sonic.

There are many things that you could do with this. People who have anaesthetized areas in their body—like they have no chest, no sensation in their chest, etc.—do weird things with this process, this Control Trio. Got it? I wanted to tell you particularly about this particular process because it is a specific, and it will be found to be very useful to you. We had to find out if one version of this would run without killing a preclear, and that's **“Recall a moment of loss.”** Actually, **“Recall a moment of loss”** should act as a havingness process, because it as-ises all of the loss points on the track, and it should be a havingness process all by itself, but we didn't want to be so bold as to run it with no Havingness.

(Until I find out differently, this Control Trio and “Recall a moment of loss” are making a bid for our chief exteriorization processes.)

RUDIMENTS AND GOALS

All you need to clear up if somebody is having too much trouble trying to locate or isolate a problem is to clear up the semantics of a problem—what does he mean by a problem? I got this rich one off a preclear one day doing this quite fascinating thing. What was a problem, I finally asked, and he told me a problem was something that could never be solved.

Whenever you run “withhold” on a valence you finish up with “can’t have” on the valence and that flattens it off better.

You will find it is quite often more advantageous to run Locational Processing than it is to run Problems of Comparable Magnitude. A Problem of Comparable Magnitude is all right, but it’s a thinkingness process, and on a case that is having an awful lot of trouble, it gives them hell to run Locational Processing, but nevertheless it does run out the present time problem, which is most fascinating.

Any one of the Rudiments are excellent processes—any one of them. Two-way communication is something that has never been stressed much on this side of the water—it has been taught very thoroughly on the other side. I took up a lot of the 4th London A.C.C. on the subject of two-way comm, how you handle two-way comm. You have to keep the reality of it very high and you have to be willing to interrupt obsessive outflows of the preclear, etc., and obsessive silences. Two-way comm is a very interesting way of going about things, and it isn’t just talking. It is establishing a high level of reality. It consists of the auditor feeding experimental data to the preclear, in order to have the preclear look it over and decide about it one way or the other. In two-way comm, you don’t let a preclear as-is everything he knows, thinks or wants to do.

All right. Now we look over this and we discover that the Rudiments consist, in part, of a present time problem. Now we already know that a present time problem can be run in this wise—Locational. It can also be run as a Problem of Comparable Magnitude. So we have a lot of processes connected with a present time problem.

Now let’s take another one of the Rudiments. Clearing the Auditor. Actually, the crudest way known of clearing the auditor is **“Who do I remind you of?” “Tell me something you don’t like about me”**—these are real crude ways of clearing the auditor. The best way of clearing the auditor we know of is in Training 13, which is **“Could I help you—how?” “Could you help me—how?” “Could I help anybody else—how?” “Could you help anybody else—how?” “Do other people ever help other people?” “Do women ever help women?” “Do men ever help men?” “Do men ever help women?” “Do women ever help men?”** And you just beat it to pieces on a big long bracket. Now this goes so far that it becomes a fantastic process in itself. You take father and mother valences—they are usually quite hot. You can run this on Help. This is usually quite necessary on a case that’s going to hang up, because the only reason the case is sitting there is

to waste help. And you can run a case on any process, no matter how excellent, on a basis of wasting help until the case simply can't find enough ways to waste it and he goes down tone scale. You have to understand the case is trying to waste help. It isn't Find the Auditor in the Rudiments today, it is Clear the Auditor. The only point on which he's cleared is Help—"Can I help you?" "Can you help me?"

All right. Now let's take another facet of this. Goals. Actually, *Handbook for Preclears* has been helping us out just to the degree that it does do a little clarification on goals and gets the guy stirred up. The real reason the *Handbook for Preclears* is used at the HGC is quite an interesting one. It's simply to stir the case up so it'll run out.

All right, this guy's sitting there in a sleep and he's just gonna run Locational, you know, and he's in a disoriented state anyhow: He isn't here and he isn't home and he isn't anywhere—well, let's get him worried, let's get him chewed up a little bit, let's get him restimulated somewhat, let's get him interested in this. All right, these problems, then, do tend to swim to the top; you run some relatively non-directional process, and does it bite on? Now if you're going to run non-directional processes—that is to say, "**Give me that hand**" and so on—you're going to have to have something to run them against, and something like the *Handbook for Preclears* gives you something. The guy thinks while he's going over this sort of thing, he thinks "Oh my, blah blah, the trouble with me is I have nothing to do and I don't want to do anything and I never will have anything to do."

But I got to thinking about goals from the usual standpoint of their high generality with most people—"I wonder if there is anybody around who could articulate with great conciseness what he would like to do"—and I found on all sides that a failure to articulate was the main difficulty. The person had a feeling he wanted to do something and this would be wonderful, and it was all in a sensory capacity. Now if he could be made to articulate this, why, we would really have something. And I experimented on ;t a little bit and we see that today in the *Handbook for Preclears*.

Now if you can get him to articulate in a session anything about the future, you have won on the subject of goals. But it must be in the alignment of this person's frame of reference—it must be aligned with his life, not aligned with something we think he ought to live. So let's take a look at clearance of goals. Goals would not be likely to run on a high generality. In other words they are specific, personal and intimate. It's "**What do you think?**" "**What do you want?**" "**What is aligned with your life?**"—and we can't beat around the bush with this one if we're going to get any place with it.

All right, let's take Goals as a process. You could run goals for 25 hours with the greatest of ease, and we just had a report of a terrific win here on a preclear who was run on Locational for 25 hours, so it looks like the Rudiments could be the session. So if somebody says, "Well, now, I ran the Rudiments and then we got into some processing"—fascinating, you see. Rudiments are dignified today with CCH 0 as an appellation. All right.

We discover this preclear in this terrible condition of not wanting any auditing, not going any place, all of his goals being somebody else's goals. Two things we can do at once are Clear the Auditor and then run Goals. Now how would you really run Goals with two-way comm? Goals could be run with two-way comm in this way: **You ask the preclear what he is absolutely sure would happen in the next two minutes-in the next day—three days from now—one week from now—one month from now-and one year from now. And we want something he'd be absolutely sure would happen.**

Now we're running right there the reverse process of atomic bombs, which say "no future"—"no future"—"no future." Well, basically, what's wrong with anybody— why does he jam on the track? It's because of "no future." He has been denied to a point where his loss is so great that he dare not own.

I knew a person at one time, a case that was, by the way, a psychology major— one of the roughest cases I have ever run into. The case put on the total appearance of being sane—it was a dramatized sanity, and yet the case would make odd remarks like “I really think people are crazy.” “Well, why do you think people are crazy?” I would say. “Well, because people say they can tell right from wrong, and you know there’s no difference.” Fascinating! The case would make odd remarks like this from time to time. One day the case made a remark on goals, like this: “Well, it’s really best to tell people that things can’t happen to them, because otherwise they might hope that they could, and then they’d be disappointed.” Now you disentangle that. This was all taught to this person, by the way, at the University of California at Berkeley. The person was also taught that the best way to preserve anybody’s status quo, etc., was to drug them and so on, I mean it was a gentle course. All right. This person was stark, staring mad and had no future of any kind, no slightest future, brought out by this. Five hours on just this one type of question, **“Is there anything going to happen in the remainder of this afternoon?”** **“Will anything happen the rest of today?”** **“Is there anything going to occur any place in the world the rest of today?”** And the confident answer, with great certainty, was “No.” “No.” Five hours. And finally we broke through it—“Well, you will probably sit there for the rest of the day wrangling with me and screaming at me the way you have been doing”—and it busted and I finally got the person to admit that there was some slight possibility that there would be a room here for the rest of the day. And it busted this case. It read from total no-future up. Well, this case was an isolated case, as we’ve occasionally had now and then, and this was an inspirational sort of process that cracked through.

Well now, we see this process of Goals on the basis of futures, and a person without futures cannot have a fancy future called a goal, and all a goal is is a fancy future determined by the person. And if he has no future at all determined by anybody, then he isn’t going to go anywhere from that point, and any goal he has is totally unreal.

So the best way I know of to clear up a goal is as follows: Two-way comm **“Is there anything that’s going to happen in the next couple of minutes?”** We finally get this totally thrashed out till he’s got some great big certainty that there will be something a couple of minutes from now. And then we move it up a day, and then we move it up a week—three days—and move it up a week; and move it up a month; and move it up a year. And we get certainties at each one of these stages and levels, regardless of on what. Now the person knows that that is going to occur. He knows there is going to be a future there.

Now let’s have him put something in this future that he now has had created. He’s created a future, he’s got certainty on it, it’s up there. All right. Now let’s put some desire in the future and we get a goal. **“Now what would you like to have happen in the next couple of minutes?”** or **“What would you like to do in the next couple of minutes?”**—**“What would you like to do tomorrow?”**—**“What would you like to do in three days?”**—**“What would you like to do in a week?”**—**“What would you like to do in a month?”**—**“What would you like to do in a year?”** And we will get these weird things which have no desire in them; they are all get-rid-ofs, and if you really plowed such a person down on it he would get down to the bottom of the ladder, which is “Knock this body off right now.” And when he says “I would like to get rid of my fear of darkness, I would like to get over feeling bad every time my mother screams at me”—well now, these aren’t desires. These are runaways, these are flinches—these are “let’s not confront it,” “let’s get out of the universe,” “let’s scam.” And the final result is the basic postulate “If I could just get rid of this body right this instant I would be all right.”

All right. So that thing doesn’t even vaguely get flat unless there is a real goal like “I’d like to have a stick of candy”—now that’s a goal, see, that’s a goal. “Tomorrow, I’d like to walk down the street and find a couple of bags of gold lying on the corner.” You see, it has to have desire in it. “Next week, why I’d like to go camping. I’d just love to go camping.” Then they’ll always modify these things in some way or other, “because of course I can’t because I have to work and I don’t have any money and” yak, yak, yak—you got the idea? They’ll modify

these goals. As long as they're modifying them they don't have a goal, because they're making a postulate and the MEST universe is kicking the postulate in on them.

So how do you solve this? If it's this arduous how do you solve it? Well, run **"Build a future—" two minutes** (these times are only approximate), **tomorrow, three days, a week, a month, a year** just build the fact that there will be something there, that time is going to advance in those areas. Then we build a desire into it: **"Well, what would you like to have happen?"—"What would you like to do in two minutes?"**, **a day, three days, a week, a month, a year?** All right. Well, he didn't give you anything he really wanted to have happen; he said, "I'd like to—if I were brave enough I'd tell you I'd like to get rid of you and me and everything, but I'm not brave enough so all I will say is I would like to get rid of the darkness, that would be fine."

All right. Two-way comm consists in the main of keeping a preclear talking, busting through their silences, knocking them into line and manhandling them with pomp. You keep 'em talking; and therefore it is a skill—a very high skill. But after you've built a future you build into it something they would like to have happen in that future. All right.

So here is a modus operandi now that makes this a process: Build a future on that span, then build something they'd like to have happen in that future. Now build a new future, go all over the same first process again on prediction, next couple of minutes, what he's sure is going to happen, what he could be certain about. **"What could you be certain about a year from now?"** All right, we've built a future—then you'll find out that's a little stronger, and then we build something in that future that he'd like to have happen. And then we build a new future—same first process again—and then the second process of adding the desire to it, and we finally will come out into the clear.

Now there is a way to run Goals for twenty-five hours—slug, slug, slug. Now you can run Help for twenty-five hours, too, on just who helps who, when, where. **"Has there ever been anybody in the whole universe who ever helped anybody in the whole universe?"** is the most general form of question. But here we have these Rudiments, then, moved out into processes, and it's possible to just handle intensives with Rudiments.

Now we find somebody wasting help—well, he's hard to put into session. And if you are going to help him anyway, it isn't goals that's in trouble, it's help, and if you try to help him too much and he's wasting help, he will eventually waste help by blowing. So it's help that has to be cleared if goals won't. Got this? All right!

**THE FIVE LEVELS OF INDOCTRINATION AND
PROCEDURE CCH**

The first thing that we should take up is the state of Scientology at this time, and to tell you that we are on a plateau. We are certainly on a plateau, and it is a plateau so very much higher than man has ever walked before that it is well worth saying it is a level that can be maintained. If people want more results than we can get today from CCH properly used, there will have to be a better auditor than we can make today.

The idea that "This is it" periodically has occurred in Scientology. Right now we are justified in saying that we are on a plateau which does not have to change.

When you can process a catatonic schiz, a five-day-old baby, you've got it made in the world of homo sapiens. The only further adventure we might adventure upon would be the processing of the thetan not connected with the body, and that would be an entire field about which we know practically nothing. But anybody who is having anything to do with bodies is well within the reach of Procedure CCH, providing it is used by an auditor who has been validated through the five levels of indoctrination. CCH used by an auditor who has not been validated would be the least guaranteed thing I can think of at the moment. I have already thrown up my hands in a few expressive horrors when I have seen auditors who have not been through the five levels fumble around with any Tone 40 process, and it is so grim that even now, to you, watching it, untrained, trying to do one of these things, it would not look like auditing.

Back in old Book One days, a fellow could sit down beside someone on a couch and say "Go back to that engram," and it looked like auditing. It doesn't look like auditing today. It is the difference of indoctrination which makes the difference. The person who applies it has been successfully checked through the five levels of Indoc. It is now the auditor plus the process. That is one of the reasons why we knew we were on a plateau. There wasn't something you could tell out of CCH easily to your Aunt Mame's little girl, to fix up her fear of cats. It is interesting that such employment does not reach any level that you yourself can consider a good result. Somebody untrained does not achieve any great result with it, and is liable to leave his preclear in a badly restimulated condition. We are dealing with a package of dynamite with Procedure CCH. We have to take into account the five levels of indoctrination successfully passed, which is necessary to apply CCH to a preclear.

CCH is a very sloppy title, for Procedure CCH is really C for Control, D for Duplication, C for Communication, C^t for Control of Thought = Havingness; and that is the real name of it.

First, we get the person under control, get him into the capability of duplicating, and then we move him up into communication more or less on a person level. Now we take the mind. The mind consists of mental image pictures, and if duplication is addressed to the mind we get

communication. The third zone is the control of the Thetan, which brings us to Control of Thinkingness, Ct. I will show you more graphically what these three things are:

1. Notice that you are sitting in the chair. Notice that you have a body sitting in a chair.
2. Get a picture of a cat. Can you? Note that it is a picture. That is the mind. It's pictures and the apparatus which handles pictures.
3. Get a picture of a cat again. Answer this question: "What is looking at the cat?" That is all you ever need to know about a thetan with CCH.

As we extend out from the thetan we get the physical universe, so actually there is a fourth thing there which undercuts the body, and that would be the physical universe. In other words, you are in immediate and direct contact with everything that you will be expected to study or ever process in Scientology. Every one of these things that I have mentioned, the physical universe, body, mind, thetan, may have a clearer appearance to you, or some other condition connected with it, but there isn't anything outside of this. We omit the physical universe, because it is pretty hard to look totally at the physical universe right at this moment. But for sure you are looking at all the body you have got. As far as this picture is concerned, it may flop over and have many cross associations, and you could trace this endlessly as I have. As far as thetans are concerned, the most you will ever learn about one is your own beingness, or the observation that something is being moved, made alive, and motivated.

This is the entire target of CCH. There isn't anything else to shoot at. All of these things intimately, then, relate to the thetan, and we have Control, Duplication, Communication, Control of Thinkingness, and Havingness, that relate to a thetan. We could process in any one of these zones. When you process any part of these four things, you really cater to some slight degree to the other three, but you can concentrate upon any one of these things.

CCH has in its concentration levels first the body, then the mind, and the thetan just happens—nowhere in CCH do we intimately address a thetan. But we can come close to addressing a thetan by addressing thinkingness.

Here is what CCH does. It makes the person more aware of a body, and he eventually recognizes to some degree that he can control the body. Next, it addresses the physical universe, in the locational processes of the next facet. Actually, it addresses intimately the thetan plus the physical universe.

How can you as an auditor overcome the obsessive mental changes which occur? You cannot see what he is thinking. You put his body under control, then you get him into communication, and then you can also clarify and control to some degree his thinkingness. At thinkingness we are standing at a borderline between the mind and the thetan.

By control and duplication we get communication. When we have communication we can straighten up the fellow's time track and his habitat in the final process, Then and Now Solids.

Let me be much more positive about this. The make-or-break point of any case is this: Can he make things more solid or can't he? A person who can make things a little more solid can also be processed on almost anything and get along fairly well. I knew there was one point above which cases process easily with almost any technique you use, and there was a point below which no process seemed to have anything to do with a person. As soon as this was isolated we had things made, for we could graduate somebody up to a toleration of solids.

We can cross this borderline in all cases today.

But how about the fellow that we cannot communicate with at all? He has another bug that we have to overcome, and that is the bug of obsessive change. When you tell him to think of a cat, he has to be able to think of a cat. When cases failed in the past, it was that the preclear never thought what we had told him to think. He said so, but didn't do it. Here we have this thing. If we can get him to think the thought "keep it from going away" we can graduate him up to solids.

There are two things that you do with a person. You control his person and you make him duplicate and communicate; you control his thinkingness. So you use the early steps of control of a person, which are **“Give me your hand,”** Tone 40 8-C, Hand-Space Mimicry and Book Mimicry, over and over, until you are absolutely sure that the fellow can think when you tell him to. Then you go into the next stage, which is Tone 40 **“Keep it from going away,”** Tone 40 **“Hold it still,”** and Tone 40 **“Make it a little more solid.”**

What is the bank doing? He has some attention units which get stuck on the track that are only being fixed by the bank sticking him, so we do all these things on the body and then we do practically the same things on the attention. After that, we have got it made, because we can graduate him to making something a little more solid. Let’s take him aside and let him get the inside confidential story of the whole thing. Have him take a look at his mind, and there comes the trickiest step of CCH. It only condenses almost the entirety of what an auditor had to know that was developed in three years.

This is the rough process and I don’t make any bones about it. You can either subjectively remedy havingness or you can’t. So the way we run CCH is to graduate a person up to making things objectively (the outside world) or subjectively (mind) solid, and then have him straighten out the whole track. All sorts of odd and interesting thoughts occur when we use this thing Then and Now Solids. Above this we do have a couple more things. They are super-developed gee-whiz processes, completely unusable on homo sapiens. However, you start winding up, why, you go over into these processes. I’ll give you some idea of where this goes. You could turn on a person’s mental image pictures the size of that wall in three dimensions, with total perception, in half an hour’s processing. Abilities are not perishable. The only thing which is perishable is willingness. Processing is still a matter of choice. A person would never refuse processing or help if he knew what it was. That which refuses processing is not the person. After a while, it isn’t that he pulls up on you and surrenders. He finally takes an apathetic look and says, “What you are doing is not bad. I wouldn’t mind being a lot better. “

You give him a surfeit of control, until he finds out it doesn’t kill him. Maybe he can control something now. Now that is the background theory of CCH. What I want to punch up is that if you wish to handle body illnesses, they come under the heading of person. If you want to handle mental actions you would do it with control of attention, and if you wish to handle a thetan it would be through control of thinkingness.

L. RON HUBBARD

A BASIC CHART OF PROCESS TYPES

October 29, 1957

Prerequisite understanding to this chart: Definitions of body, bank and mind. Communication—Upper Indoc course. Text: *Scientology: Fundamentals of Thought*.

| Type No. | 1 | 2 | 3 |
|--------------------|---|---|--|
| a) Name | Starting— Ending session | Control Processes | Duplication |
| b) Characteristic | 2-way Comm | Control by Action | Mimicry by Action |
| c) Purpose | To compose pc into and release him from the auditing session | To place pc's body and actions under auditor's control to invite control of them by pc | To establish communication |
| d) Action on Bank | To double control of it Auditor + Preclear | To better control of it | To go into comm with it on pc determinism not bank determinism |
| e) A Basic Example | Is it all right with you to start an auditing session? | Sit in that chair Thank you | Pc makes motion; Auditor makes same motion. Auditor makes motion; pc makes same motion. |
| f) Stable Datum | Agreement | Never let the pc get out of doing what he is told | Each command in its own unit of time separate from every other command |
| g) Phenomena | Auditing is a knowing and known activity | Pc is controlled by unknown source, which must be turned into known sources | Mis-duplication (only once) shows up and runs out before insistent duplication |

| Type No. | 4 | 5 | 6 |
|----------|---|---|---|
|----------|---|---|---|

| | | | | |
|----|------------------------|--|--|---|
| a) | Name | Straight-wire Processes | Objective Processes | Subjective Processes (think) |
| b) | Characteristic | Remembering & Forgetting | Spotting & Finding | Thinkingness |
| c) | Purpose forgetting and | To recontrol present time, remembering and relate past to present | To orient pc in maticities of drop out past and improve havingness | To recover auto thought and as-is unwanted thinkingness |
| d) | Action on Bank | To as-is locks and engrams and bring them into knowingness level | To drop out past havingness by substituting present havingness and to reorient | To mass as-is significance |
| e) | A Basic Example | Recall a moment | Notice that wall | Think a thought |
| f) | Stable Datum | Specific things, not generalities | Attention of pc must be under auditor's control | Body control comes before control of thinking |
| g) | Phenomena | Occlusions turn from generalities to specifics. Cycle aspect of recall in time (earlier, late, etc.) | Old locations (change of space) drop out | Thought has become substitute for masses. Classes of thought group and source appears |

Escape

L. Ron Hubbard

Well, I've been working now for a lot of years to bring Dianetics and Scientology up to a point of supermagic.

It was easy to get them up to magic. In a world where *no* results, aside from accidentals, had been the order of things, it was simple to create magic. A cloying illness resolved, a fast heal of a broken limb, a recovery from fixations and obsessions, it was easy to repair these. That was simple magic.

And time and again I've told you "this is better" and it's been true and auditing worked better.

But what were we really looking for?

We knew all of us that we were in a sort of trap called physical universe. And although it was all right to say we'd gotten in ourselves and that it was each man's fault, it is nevertheless true that it was a trap complicated by innumerable traps.

It was all right to say that it was "natural" for man to kill deer. But that wasn't making it any easier on the deer.

It was all right to recover enough data to know that dying wasn't fatal but *still* men died and dying often hurts.

By no actual consent of our own we are torn from our friends and possessions and crushed into new lives. But just because we understood it made it no less arbitrary, no less painful. Just because we could better understand the trap made it no less a trap.

I've heard people say, "I don't know what I ever would have done if you hadn't come along, Ron." All right, why should somebody like me have to come along if all the world is right and the universe an expression of deep love.

We curse at man-made hells. We spot cause in villainies uncountable. Yet, think now, what are we doing in a universe in which hells are possible.

Sure, maybe you even *asked* to come here. But deep in pain and shock, shadowed by your own forgetting, why puzzle now if this Universe is a *good* place.

You wouldn't say a lion's cage is a good place for a child. Nor would you jeer at and accuse a child who unwittingly stumbled into a lion's cage. *What is* the cage doing there in the first place for a child to fall into?

Let's be sane. We can rationalize this universe, we can explain complaints, we can blame the inmates *but is* it not true that we came unwitting into it?

What do we really *want* out of Dianetics and Scientology? What could I really give you that you want?

Escape.

Is there anything wrong with escape? Is a man mad who seeks to leave a fire that chars him, a mass that crushes him, a world that laughs at his dreams and scolds him for his stupidity?

Escape.

Why not escape?

Why not let a few others escape. After all, we're not all only ones. We can feel and we can cry.

Tell me why Christianity won so well. Wasn't it because of promised escape?

Tell me why Buddhism won so sweepingly. Because it promised escape.

Well, why *not* escape. If the great religions of all time became great on the promise of escape, we must assume that a *lot* of people want out and that there's something wrong with in.

This universe is a breaker of bones, a defiler of deeds, a mocker of gallantry and peace. I can say this with equanimity. I don't have to get emotional or even personal about it.

A spirit seeks to advance, to improve. Each way is blocked. This universe knows only how to decay.

Is there a way out?

Yes there is.

We have it in Scientology now. I have found it and charted it. I know exactly how to open the gate.

For whom. Ah yes, that's the news. We used to say—"if your case is in good shape" or "if you really want to." Of course you want to. But it didn't require *magic* to open the gate. It required a supermagic to let our friends go free.

For seven years or less you have believed in me. You saw enough to know two things: (a) that I was sincere and would continue to work on it and (b) that a progress line existed which improved.

All right. What has been done? The auditing skills have been created which led an auditor up to this.

What has been done? In the lower steps of CCH we can rescue the people lowest down, even the unconscious people.

I told the 18th ACC—"I am through researching south. All further HGC researches will consist of going North." I went North faster than I had thought I would. I have now taught the auditors in Washington and the Academy instructors how to go all the way north.

All the way.

I know why you're here and the fast way out. I have taught auditing *skill* to Academy students and the 18th ACC. I've taught all the way *north* to the HGC auditors.

What is the way out? With no excuses, no byroads. Straight out. All the way.

Without belief or faith or "right conduct" you can go all the way.

THE REALITY SCALE

*Prepared from L. Ron Hubbard's second lecture to the 17th American A.C.C.
in Washington, D.C. on 26 February 1957*

I want to talk to you about the Reality Scale and the whys and wherefores of Hand Contact Mimicry.

For a very, very long time we had the ARC Triangle. We had Affinity and Reality, and afterwards had Communication. A lot of people thought that Reality was the most important corner, but evidently Communication was the most important corner because by processing with communication we could do some astonishing things.

Two-way communication: Pc has a problem, you make him talk about it. If you don't go to a point where you excessively reduce his havingness, he will have a tendency to desensitize on the problem. This is one of the oldest therapies known: you go and tell a friend you're in trouble and you feel better. However, in Scientology this thing took on a new burnished radiator cap. Nobody knew before what it was in communication that made things communicate and made it therapeutic and so forth. We isolated the various parts of communication, and we isolated, much more importantly, the Bill-Joe interchange of two-way communication.

Now what can you do with communication? Well, a lot of people go around and they don't have any reality on Scientology because nothing has ever happened to them. Their idea of what it takes to get reality on something is—they can't examine something—the reality must have a mass. It must have an impact, a very heavy effect.

Now remember that you can reduce havingness by communication, but within that framework let us take somebody who has no reality on anything happening to him. Of course he has no reality on anything happening to him! He's in a high games condition, which means "no effect on self, total effect on others." So you're trying to plow through his consistent postulation that there must be no effect upon himself of any kind whatsoever, and if you get through that barrier, then he says, "I have some reality on this subject." If you destroy his "no effect on self," then he'll believe you. This is totally idiotic, but that's the way it works.

Now we get this fellow. He has no reality on Scientology, but he's got a toothache. We have him say "Hello" to the tooth, have the tooth say "Okay" to that hello. Have the tooth say "Hello" to him, and have him say "Okay" to the tooth. Which makes a two-way comm. Have him do this a few times and the toothache goes—poof!

We take a heavier mass than this, like an arthritic leg. Arthritis is a ridge illness, and therefore you go up or down from the ridge and you've got it made. We can make him get rid of his arthritis even by simply putting him in apathy about it. You could hammer and pound

him until he was sitting there very, very quietly and unable to wiggle in any way, and he wouldn't feel his arthritis. Well, he wouldn't feel anything else either.

You take slight little somatics, little conditions, or fears of things, and run two-way communication on them, and you get some fabulous results. Let's say somebody's afraid of a stove. Have him say "Hello" to the stove, and have the stove say "Okay." Have the stove say "Hello" to him, and have him say "Okay" to the stove. After a while he won't have any fear of touching the stove. Oddly enough, he will receive less effect from the stove even if hot. That is quite important. It tells you that the body does not naturally lend itself to injury, but injury takes place only in a highly aberrated condition. You should be able to take a body and throw it up against the wall hard enough to crush its skull in, have it drop to the floor, stand and walk away—providing you aren't holding in suspension the image picture of its hitting the wall and being injured.

Now I'll give you an example of that. I want you to look at this ashtray. Now I'm going to raise this ashtray and then I'm going to put it back on the desk. Is that action now in existence? Where? You've got some pictures of it, haven't you? This universe doesn't make things survive. Only you make things survive. And this is: you are holding the engram in restimulation, which permits it to have an effect. You're so doggonehipped on the subject of survival that it's just marvelous to behold. That is because a thetan cannot do anything *else* but survive. Naturally, anything that's surviving he can go into good communication with.

People like to look at the Pyramids. Why? Well, the person is surviving and evidently the Pyramids are surviving, so there is a medium of interchange. A thetan looking at a solid is much happier if the solid is surviving. If this solid has duration, then the thetan can have a means of communication between himself and the solid, in spite of the fact that the thetan can't be solid.

So people really don't have much of a tendency to look at and study and examine very closely things of very finite survival periods—things that die right now, things that vanish right now. But they could say, "Look. It became nothing just like I am, and therefore I have another communication point with it."

Sudden disappearances stay hung in the bank. That is different than something with a finite life. Things with a very finite small life are not very important, but solids which suddenly disappear are quite curious to a thetan. Hence we like magic shows and such things.

Now let's add these factors up. This nothingness tends to survive only when arrived at under that circumstance: there was something there, now there's nothing there. So that I give you a motion of MEST and you make a picture survive, but it's not any longer moving in MEST. MEST has very, very finite duration, so we have to rig up all sorts of things so it'll survive, so it'll continue.

And people like to have things continue, but after a while, when things have not continued with them for a long time, then they get onto another kick: they only hold on to. It was something and suddenly became nothing, so therefore they hold on to losses. And the whole track, at length, becomes a concatenation of losses.

Communication, oddly enough, has always attended one of these losses. It is not true, basically, that communication as-ises or destroys or knocks out any mass. But communication has always accompanied the vanishment or destruction of mass, so the preclear gets these two things involved with each other, and then he goes through an automaticity of having mass vanish when he communicates. You must get this clearly. The only thing that as-ises mass is as-ising mass. But communication always accompanied this, and after a while the preclear gets one very solid conviction: that if he talks to something, something disappears. It's not true.

Sound is another aspect of communication which is fabulous. You realize, the first sounds were evidently those which accompanied explosions or destructive actions. Electronic

particles traveling through space will carry with them sound, even in the absence of air. Sound does not go through a vacuum. Unless you have some carrier for sound it doesn't reach you at all. Therefore, a sudden electronic explosion was usually the first acquaintance with sound.

It's true that he had to put sound there in order for sound to be there, but he has a number of experiences whereby something blew up (and therefore disappeared) and sound took place. So you'll find any preclear willing to swear that sound is disintegrative. Not all communications contain sound, but sound is a disintegrating factor. So communications with sound combine the destructive aspect of sound (of which the preclear's convinced) with the as-ising aspect of communication itself (of which he is again convinced), and between the two of them you get an awful loss of havingness if you're not very careful. Communication, verbal, tends to as-is (or knock out) the masses in the bank of the preclear. So we just start right in auditing him. Now if he has a present time problem which is terribly pressing, well, you could do something with this if you didn't talk about the problem too much. If you ran problems of comparable magnitude to it, you'd probably add to his havingness.

The way we got away with it with running engrams was quite peculiar. The person was having to put the engram there to some degree in order to run the thing. This made him capable of confronting the incident and so brought a discharge of the fixation he had for that incident, and yet did not rob him particularly of the incident, the mass. We were running the significance out of the mass. It's interesting. But where a person couldn't afford to lose anything, he couldn't even afford to lose significance, and so we couldn't run an engram. Well communication goes much further south, and we have a condition here whereby we see an individual drop through the bottom just by too much yackety-yak with the auditor on the subject of his particular phobia or bank.

This tells you, by the way, at once, one of the most condemning facts of psychoanalysis. I started digging up all the factors utilized in psychoanalysis, and I discovered this fantastic thing, that I couldn't find any factor present which was therapeutic. Beyond the fact of telling a friend your troubles, there is no therapeutic rationale behind it, because you get the as-ising of mass. Where Freud achieved any result—let's be generous, let's say he *did* achieve some results—let's find out how long it took him to achieve them. An old lady came in from Bavaria and talked to him for a few minutes and just ranted on and on, and all of a sudden said that she felt better and got up and left. Freud, as far as I can discover, never had any results from cases who went longer than a very few hours in psychoanalysis. In other words, Freud's results were the magic results. A person came in and said, "This is wrong, and that is wrong" and felt better and went away. If you let the patient talk too long, he is going to go out the bottom, and that I guarantee. They talk themselves down the tone scale.

Just take a preclear who's in bad shape and have him tell you about his problem or something, and he drops on out the bottom doing this. You can watch him go right on downscale. It's possibly an experiment you ought to make to really understand this. Just make somebody tell you his trouble over and over and over. And you will understand at once why Freud got spectacular results in a very few hours, and why nobody's gotten any results since in a great many hours.

Brainwashing—that's the biggest joke of this half-century, brainwashing. A fellow will talk out enough havingness to throw himself into an introverted condition. You've got his mind concentrated upon his bank, and now you make him talk, and out goes the havingness. And he goes right on downscale with great speed.

Please understand this as auditors. Know what you are looking at. You're just looking at the vanishment of mass. And a thetan believes that to be recognized and to be able to prove things and to be able to demonstrate to the world that he is there and that things have happened to him, he has to have mass.

And so we get the third corner here. Affinity is actually the consideration of distance. Communication is an interchange of ideas. But Reality is what it is about and what it is proved by.

Looking all around now, I would say that the weakest corner of the ARC Triangle is “A”—Affinity. This has the least monitoring effect upon a preclear but is the most strongly demonstrated. It is NOT a good entering point. C and R run out A, or re-establish A. And A is very easily monitored. C is less easily monitored by A and R. And you pull R and C apart and you’ve got nothing. You have no reaction. You have no universe. So C and R—Communication and Reality—are very, very closely associated.

And Reality has a scale. And because C is closely associated with Reality, Reality then again (after ‘54) started to take a certain prominence. Reality is a scale in its own right, and that scale begins at the top with a Postulate. Which postulate, continuing, can make a Consideration. You can acquire considerations by other means than postulating; all you have to do is agree with an existing postulate or an existing consideration, and you too can have the consideration—you didn’t have to postulate it in the first place.

It’s Postulates; Continuing Postulates/Considerations—and the next step down from there is Agreement. And here we see this vast panorama of “everybody agreed with everything,” which knits them all together in the same time continuum. It’s a postulate, a consideration, and then a couple of guys or more have this same consideration and, having it, then we have a specialized consideration—it is shared in common—and this we call an “agreement”: a shared consideration.

Having accomplished that, we get Solids. We get proof of the consideration, and that takes place in spaces and solids. But Reality, actually, is the solid aspect, whereas A is more closely associated to the spatial aspect. Because they wish to prove it and convince one another, they get something that can enter the phenomenon of sight, and the other phenomena of touch, smell. Here we have spatial relationships established and confirmed by mass.

What happens to somebody who is no longer convinced even though the mass is there? Where would he go? The one just below that is “a Line.” The mass called a “terminal” tends to vanish, and the line between a couple of terminals tends to take place and appear.

And then, below that we get “No Terminal, No Line.” And don’t mistake that for a postulate condition. You get this person selling you a beautiful bill of goods—because there’s nothing there—that he’s in a postulating condition. He has become the total effect of his postulates, total effect of his considerations, total effect of all masses, total effect of all lines—and now he can’t even see lines and masses. Such a person is liable to tell you, “My thoughts affect things thousands of miles away.” It’s true that an OT can affect something thousands of miles away. But he isn’t an OT, he’s got lumbago. OTs don’t have lumbago.

You start to process him, and what happens? The line shows up. You process him longer, and shadowy things show up at either end of the line, and the line starts to disappear and the terminals start to appear. And then you process him a little bit longer and boy, do those terminals become solid! And after he is able to make a terminal have an effect upon him so that his confidence in this is unassailable, he can only then enter into the world of agreement. Only then are his agreements binding and valid. Only then can he make them or break them. Up to that time he is obsessed by any agreement of the past track. He is the victim of all the upper scale at any point he is on the scale. And that is true of the Tone Scale, or is true of any other scale.

A person, you know, does not move up level by level of the Tone Scale. He *broadens up* the Tone Scale. He becomes the whole scale. There is a big difference. A person who is in good shape can postulate, consider (which is to say, continue a postulate), agree, make masses, or make masses disappear, or make lines between masses appear or disappear. At any

point you find him on the scale, he can do the points from there down, and you win for him the ability again, you make him willing to have the ability again, to do the points from there up.

The Reality Scale is very important. It tells you that communication down below “No Line, No Terminal” is almost totally first dynamic communication. The person actually gets convinced that if he thinks it, it arrives in Chesapeake Bay, you see. He gets a telepathic idea of his own thinkingness. Naturally, all terminals there are all there too, and all lines are there too.

Now what’s the state of a case at any one of these levels? Well, it matches up right there alongside the old Tone Scale—the Sub-Zero Scale and the original Tone Scale in their continuum, you see, from Serenity clear on down to Wait—Wait, not even Unconscious. This level is paralleled by this Reality Scale. And there’s also a series of communications which go down along the whole line.

Let’s take our preclear at the point where he doesn’t know you’re there and doesn’t know the room is there and doesn’t know he’s there and doesn’t know that he has a body sitting there, and he just DOESN’T KNOW, but he’s performing on some social machinery. Where is the entrance point? The first thing that you can do with this preclear, we believe now, that would recall to him an ability would be the recognition of the existence of a line. Hence, your hand against the preclear’s hand—that’s a line. By establishing a line he can come into cognizance of the terminal. Your arm is liable to get awful real to him. Unless his hand and arm get real, you’re not going to find anything else gettin’ real.

It doesn’t mean that a person responds to Hand Contact Mimicry only when he is in terrible shape. Anybody ought to respond to Hand Contact Mimicry. You do Hand Contact Mimicry with most anybody who hasn’t had his hands cleared, and you’re going to get some results, that’s for sure.

A solid communication line is very fine, but what if you break it? Well, you can break it so slowly that the person doesn’t notice that the hands have ceased to be lines and have become terminals. There is a little space, an inch, between your hand and the preclear’s hand, and he hasn’t noticed to any great degree. Affinity starts to take place, because we’ve got some distance, but the affinity, you’ll find, will be first worst and then best with the terminals close together. Hand Contact Mimicry is the point back to which I would drop at any time I became very suspicious that I was auditing over the head of the preclear. I’ve gone way over his head, therefore I’ve given him a loss, so therefore momentarily I would consider he was in bad communication with me—and his reality on me possibly could be graduated up to a line now.

Reality contains a level known as Havingness. In this little band of Mass there is a scale inside the Reality Scale—the Havingness Scale. And that has to do with the consideration of mass. It’s what you *do* with mass. That scale is quite an interesting scale in itself.

It starts out, probably, with Waste, or maybe with Substitute. It is so messed up at that point of Mass that it is very hard to get preclears to come up uniformly as to which one is the lowest one. It possibly goes this way: Waste, Substitute, Waste, Substitute, Waste, Substitute until you get up to the next one. Just as you find a great many false emotions jammed in at the level of Apathy on the Affinity Scale—and I’m sure you’ve seen this—so do you find this Waste and Substitute kicking around and kicking at each other on the Havingness Scale.

“Have” is the next one up. If a person can’t have something, you can have him waste it enough, and you’ll find out after a while he’ll say, “Well, I can have it.”

What is the next important way-stop on this Havingness Scale? The next one up the line is Confront—and that’s awfully important. A person who can’t confront something is liable to “have to have it” as his highest expression. And if he can’t confront it and can’t have it, it’s a cinch that he will waste it. And if he can’t even waste it, it’s a cinch he’ll substitute. And we get Freudian and other sublimations and all of that. Sublimation—they never knew what they

talked about. This is *not* sublimation I'm talking about. This thing called "sublimation" is substitution. I mean, why get sublimative about something that is easily done? If a person hates women, it is a cinch that he probably hates "a woman" and substitutes for her all other women. But this is not a clean statement of it for this reason: you get identification, which is substitution, of one woman for another—and then you get disassociation; he can't even *identify* any more. Hence your lower Waste level. He's wasting now a substitute.

You'll find a preclear after a while will, on some subject, disassociate. He says that ashtray isn't that ashtray. You get the idea? He says, "This ashtray is a camel." Well, now, that's disassociation. He can't recognize a thing for itself, but it must be something else, so we must understand that as an action of Mass to lie on the lower end of the Havingness Scale. It's just as simple as that.

Now, as we go upscale further from Confront, we run into something which is pretty doggone high, and that's Contribute To. People, if they are prevented from contributing to something, go downscale. Now if contributing to something is getting rid of mass, it's somebody else is going to have something besides yourself—and you take a person who is sitting down at Have, or below, and you make him contribute a little bit, and he gets to be a sick puppy. He'll just go on down into Waste and Substitute. It is a very high manifestation. It holds true all up and down this Havingness Scale that if an individual is prevented from helping, from contributing in some fashion, he gets very ill. Not in auditing, but in real life.

Let's go on even higher than this, and what do we get to? We get to Create.

So the Havingness Scale, which fits at that innocuous word "Mass" on the Reality Scale, consists of the doingnesses with regard to Mass. And they begin at the top with Create, go down at once into Contribute To, into Confront, into Have, into Waste, and on down into Substitute. That all belongs at Mass; these are all the things you do with mass.

Now probably there are a bunch of doingnesses with Agreement. Ask an attorney. There are probably doingnesses with Postulates, and doingnesses with Lines—ask the telephone company. And these things probably, too, form up other scales quite similar to the Havingness Scale. And when you had all these doingness scales paralleling the

Reality Scale, you would have this difference: the *thing*, which is the Reality Scale and its *aspects*, which would be the doingness scale (considerations with regard to these things in actuality would be over here on this other scale). We mustn't confuse the thing with what you do with it. You can have without doing. It's pretty hard, however, to do without having, which is why Reality is so important in running on the preclear.

Now I hope you understand these two scales, and I hope you will take them around with you on auditing and look them over a little bit and understand what they are all about. Because we're still talking about ARC, and as a matter of fact we'll be talking a lot about Survive, which is OLD HAT, but it has certainly been polished up, and it certainly has a nice new band, and it certainly fits on a lot more heads than it used to.

Note: This sheet does not replace regular report sheets in HGC but must be included.

INFORMATION SHEET ON PROJECT CLEAR

It is expected that the processes scheduled for project clear be run more or less in the following order.

CCH 0 at the beginning of each session. If pc falters on one or another point, stress that point until cleared up.

CCH 1, 2, 3 and 4 to be run as follows. If 1 produces no reaction go to 2, if 2 produces no reaction go to 3, if 3 produces an action flatten it a bit and go to 4. If 4 produces an action or no action either flatten or go quickly to 1, etc, until these steps have each one been unflattened and flattened again.

Tr. 10 is used liberally as a bridge process and to start and end sessions. If it develops a somatic, auditor should treat it as a process and flatten it and then go right on using it. Main use is at session end.

RECALL SOMETHING REALLY REAL TO YOU is run to test recalls. It is a very effective process in itself. In fact all the three questions of ARC Straight Wire can be run if pc is found pretty bad on this. But it is intended to be used simply to groove the pc and to keep a cataclysm from occurring if the pc can't run recall processes. If he has a hard time, flatten ARC Straight Wire. Otherwise, run for minutes only.

RECALL AN UNWANTED OBJECT and RECALL A MOMENT OF LOSS are a pair. If one is used, then the other must be used exactly the same length of time in the same session. They are alternate processes where one is run a half hour then the other is run a half hour. These two are the chief processes of Operation Clear so give them lots of concentration and time.

TRIO is run as a step between recall processes. If one session is run on recall processes the next is run on TRIO. There is Control Trio and Trio. It is up to the auditor which is used. But use all three commands of either in any proportion that seems right to the auditor. Run lots of Trio even though both recall processes are havingness processes.

RECALL AN EXPECTED COMMUNICATION and RECALL A COMPLETED COMMUNICATION are interesting processes. Communication as-ises havingness. Thus this is a reverse process which, by dropping the pc's level of concentration on past persons and activities thus gives him the havingness of those areas of the track. These processes may or may not be vital to Project Clear as they are released ahead of long experiment and use.

RISING SCALE PROCESSING is run when the pc can change ideas. He must be up to lots of cognitions before this is run. It is run from the Chart of Attitudes as given in *Creation of Human Ability*.

ADJUSTING ANCHOR POINTS is done almost at project end. This is a delicate auditing job and additional material will be released upon it.

SHORT SPOTTING and VALENCE SPLITTING are fitted in at the auditor's discretion. SHORT spotting is done by indicating objects close up to pc and making him repeatedly notice his psychosomatic area. Valence splitting may not even be necessary if the above auditing steps are well done. Also, it may be that psychosomatic difficulties will not need further attention than earlier processes on this sheet.

PROBLEMS OF COMPARABLE MAGNITUDE are here done with MOCK UP SOMETHING WORSE THAN PSYCHOSOMATIC CONDITION. UNWANTED FUTURES may also be fitted in anywhere.

The Magazine of
DIANETICS and SCIENTOLOGY
from
Washington, D.C.

We Are the Free People

L. Ron Hubbard

We are the Free People. We have grown up—grown up to Freedom, not senility.

We are the Free People. The Scientologist has left behind the claws and barriers of miscontrol.

We are the Free People. Grown from out the mud and jungle rot of fear, our unchained minds can reach afar and grasp the idea of ultimate Freedom.

We are the Free People in whom the whims of “I’m supposed to” have no rule, on whom the scientist can blunt his weighty arguments to prove we are not Free.

Be glad, they said before we came, that you are mad, insane, for *there is* genius, so they said. You cannot change. Our brand on you is fixed. Your brain is all you are and fixed like clockwork in a robot head. So think, they said, as we have said, to think, for thought is our own chain and your ideas nil.

Die, they said, and live no more and become dispossessed so we can own. Fall down, they said, and worship clay or maybe space, but of course wrath. And sing lugubrious songs to fear or maybe international cults that specialize in slaves.

Believe, they said, that Man is just a shiny thing well meant to die beneath the pounding of their bombs—the mightiest God they knew.

The flesh, they said, is All and you are but a decay of yourself.

And so they barriered All men.

The witch and the pot; the test tube and the scope; the cell and the club; the textbook and the lies-Control! Control them or we die! Beat them or they win! Starve them or we shrink. We are afraid, afraid, afraid!—they said in that old age we killed.

Freedom becks and we now laughing at their lies, went free.

Scientology—The Road Sign Out.

We are the Free People. We LIVE! We’re Free !

COMMUNICATION AND IS-NESS

A man is as well off as he can consider himself dangerous to his environment.

I will tell you a little short anecdote, which is quite amusing. Well, sometime early in 1945 I flunked my overseas examination. Well, I crawled around and felt sorry for myself, and the fact of it was that the Judo instructor there at the hospital brought up the idea that there was a shortage of people in the war—there was. So he kept up my training for me. I think it was July 25th that I went down to Hollywood and three sailors with Petty Officers' ratings accosted me on the street. They were drunk. They were out to kill officers. And the three of them tied into me. An unbelievable thing happened. One of them turned me around facing him while the second one took a heavy beer bottle to bring it down on my skull. I took the fellow who brought the beer bottle down, threw him over my head into this fellow, who went down and hit the side of a bumper. The beer bottle hit the pavement, broke the end off, and the other fellow reared up where he had been sitting on the running board of a car, and I put it in his face. That's what you are trained to do.

Overnight, the wound in my side healed—overnight. They wouldn't let me out at all, but I could get extended leave from the hospital. I went down to Hollywood and messed around at the studios. In the middle of all that I managed to complete all the researches which I'd stacked up and which had been interrupted by the war.

Steam. . . where had it come from? You get your teeth shoved in this way and that, and you develop a tremendous amount of inflow. And then one day you just outflow! The Chief Petty Officer in charge of the Shore Patrol had been sitting at his desk, telling me, "Under no circumstances should you have taken any action. You were trifling with your life." Telling me what a good boy I ought to be. And then through the door he saw the Shore Patrol bring these people in. Of course, they were all saturated with blood, and they were all messed up. And he just shut up right then!

He was running the usual social dramatization—"You must protect yourself." The society teaches you to hold in. All you have to do to somebody is to prevent him from outflowing to make him ill. And someday he decides to outflow. Not only the social world but the world of yourself can act to cause you to prevent outflow. Outflow is prevented by regret, it is prevented by all sorts of things. If one has something terrifically valuable he protects it—which is what? Prevent an inflow! Well, when you say prevent an inflow you might as well say prevent an outflow. If you hold flows from coming in toward you you might as well flow them in, because sooner or later that dike that you put up is going to burst. So you get these confounded actions in this universe composing a picture of tremendous inflow, not balanced at all by outflow.

What does this all add up to? Any time that you protect and defend, you are aiding and abetting all the structures which make up this universe. The child who is taught to defend

himself against these big, vicious automobiles some day turns out to be one of the louisiest drivers you ever saw, because he is taught to defend and protect. All you have to assume is that safety is desirable to have all of the ills of Pandora's box swarm around your head.

Just what boxing glove can hit a thetan I wouldn't know. A thetan has to mock himself up to be reachable. You are dealing with the idea of what a person is supposed to feel as a result of, when it comes to inflows. And that's just an idea. If a person over-defends himself through some exaggerated idea of pain, he will suffer the full consequences of that over-defense, just to the degree that anybody else over-defends himself to that degree.

So the reason for the defense or the reason for safety is variable, but the consequences of it aren't. As long as you deal with masses, and agreements and ideas directly concerning masses, you are all right. But when you go back into an opinion of what it ought to be as far as the preclear is concerned, you are of course immediately in trouble. Any auditor who is having a rough time with preclears, not snapping them out of the hop immediately, is paying attention to this factor, which is a variable, which is opinion. Figure-figure, ideas, ideas, ideas.

Suppose we had no cops in the society but there was the idea around that there were cops. We would get some of the nuttiest ideas you have ever heard of! We would have a set of ideas about cops, different for each person in the entire community. Why? Because there is no way to experience cops. Cops are an idea which one cannot get into communication with; therefore we get this great oddity—abundance and scarcity. Only it isn't actually the possession of quantity; it is only apparently quantitative. It is having something to go into communication with.

I'm very sure that the whole world of disease is built entirely on this mechanism. I seriously doubt the existence of any given germ—I seriously doubt it. It is very embarrassing to men in sailing ships and so on, very embarrassing to these fellows, to have venereal diseases happen when they have had no contact with women at all. And I have seen that often enough in young boys that were as pure as the driven lily to understand completely that we didn't have here a germ at work. We had a series of ideas at work. Fascinating subject in view of the fact that it has ruined as many lives down the decades and centuries as it has. When you socially enter a great many prohibitions against communication on the second dynamic, you will get all sorts of interesting ideas.

Aberration is caused by cut communication with the mass, and is remedied by re-established communication with the mass. Look what they are doing with the A-bomb. This is one of the silliest things you ever saw in your life. They make everything about it confidential, secret, and nobody must be let in on it.

And there is possibly no more illness to radiation than that.

The formula for creating an illness is to establish a terminal, get everybody convinced that this terminal is there, and refuse to let them communicate with it.

Now one of the dangerous things to do with Scientology would be to put it under the counter. In the first place it isn't a terminal. A terminal, however, must be maintained, and access to that terminal must be preserved. And it mustn't be put on confidential, any part of it. Why? Because it's already dynamite. We do anything with it that can be done with anything. Let's not cut a line to it and let's not put it beyond reach. There would be a certain fatality in doing that. And yet every group that has ever learned a series of great truths has inevitably gone into secret priesthods concerning them, which was of course a destructive action.

It isn't jumping into ten thousand volts of current that electrocutes a man. It's having so many times in the past disconnected from electricity when confronted with it. Every time you disconnect you to that degree lower your own tolerance.

Obviously the electricity flying through these poles is more real to the individual being the line than the actual terminal of the pole. Why is it more real to him and his body? Because it has the greatest effect on him and his body. He can touch the pole, but he can't touch the juice. That tells you there must be some terrific reality about the dangerousness of this juice, and the pole is either in apathy or non-existent. Therefore you can only teach one thing to a preclear, horribly enough, and that is—"You can communicate with it." The communication with a mass is the only thing we can do for him, but we have to have a mass.

We can get him to conceive of an is-ness, and we can get him to communicate with it, and by this he will change his mind concerning its existence. He will change his mind concerning its conditions, but most particularly and more important to you, he will change his mind with regard to its abundance or scarcity, and therefore its importance. It is the scarcity or abundance of things which denotes their value or importance. A man who has lived too long without women will consider women dangerous.

So scarcities and abundances do declare the final state of one's reactions to anything. When something becomes very scarce it is because one has cut communication, and that action of cutting communication is the same action of defending or protecting self. Now as I say, you can break out of this. You can have this tremendous resurgence. You can outflow. You can act. And that's all there is behind one of these resurgences, by the way, there are no other factors. Or you, as an auditor, can bring him gently and quietly up on a gradient scale until he can again communicate with the objects in his environment, and he again will experience the same thing he experienced when he did this tremendous outflow. We are reaching towards the same goals but we're saying that by communication we establish the is-ness of existence, and by doing that, why, we make people well.

THE PARTS OF MAN

I am going to go over with you the parts of man. The first thing we're going to take up is exteriorization, as the most important part of man. It's the causation. That's the thetan. Now, the fact that you can't weigh one is because this is the author of weighing. There is, however, a way of experiencing this. It is a personal attitude, it is a personal view. An individual can exteriorize and experience this phenomenon. It is very easy to experience being a thetan, but it's not easy to experience seeing one.

So therefore people tend quite markedly to become Only Ones. Here is a phenomenon which a person can experience himself but cannot observe in others. There are many ways to experience the idea of somebody else exteriorizing.

Exteriorization is the phenomenon of being in a position of space dependent on only one's consideration, able to view from that space, bodies and the room, as it is. That is exteriorization. Well, people who have difficulty controlling the body from close up, I can assure you, won't get out of their heads, because they can't control anything at a distance. If you can't control a body from a distance you will find yourself very, very reluctant to get out of your head. It is as simple as that. Any phenomenon which occurs beyond the point of willingness to be out of the head or control the body from a distance is regulated by the scarcity and abundance of bodies and universes. And if you can't see your body, then there is a scarcity of them. If you can't see the universe, there is a scarcity of that. That's all there is to that.

Now, here is exteriorization: Keep your head from going away. **"Take your hands and hold on to your head and keep it from going away."** I don't know how many hours it would take with some preclears. Probably a Black 5 would have to sweat along at this for fifteen or twenty hours before he was really there, but he would get there on that one technique. That is quite amazing, isn't it? There are probably about five thousand other techniques. This is the only shotgun one that I know, the one that doesn't ever fail. It is only contingent upon one thing—being able to take hold of your head. That is a necessary prerequisite to that technique.

All right. Now let's take the next fact about this, and we find that vision depends upon scarcity and abundance. The ability to exteriorize depends on the willingness to exteriorize, but the willingness to experience is totally monitored by the amount of things available to experience. A thetan gets quantitatively minded.

What good is a human being? The fact is, there are too many of them to be seen. Now, how about too few? Well, on a frontier, the fewness of people is one of the fabulous things. Man dramatizes. When he gets into an area of too few people, he then kills the people who exist. And when he gets into an area where there are too many people, he then overlooks the people who exist. Somewhere in between this, you will have a progressive society. And such a society was the United States—anywhere between twenty-five and a hundred million people

the United States was in there pitching. But now that it has begun to exceed that, people have started to disappear. They aren't. That sounds to you like a cynical statement. If we were to have an atomic war, and cut the population down to fifty million, you'd get another view. It is simply a statement of scarcity and abundance.

All right. We take somebody and we can get him out of his head, but would he just go out of his head without being gotten out of his head? Well, yes. Scarcity and abundance will actually kick him out of his head. Scarcity and abundance of what? Let's say that the preclear's idea of the scarcity or abundance of rooms depends then upon his willingness to view them. You have to put him into direct contact with the is-ness of rooms. Now let's go a little bit further than that and look at the body. If he has too few bodies he is certainly going to be unwilling to get out of the body he is in. And if he has too many right where he is, he'll be trapped there too. He won't know where he is. So remedying his havingness on the subject of his own body is very necessary to an accurate and stable exteriorization.

So much for exteriorization. Let's go off now into the second part, which is the mind. By mind today we mean that structure of mental image pictures and machinery on which the preclear is depending for his opinions and ideas. The structure of the mind is totally composed of mental image pictures. I'm afraid the mind doesn't produce any thoughts. The mind may be considered to have certain phonograph records. The phonograph record, as you know, doesn't play unless you put a needle on the platter. Well, the thetan is the needle on the platter, and unless the record is played directly it doesn't activate it. Any livingness, even a thetan exteriorized, tends to utilize some sort of mental image pictures. But when he reads all of the records in the mind as the absolute truth and fact and conviction, when he is obeying concatenations of "I am supposed to," we have behavior patterns; we have mental reactions; we have all of these various things that were never studied, by the way, in psychology. I don't know where a psychologist lives, but it's certainly not in this universe.

Now the exact workings of this mechanism depend on association and differentiation, or identification and differentiation. Now when that part of the mind which we call a reactive mind begins to identify everything with everything in order to get certain pattern responses, and is able to exert its influence upon a person far better than the thetan himself can, we say that this person is suffering from reactive conduct. A=A=A=A.

Now Association—Differentiation are the two principles of the mind. It is supposed to tell the difference between two or more things, and it is supposed to tell the similarity between two or more things. Now, a mind in good shape doesn't identify. What causes association to become identification? Lack of objects. Lack of incidents. Lack of experience. When you have too few things happen to you, you're liable to have all sorts of things happen to you. In other words, if you are busy and there are lots of incidents, there is a high probability that you will not suffer the consequences thereof. But if you are not busy and you are idle, then you are liable to long for those times when you were very busy. And if you are ever worried about a mental image picture, it's because you haven't enough to worry about.

Where all drama is tailor-made for you, you are in grave jeopardy. In a TV screen world you are apt to be in trouble, because the TV is only a pattern of lights and shadows which is a restimulative mechanism to shuffle your bank around, and give you again some segment of that which you have already experienced. It's a funny thing that people will not read about certain periods. If you are talking to somebody who is very upset on the subject of past lives, you should realize that he was probably just executed up at Sing Sing in 1932 or 1933, and he just can't stand the idea. It is only people who are borderline insanity cases who got up and screamed about past lives. This I have kept a very careful tally on. They were people who were terrified; people who were incapable ever of holding their own on the subject. They couldn't have talked about it very long before a past life would have snapped in and snapped their heads off. *Those incidents which are most scarce tend to stick hardest.*

Let's look at this thing called the mind, and let's find that the mind is a mechanism for overcoming the lack of incidents, lack of experience in present time by storing pictures and

knowingnesses of the past, which could be made available to the present. A preclear is always losing incidents. One of the methods of not losing them would be to simply suspend them as a picture. Now, if you restore his ability to make these pictures solid, you've really done something. He can have the picture then any time he wants, in its full form. You have to change the idea of how much picture and incident is actually necessary in order to alter the preclear's viewpoint, and you change that with scarcity and abundance. Scarcity and abundance naturally comes up, and is handled by Havingness.

Now, let's take up the final and remaining part of man, which is the body.

Now, the body is a solid appendage which makes a person recognizable. The body is a game of considerable magnitude, and very popular at this time. It is quite old, but still very popular. The body can be monitored and handled by mental image pictures, and it can also be monitored and handled by thetans, fortunately. But a body is subject to these two other things. It is actually not possible to change a body without changing the other two things. The body is modified by the mind and the thetan, and is actually a very low order of MEST.

Now the anchor points of the body are quite interesting, in that the body exists as solid only within these spaces, and in the absence of some of these anchor points the body will aberrate its shape. We know the fastest way to change body shape is to put the thetan into a condition of willingness to handle anchor points, and then remedy the scarcity and abundance of anchor points, and put the actual anchor points back there and have him put them back there. You will see the body change its shape, health and general characteristics.

Now, mental image pictures also influence the body, and they influence the body basically by influencing these anchor points. A facsimile evidently imposes itself by magnetic fields and currents and other things upon the anchor point system. It is quite interesting.

So therefore the body is handled and controlled on a mental level through these anchor points. If you were sailing along seventy-five feet back of your head some day, and you see some preclear come along, just shift your range of vision enough to find that preclear's wing anchor points; if you were to get hold of one of these wing anchor points and just bend it off line—the person will walk in a circle. As long as you hold the anchor point out of line the person will walk out of line.

Joints operate because of anchor point structure. The body is then held together by electronic structure which is easily influenceable, and that electronic structure has much more command upon the body than the MEST around it. And the thetan goes through these very many vias of mental image pictures and these anchor points, and thus influences the structure of the body.

Now, to influence the mind by influencing the body is only possible by doing something to the havingness of the thetan. Now you can influence a thetan by influencing the body. Let's not overlook this point. But that influence only takes place to a degree that it influences abundance and scarcity.

In other words, as you influence his ideas of havingness of bodies, so you influence his condition with regard to bodies, and we re-influence the body. We find out that a body can be moved, thus influencing the thetan, or two or three bodies can be put back, thus influencing the thetan, and we have simply run the back flow of mass reaction on the person. And we do that in auditing all the time. We adjust the person's havingness, his ability to communicate with an is-ness, his ability to conceive an is-ness, to communicate with it. This is Havingness; this is the way you run Havingness.

There in essence we have the body.

But with the three subdivisions of a human being we have to include the fact that he lives in the universe.

All right. These, then, are the three parts of beingness, with the condition that one lives in the universe. And these are inter-influencing. These parts of man, each one of them, are insistent upon experience, incident. Man grows old, minds become complicated, thetans become wise. But at no time does their capability, or ability in general, lessen. Only their willingness to live increases and decreases, and that increases and decreases in direct ratio that there is a scarcity or abundance of the various things in which they are interested. And these scarcities and abundances influence them and monitor their conduct, or any culture. The cure for this is to put the person into communication with actual is-ness, or the is-ness of any given object, and to permit him to reacquaint himself with that. And so by auditing his life can be righted.

Scientology: The Philosophy of a New Age

L. Ron Hubbard

It takes Truth to live with a swiftly changing world. Nothing less than Truth can Survive. You cannot Survive with anything less than Truth.

We are the heralds of a New Age. Man, stuck for millennia in the rut of status quo can at first balk and even ridicule, but, Can He Survive?

Always the old has hooted at the new. But the new grows strong and each day's dawning sees us closer to a new World.

What will this world be? Atomic reactors giving unlimited power. Automatic machines providing for the most of Man's animal wants. Space flight to the Solar System. New politics, new leisure, new hates, new loves.

But before any new era begins there is always a period of instability and change, a period of violence, a period soiled with the death of the old and the failed experiments of the new.

Such periods of change are violent. Many things, many men may not Survive them.

What will it take to Survive this change? Who can Survive it and sail onward to live in new times?

The lucky and the clear.

But who are the lucky but the clear.

Scientology for the individual is a passport to this new time. Scientology for the group is the Survival of the State.

No old shaky basis of thought could last out the fire of the period of change. No quivering, unstable person could Survive the duress of the times just now to come.

One's first duty to all is to be himself clear, able to Survive, able to lead his own destiny by the hand.

One's next duty is to his fellows to be sure their ability can compare to the tasks imposed by the new State of things.

The answer to these trials is contained in Scientology. And Scientology is the answer to you.

Only a clear could think and act fast enough to live in a disaster and to make others live. Only a clear could Survive in Space. Only a clear could enjoy the fast pace of the game to come.

Others may die or worse, become slaves in the inevitable advance of technology which holds in question the abilities of a man.

Hence, Project Clear. That's our goal now. We can do it. We can teach you to get it done.

It's taken seven years to iron out the kinks. Seven years isn't long against 73 trillion.

Today can be ours. Tomorrow can come. Let us be ready for it.

We are the prime movers in this, the new age. Forget the old. Face up to what will come. And let the dead yesterdays bury the philosophy of Authority and Capital Gains and Communist psychology cults. We're no longer tied.

The eons march on. Space Opera has again come to a planet on which we live. Always before it meant destruction.

Perhaps, this time, due to our efforts, a humanitarian world can exist. We, the Prophets of the Morrow, know the way.

HCO BULLETIN # 1 OF 3 DECEMBER 1957

CLEAR PROCEDURE

DEFINITIONS, GOALS

There are three possible goals in processing a preclear. The first of these is Mest Clear. The second is Theta Clear. The third is Operating Thetan.

By Mest Clear is meant a BOOK ONE CLEAR. Here we defined clear in terms of facsimiles. This is a rather simple mechanical definition. It said in effect that so far as human beings were concerned our preclear finally arrived at a point where he had full color-visio-sonic, had no psychoses or neuroses and could recall what had happened to him in this lifetime. This is almost a baby-talk sort of clear. It pays no heed at all to identification with a body and it has nothing to do with ability. Today, by running Creative Processes (four years old!) we can turn on visible facsimiles and weed out the bottom spots of operations and what not. This is actually a rather easy goal. Somehow I've never given a real tight procedure for achieving it even though the essence of the processes have been around for a very long time. COMPLETING STEP SIX OF CLEAR PROCEDURE IN FULL GIVES US A MEST CLEAR.

By Theta Clear is meant a Clear obtained by Clear Procedure as is being delineated in this regimen. The main trouble is, amusingly, trying to reach Mest Clear without running into Theta Clear. I personally don't believe now that it can be done without actually shoving the pc back in his head every time he pops out. Thus the goal of this procedure is actually THETA CLEAR. This is what we mean then when we say "clear". We mean a Theta Clear.

By Operating Thetan we mean Theta Clear PLUS ability to operate functionally against or with Mest and other life forms. For the first time we have here the matter of ABILITY. An Operating Thetan is not an absolute term. Theta Clear is a more absolute term than Operating Thetan. An Operating Thetan is a Theta Clear (Not a mystical mystic out on an inversion) who can also do something.

Thus we have two goals which contain no ambition to accomplish anything and one goal which contains much ambition. Now here is another puzzle in definitions. Which is highest, the Theta Clear or the Operating Thetan? Well, the answer to that is not what we used to think. As DOINGNESS is not really at the top we find that we will probably make an Operating Thetan before we achieve Theta Clear for a Theta Clear would probably not be much interested in operating. Therefore we see that the actual goal we are trying to reach, no matter in which limited sense, is Operating Thetan.

Operating Thetan is then a highly variable goal. A thetan who can move in and out of a body is actually operating somewhat but he is not really a Theta Clear since a Theta Clear, in its highest sense, means no further dependency upon bodies.

The goals of the auditor, therefore, do not rack up one, two, three, Mest Clear, Theta Clear, Operating Thetan. They actually stack up on a very gradient scale between thetan inoperative and a thetan who can operate. The auditor is therefore seeking to reach with the pc a state wherein the pc can function. At no time does the auditor suddenly arrive with a pc in a startling new shiny state all of a sudden that can be called a certain thing. In that pcs often expect this suddenly bursting "into the light" the auditor is subjected to disappointment when he

has actually achieved an enormous gain for the pc. In other words, pcs gain on a smooth gradient scale and do not suddenly become something.

There is only one point on the road up where something does happen and that is exteriorization. When the pc exteriorizes for the first time he feels there must be a cause for rejoicing and has the idea he has gotten somewhere. Well, in fact you could achieve the same result by hitting him over the head with a club. He would exteriorize. The point is not exteriorizing the pc but cutting down his dependency upon a body. A pc who exteriorizes and is not carried right on with the same process that sprang him out of his head until it is flat will go back into his head in an hour or a week and will be harder to dig out the next time.

In other words this point of exteriorization does happen and does mean to the pc that he is himself. But it shouldn't mean very much to an auditor beyond his noticing that this phase has been entered in the case. For in truth thetans don't stay out of their bodies very long if they are not in good shape. Thus exteriorization means less than ability to act, to live, to be and do. The attention of the auditor should be upon the increasing ability of the pc to handle life, not upon the distance the pc gets from his body. Is that clear? Well, it tells us that arriving at a state of Clear is easy if that means stable outside and that any state of betterment on the road to Operating Thetan is an honest achievement.

Thus an auditor should at all times go toward the state of Operating Thetan and should not be mixed up in the oddities of exteriorization for a day.

HGC Clear Procedure goes straight toward exteriorization and achieves it. But it also goes straight toward increasing ability to handle life. The latter is the auditor's best goal. The auditing goal should go in the same direction as this new definition for Operating Thetan.

An Operating Thetan can be at cause knowingly and at will over Life, Matter, Energy, Space and Time, subjectively and objectively.

This Action Definition of Operating Thetan is the true goal of the auditor and if followed with complete understanding will achieve the best possible results.

In this discussion of goals and definitions, I am telling you cleanly that the goals of Mest Clear and Theta Clear are not worth following from the auditor's standpoint. You can let pcs think what they will about them. The only goal worthy of the auditor's time **WHATEVER THE STATE OF CASE OF THE PC** is Operating Thetan. To achieve one on any subject it is only necessary to place the pc to some degree at willing and knowing cause point with regard to that subject. All the steps of HGC Clear Procedure are leveled at Operating Thetan. But you need not tell your pc that. You can use the words **RELEASE**, **MEST CLEAR**, **THETA CLEAR** or any other if you like. Just remember there is only one payoff goal and that is Operating Thetan.

MEST CLEAR: Can see facsimiles with sonic present lifetime, has no psychoses or neuroses. Upper part of APA (in UK OCA) graph. Above 135 IQ.

THETA CLEAR: Can exist knowingly independent of bodies.

RELEASE: Average a third of a graph higher than first test, above 115 IQ.

OPERATING THETAN: Can be at Cause knowingly and at will over Life, Matter, Energy, Space and Time, subjectively and objectively.

L. RON HUBBARD

HUBBARD COMMUNICATIONS OFFICE
1812 19th Street, N.W., Washington, D.C.

HCO BULLETIN OF 4 DECEMBER 1957

Clear Procedure as of Dec 3, 1957, is supplemented by a tape made at Auditors' Conference of Nov 30, 1957.

This current bulletin supplements HCO Bulletin of Dec 3, 1957, which is the Introduction. There will be a series of these, giving a bulletin to each step. The entire series will be published in a photolitho booklet called CLEAR PROCEDURE which will be ready for the December Congress and which will cost \$2.00 in the U.S. and 10 shillings in Great Britain. Both booklets will be published by the HCO and will be copyrighted internationally. The booklet published in Great Britain will be a photolitho of the U.S. photolitho copy. The booklet may not be published in whole or in part by anyone but the HCO.

CLEAR PROCEDURE CONTINUED

STEP ONE: PARTICIPATION IN SESSION BY THE PC.

We have long known that ARC was important. Just how important it is was established by some tests I made in London in 1956 wherein every time the pc showed any restlessness or other signs of loss of havingness, instead of remedying havingness I carefully searched out any fancied break of ARC and patched it up. The "loss of havingness" vanished. In other words loss of ARC is even more important than loss of havingness since a repair of ARC restores havingness. Lack of havingness is only one symptom of a lack of communication.

There are two ways an auditor, according to long practice, can err. One of these is to permit two-way communication to a point where the pc's havingness is injured. The other is to chop communication to such a degree that havingness is injured. There is a point past which communication is bad and short of which lack of communication is bad. Here we have auditor judgment at play. Because the pc will fidget or go downscale in tone when his havingness drops an auditor can SEE when the pc's havingness is being lowered. Because a pc will go anaten or start to grind into the process an auditor can tell whether or not the pc feels his communication has been chopped. When either happens the auditor should take action—in the first instance by shutting off the pc's outflow and getting to work and in the second instance by making the pc talk out any fancied communication severance.

Participation in session by the pc is not something the auditor sees to at the beginning of the session and then forgets for the rest of the intensive. This step is continued throughout the intensive and is given as much attention as any process being run at the time. The auditor's attention is always therefore upon two things—first the continued participation in session and second the action of the process.

Grouped under this head we would also have ways and means of getting the pc into session in the first place. An unconscious pc used to be an apparent road block. A downtone, antagonistic, you-can't-help-me pc was also a rough one. These two things are countered by always carefully starting a session and following through on standard CCH 0.

It is as important to open a session with a baby or an unconscious person as it is with any other preclear. It doesn't matter whether the pc is answering up or not. It is only necessary to assume that the pc would answer if he could answer and that the mechanics of voice and gesture are simply absent from the answer. Therefore one always carefully starts every session, paying attention to what is happening, where it is happening, who is there, help, goals and problems. Obviously anaten or inability to control the body are the present time problem of the unconscious person or the child. One can actually audit this with a plain question and simply

assume after a bit it has been answered, then give the acknowledgement and ask another question just as though the pc were in full vocal action. Auditors still fall for the belief, very current, that “unconscious” people are unable to think or be aware in any way. A thetan is seldom unconscious regardless of what the body is doing or not doing.

PRESENT TIME PROBLEM is a highly vital point of PRECLEAR PARTICIPATION. If a preclear is being nagged too thoroughly by a PT Problem auditing can actually send him downhill if done without addressing the problem. A whole intensive, even seventy-five hours can be wasted if the auditor does not clear the PT PROBLEM.

The preclear generally doesn't know he has one which is nagging him, for the rough PT Problems go into the apathy band and below into forgetfulness rather rapidly. Therefore the auditor should ferret out the PT Problem with an E-Meter. Adroit use of an E-Meter does not include evaluating for the preclear but it certainly does include ferreting out PT Problems. The E-Meter is also used for valences and sometimes psychophysical difficulties. (Auditor: Use the word “psychophysical” rather than psychosomatic and stay out of a medical field.)

THE RUNNING OF A PT PROBLEM today is the most. PT Problem, valences, psychophysical ailments, all run beautifully with “Mock up something worse than (terminal)” or “Invent something worse than (terminal)”. To run this it is necessary to isolate the TERMINAL most intimately connected with the PT Problem (or the valence or psychophysical difficulty). One then CLEARS THE COMMAND (and you always better do that with any command) and lets go.

The whole idea of WORSE THAN is the whole of the dwindling spiral. People who are “trying to get better” and “be more perfect” and “think the right thought” lose all control of “getting worse”, “being imperfect”, and “thinking the wrong thought”. All these WORSE THANs are then left on automatic and we arrive at something less than optimum. In fact we arrive with the dwindling spiral. We also arrive with the “point of no return”. We also arrive with the declining ability to heal or get well. And we also arrive with old age.

After running “worse than” on the PT Problem, we proceed with other parts of CCH 0. Clearing help will be found quite beneficial. But to get a pc to participate who is downright ugly about it, running help is usually only a partial solution. When these only ones get going they really snarl on the subject of getting audited. Here CCH 1 is of benefit. No questions asked. But this of course defeats the purpose of STEP ONE.

PARTICIPATION OF THE PC in the session is necessary in order to place the pc somewhat at the cause point in the actual fact of auditing. This fits the definition. You can always change a body or recover it from some illness by auditing without much helping the pc himself. Therefore the pc, while under auditor control, is still somewhat at cause what with comm bridges and clearing commands, etc. But he is made to feel no bad effects from being AT EFFECT if ample ARC is used. In other words, the pc can't be entirely at cause in a session or he would be self-auditing, which isn't good, but he can be salvaged from being a total effect by good ARC. When the ARC drops out that DOES leave the pc at more or less total effect, a thing you have probably noticed.

The things to be done in CCH 0 should be done thoroughly at intensive's beginning and should be glanced at whenever a new session starts and should get a bow when a new command is used. But all CCH 0 is is a collection of mechanical aids to assist the pc's participation in the session and to assist the auditor in ARC. Although CCH 0 must be used always, it is not a total substitute for ARC.

The sum of CCH 0 is find the auditor, find the auditing room, find the pc, knock out any existing PT Problem, establish goals, clear help, get agreement on session length and get up to the first real auditing command. CCH 0 isn't necessarily run in that order and this isn't necessarily all of CCH 0, but if any of these are seriously scamped, the session will somewhere get into trouble.

When the participation of the pc ceases in a session, he must be gotten back into session by any means and then participation is re-established. A pc is never permitted to end a session on his own choice. He seeks to end them when his participation drops out of sight.

The trick question “What did I do wrong?” re-establishes ARC.

The problem of handling a pc who is not co-operative, who does not wish to participate, is a highly special problem. In the first place it is the pc’s engrams that do not want to continue, in the second place it is the engrams which are doing the talking. One ordinarily tackles this case with a formal opening of session, brief but positive, and then sails in with CCH 0, just as though the person were unconscious, which, of course, the person is.

Participation by an unconscious person, while covered above, requires the additional refinement of technique. ONE MUST ALWAYS FIND SOMETHING THE PRECLEAR CAN DO AND THEN BETTER THAN ABILITY. An unconscious person is usually lying in bed. If not, the command must be varied to fit the environment. But the best command is something like “You make that body lie in that bed.” A slightly upper grade process to a person sitting in a chair is “You seat that body in that chair.” In such cases a grip on the pc’s hand and the use of a slight squeeze each time the auditor acknowledges considerably speeds the process.

There is another special case—or maybe it isn’t so special. There are many people who cannot tackle a present time problem with a process. If the auditor sought out a PT Problem and then ran “something worse than a related terminal” or a “problem of comparable or incomparable magnitude” he would find the pc digging in hard, unable to handle the process. Thus some judgment must be used in such cases. Don’t run a PT Problem on somebody in very bad shape casewise.

There is an awful lot to know about starting sessions. The bad off case and the case in very good condition alike require special handling. For the case just mentioned who cannot handle a PT Problem with a process, there is always locational (TR TEN). TR TEN will run a PT Problem or anything else if slowly. Thus many a person with a PT Problem can only participate in a session to the extent of TR TEN, “YOU notice that (object—wall, floor, chair, etc).” By introducing in the auditor’s and pc’s bodies as a couple of the items being spotted along with everything else we eventually wind up with “find the auditor, find the auditing room, find the pc”. And we get there without a PT Problem being in full bloom.

In running “You notice that object” there are some things that MUST be observed. Most important of these is this one: ANY PROCESS WHICH TURNS ON A SOMATIC MUST BE CONTINUED UNTIL IT NO LONGER TURNS ON SOMATICS. This is true particularly of TR TEN, 8-C and TRIO. The case hangs right there until the process is flat, whether in one day, one year or six. Another thing which must be stressed is the inclusion of the auditor’s and pc’s bodies. Because some pcs WHEN EXTERIORIZED snap back in when they see the body is no reason to avoid it in TR TEN. Another thing is to make the pc use his eyes to view the objects and if he doesn’t turn his eyes toward them, then it is up to the auditor to use manual direction of the head and even pry the eyes open. No balks are ever permitted in auditing. If TR TEN is being run at a problem, every now and then the auditor pauses and discusses the problem again with the pc in order to keep it in restimulation until TR TEN can run it out.

The high case is a worse problem than auditors commonly believe. In the first place a high case can “blow” a situation out of the bank with considerable ease and if the auditor insists on sledge-hammering it out with a process, then pc participation blows rather than a facsimile.

High case participation can also be misunderstood in that there are a lot of cases that think they are high which aren’t. Here’s how you tell a real high case from a bogus (“I can do everything”) case. A thetan in good shape can be cause. When he looks at something in the bank it becomes the effect. A bogus high case can think anything he wants without anything having an effect on the bank. You want to watch this point because here is the definition of OT thoroughly at work. Pc at Cause. A case that has pictures and everything and is impatient to get

on with it BUT DOES NOT MARKEDLY ALTER THE BANK WITH THINKING ALONE is not a high case but an old “wide open case” of Dianetic days.

Two-way communication AS A PROCESS is the key to all this. If you put a pc on an E-Meter and locate a present time charge, you can, if the pc can somewhat handle his bank, get him to two-way comm the incident flat very quickly—in five or ten minutes at the most. This is all the process used. It would take an actual E-Meter run to give you a full reality on this.

Here we are looking at the basic difference amongst cases. That difference lies in the ability to knowingly CAUSE. Bodies are the same, they all react alike. Banks differ only vaguely and only in content and significance. Engrams are engrams and they all behave alike. There is only ONE DIFFERENCE amongst pcs. We called this BASIC PERSONALITY in BOOK ONE. We can be a lot more simple about it now that I have my teeth into the subject a few more feet. The difference is DEGREE OF KNOWING CAUSABILITY. What do we mean by CAUSE? The basic, old Scientology definition is still at work. CAUSE-DISTANCE-EFFECT. Joe knowingly shoots Bill. Joe is at Cause, Bill is at Effect. Mary gives John a present. Mary is at Cause, John is at Effect. Bill says Boo to Joe. Bill is at Cause, Joe is at Effect. But when we introduce KNOWING CAUSE and CAUSE AT WILL into this CAUSE-DISTANCE-EFFECT idea we see we have something else added. The person at Cause is there because he knows he is there and because he is willingly there. The person at Cause is not at Cause because he does not dare be at Effect. He must be able to be at Effect. If he is afraid to be at Effect, then he is Unwilling Cause and is at Cause only because he is very afraid of being at Effect. Education can show a person he can be at Effect without liability. Then he can be at Cause without HAVING TO BE BECAUSE HE DOESN'T DARE BE AT EFFECT. Auditing in its whole operation is teaching the pc this. Pc slides from terrified effect to tolerated effect to knowing cause with regard to any incident he contacts IF HE IS AUDITED PROPERLY. The pc who has to get rid of all his engrams because he has to get rid of them because it's all too horrible winds up, with good auditing, into a tolerance of the pictures since he has learned he can tolerate them and so can swing around to Cause.

So we have this great difference in pcs. DEGREE OF KNOWING CAUSABILITY is the extent that he is willing to be at Cause and the extent he is willing to know he is at Cause plus the ability to cause things.

You will see this on an E-Meter in PT Problem handling. Bill has a PT Problem. It drops a dial when first contacted. The auditor, using his UNDERSTANDING of Scientology, two-way comms on it. The incident discharges and no longer registers after a few minutes. Mary has a PT Problem. It drops steeply on the E-Meter. The auditor tries to two-way comm on it. The charge remains the same or Mary begins to disperse. She doesn't hold to the subject. The auditor at length finds that two-way comm only serves to run down her havingness. The charge remains on the meter dial. What is the difference between Bill and Mary? Bill can be at knowing cause, Mary is either obsessive cause or heavy effect. Bill can blow facsimiles. Mary cannot. On Mary the auditor is very wise to enter upon TR TEN.

One version of TR TEN is called Short Spotting. “You notice that (nearby object).” So long as the pc can see with his eyes the object or feel the auditor's hand on it the process works. It is spotting right up close. If run with mediumly near and far objects (such as the room wall) it is very effective in getting a case going. It has given some cases their first reality on auditing. BUT the rule still holds here about somatics. When a somatic is turned on with a process, turn it off with that process. See Auditor's Code 13. This is entirely true of Short Spotting. In that it almost always turns on somatics, when you start it, you have to flatten it and that's often lengthy.

Remember this about pc participation. A low case can't handle the bank, therefore you keep high ARC and kid-glove him through a session. A very high case doesn't need dynamite, therefore you retain his participation by going as rapidly as you can. A medium, average case needs ARC, something of dynamite, something of kid-gloves, something of two-way comm.

And IN ALL GOOD AUDITING CASES IMPROVE. Just because you start a pc low doesn't mean he'll always stay low. Check the case often. See if his CAUSABILITY is rising. If it isn't, he isn't improving and you better go easier or heavier. PROBABLY when a case doesn't improve you didn't handle a PT Problem. THAT IS THE ONLY THING WHICH CAN KEEP A CASE FROM GAINING. So check every session for one.

There are probably thousands of ways to gain the participation of the pc, there are probably thousands of ways to open a session. There are probably an infinite number of tricky things you can do. However, this breadth of choice should not obscure the following.

1. A pc who is not participating in the session is not at Cause.
2. An auditor who isn't able to maintain ARC, who isn't able to "Freeze" a process for a short time, even a tone 40.0 process, and re-establish ARC, will not get results.
3. The end-all of processing is the attainment of a goal, the goal of OT. One always processes the problems and difficulties of the pc, he does not process the process. Processes only assist in processing the pc. They will not do anything by themselves. Processes are a road map to the goal of OT, they are nothing in themselves. The target is the condition, the disabilities of the pc. How one achieves the eradication of these difficulties is secondary to the fact of their eradication. Scientology is a route attained after several thousand years of no attainment by Man and the route is important and valuable and must be travelled correctly, but the concern is the pc, not the route.
4. A new auditor can be adrift with his tools. He is uncertain as to what he is attacking. He should have reality on engrams, locks, key-ins, secondaries, the time track, the key buttons of Scientology such as Communication, Control and Havingness. Given an understanding of all these and the theory of Scientology itself he can almost pilot his way through a case with two-way comm. But two-way comm will not work if one doesn't understand all the above. So two-way comm is not conversation. The pc has had a few trillion years of that and it hasn't made him well, so two-way comm is a highly specialized thing, done with full understanding of the thetan, bank and body. Good two-way comm means participation by the pc.
5. Scientology is a precise commodity, something like engineering. A pc is a precise thing, part animal, part pictures and part God. We want the ability to handle things and the God, and the less unthinking responses in the pc, the better off he will be. Therefore a PC WHO ISN'T COGNITING regularly is being processed beyond his ability to do and it is necessary to drop back downscale to find something he CAN DO.
6. The golden rule of processing is to find something the preclear CAN do and then to improve his ability to do it. At once you will have participation. The highest ability one pc had was to get drunk: a resolution of his case was entered upon by having him invent ways to get drunk.
7. The attention span of children and psychos is not necessarily a factor since it is only the phenomena of dispersal against mental blocks, keying in of incidents. The auditor can pay attention to it or not as he likes. Short, regular sessions on people with limited attention span get more gain per week than a steady grind since the participation is maintained.
8. The auditor remains at Cause in all sessions without forbidding the pc to be at Cause. See the rules in DIANETICS: THE ORIGINAL THESIS.

HCO BULLETIN OF 7 DECEMBER 1957

HGC PROCEDURE

The following is laid down as an entirety of processing to be done in the HGC in London. No other processes or variations are allowed.

GOAL: Operating Thetan.

DEFINITION: An Operating Thetan is one who can be knowingly at Cause over Life, Matter, Energy, Space and Time.

CCH 0 in brief, find auditor, find pc, find auditing room, clear help and goals. BUT IN THE MAIN HANDLE THE PT PROBLEM IF IT EXISTS. IF IT DOESN'T EXIST do CCH 0 briefly and quickly and get on with the session.

It will be noted that giving pc's attention to auditing room or environment can turn on a somatic after three or four commands. After one command of "Have you got an auditing room," this becomes a process called LOCATIONAL. If Locational turns on a somatic it must be run until somatic is flat. Therefore the auditor has no business attempting Locational or getting the pc involved unless he intends to do something about it.

PRESENT TIME PROBLEM

The pc is put on an E-Meter before PT Problem is discussed. When the E-Meter has been adjusted (one third of a dial surge when pc squeezes cans) the auditor asks if the pc has a present time problem. After a little discussion of this, the needle may surge. If it does the auditor locates the PT Problem's most intimate terminal and runs (with the pc still holding the cans) "Invent something worse than (indicated terminal)" until the problem flattens out on the dial. The auditor can ask for and run another PT Problem or even three or four but always flattening down the surge of the needle. IF THE PC IS 50% below the center line of the APA it is not safe to run "Invent". Instead, without scouting around Invent but knowing the graph in the first place, simply two way comms the problem and runs Locational until the problem flattens out on the needle. The auditor does not begin with Invent and then change his mind and run Locational. It is an either or. The auditor starts with "Invent" or he starts with Locational and whichever he does he does not change. IF LOCATIONAL TURNS ON A SOMATIC IT MUST BE RUN UNTIL LOCATIONAL NO LONGER TURNS ON SOMATICS .

Once the PT Problem is flat the auditor puts away the E-Meter.

S-C-S STEPS

S-C-S begins with 8c of any kind. If 8c turns on a somatic it runs until it no longer turns on somatics. 8c is run formal or tone 40.

Start is then run as per 1956.

Change is then run as per 1956.

Stop is then run as per 1956.

If each of these is flattened in turn it does not mean that S-C-S is flat. It means only that Start is probably unflattened. Thus one again runs Start after Stop, runs Change after Start, Stop after Change until none of the three unflatten the others.

More 8c can be run. There is no error in liberally running 8c which is, after all, a more complicated Locational of a Short Spotting sort.

SPOTTING STEPS

Spotting itself is a broad process. Locational is only one of many spotting processes. Spotting spots in the past, in space, in the present, Short Spotting (Locational done up close) are all effective.

SPOTTING DEPENDS FOR ITS WORKABILITY ON THE DISLIKE OF A THETAN OF BEING LOCATED. IT RUNS BEST, of course, WITH THE THETAN AT CAUSE DOING THE SPOTTING.

Connectedness is the basic process on ASSOCIATION of Theta with Mest. All forms and kinds of association including being caught in traps are prone to become identifications as in Dianetics. Connectedness puts the thetan at cause in making the Mest (or people when run outside) connect with him. The command is "Get the idea of making (indicated object) connect with you." The auditor points. The worse off a person is the less reality they have on far objects.

Havingness is a complicated Connectedness. Also a permissive one. Thus Trio is above Connectedness and may be used when Connectedness is flat.

PROBLEMS: HANDLING AND RUNNING

Easily the most important process in Scientology is Problems of Comparable Magnitude. It has no peers. We don't care how low a process runs, or how high it runs. But nowhere in Scientology do we have a process which runs as high and low as Problems of Comparable Magnitude.

Now that idea of span should be clearly understood by you. There are processes which undoubtedly run lower or higher—of this we are certain. But no other process runs both so low and so high. The only thing necessary in a “problem of comparable magnitude” is for the terminal selected to be real to the preclear. Now that is a necessary condition for the running of it. “Problems of comparable magnitude” become real only if the terminal or terminals selected become real. That is the first condition. Where this process breaks down, it is actually not being run, since Problems of Comparable Magnitude by definition is a process which brings the preclear to invent situations of similar importance to a given situation, and the given situation must be composed of one or more terminals.

Now what do we mean by “terminal”? *It would be any fixed mass utilized in a communication system.* Thus, you see, a man would be a terminal, but a post could also be a terminal. Thus, a head could be a terminal, but so could a hat. But between the two, we get a hat as questionable. It is questionable to the degree that it has less mass, and is easily shed. Somewhere along the line there is a border between a terminal and a condition. Now, we have to know what a condition is.

A condition is a circumstance regarding a mass or terminal. When you are asking for “problems of comparable magnitude,” if you run them on conditions you are calling for a circumstance or a problem comparable to a circumstance, which doesn't have any fixed position and never did have any fixed position and never did operate in any communication system, so you are describing a description—and there is nothing into which the preclear can get his teeth.

First we must conceive, then, a difference between a condition and a terminal. That is quite important for you to conceive. If you can't conceive the difference between a condition and terminal, why, you're in for it; this technique will forever be beyond your grasp—and that is a very easy thing to conceive, however.

The light is on. Now, “on” is a circumstance regarding the light. So you wouldn't run a “problem of comparable magnitude to ‘on,’ “ but you would run a “problem of comparable magnitude to the light.” Do you see that? It sounds idiotic, but a lot of people miss this one. Let's take this now, and see that there are masses, and all masses are only relatively fixed. Masses are masses, and they are not, by the way, particles.

Masses are something that are shed from a thetan by mock-up, and particles are something that are shed from masses. You don't run particles. So what we mean as a terminal has a relatively fixed, identifiable, isolatable location in space.

Now just why you don't run particles, just why you don't run "problems of comparable magnitude" to words, just why you don't run "problems of comparable magnitude" to conditions of one kind or another, that is best demonstrated by your running it some time—and that's a happy adventure for the auditor, not the preclear. To make a real, sure-fire test, why, you should run something like this: a problem of comparable magnitude to fancy words. Now that is indefinite enough and up in the air enough You would shoot the bottom out from your preclear fast enough.

The auditor to run this successfully must choose first and foremost a terminal as his target—not a condition. The next thing is to choose the right terminal.

Now you must understand the procedure of running this technique. Now you wonder why I'm stressing this. The most fabulous thing—this technique can go off the rails faster in auditing than any other technique I know anything about. Now one of the things that is most remarkable about it is that auditors do not accept from the preclear—problems. In other words, an auditor who is obsessively solving problems would have an awful time running this technique, because he has to accept from the preclear a problem every time the preclear answers the question. The way to run it is this: it actually requires about three answers. You said, **"Give me a problem of comparable magnitude to your mother,"** and the preclear said, "The Atlantic Ocean." Now if the auditor said, **"Well, how could that be a problem to you?"** you would get this oddity. The preclear would say, "Well, the Atlantic Ocean overflowing its banks." Now, an auditor who can't stand problems would accept this one as a problem—but it is a condition. The first thing the preclear gave was what he conceived to be a comparable terminal, then he gave a condition. And only on another repetition of **"How could that be a problem to you?"** would it come home to him. But there was a problem involved with it—"How could that be a problem to you?" So the auditing commands are: **"Give me a problem of comparable magnitude to (a terminal),"** **"How could that be a problem to you?"** and if necessary **"How could that be a problem to you?"** and as many times as necessary to get the preclear to finally dredge out the problem.

Unless the preclear can get that idea of a problem, the technique is unworkable. The semantics of the thing may throw him. Therefore the command could be cleared with some profit. The word that is liable to throw the command is "problem," not "comparable magnitude," and because those are polysyllabic you are liable to believe that on some preclears "comparable magnitude" is where they will hang up, and this is not where they hang up.

The auditing of it must include another thing, and that is a feeling on the part of the preclear himself figuring on it. This is evidently a necessary part of the running. We say, **"A problem of comparable magnitude to your mother."** The preclear says, "The Atlantic Ocean." We say, **"How could that be a problem to you?"** The preclear says, "Oh, its overflowing its banks." And you say, **"All right, how could that be a problem to you?"** He says, "Oh, I could figure out some way to keep it from going over its banks." If you're not sure yet, because you wouldn't be sure with that one, you say, "But how *could* that be a problem to you?" or—alternative command here— **"Can you get yourself figuring how to do that?"** He'll get that—that's what you want. He's got to get an idea of himself figuring it out. You want that included in the anatomy of the running of it.

Now, an alternative command to all this is **"incomparable magnitude,"** as I have just mentioned. When you tackle something so huge, so formidable that it would mean a couple of hours' comm lag on the part of your preclear—you see, he's just this moment been informed that he is going to be electrocuted at dawn—you want to desensitize him and blow him out of his head and leave them a dead body, which would be a good joke—something on this order, you see. You realize that this problem could be huge. His fixation is unbelievably great. It goes from horizon to horizon, down to the very center of the earth, and fills the entire universe on

the other side. And that's how big this problem is. Now this technique of incomparable magnitude enters in at the bottom on problems. If a person can't get a datum of comparable magnitude, why, what do you suppose that you should do? Get a problem of incomparable magnitude. You cannot evaluate on a single datum except by postulate. Of course, you yourself should be in a condition whereby you simply say "That is important" or "That isn't important" and that could then be the evaluation of any single datum. But you would no longer be human. You are aware of the fact, by the way, that you cannot be human and be right—that is not possible. I have mentioned that before.

Now here we have, then, a necessity to have evaluation by others. Evaluation from other people. Now get this idea of the only-oneness of problems or situations. When a person is no longer pronouncing the evaluation of things in some grand and kingly style, when he has surrendered this in order to have a more intricate and involved game, he then needs two data. It requires a certain amount of experience of evil to experience good. And we get some people who are around telling us how bad it all is, who have experienced a great deal of kindness. This is a great oddity. You should look it over. All you have to do is to restimulate the early goodness to slip into the consequences of the later evil. Supposing somebody was just being filthy mean, and we compliment him on his good heart, his love of his fellow men—and we'll watch him chuck his cookies. He's liable to fold right up in front of you. You could restimulate such a thing into being until it collapsed and was no longer a button.

We understand things when we are no longer evaluating by postulate, but when we are being polite and evaluating by proof, by demonstration, we no longer are able to accept an "only-one" thing. This is a bad thing because a thetan is to a marked degree an "only-one" creature, and it restimulates his own beingness. When he falls into the lower harmonics of his own beingness, he comes to grief. All you've got to do is exaggerate being a thetan in any one of its facets and you're in trouble. But now it doesn't say that you cannot attain these things. I said the lower harmonics. How does he get to the lower harmonics? By fixation. By fixations on various incidents, and certainly on things which exist as "only-one." There is nothing else like it, so you can never look away if you want to look at such a thing, you have to look at it. And this becomes very bad . . . very, very bad.

As a matter of fact it becomes very amusing when you have problems of comparable magnitude, because a person is using when he runs this his desire for evaluation, but he's putting evaluation on a cause basis, and you are running off the highest logics in logic straight out of the bank. So a person doesn't have to have beautiful sunshine in the streets in order to have a beautiful day. Do you understand that? A person to a marked degree ceases to be dependent upon his environment to give him pleasure or pain.

If you stand around and wait for something else to decide it is something or other, you are in bad trouble. Now children do this—do this to such a marked degree that they don't even know how much pain is painful until they ask Momma or ask Poppa. A child is dependent on exterior evaluation, and I've seen a child go so far as not to eat ice cream. Why? "Ice cream's bad. I don't like ice cream." I said, "What?" I was pretty fast on my feet as an auditor and I said, "Who told you that?" "Oh" "Well, who told you that?" I said. "Ice cream's good." A horrible thing to do. I ran out the other person's magic spell and ran my own in. Kids straightwire rather fast. You can straighten out almost anything with a child if you straightwire them.

Thus we look over the situation and find out that an individual is made to suffer by life to a degree that he is made to by life. Thus his evaluation of life from himself as cause point, as an ability, is necessary to his recovery. We find this under Problems of Comparable Magnitude. We could go off and discuss the whole subject of logic, you realize, the second we say comparable magnitude. I'm going to point your attention to the Prelogics, by the way. I'm going to ask you to read those.

The only reason Problems of Comparable Magnitude works so well and easily is that the individual puts certain things on automatic, which is to say he will not take certain

responsibilities for one side of a dichotomy. He abandons all responsibility for evil. It's an interesting state of affairs, because he becomes incapable of handling evil, and then goes on this one-two basis of stimulus-response, and in his next life he's going to be totally evil. He didn't take any responsibility for it, and it's going to eat him up. You take enough responsibility for a lion, you'll dine on him—every time.

There is an interesting experiment that you can perform yourself—I advise that you should perform this to have an understanding of responsibility and automaticity, because automaticity and responsibility are nowhere more necessary to understand than in Problems of Comparable Magnitude—and that is this: “Get the idea of the effort it took to make that wall.” Get the idea of anything in the line of effort and feel almost at once the overwhelming irresponsibility concerning it. It could be an irresponsibility so great it could make you practically ill.

If you wanted to be real mean to a preclear, not improve him particularly, you could just ask him, “Give me an idea of the effort necessary to make your case.” He would be sitting right there in a total irresponsibility for his case. His case is there, he's not responsible for it. Now how do you recover his responsibility for anything? He has to be able to handle it. Now you could put something on automatic, but usually when you do you will sooner or later get into an irresponsibility for it, because that's what automatic is. So we put something on automatic. Well, if we put problems on automatic, then we ourselves become a problem eventually without our consent. In other words we put problems on automatic, then we ourselves become solution. And when we ourselves are in nothing but solution, the whole world around us is nothing but problem and we're obsessively solution and all the problems are automatic, we wind down faster than any other method I know. We'll wind up being a problem, that's all. The whole Service Facsimile can be summed up by just this one word—solution. A Service Facsimile is a solution. That's all. If you took over this automaticity of problems the individual then could recover from his Service Facsimile. But remember that you had better run terminals, not conditions.

What I have just been talking to you about solves *in toto* all of that which we were going over in 1952 concerning Service Facsimiles—and that is quite a mouthful. If you do it this way, if you know how to do it, if you can look over this whole thing and see quickly how it is done and why it is done, and get it set and settled so you know what's going on with the preclear, then you'll be able to handle chronic somatics directly. You will be able to handle any dynamic directly.

HCO BULLETIN OF 16 DECEMBER 1957

PRESENT TIME PROBLEM

The handling of a present time problem is relatively simple but requires a certain deftness on an E-Meter.

DEFINITION: A present time problem is one which has its elements in the material universe in present time, which is going on NOW, and which would demand the preclear's attention to such an extent that he would feel he had better be doing something about it rather than be audited.

EXAMPLE: Auditor locates girl friend as pt problem of pc. He runs problem with "invent something worse", considers it flat, never looks at it again in intensive. Girl friend calls up pc every night, invalidates him, finally makes him so sick she carts him off in triumph to a hospital. **BLUNDER:** Auditor tried to clear pt problem for the whole intensive, not at the beginning of each session. **BLUNDER:** Auditor in this case went backtrack to a dead wife to clean up charge.

A pt problem is cleaned up as itself only. One doesn't backtrack to get why the pc has such a problem when doing CCH 0.

A pt problem is checked at the beginning of every session—and if there is a break at noon, is cleaned up also at the beginning of the afternoon session.

A pt problem doesn't always bop on the meter at the first question. The auditor has to spend a little time asking around and making sure. Then he audits it on if it falls under above definition of pt problem.

THINGS TO AUDIT PT PROBLEM WITH: A very bad off case: TR Ten and if it turns on a somatic, flatten TR TEN "YOU notice that object." An average case: Isolate the terminal most closely associated with the problem and run "Invent something worse than (terminal)" and then flatten it off with "Invent a problem of comparable magnitude to (terminal)." Also can be run "Spot where (terminal) is now. Okay. Spot where you are now. Okay." A very easy case: Two way comm about the problem and terminals, getting pc to cognite, until the charge is gone.

Where the PT PROBLEM is pain in some member of the body, the auditor can run "Recall an unwanted (member that hurts)." And when that has been run for a few cycles from present to past, "Recall a lost (member that hurts)." (Always run lost and unwanted in the same session and for the same length of time.) Short spotting will also relieve a pain but is rough on the pc unless wholly flattened and run along with medium and long spotting.

HCO BULLETIN OF 18 DECEMBER 1957

PSYCHOSIS, NEUROSIS AND PSYCHIATRISTS

An auditor who does not understand the true character of neurosis and psychosis is likely to find himself trying to understand neurotics and psychotics and psychiatrists and to the degree of that un-understanding could become the effect of these.

If we examine the definition for operating thetan we find his highest capability is knowing and willing cause. This should tell us at once that the definition of neurosis and psychosis would be unknowing and unwilling effect, and this is the actual definition of either.

Neurosis and psychosis are different only in degree of singleness of effect. A neurotic is the subject of one or more unknown causes to which he is the unwilling effect—but he can still function to some degree, which is to say he can still be cause in other lines. A psychotic is the complete subject of one or more unknown causes to which he is the unwilling effect and any effort on his part to be cause is interfered with by the things to which he is the effect; in other words, a psychotic's outflow is cut to zero by the inflow.

Now let us examine the potential number of neuroses and psychoses in the light of the above definitions. How many aspects are there to a life unit, which is to say, a thetan? Perhaps the number is infinite but at least we can say the number of aspects is very large. There are no additional aspects in this or any other universe. In other words when you examine the aspects or abilities of a basic life unit you have examined all the aspects or abilities there are in a universe. There aren't any left over. Even if you include gods in every universe you will see that you have not escaped the potentialities of life units.

All the aspects and abilities there are are the aspects and abilities of a thetan. The only thing that can be done with these aspects or abilities is included, at least in this universe, in the formula of cause and effect. Take one ability and add to it the idea of cause and effect of the more simple variety CAUSE, DISTANCE, EFFECT, fix it so it can never be flowed against by anything else and we have a source of neuroses. Now take a being at the effect point of this flow. If this being is the effect point of a flow he can never flow back against, we have here what we could carelessly call a neurosis. But there is no other qualification for this neurosis than that it be unwillingly received and unknown. Therefore a known "stuck flow" at a person which he is not unwilling to receive does not cause a neurosis. Now as we make this "stuck flow" unwillingly received, then unknown, and make it so that it bars out all back flows of whatever kind on any subject then we have psychosis.

As there are no other aspects than those of a thetan, we see at once that all neuroses and psychoses are EXAGGERATED, CONCENTRATED ABILITIES. The recipient, still trying to be cause, transfers himself to a false cause point. We call this dramatization. He seeks to do only the ability and no other. We have then a psychosis. As he can do no other thing, because he is really unwilling and unknowing EFFECT seeking to be CAUSE by DRAMATIZING the EFFECT, he loses all the abilities but this one ability. This makes a peculiar and lopsided personality. People object to it partially because it is false cause and partially because it denies society all the other social abilities of the person. The psychotic himself is insufficiently willing or knowing about it to object to it.

Thus we have the standard Scientology method of eradicating one of those psychoses or neuroses. Actually we don't even use these words or admit them as any kind of irreparable

state. We are not in such a business. We say we must find something the preclear can do and then improve it. Let us say that we find something the preclear can do knowingly and willingly and have the preclear do it to improve it. All you have to do is get him to reach toward the source of the CAUSE of his condition. The lowest level cause of any difficulty is MEST, therefore the objective processes of Trio, locational, 8c, etc, work uniformly well since anybody here is to some degree the unwilling and unknowing effect of this universe.

Now where does the psychiatrist come into this? And why is he a bad fellow to have around in the society? Well in the first place, he is cognizant only of insanities. As every insanity is only an exaggerated and concentrated ability the psychiatrist can see in every ability an insanity.

There are no other aspects or abilities than those of a thetan. Any one of these can pressure, as detailed above, into an insanity. A psychiatrist or any other person totally associated with insanity then sees all abilities as a parade of insanities. Only where abilities are several and performed socially, not anti-socially, do we have sanity. The psychiatrist never, or rarely, inspects the sphere of sanity. To him, all things then, add up to madness, since every madness is compounded of abilities (disarranged as above).

Let us see a good example of this. "A" is a fine statesman. He plays polo, has a satisfied wife, collects old cars, can do a good job of work as a carpenter, a fisherman and an ice skater. He reads detective stories and plays good poker. He is working on a plan privately to disentangle the Middle East and assist France. One day he is at his club and he is joined by "B". "B" is a political dilettante. He spends most of his money on maps and treatises about the Middle East. He cannot ride, sing or work and his family life is in ruins. He is obviously a neurotic at best. His ideas are disassociated, impractical but loud. Everyone at the club except "B" knows "B" is a poor risk.

"A", the sane, versatile man, hears "B", the neurotic, sounding off about the Middle East and saving France and how only "B" could accomplish this. "A", knowing "B's" character, BEGINS TO WONDER IF HE IS CRAZY BECAUSE HE IS INTERESTED IN THE MIDDLE EAST. In such a way, and in any line, the psychotic or neurotic is a sort of mockery of the sane ability.

Now, as an authority on man and insanity (but not an authority on sanity as is a Scientologist) the psychiatrist, studying insane people runs across "B". He classifies "B" as a save-the-world type and notes that "B" is fixated on France and the Middle East. Shortly thereafter the psychiatrist is called upon to render a decision about "A". He looks in his book, finds "A" is trying to do something about France and the Middle East and, of course classifies "A" as insane.

Another case. George loves Norma. Norma is at first very impressed. George works hard, likes to hike, has some property he is fixing up at week-ends. Now along comes Oswald. Oswald says he loves Norma. Oswald says he is mad about Norma. This is, of course, the case. Oswald has big ideas but no job, wouldn't walk out of the building if it was on fire, gets rid of every piece of real or personal property that comes his way. George knows Oswald is "nutty". Oswald loves Norma. George begins to think he, George, must be crazy to love Norma because Oswald does.

As an authority on twisted and insane love, but not an authority on love, the psychiatrist examining Oswald finds he loves Norma's type of girl. Later, examining George, the psychiatrist finds that George is crazy because he loves the type of girl Norma is. Well, that's an exaggeration but you see where it goes. The psychiatrist, having noted that love was pretty well flung about in the insane wards, leaps to the conclusion that all love is insane because it is so common in the wards and founds in a flash of inspiration psychoanalysis which says all insanity derives from love.

We are held to mockery in all our loves and dreams by the neurotic and psychotic who specialize in mishandling these dreams and loves. And so the world goes mad.

It is not safe to have experts on insanity who are not also experts on sanity. Such persons as those who know only the insane eventually judge that everything man can do is insane and that all men are mad and then we get a society devoted entirely to the support of asylums until it is at last only an asylum itself.

The auditor should understand the mechanism behind neurosis and psychosis. He should draw it out for himself on a graph, showing cause and effect. He should understand that mechanism because it is the **ONLY THING THERE IS TO UNDERSTAND** about neurotics and psychotics, for all else they do is gibberish and un-understandable.

If he truly understands this mechanism in all its phases then neurosis and psychosis can never make him an effect point and he can audit them with ease when he has to step out of character that far.

If the Scientologist thoroughly understands that the downfall of psychiatry which is now occurring came about because the psychiatrist never understood sanity then we won't have any future specialists in insanity beyond these data.

Society has long suspected versatility and the man of many skills. We should have realized there was something right with him.

Scientology: Clear Procedure Issue One

December 1957

L. Ron Hubbard

GOAL:

To obtain the state of clear in individuals.

DEFINITION OF A CLEAR:

A thetan who can knowingly be at cause over Life, Matter, Energy, Space and Time, subjective and objective.

This is a working definition. Self-determinism and knowledge that he himself can be at cause point are then primary targets.

Minimum Requisite for Auditor in Using These Techniques:

A Validated Hubbard Professional Auditor Certificate.

INTRODUCTION

I have been at work for seven years to produce a series of techniques which any well trained auditor can use to clear people. We now have them.

I am truly sorry that this took seven years. Actually, it took more than twenty-five.

Under other "systems of research" it could not have been done. It was financed at first by my writings and expeditions. Some 15,000,000 words of fact and fiction articles ranging from political articles to westerns were consumed in a large part by this research-but it was free to act if not free from sweat.

No bullying dictator wanted it for his mass slaveries as happened to poor misguided Pavlov. No big corporation wanted it for a better Madison Avenue approach to advertising—another kind of slavery. No big RESEARCH FOUNDATION like Ford was there to interject their "America First" philosophy. These had not paid for it; therefore they didn't own it. The work stayed *free*. Thus it prospered. It did not wither in support of some aberrated "cause." It bloomed.

But the violence of protecting this work while continuing it took a toll nevertheless. Special interests believed it must be evil if they did not own it. Between 1950 and 1956, 2,000,000 traceable dollars were spent to halt this work. Newspaper articles, radio ads (as in Seattle from the University of Washington), bribed "patrons," financed "patients" all cost money. You hear the repercussions of this campaign even today.

Money could not stop this work by then. It was too late. If anything had been wrong with our organizations, my character, our intentions or abilities the whole advance would have crumbled. But we had no Achilles' heels. We carried on. All that has survived of this attack by

the two APAs, the AMA and several universities is a clutter of rumors concerning your sanity and mine—and rumors no longer financed will some day die.

And so the work has emerged free of taint and misguided slants. It is itself. It does what it says it does. It contains no adroit curves to make one open to better believing some “ism.” That makes it singular today in a world gone mad with nationalism. Buddhism, when it came to the millions, was no longer free of slant and prejudice. Taoism itself became a national jingoism far from any work of Lao-Tze. Even Christianity had its “pitch.” And if these *great* works became curved, with all the personal force of *their* creators, how is it that our little triumph here can still be found in a clear state?

Well, no diamonds and palaces have been accepted from rajahs, no gratuitous printing of results has been the gift of warlords, no testament had to be written 300 years after the fact.

For this we can thank Johann Gutenberg, and the invention of magnetic tape.

Therefore, although we have no such stature as the Great Philosophies, I charge you with this—look to source writings, not to interpretations. Look to the original work, not offshoots.

If I have fought for a quarter of a century, most of it alone, to keep this work from serving to uphold the enslavers of Man, to keep it free from some destructive “pitch” or slant, then you certainly can carry that motif a little further.

I’ll not always be here on guard. The stars twinkle in the Milky Way and the wind sighs for songs across the empty fields of a planet a Galaxy away.

You won’t always be here.

But before you go, whisper this to your sons and their sons—”The work was free. Keep it so.”

SUMMARY

STEP ONE: Establish participation in session of pc. Do not here or anywhere else neglect this factor. Maintain always ARC. Pc must to some degree be at cause with regard to session if only by wanting it or some result of it, or to escape some elsewhere consequence. This step is CCH 0 but it is run only to establish the thetan to some degree at cause with regard to the whole session. This must be improved throughout the intensive. Applies even to dead pcs.

STEP TWO: Establish obedience of some part of the auditing room to the pc. Here he must begin at some level of knowingness. He must KNOW that he himself, when ordered to do so, can gain some compliance on the part of the auditing room. This includes his own body. Thus we get “You seat that body in that chair. Thank you.” “You make that body continue to lie in that bed. Thank you.” We also get CCH 1. And we get a very important but neglected process run with two objects wherein the pc himself is ordered to keep one then the other from going away (alternately), hold it still, make it more solid, all with two objects. Stress is on YOU do it.

STEP THREE: Establish control of pc’s body by pc. Here we have CCH 2, but we also have an even more important series of processes, S-C-S in all their ramifications on the body. Here is pc at cause with regard to body. It is expected that lots of S-C-S will be run on pcs.

STEP FOUR: Make pc even more conscious of auditor and place him somewhat at cause with ARC. The mechanical steps of this are CCH 3 and CCH 4 but these steps are only valid if they heighten ARC and make the pc decide HE did it.

STEP FIVE: Establish pc as cause over Mest by establishing pc’s ideas as cause over Mest. Here, running these, we again emphasize YOU DO IT. The basic process of this is

CONNECTEDNESS with the PC doing the connecting. Control Trio, Trio, Look around here and tell me what part of the environment you would be willing to be responsible for. You look, You connect, You make Alter the old commands to put pc at cause point in doing these.

STEP SIX: Establish pc's control over Mest subjective. Creative Processes, Recall Unwanted and Lost Objects. Then and Now Solids. First step on this in some cases is conquering black "field" and invisible "field." This is done by a repair of havingness over black masses and then invisible masses, run even if pc goes unconscious. When field is cleared up, start on a gradient scale of mock-ups and get pc able to mock things up. Then run "Keep it from going away" until flat on mock-ups. Then run "Hold it still" on mock-ups. Then run "Make it more solid" on mock-ups. All this until pc really has fine, solid mock-ups. Typical command, "Mock up a and keep it from going away. Thank you." RULE: A PC'S FACSIMILES ARE NOT STORED, THEY ARE MADE IN THE INSTANT AND UNMADE BY THE PC, therefore remedy of mock-ups AND THEIR PERSISTENCE is actually a direct route to clear and winds up with no obsessive mock-up making (which we call a bank). A valuable side process here: "Decide to make a mock-up. Decide that will ruin the game. Decide not to do it." Also this one, "Decide to make a mock-up everyone can see. Decide that would ruin the game. Decide not to do it." A TOTAL REMEDY OF MOCK-UPS WOULD MAKE A BOOK ONE CLEAR.

STEP SEVEN: Establish pc's control over his "bank." "Mock up a facsimile and (keep it from going away, and when that is flat, hold it still, and when that is flat, make it a little more solid)." Run this alternately with "Mock up that wall (keep it from going away, hold it still, make it a little more solid)." Run the "Keep it from going away" on a facsimile one command, then the wall one command, until flat, then shift to "Hold it still" same way, then shift to "Make it more solid," same way.

STEP EIGHT: Make some Time.

AUDITING TRUTHS:

ARC breaks must all be repaired thoroughly. ARC Must Be Maintained.

There is no real liability to a pc in this universe except one: becoming total subject of Mest.

Life versus Life, no liability. Life via Mest versus Life, some liability. Life versus Mest, total liability.

A pc must be kept at Cause as much as possible.

An Intensive in Brief for Practical Use

Begin by carefully easing the pc into session with CCH 0 but don't talk too much or permit him to talk too much as you will as-is his havingness.

Establish control of a room object with "You make that chair sit on the floor."

Get wheeling with S-C-S and run it up to Stop-C-S.

Run Connectedness inside the auditing room and then outside with "You make that connect with you." or "You look around here and tell me something you could have." Or, "You look around here and tell me something you could be responsible for."

Run an engram or do Then and Now Solids and put pc at cause with regard to facsimiles.

If you have any time left, do it all over again.

DEFINITIONS, GOALS

There are three possible goals in processing a preclear. The first of these is Mest Clear. The second is Theta Clear. The third is Operating Thetan.

By Mest Clear is meant a BOOK ONE CLEAR. Here we defined clear in terms of facsimiles. This is a rather simple mechanical definition. It said in effect that so far as human beings were concerned our preclear finally arrived at a point where he had full color-visio-sonic, had no psychoses or neuroses and could recall what had happened to him in this lifetime. This is almost a baby-talk sort of clear. It pays no heed at all to identification with a body and it has nothing to do with ability. Today, by running Creative Processes (four years old!) we can turn on visible facsimiles and weed out the bottom spots of operations and what not. This is actually a rather easy goal. Somehow I've never given a real tight procedure for achieving it even though the essence of the processes has been around for a very long time. COMPLETING STEP SIX OF CLEAR PROCEDURE IN FULL GIVES US A MEST CLEAR.

By Theta Clear is meant a Clear obtained by Clear Procedure as is being delineated in this regimen. The main trouble is, amusingly, trying to reach Mest Clear without running into Theta Clear. I personally don't believe now that it can be done without actually shoving the pc back in his head every time he pops out. Thus the goal of this procedure is actually THETA CLEAR. This is what we mean then when we say "clear." We mean a Theta Clear.

By Operating Thetan we mean Theta Clear PLUS ability to operate functionally against or with Mest and other life forms. For the first time we have here the matter of ABILITY. An Operating Thetan is not an absolute term. Theta Clear is a more absolute term than Operating Thetan. An Operating Thetan is a Theta Clear (not a mystical mystic out on an inversion) who can also do something.

Thus we have two goals which contain no ambition to accomplish anything and one goal which contains much ambition. Now here is another puzzle in definitions. Which is highest, the Theta Clear or the Operating Thetan? Well, the answer to that is not what we used to think. As DOINGNESS is not really at the top we find that we will probably make an Operating Thetan before we achieve Theta Clear for a Theta Clear would probably not be much interested in operating. Therefore, we see the actual goal we are trying to reach, no matter in which limited sense, is Operating Thetan.

Operating Thetan is then a highly variable goal. A thetan who can move in and out of a body is actually operating somewhat but he is not really a Theta Clear since a Theta Clear, in its highest sense, means no further dependency upon bodies.

The goals of the auditor, therefore, do not rack up one, two, three, Mest Clear, Theta Clear, Operating Thetan. They actually stack up on a very gradient scale between thetan inoperative and a thetan who can operate. The auditor is therefore seeking to reach with the pc a state wherein the pc can function. At no time does the auditor suddenly arrive with a pc in a startling new shiny state all of a sudden that can be called a certain thing. In that pcs often expect this suddenly bursting "into the light" the auditor is subject to disappointment when he has actually achieved an enormous gain for the pc. In other words, pcs gain on a smooth gradient scale and do not suddenly become something.

There is only one point on the road up where something does happen and that is exteriorization. When the pc exteriorizes for the first time he feels there must be a cause for rejoicing and has the idea he has gotten somewhere. Well, in fact you could achieve the same result by hitting him over the head with a club. He would exteriorize. The point is not exteriorizing the pc but cutting down his dependency upon a body. A pc who exteriorizes and is not carried right on with the same process that sprang him out of his head until it is flat will go back into his head in an hour or a week and will be harder to dig out the next time.

In other words, this point of exteriorization does happen and does mean to the pc that he is himself. But it shouldn't mean very much to an auditor beyond his noticing that this phase has been entered in the case. For in truth thetans don't stay out of their bodies very long if they are not in good shape. Thus exteriorization means less than ability to act, to live, to be and do. The attention of the auditor should be upon the increasing ability of the pc to handle life, not upon the distance the pc gets from his body. Is that clear? Well, it tells us that arriving at a state of Clear is easy if that means stable outside and that any state of betterment on the road to Operating Thetan is an honest achievement.

Thus an auditor should at all times go toward the state of Operating Thetan and should not be mixed up in the oddities of exteriorization for a day.

HGC Clear Procedure goes straight toward exteriorization and achieves it. But it also goes straight toward increasing ability to handle life. The latter is the auditor's best goal. The auditing goal should go in the same direction as this new definition for Operating Thetan.

An Operating Thetan can be at cause knowingly and at will over Life, Matter, Energy, Space and Time, subjectively and objectively.

This Action Definition of Operating Thetan is the true goal of the auditor and if followed with complete understanding will achieve the best possible results.

In this discussion of goals and definitions, I am telling you cleanly that the goals of Mest Clear and Theta Clear are not worth following from the auditor's standpoint. You can let pcs think what they will about them. The only goal worthy of the auditor's time **WHATEVER THE STATE OF CASE OF THE PC** is Operating Thetan. To achieve one on any subject it is only necessary to place the pc to some degree at willing and knowing cause point with regard to that subject. All the steps of HGC Clear Procedure are leveled at Operating Thetan. But you need not tell your pc that. You can use the words **RELEASE**, **MEST CLEAR**, **THETA CLEAR** or any other if you like. Just remember there is only one payoff goal and that is Operating Thetan.

MEST CLEAR: Can see facsimiles with sonic present lifetime, has no psychoses or neuroses. Upper part of APA (in UK OCA) graph. Above 13 5 IQ.

THETA CLEAR: Can exist knowingly independent of bodies.

RELEASE: Average a third of a graph higher than first test, above 115 IQ.

OPERATING THETAN: Can be at Cause knowingly and at will over Life, Matter, Energy, Space and Time, subjectively and objectively.

STEP ONE

Participation in Session by the Pc

We have long known that ARC was important. Just how important it is was established by some tests I made in London in 1956 wherein every time the pc showed any restlessness or other signs of loss of havingness, instead of remedying havingness I carefully searched out any fancied break of ARC and patched it up. The "loss of havingness" vanished. In other words, loss of ARC is even more important than loss of havingness since a repair of ARC restores havingness. Lack of havingness is only one symptom of a lack of communication.

There are two ways an auditor, according to long practice, can err. One of these is to permit two-way communication to a point where the pc's havingness is injured. The other is to chop communication to such a degree that havingness is injured. There is a point past which communication is bad and short of which lack of communication is bad. Here we have auditor judgment at play. Because the pc will fidget or go downscale in tone when his havingness

drops, an auditor can SEE when the pc's havingness is being lowered. Because a pc will go anaten or start to grind into the process an auditor can tell whether or not the pc feels his communication has been chopped. When either happens the auditor should take action—in the first instance by shutting off the pc's outflow and getting to work and in the second instance by making the pc talk out any fancied communication severance.

Participation in session by the pc is not something the auditor sees to at the beginning of the session and then forgets for the rest of the intensive. This step is continued throughout the intensive and is given as much attention as any process being run at the time. The auditor's attention is always therefore upon two things—first the continued participation in session and second the action of the process.

Grouped under this head we would also have ways and means of getting the pc into session in the first place. An unconscious pc used to be an apparent roadblock. A downtone, antagonistic, you-can't-help-me pc was also a rough one. These two things are countered by always carefully starting a session and following through on standard CCH 0.

It is as important to open a session with a baby or an unconscious person as it is with any other preclear. It doesn't matter whether the pc is answering up or not. It is only necessary to assume that the pc would answer if he could answer and that the mechanics of voice and gesture are simply absent from the answer. Therefore one always carefully starts every session, paying attention to what is happening, where it is happening, who is there, help, goals and problems. Obviously anaten or inability to control the body are the present time problem of the unconscious person or the child. One can actually audit this with a plain question and simply assume after a bit it has been answered, then give the acknowledgment and ask another question just as though the pc were in full vocal action. Auditors still fall for the belief, very current, that "unconscious" people are unable to think or be aware in any way. A thetan is seldom unconscious regardless of what the body is doing or not doing.

PRESENT TIME PROBLEM is a highly vital point of PRECLEAR PARTICIPATION. If a preclear is being nagged too thoroughly by a PT problem auditing can actually send him downhill if done without addressing the problem. A whole intensive, even seventy-five hours can be wasted if the auditor does not clear the PT PROBLEM.

The preclear generally doesn't know he has one which is nagging him, for the rough PT problems go into the apathy band and below into forgetfulness rather rapidly. Therefore the auditor should ferret out the PT problem with an E-Meter. Adroit use of an E-Meter does not include evaluating for the preclear but it certainly does include ferreting out PT problems. The E-Meter is also used for valences and sometimes psychophysical difficulties. (Auditor: Use the word "psychophysical" rather than psychosomatic and stay out of a medical field.)

THE RUNNING OF A PT PROBLEM today is the most. PT problem, valences, psychophysical ailments, all run beautifully with "Mock up something worse than (terminal)" or "Invent something worse than (terminal)." To run this it is necessary to isolate the TERMINAL most intimately connected with the PT problem (or the valence or psychophysical difficulty). One then CLEARS THE COMMAND (and you always better do that with any command) and lets go.

The whole idea of WORSE THAN is the whole of the dwindling spiral. People who are "trying to get better" and "be more perfect" and "think the right thought" lose all control of "getting worse," "being imperfect" and "thinking the wrong thought." All these WORSE THANS are then left on automatic and we arrive at something less than optimum. In fact we arrive with the dwindling spiral. We also arrive with the "point of no return." We also arrive with the declining ability to heal or get well. And we also arrive with old age.

After running "worse than" on the PT problem, we proceed with other parts of CCH 0. Clearing help will be found quite beneficial. But to get a pc to participate who is downright ugly about it, running help is usually only a partial solution. When these only ones get going

they really snarl on the subject of getting audited. Here CCH 1 is of benefit. No questions asked. But this, of course, defeats the purpose of STEP ONE.

PARTICIPATION OF THE PC in the session is necessary in order to place the pc somewhat at the cause point in the actual fact of auditing. This fits the definition. You can always change a body or recover it from some illness by auditing without much helping the pc himself. Therefore, the pc, while under auditor control, is still somewhat at cause, what with comm bridges and clearing commands, etc., but he is made to feel no bad effects from being AT EFFECT if ample ARC is used. In other words, the pc can't be entirely at cause in a session or he would be self-auditing, which isn't good, but he can be salvaged from being a total effect by good ARC. When the ARC drops out that DOES leave the pc at more or less total effect, a thing you have probably noticed.

The things to be done in CCH 0 should be done thoroughly at intensive's beginning and should be glanced at whenever a new session starts and should get a bow when a new command is used. But all CCH 0 is is a collection of mechanical aids to assist the pc's participation in the session and to assist the auditor in ARC. Although CCH 0 must be used always, it is not a total substitute for ARC.

The sum of CCH 0 is find the auditor, find the auditing room, find the pc, knock out any existing PT problem, establish goals, clear help, get agreement on session length and get up to the first real auditing command. CCH 0 isn't necessarily run in that order and this isn't necessarily all of CCH 0, but if any of these are seriously scamped, the session will somewhere get into trouble.

When the participation of the pc ceases in a session, he must be gotten back into session by any means and then participation is re-established. A pc is never permitted to end a session on his own choice. He seeks to end them when his participation drops out of sight.

The trick question "What did I do wrong?" re-establishes ARC.

The problem of handling a pc who is not cooperative, who does not wish to participate, is a highly special problem. In the first place it is the pc's engrams that do not want to continue, in the second place it is the engrams which are doing the talking. One ordinarily tackles this case with a formal opening of session, brief but positive, and then sails in with CCH 0, just as though the person were unconscious, which, of course, the person is.

Participation by an unconscious person, while covered above, requires the additional refinement of technique. ONE MUST ALWAYS FIND SOMETHING THE PRECLEAR CAN DO AND THEN BETTER THAT ABILITY. An unconscious person is usually lying in bed. If not the command must be varied to fit the environment. But the best command is something like "You make that body lie in that bed." A slightly upper grade process to a person sitting in a chair is "You seat that body in that chair." In such cases a grip on the pc's hand and the use of a slight squeeze each time the auditor acknowledges considerably speeds the process.

There is another special case—or maybe it isn't so special. There are many people who cannot tackle a present time problem with a process. If the auditor sought out a PT problem and then ran "something worse than a related terminal" or a "problem of comparable or incomparable magnitude" he would find the pc digging in hard, unable to handle the process. Thus some judgment must be used in such cases. Don't run a PT problem on somebody in very bad shape casewise.

There is an awful lot to know about starting sessions. The bad-off case and the case in very good condition alike require special handling. For the case just mentioned who cannot handle a PT problem with a process, there is always locational (TR TEN). TR TEN will run a PT problem or anything else if slowly. Thus many a person with a PT problem can only participate in a session to the extent of TR TEN, "YOU notice that object (wall, floor, chair, etc.)." By introducing in the auditor's and pc's bodies as a couple of the items being spotted

along with everything else we eventually wind up with “find the auditor, find the auditing room, find the pc.” And we get there without a PT problem being in full bloom.

In running “You notice that object” there are some things that **MUST** be observed. Most important of these is this one: **ANY PROCESS WHICH TURNS ON A SOMATIC MUST BE CONTINUED UNTIL IT NO LONGER TURNS ON SOMATICS**. This is true particularly of TR TEN, 8-C and TRIO. The case hangs right there until the process is flat, whether in one day, one year or six. Another thing which must be stressed is the inclusion of the auditor’s and pc’s bodies. Because some pcs **WHEN EXTERIORIZED** snap back in when they see the body is no reason to avoid it in TR TEN. Another thing is to make the pc use his eyes to view the objects and if he doesn’t turn his eyes toward them, then it is up to the auditor to use manual direction of the head and even pry the eyes open. No balks are ever permitted in auditing. If TR TEN is being run at a problem, every now and then the auditor pauses and discusses the problem again with the pc in order to keep it in restimulation until TR TEN can run it out.

The high case is a worse problem than auditors commonly believe. In the first place a high case can “blow” a situation out of the bank with considerable ease and if the auditor insists on sledge-hammering it out with a process, then pc participation blows rather than a facsimile.

High case participation can also be misunderstood in that there are a lot of cases that think they are high which aren’t. Here’s how you tell a real high case from a bogus (“I can do everything”) case. A thetan in good shape can be cause. When he looks at something in the bank it becomes the effect. A bogus high case can think anything he wants without anything having an effect on the bank. You want to watch this point because here is the definition of OT thoroughly at work. Pc at Cause. A case that has pictures and everything and is impatient to get on with it **BUT DOES NOT MARKEDLY ALTER THE BANK WITH THINKING ALONE** is not a high case but an old “wide open case” of Dianetic days.

Two-way communication **AS A PROCESS** is the key to all this. If you put a pc on an E-Meter and locate a present time charge, you can, if the pc can somewhat handle his bank, get him to two-way comm the incident flat very quickly—in five or ten minutes at the most. This is all the process used. It would take an actual E-Meter run to give you a full reality on this.

Here we are looking at the basic differences amongst cases. That difference lies in the ability to knowingly **CAUSE**. Bodies are the same, they all react alike. Banks differ only vaguely and only in content and significance. Engrams are engrams and they all behave alike. There is only **ONE DIFFERENCE** amongst pcs. We called this **BASIC PERSONALITY** in **BOOK ONE**. We can be a lot more simple about it now that I have my teeth into the subject a few more feet. The difference is **DEGREE OF KNOWING CAUSABILITY**. What do we mean by **CAUSE**? The basic, old Scientology definition is still at work. **CAUSE-DISTANCE-EFFECT**. Joe knowingly shoots Bill. Joe is at Cause. Bill is at Effect. Mary gives John a present. Mary is at Cause, John is at Effect. Bill says Boo to Joe. Bill is at Cause, Joe is at Effect. But when we introduce **KNOWING CAUSE** and **CAUSE AT WILL** into this **CAUSE-DISTANCE-EFFECT** idea we see we have something else added. The person at Cause is there because he knows he is there and because he is willingly there. The person at Cause is not at Cause because he does not dare be at Effect. He must be able to be at Effect. If he is afraid to be at Effect, then he is **Unwilling Cause** and is at Cause only because he is very afraid of being at Effect. Education can show a person he can be at effect without liability. Then he can be at Cause without **HAVING TO BE BECAUSE HE DOESN’T DARE BE AT EFFECT**. Auditing in its whole operation is teaching the pc this. Pc slides from terrified effect to tolerated effect to knowing cause with regard to any incident he contacts **IF HE IS AUDITED PROPERLY**. The pc who has to get rid of all his engrams because he has to get rid of them because it’s all too horrible winds up, with good auditing, into a tolerance of the pictures since he has learned he can tolerate them and so can swing around to Cause.

So we have this great difference in pcs. **DEGREE OF KNOWING CAUSABILITY** is the extent that he is willing to be at Cause and the extent he is willing to know he is at Cause plus the ability to cause things.

You will see this on an E-Meter in PT problem handling. Bill has a PT problem. It drops a dial when first contacted. The auditor, using his UNDERSTANDING of Scientology, two-way comms on it. The incident discharges and no longer registers after a few minutes. Mary has a PT problem. It drops steeply on the E-Meter. The auditor tries to two-way comm on it. The charge remains the same or Mary begins to disperse. She doesn't hold to the subject. The auditor at length finds that two-way comm only serves to run down her havingness. The charge remains on the meter dial. What is the difference between Bill and Mary? Bill can be at knowing cause, Mary is either obsessive cause or heavy effect. Bill can blow facsimiles. Mary cannot. On Mary the auditor is very wise to enter upon TR TEN.

One version of TR TEN is called Short Spotting. "You notice that (nearby object)." So long as the pc can see with his eyes the object or feel the auditor's hand on it, the process works. It is spotting right up close. If run with mediumly near and far objects (such as the room wall) it is very effective in getting a case going. It has given some cases their first reality on auditing. BUT the rule still holds here about somatics. When a somatic is turned on with a process, turn it off with that process. See Auditor's Code 13. This is entirely true of Short Spotting. In that it almost always turns on somatics, when you start it, you have to flatten it and that's often lengthy.

Remember this about pc participation. A low case can't handle the bank, therefore you keep high ARC and kid-glove him through a session. A very high case doesn't need dynamite, therefore you retain his participation by going as rapidly as you can. A medium, average case needs ARC, something of dynamite, something of kid gloves, something of two-way comm.

And IN ALL GOOD AUDITING, CASES IMPROVE. Just because you start a pc low doesn't mean he'll always stay low. Check the case often. See if his CAUSABILITY is rising. If it isn't, he isn't improving and you better go easier or heavier. PROBABLY when a case doesn't improve you didn't handle a PT problem. THAT IS THE ONLY THING WHICH CAN KEEP A CASE FROM GAINING. So check every session for one.

There are probably thousands of ways to gain the participation of the pc, there are probably thousands of ways to open a session. There are probably an infinite number of tricky things you can do. However, this breadth of choice should not obscure the following:

1. A pc who is not participating in the session is not at Cause.
2. An auditor who isn't able to maintain ARC, who isn't able to "freeze" a process for a short time, even a Tone 40.0 process, and re-establish ARC, will not get results.
3. The end-all of processing is the attainment of a goal, the goal of OT. One always processes the problems and difficulties of the pc, he does not process the process. Processes only assist in processing the pc. They will not do anything by themselves. Processes are a road map to the goal of OT, they are nothing in themselves. The target is the condition, the disabilities of the pc. How one achieves the eradication of these difficulties is secondary to the fact of their eradication. Scientology is a route attained after several thousand years of no attainment by Man and the route is important and valuable and must be traveled correctly, but the concern is the pc, not the route.
4. A new auditor can be adrift with his tools. He is uncertain as to what he is attacking. He should have reality on engrams, locks, key-ins, secondaries, the time track, the key buttons of Scientology such as Communication, Control and Havingness. Given an understanding of all these and the theory of Scientology itself he can almost pilot his way through a case with two-way comm. But two-way comm will not work if one doesn't understand all the above. So two-way comm is not conversation. The pc has had a few trillion years of that and it hasn't made him well, so two-way comm is a highly specialized thing, done with full understanding of the thetan, bank and body. Good two-way comm means participation by the pc.

5. Scientology is a precise commodity, something like engineering. A pc is a precise thing, part animal, part pictures and part God. We want the ability to handle things and the God, and the less unthinking responses in the pc the better off he will be. Therefore a PC WHO ISN'T COGNITING regularly is being processed beyond his ability to do and it is necessary to drop back downscale to find something he CAN DO.

6. The golden rule of processing is to find something the preclear CAN do and then to improve his ability to do it. At once you will have participation. The highest ability one pc had was to get drunk: a resolution of his case was entered upon by having him invent ways to get drunk.

7. The attention span of children and psychos is not necessarily a factor since it is only the phenomena of dispersal against mental blocks, keying in of incidents. The auditor can pay attention to it or not as he likes. Short, regular sessions on people with limited attention span get more gain per week than a steady grind since the participation is maintained.

8. The auditor remains at Cause in all sessions without forbidding the pc to be at Cause. See the rules in *Dianetics: The Original Thesis*.

STEP TWO

Placing the Preclear at Cause

Establish obedience of some part of the auditing room to the pc. Here he must begin at some level of knowingness. He must *know* that he himself, when ordered to do so, can gain some compliance on the part of the auditing room. This includes his own body.

The basic rule of auditing is to start with something the preclear can do and then get him to do it better. This is the basic difference between a high level and a low level process. This is also the difference between a process which is real to the preclear and a process which is unreal to the preclear. A preclear "can do" a process without doing it at all. Actually the body and bank are obeying the auditor. Now here we had in Dianetics one of the more interesting phenomena of an auditor being able to make a preclear physically well without the preclear once finding out about it. This was a source of great grief and upset to auditors. They could not see how this could possibly be. The man priorly could not walk, apparently, and after auditing he could walk, and yet he did not attribute to Dianetics or to the auditor any of this renewed ability.

The auditor could monitor the preclear's bank and body, shift around the engrams, as-is them and do various things with them without the preclear finding out about it. All of this was so far above the preclear's ability to do that it was totally unreal to him.

We also get the phenomenon of an individual doing a great many spotting processes and feeling better but not being able to understand what this has to do with sanity or insanity. In the first place, the individual could not himself spot. The auditor more or less did the spotting for him. The preclear then never connected it in any way with his own capabilities.

A test an auditor should make to ascertain the sense of this is as follows: "Look around here and tell me something you could do." The preclear will get many odd and peculiar sensations as he fishes around and finally decides that he could do some minor thing. This is not really a good process but it is a good test process for an auditor. This preclear who has been walking and talking and working and going around the world and apparently behaving in a fairly sane and rational fashion actually could do none of these things. He was supported entirely by his "machinery," by the social responsibilities which were demonstrated toward him, by his education, by the basic agreement of what goes on in the world. He was walking around in a dream and life felt to him much like a dream. Now the auditor starts to audit him on the basis that this individual is capable. Well now the individual himself is the thetan and

whereas the bank might have been capable (and would have broken down some day), the thetan himself was not. He was going along for the ride.

We often see this phenomenon in the third dynamic. It could be said that a government is the aggregate irresponsibility of a people. They are not taking responsibility for the course of justice or protection of the state from foreign aggression, and they shove all this responsibility over on to a government and they themselves are quite irresponsible for it. After a while the government doesn't look to the people at all to furnish any responsibility. The government takes all the initiative, and we eventually wind up with some sort of a dictatorship. The people then no longer count; they are slaves; they are totally irresponsible.

In a similar wise, a thetan can be totally irresponsible for everything that goes on in relationship to his workaday world, and we see people dramatizing this on every hand. Wherever a thetan refuses to take responsibility and is participating in action, he is being "unreal." This is the unreality of a situation. Let us say you were part of a crowd which was surging downtown to Third Street and you yourself wanted to go uptown to Tenth Street. The crowd swept you along toward Third Street and after a while things would become pretty unreal. That is because you were being carried in a direction opposite to your basic intent. Thus your own intention is overwhelmed. This intention overwhelmed becomes what we know as unreality.

It is very easy for an auditor to overwhelm the preclear's intention. The preclear is actually going to Tenth Street, the auditor is trying to push him to Third Street. We get the most remarkable subdivision of this in Survive and Succumb. The auditor is going on the basis that the preclear wants to Survive and the preclear is going on the basis that he wants to Succumb. The auditor is then thrusting him in an opposite direction. Hence it is really necessary to clear Goals in an auditing session. There must be some goal which the preclear considers obtainable. The goal of just being able to sit there for the next two or three hours is a goal. You would be surprised to find that in some preclears this is a tremendously high goal. But even a preclear's goals can be unreal to him. They are the social goals. Actually, the preclear privately thinks he'd like to get rid of every man, woman and child on Earth and the goal he gives you is to save everyone.

Now the question actually confronts us—what can the preclear really do? Of course, in a case of tremendous doubt, you could run the above process—"Look around here and find something you could do." But there are certain things that an auditor can take for granted which undercut any other thing. The body is sitting in the chair. The preclear can be brought up to a realization that he can make the body sit in the chair. And thus we get the first really worthwhile process on a preclear who is conscious, and that process is "You seat that body in that chair. Thank you." And in the case of somebody who is Lying in bed, even unconscious, we get this basic process: "You make that body continue to lie in that bed. Thank you."

All we are asking anybody to do when we ask for these two processes is to take responsibility for what is actually occurring in the first place. We raise his responsibility level in other words, and thus raise his doingness level. A preclear who does not come through eventually with a cognition that he can make the body sit in the chair of course isn't worth bothering with, in that his doingness level is even below this. This preclear ought to be lying in a bed. He must consider himself completely helpless and completely ill. Thus if we ran "You seat that body in that chair. Thank you," for several hours without any realization on the part of the preclear that he could do this and without turning on any somatics or without getting any effect at all, we would consider that we had overshot this. Actually it shouldn't take several hours to find this out. We would go back to the basic position of Dianetic auditing. This preclear probably thinks of himself as being dead or probably thinks of himself as being very ill or thinks of himself as being totally unconscious. Thus we would run him as an unconscious person. Putting him down on a couch we would run "You make that body continue to lie in that bed. Thank you."

Also, on a much higher level we get CCH 1.

“You give me that hand” is actually the old cat process where we got the cat to reach for the auditor, plus an obedience process. The preclear after a while should decide that he can do this. Sometimes we run CCH 1, then CCH 2, CCH 3, and then CCH 4 and going back discover that CCH 1 is now unflat and the preclear is unable to perform this action which he previously could perform. Now what has happened here is we have broadened the scope of the preclear’s responsibility. His bank at first was perfectly capable of giving that hand but once we have invited further responsibility and gotten him to find the auditor as in CCH 3 and CCH 4, we discover that the preclear himself is now trying to do it and in trying to do it is having difficulties but he wins through with this difficulty and eventually comes out much better.

Unless these particular goals and theories behind these processes are understood they very often do not work at all in the CCH bands. Thus CCH 1 to 4, while tremendously successful when run by a very excellent auditor understanding his job, may not be successful in the hands of somebody who is simply going through some mechanical motions.

Basically we are trying to get the preclear to do something and know that he himself can do it. Thus we are improving his ability. On this fundamental we can go forward and establish many processes, all of which are fundamental doingness or obedience processes. We can do such a process as “You make that chair sit on the floor.” This process at first seems a little incredible to the preclear, but after a while he gets the idea that he can do it, then this unflattens and he gets the idea that it’s gravity that’s doing it and therefore he can’t do it, and he goes through various cognitions of one sort or another simply about having a chair, which is already sitting there, sit there. Unless we can cross this particular stage of a case and get the preclear up to an idea that he does have some sort of an ability of some kind, we might as well do nothing else about the case at all. Therefore this Step Two is quite important and actually is the basic entrance into auditing.

STEP THREE

Establish Control of Pc’s Body by Pc

Although we could continue onward with the CCHs simply rotating them from CCH 1 through to 4 and back to 1 and to 4, and back to 1 and to 4 again and again and again and win, there is a faster way of going about this which has been known to us for a very long time. This way starts really with 8-C.

It does not matter particularly which brand of 8-C is run. We have had now three or four varieties of 8-C. The first one was rather permissive and indirect and did not demand very much compliance and possibly had its own place in the firmament since use of it has resolved a very, very great many cases. The first command of this is “Do you see that wall?” Then “Walk over to it.” Then “Touch it.” And that was all there was to the process. Later 8-Cs, particularly Tone 40 8-Cs, were highly precise, very directive and had a great deal of control stress to them. It does not matter particularly which 8-C is used so long as the auditor feels that it is biting. If the particular 8-C he is using isn’t biting, maybe he needs a more permissive one, maybe he needs a more exacting control one.

There are a great many factors surrounding the control of the pc’s body by a pc. Most pcs feel their body if tampered with in any way would fly out of control and flip-flop all over the floor, would suddenly freeze or would get ill, and they have anxieties about their bodies and the control of their bodies which must be solved, otherwise we don’t get very far. Control of bodies can actually be assisted by old-time flip-flopping.

Flip-flopping was a process by which the preclear’s excess motion was taken off. The creative processes of earlier times did not require of the preclear any great cognition of what was going on. Thus flip-flopping could be used at a very early stage of case. We would say, “Mock up a man and make him flip-flop” and then make him insist that the body flip-flop even further and even more wildly until he himself knew that he was making the body flip-flop. We would do this with a woman’s body and would eventually take the motion off the case that was

inhibiting the preclear from controlling the body. This is actually a motionectomy. It is really a case of the auditor controlling the bank and body of the preclear. When we did not do this we found that in running 8-C and in doing some other processes the preclear all of a sudden would convulse and start to fly apart. These fly-aparts were simply the flip-flop manifestation of bodies.

It is extremely interesting that a preclear exteriorizing from his own body which is out of control, flip-flopping, writhing, convulsing and going into epileptiform seizures was at a distance from a flip-flopping body. One day while in his own body he causes some other body to go out of control, he shoots somebody or hits somebody, and has this person go into a flip-flop. He himself gets restimulated and he feels that his body in the future is liable to go out of control at any time. If you draw a little picture of this you will see that a thetan exteriorized from his own body and a thetan in his body knocking about some other body is, to the thetan, the same point of view. In other words, if you make somebody's body flip-flop, your own body may flip-flop. It looks the same to a thetan.

Some guarantee or security of body control is therefore necessary.

There is a very fine set of processes which have been used for more than a year at this writing and which produced excellent results. These we call the S-C-S processes.

After running 8-C (and if it turned on somatics remember to flatten the process entirely, even though it takes 50 hours, before going on to another process), we go into these control processes grouped under S-C-S. There have been several varieties of process, all entirely in the control bracket but with different severities of control. The commands of S-C-S processes are almost all the same except that some are made more severe than others.

The first of these processes is the Start process. This is very simple. We have a preclear out in the middle of the room standing up while we stand up alongside of him touching him, and we explain to him (and we explain this every command) that when we say "Start" we want him to start his body in that direction, and we point out some direction.

Then we take our hands off of him and we say "Start." We do not say Stop, Halt, or anything else, but after he has moved forward we then say, "Did you start your body?" And he says he guesses he did or he did, and we then—and only then—acknowledge. We do this many times until the process apparently has no charge on it or is flat. We then go into the next of this series, which is Change.

To run Change the auditor marks four points out on the floor. These points can be imaginary or they can be actually chalk-marked on the floor. One of these points we label "A," one "B," one "C," and one "D." We explain the meanings of these symbols to the preclear and we give him this auditing command: "Now when I ask you to change the body, I want you to change the body's position from A to B. Do you understand that?" The preclear says he does, and the auditor, stepping back from the preclear, says "Change." The preclear then changes the body's position. Similarly in using the various points and combinations of the points A, B, C and D, the auditor drills the preclear on Change until that particular process seems to be flat.

The auditor then goes to Stop. The auditor takes the preclear by the arm and explains (explains every time) that when he says "Stop," he wants the preclear to stop the body. The actual wording of the auditor is "Now I want you to get the body moving in that direction and when I say Stop, I want you to stop the body. Do you understand?" When the preclear says that he does, the auditor lets go of him, lets him move down the room a distance (never the same distance twice) and says "Stop." When the preclear has stopped the auditor says "Did you stop the body?" And the preclear says "yes," or "maybe" and the auditor then acknowledges. The auditor does this many times until the preclear understands that he himself can stop the body or he has regained an ability, or the process appears to be flat and has no charge on it.

These three steps done in that order are then repeated. And it will be discovered that once Stop has been flattened, Start is now unflattened and can be flattened all over again by running it anew. Similarly, Change will be found to be unflat and again Stop will be found to be unflat. Thus, one runs Start and one runs Change and then one runs Stop, in that order, over and over and over again until all three appear to be flat.

A variation of this particular process has been called Stop Supreme. Stop Supreme is a heavy emphasis on Stop and it will be found that after the three processes of Start, Change and Stop are flat, one can move rather easily into Stop Supreme and concentrate heavily upon it. In other words, one runs Start, Change and Stop, Start, Change and Stop, Start, Change and Stop until they are relatively flat. He should not then suppose that the whole of S-C-S is flat since he still has Stop Supreme in all of its variations.

The idea behind Stop Supreme is that Stop, or motionlessness, is probably the most thetan ability a thetan has. Thus the rehabilitation of this particular ability is worth while and does produce considerable results. But don't be surprised if the preclear falls apart in the process of doing it.

The commands of Stop Supreme are roughly these. Every time one runs one of these S-C-S processes he, of course, explains the thing in full at the beginning of every command. He does not let any explanation hang over from the last time the command was executed. It will be found that the preclear cannot hold in his mind these explanations. Therefore, it has to be all explained anew every time. Thus we say to the preclear in Stop Supreme, "Now I want you to get your body moving down the room when I so indicate and when I say Stop, I want you to stop your body *absolutely still*." Then the auditor gives the preclear a slight shove and the preclear moves the body down the room, and the auditor says "Stop," and the preclear tries to stop his body absolutely still in that instant. It will be found that faster and faster responses are achieved by the preclear and he can actually stop the body in more and more peculiar positions. The auditor then says, "Did you stop your body absolutely still?" The preclear answers this and then the auditor acknowledges. There are even more severe versions of this, but they are left to the imagination of the auditor.

These S-C-S processes produced the greatest control changes that have been produced with any control process. They were consistently used with great success by a great many auditors. This is not really true of CCH 1, 2, 3 and 4. CCH 1, 2, 3 and 4 depend in a very large measure not only upon the excellence of the auditor but upon how the auditor himself is feeling while he is running them. And we can get an auditor who is not feeling up to par that day not doing well with CCH 1, 2, 3 and 4. This difficulty was never encountered with the S-C-S processes and therefore the S-C-S processes are to be recommended.

An apparent drop of havingness is occasionally experienced by the preclear as he does these processes. This is because of compulsive exteriorization. If a preclear is about to fly out of his head he'll fly out of his head on S-C-S. If he does fly out of his head on S-C-S, or any other process, you, of course, continue the process. You do not suddenly change and do some other process. Once upon a time we felt at liberty to change because of the severity of the change, but we have learned in long experience that one never changes the process just because somebody compulsively exteriorizes. S-C-S is probably more susceptible to compulsive exteriorization than any other single process, and as it is run preclears fly into their heads and out of them at a great rate and eventually get to a state quite ordinarily where they can move into the head or out of the head at will.

The reason the preclear is holding on to the body is (1) fear of loss of control and (2) havingness. If the havingness of the preclear is low, he is apt to close in tight to the body because this gives him more havingness and if the preclear fears that the body is going to go out of control he will also move in closer to the body. Thus we get interiorization as no more complicated than fear of loss of control and drops in havingness.

When a loss of havingness is experienced, a preclear will agitate or go anaten and tend to be upset in general. Actually, any loss of havingness in an auditing session can be repaired by *an excellent auditor* by repair of the ARC of the session. One uses the trick “What did I do wrong?” and two-way comm in general to patch up state of affairs. Loss of havingness is first manifested on loss of havingness of the session or loss of goals rather than on actual loss of mass.

In running S-C-S, however, the preclear flying in and out of his head will experience various changes of havingness which are quite upsetting. The very best handling of this situation is to restore the ARC of the session in every way possible. It is actually not allowed to stop S-C-S and go into Trio.

Concentration upon the body is one of the frailties of S-C-S and we have long since discovered that those preclears who had difficulty in exteriorization would very often re-interiorize the moment they glanced at the body. Well, keeping a body there and looking at it are apparently two different things entirely. Thus if a preclear can't put his attention upon the body without bad things happening, we should run a process which prevents the preclear from being upset simply because he is concentrating upon his body, and S-C-S certainly does this and does it well.

Don't be surprised in running S-C-S if the preclear suddenly flies to pieces, goes into flip-flopping, has to be picked up off the floor and put over on the couch and left aghast, but do be very surprised at yourself if you fail to get the preclear back up on his feet and into session again at once. This is no time for you to be changing processes simply because a preclear collapses. Now if this did happen, that the preclear went entirely out of session while running S-C-S and you could not get him in any way to do any more of the S-C-S and get it flat, then you had better start the entire intensive all over again and go right back to the beginning and carry on from the beginning and bring him right straight on through to S-C-S. You would do this rapidly, of course, but you would nevertheless have no other choice. It would not be good enough to change processes simply because the preclear found himself incapable of running this body control process of S-C-S.

It has been noticed that S-C-S can be run very sloppily by some auditors who do not have very much experience with it. The only way to err is in the direction of imprecision and bad ARC. It is perfectly easy to be very precise with high ARC. ARC does not mean non-confronting.

One of the elementary processes which can be used after S-C-S and which is a very fine process and will have to be done at some time, is the Keep it from going away— Hold it still— Make it more solid series on two objects.

To do this particular process one takes two disrelated objects, that is to say he doesn't take two ashtrays or two bottles. He could take one object made out of wood, one made out of glass, both of them with different purposes. But these are usually picked up as non-significant objects and the auditor asks the preclear to place the two of them to the right and to the left of the preclear and asks the preclear to pick up one of them and keep it from going away and put it back in exactly the same place, pick up the other one and keep it from going away, put it back in exactly the same place, and keeps up this drill between these two objects. Actually, preclears who are having a very hard time require more than two objects, even as many as six or seven. In this event the auditor places the preclear at a table and scatters several objects around and picks them up at random. The duplicative feature of the process can be toughened up as the process is continued, but on some preclears it will be found to be very arduous to start out basically with two. When the preclear can successfully keep the two objects from going away, knowing very well that he kept them from going away—which the auditor asks him every time, “Did you keep it from going away?”—the hold-it-still phase is run in exactly the same way, and when this seems to be flat on the two objects we get into “Make it more solid.” One of the principal dividing lines between a psychotic state and a sane state is the ability to make things solid. It will be found that people who are having a very bad time indeed have the whole world

in a very thin look-straight through-it state. Only when they themselves can be at Cause in keeping things from going away and making things hold still and making things more solid will it be found that they have a solidity in the environment.

There would be another process which we could run at this particular stage and that is old-time Book and Bottle, which is also one of the deadlier exteriorization processes.

Old-time Book and Bottle was run in this wise. The auditor placed a book on one table or chair and a bottle on the other table or chair and he directed the individual to first one and then the other, always with a very duplicative command. Probably the first version of Book and Bottle was the best. It should be understood that Book and Bottle is an absolute necessity and must be run at some time or another upon a Scientology auditor, but it is not necessarily something which must be run on somebody who is simply trying to attain a state of Clear. Thus a mention of it is introduced at this time.

STEP FOUR

Find the Auditor

Make pc even more conscious of auditor and place him somewhat at Cause with ARC.

There are probably a thousand inventive ways that this could be done but it is time when one has been butchering the pc this long for the pc to regain some of his self-respect with regard to the auditing session. One could do this with almost any auditing command which made the pc look at the auditor. Such a question as "Is there anything I am doing that you could do?" carried forward to its logical conclusion would find the pc regaining some of his Cause with regard to the session. Simple locational spotting, however, is probably the best process here. One directs the pc's attention with "You notice that (object)" all about the room and at first only occasionally includes the pc's body and the auditor's body in the spotting. Then the auditor, using the same process, concentrates less and less upon the room and more and more upon the auditor and the pc. It will be found that the pc will eventually find the auditor with his attention so directed.

It will be seen then that S-C-S directed the pc's attention very strongly to the auditing of his own body and it will be seen that we have not yet started to get the pc's attention out into the environment.

But here we have two very pat processes which are CCH 3 and CCH 4. These are extremely simple processes but require a considerable amount of care in their use. Any validated auditor knows how to run these two processes. CCH 3 is Hand Space Mimicry and CCH 4 is Book Mimicry. Both of these processes simply invite the pc to find the auditor more thoroughly.

The earliest process along the line was "Look at me, Who am I?", and it has very far from been disallowed, so that in lack of anything else simply this process could be picked up and used at this stage. Now here we get the preclear to identify or to say who the auditor is and you will find that many preclears go through a considerable number of convulsions in trying to establish who the auditor is.

There is no particularly recommended step for this. It depends in a large measure on what state the pc is in when he arrives at this point. But it is necessary for the pc to become somewhat causative with regard to the session at this stage, whether by spotting, CCH 3 and CCH 4, or by old-time "Look at me, Who am I?" They all more or less accomplish the same thing. CCH 3 and 4 accomplish the location of the auditor very mechanically according to the Reality Scale. Spotting has the additional advantage of taking a pc's attention very thoroughly under control, and "Look at me, Who am I?" invites the pc to use his identification and thinking capacities. If an auditor wanted to be totally sure, he would use all of them.

STEP FIVE

Pc Versus Mest

Establish pc as cause over Mest by establishing pc's ideas as cause over Mest.

There are several varieties of spotting processes. The most basic of these is the most basic process to association and this is Connectedness. This process is run directly with the following command: "You get the idea of making that (object) connect with you. Did you? Thank you."

The reason Connectedness works is because it is the basic process on association. The most aberrative thing on any case is association with Mest. This does not mean that the individual is not creating the Mest, it does not mean that he has no relationship with Mest, but it does mean that Theta and Mest interconnected too strongly are the components of a trap. Theta is mixed up with Mest, Mest is mixed up with Theta. They are two different things actually, and it is not true that all thought derives from Mest, nor is it true that all Mest derives from thought. A thetan can create Mest by simply creating Mest, not by telling it to be created, but simply by putting it there. This is the isness of Mest. Now when he connects his thoughts with the actual mass he gets into trouble and we get association, we get compulsive thinking, we get identification and the old $A = A = A$ of Dianetic days.

Thus you will see at once that Connectedness in any form is a very excellent process to run. But note carefully that we have him get the idea of making the object connect with him. We never command the preclear to get the other idea of connecting with the object. This is a no-games condition. This is what is wrong with the preclear.

Now there are a large variety of processes which stem out of this process of basic association. These are Control Trio, Trio and Responsibility. But all of these things are basically connectedness processes.

The only thing that ever went wrong with connectedness processes was the unreality factor. The auditor would tell the preclear to get the idea of making that wall connect with him, when as a matter of fact the preclear couldn't have gotten much of any kind of an idea of making anything connect with him.

Thus it is mandatory for an auditor to start out a preclear on some level of reality and some two-way comm should precede this connectedness process, such as "Do you think there is anything anywhere that you could get to connect with you?" Once this is cleared up, it will be found that only those things very close in could be real to the preclear on this line of connectedness. Thus the auditor is given no great power of choice in this matter in the first runnings of the process. He will have to run things which are relatively close in to the preclear, then proceed to things which are middle distance and then things which are further from the preclear.

A great deal of good common sense is needed here, and a great deal of two-way comm is necessary to get some idea of whether or not the preclear thought it was real.

Thus the earliest commands of Connectedness should probably be the preclear's nose and the auditor's hand; the arm of the preclear's chair and the button on the auditor's shirt; the button on the preclear's shirt and his own left hand, et cetera. Further, the auditor is only asking him to get the idea of making the thing connect with him, not to make the thing connect with him, otherwise he will have the preclear being yanked all over the room.

Control Trio, Trio and Responsibility are actually only complications on top of Connectedness, but they themselves have their own particular peculiar virtues, and a preclear who can actually run straight, old-time Trio, "Look around here and find something you could have," can get a very long way on that process all by itself.

Control Trio is actually a three-stage process on a heavy spotting control. It runs in this fashion. “Get the idea that you can have that (object).” And when this is relatively flat, “Get the idea of making that (object) remain where it is,” (or continue where it is) and “Get the idea of making that (object) disappear.” This is actually a very fine process and undercuts (runs on a lower case than) Trio itself.

Old-time Trio is extremely good, however, and is not to be underrated in any way. You can run a whole three-week intensive on this if the preclear can do it. The commands are: “Look around here and find something you could have.” And when that is somewhat flat, “Look around here and find something you would permit to remain,” and then “Look around here and find something you would permit to disappear.” These are run in relationship to each other. In other words, all three of them are run in the same session. Sometimes a preclear will run the third command two hundred and fifty times before he can get either of the other two commands with any reality at all.

Responsibility is another process just like Trio and actually has its three commands, too. “Look around here and find something you could be responsible for.” “Look around here and find something you don’t have to be responsible for.” “Look around here and find something you would permit somebody else to be responsible for.”

The emphasis here is “You look,” “You connect,” “You make” in any of these processes, and the “You” should be entered into the old commands to make the thing as causative as possible.

Although we cover this rather briefly, this is probably the most effective section of Clear Procedure. The whole trick is to get the preclear to actually do it. It does no good for a preclear to run these processes with no reality. It does no good for a preclear to run these processes with no ARC between himself and the auditor. But it does a lot of good to get these processes run.

Basically TR TEN, “You notice that (object),” is a fundamental process on connectedness. It will be discovered that unless the preclear is actually able to look at a few things he will not be able to get an idea about them, too. Furthermore, it will be discovered that there is a process called Short Spotting, wherein the auditor has the preclear spot things that are very close to him. The only thing wrong with Short Spotting is that the auditor must give the preclear things to spot which the preclear can actually see with his eyes. If the preclear cannot see these things with his eyes there is not much use in having him spot them as it will run down his havingness and add to an uncertainty.

Havingness of an objective variety, namely Trio, is one of the greatest processes ever invented. Do not lose sight of this fact. The process can do things that no other process can do. There may be some factors kicking around in Havingness which are not entirely understood and which are not entirely connected with Connectedness. However, it has been found that Connectedness will put a preclear in a condition where he can eventually run Havingness. Therefore, Connectedness undercuts and possibly even overpasses Havingness in general.

This process of Connectedness can also be run outside. It can be run on people. It can be run on a certain type of object. It can be used to familiarize a pilot with his airplane and a driver with his car. It can be used to increase ARC between the preclear and the world around him by letting him run it in a heavily populated area or upon a busy street and using bodies. Here we have one of the more interesting processes to run in terms of cognition, because it undoes so much basic association. If your preclear is not cogniting while running Connectedness you can be very sure of the fact that somewhere along the line you have not given him a reality and you should flatten it off gracefully and start the intensive all over again.

STEP SIX

Creative Processing

Read and understand *Scientology 8-8008* and “Electropsychometric Auditing,” and use an E-Meter throughout the auditing.

The first step on this in some cases is conquering black “field” and invisible “field.” This is done by a repair of havingness over black masses and then invisible masses, run even if the pc goes unconscious. This means that you continue to audit him even if he goes unconscious and you use the same command and pay no attention to his unconsciousness. You continue just as though he were wide awake. When field is cleared up, start on a gradient scale of mock-ups and get pc able to mock things up. Then run “Keep it from going away” until flat on mock-ups. Then run “Hold it still” on mock-ups. Then run “Make it more solid” on mock-ups. All this until pc really has fine, solid mock-ups. Typical command, “Mock up a and keep it from going away. Thank you.” **RULE: A PC’S FACSIMILES ARE NOT STORED, THEY ARE MADE IN THE INSTANT AND UNMADE BY THE PC, therefore remedy of mock-ups AND THEIR PERSISTENCE, is actually a direct route to clear and winds up with no obsessive mock-up making (which we call a bank). A valuable side process here: “Decide to make a mock-up. Decide that will ruin the game. Decide not to do it.” Also this one: “Decide to make a mock-up everyone can see. Decide that would ruin the game. Decide not to do it.” A TOTAL REMEDY OF MOCK-UPS WOULD MAKE A BOOK ONE CLEAR.**

STEP SEVEN

(Optional)

Establish the preclear’s control over his “bank.” “Mock up a facsimile and (keep it from going away, and when that is flat, hold it still, and when that is flat, make it a little more solid).” Run this alternately with “Mock up that wall (keep it from going away, hold it still, make it a little more solid).” Run the “Keep it from going away” on a facsimile one command, then the wall one command, until flat, then shift to “Hold it still” same way, then shift to “Make it more solid,” same way.

STEP EIGHT

Make Some Time

See *Dianetics ‘55!*, Chapter XV.

AN INTENSIVE IN BRIEF FOR PRACTICAL USE

GOAL: Operating Thetan.

DEFINITION: An Operating Thetan is one who can be knowingly at cause over Life, Matter, Energy, Space and Time.

CCH 0 in brief, find the auditor, find pc, find auditing room, clear help and goals. **BUT IN THE MAIN HANDLE THE PT PROBLEM IF IT EXISTS. IF IT DOESN’T EXIST do CCH 0 briefly and quickly and get on with the session.**

It will be noted that giving pc’s attention to auditing room or environment can turn on a somatic after three or four commands. After one command of “Have you got an auditing room?” this becomes a process called **LOCATIONAL**. If Locational turns on a somatic it must be run until somatic is flat. Therefore, the auditor has no business attempting Locational or getting the pc involved unless he intends to do something about it.

Present Time Problem

The preclear is put on an E-Meter before PT problem is discussed. When the E-Meter has been adjusted (one-third of a dial surge when pc squeezes cans), the auditor asks if the pc has a present time problem. After a little discussion of this, the needle may surge. If it does, the auditor locates the PT problem's most intimate terminal and runs (with the pc still holding the cans) "Invent something worse than (indicated terminal)" until the problem flattens out on the dial. The auditor can ask for and run another PT problem or even three or four, but always flattening down the surge of the needle. IF THE PC IS 50% below the center line of the APA, it is not safe to run "Invent." Instead, without scouting around "Invent," but knowing the graph in the first place, simply two-way comm the problem and run Locational until the problem flattens out on the needle. The auditor does not begin with "Invent" and then change his mind and run Locational. It is an "either-or." The auditor starts with "Invent" or he starts with Locational and whichever he does he does not change. IF LOCATIONAL TURNS ON A SOMATIC IT MUST BE RUN UNTIL LOCATIONAL NO LONGER TURNS ON SOMATICS.

Once the PT problem is flat the auditor puts away the E-Meter.

S-C-S Steps

S-C-S begins with 8-C of any kind. If 8-C turns on a somatic, the auditor runs it until it no longer turns on somatics. 8-C is run formal or Tone 40.

Start is then run as per 1956.

Change is then run as per 1956.

Stop is then run as per 1956.

If each of these is flattened in turn, it does not mean that S-C-S is flat. It means only that Start is probably unflattened. Thus one again runs Start after Stop, runs Change after Start, Stop after Change until none of the three unflatten the others.

More 8-C can be run. There is no error in liberally running 8-C, which is, after all, a more complicated Locational of a Short Spotting sort.

Spotting Steps

Spotting itself is a broad process. Locational is only one of many spotting processes. Spotting spots in the past, in space, in the present, Short Spotting (Locational done up close) are all effective.

SPOTTING DEPENDS FOR ITS WORKABILITY ON THE DISLIKE OF A THETAN OF BEING LOCATED. IT RUNS BEST, of course, WITH THE THETAN AT CAUSE DOING THE SPOTTING.

Connectedness is the basic process on ASSOCIATION of Theta with Mest. All forms and kinds of association, including being caught in traps, are prone to become identifications as in Dianetics. Connectedness puts the thetan at cause in making the Mest (or people when run outside) connect with him. The command is "Get the idea of making (indicated object) connect with you." The auditor points. The worse off a person is, the less reality he has on far objects.

Havingness is a complicated Connectedness. Also a permissive one. Thus Trio is above Connectedness and may be used when Connectedness is flat.

SCIENTOLOGY

Control

&

The Mechanics Of
Start-Change-Stop

Edited from the tape lectures of

L. RON HUBBARD

CONTROL AND THE MECHANICS OF S.C.S.

(Edited from L. Ron Hubbard's 18th ACC lecture No.6, dated July 22, 1957)

The word control has a nasty connotation due to the bad 8-C parents and society administers upon its individuals. That is because the word control evokes moments when we were beaten down into apathy or given such conflicting commands to obey that we henceforth shudder away from any mention of the word. But in Scientology we have given it a new meaning by adding Tone 40, which makes this control exact and allows the completion of a cycle of action which bad control never considered. Also it does not dramatize the lower emotions of the tone scale.

An individual who has been made to resist control winds up allergic to control and if he is allergic to it he dies because there isn't anything one can do with anything except in one way or another to view or control it.

If a flow flows too long in one direction it has a tendency to dam up and fix itself. It is only necessary to reverse that to unfix the situation. We go back into "Scientology: 8-80" on two-way flows and we understand what is happening. When you get a person to get the idea of flowing something out away from him, he will suddenly go anaten. But it is only necessary for him to make something flow the other way toward him for a short while (just a mental idea of flowing in) for him to wake up immediately. If you have somebody who is putting mockups out in front of him and he starts to go unconscious you only need to have him put them in back of him and the unconsciousness disappears.

A thetan who is totally devoted to controlling things and who is not himself in any way controlled, runs into this phenomena. If this is the case one can immediately see why control of a preclear is necessary. If he has fought outgoing control it is only because it has gone out too long. A thetan cannot be upset by a mis-control or bad 8-C. It is just an objection. I think he could take it rather easily providing he himself didn't have a stuck flow on it. If he himself had not done so much controlling of mental image pictures, which is to say the mind, the body and objects in the environment, there would not be a stuck outward flow. When somebody comes along and controls him well, he objects. He objects more when it is bad control. But bad control, that is, bad placement and handling, naturally gets more on his nerves if he already has worn route which starts to come back to knock him out. He doesn't like it and starts to fight a flow with flows.

A flow which flows a certain time in one direction tends to continue to flow until it is totally jammed or stopped. A flow flowing long enough in one direction in the mind, eventually flows harder and harder and not easier as one might presume. This is only true when energy is being employed. The more an individual outflows energy the more vacuum he creates on this side of the flow. The more he flows out the more hole he leaves in the bank and eventually something is trying to pull the flow back in. He has created a "missingness" in the energy masses immediately surrounding him and this vacuum caused by the missingness tends to fill itself by pulling back on the same line. It's like taking a rubber band and stretching it further and further. The analogy isn't very good because the flow eventually just sticks. His effort to hold it out there is so great that he can only hold it motionlessly out there. He has got it stuck.

Somebody comes along and threatens to disturb this stuck flow just a little bit and the vacuum behind it tends to fill up too rapidly. He resists this and he sticks it out there with more effort.

The solution to this lies in these two data; one, you cannot hurt a thetan and, two, the worst that could happen on the snap back is that the bank would disarrange in some fashion and would leave him without some of his pretty pictures. That flow is usually undertaken by non-created energy. He himself did not create the energy. He collected it one way or the other, from sources on a mis-ownership basis. He packed it around him and used that energy.

There is an actual series of electrical phenomena which occur in the field of thinkingness connected with this. These things have been observed to have sufficient violence that a person holding the electrodes of an E-meter has had an explosion occur somewhere in the vicinity of his hands big enough to knock a hole in his hands and the can.

An individual once in a while gets a tremendous explosion in front of his face or above his head and he thinks he is being attacked by something. He just got too much potential and had a stuck flow out there which somebody came along and disturbed and it resulted in a complete electronic display. Any group of people playing around with such things as electric shocks on people to "help" them, is just being incredibly stupid because they are using the wrong wavelength in the first place -- a very gross wave called "action".

We look at this tremendous electrical phenomena which surrounds the being and we find that mental image pictures are themselves built of energy. They are not some imaginary thing. Imaginary means "non-energy, non-real, not existent, couldn't possibly be handled". It is a bad control operation, the use of that word imaginary. If that is the case then everything we can see is imaginary -- the walls, floors, ceilings and all the bodies one sees walking down the streets.

You can practically produce the same phenomena as a ridge exploding with any electrical current or various electrical gimmicks of one kind or another. The electronic engineer can produce this reaction very easily with condensers and resistors, but his ideas of condensers are rather strange as well. He thinks if you keep pumping electricity into a condenser until it fills up it will eventually discharge in some fashion or another. Well, we don't know if it has this capacity or not, but we know that a thetan does have some strange electrical phenomena which are not any different than the electrical phenomena of life. This is not unusual to a thetan because he is after all part and parcel to the mest universe and the electrical phenomena we see around us were probably some time or another generated by life. The current running in this tape recorder at this moment is converted or generated by some life form or another in the past. It is probably running on coal and coal is energy stored by, converted by or generated by life forms -- trees.

The moment a thetan starts to handle energy he runs into all the phenomena of electricity or else he wouldn't have any need of eating or sleeping. That this applies to the mind then should not come as a shock to anybody. That it wouldn't apply to the mind then should be a tremendous piece of balderdash. If it has anything to do with energy then there are certain laws that energy obeys and flows are no exception.

Other electrical phenomena contain engrams. Each experience in life is represented by a mental image picture of one kind or another, which contains real energy, which has real potential and which is measurable in terms of current. Meters which measure current, measure the potential in these facsimiles.

Furthermore they have mass. You can remedy somebody's havingness with these pictures. By having an individual mockup things and shoving them in, you can increase the body's weight. There are many experiences which in themselves -- and this is what is confusing -- contain electrical catastrophes. One can have pictures of catastrophes which, when run, give you a repeat of a catastrophe.

One can produce all sorts of electrical phenomena which affect beings.

People haven't begun to dream of the number of ways by which a being could be influenced by electrical phenomena. One could say that is about the closest thing there is to infinity. They are numberless and all obey the same laws. If they are so operating and if these laws hold good, then you, in processing, can command the obedience of this phenomena. One of the phenomena is the stuck flow of control. People usually control other things by energy and do not control by postulate which is the optimum thing to do. They obsessively control and then one day they control just a little more by energy and they decide they cannot control things

any more. There is no other reason to it than electrical phenomena. There isn't, "Well, I failed too many times to control it so I guess I cannot control it any longer". They just had to try too hard and had to outflow too much, worked too hard by pushing in one direction too long and they created a stuck flow. Practically all flows are aimed in the direction of control and the anatomy of control is start, change and stop. Starting, changing and stopping things then became stuck flows.

One of the things we do is to back up this stuck flow of control. The thetan has been going all the time in the universe controlling things and very few things have ever controlled him. He has a tendency to snap in on himself those times when he has been controlled whether it was good or bad control. Hence you get the various phenomena such as the Service Facsimile which finds its basic residence in just that fact.

The idea of training people until they develop automatic responses as in the forces, has practically saturated the universe. They don't ever train the person since they don't even know who the man was. The whole idea of training is completely erroneous because they think that if they get some kind of automaticity going in the bank then this person, like a wound up doll, can thereafter drive a car and tanks. Everybody thinks that it works, so that is the target of education, "Don't apply it. Just memorize the data presented to you even though you don't precisely know where to fit it into your frame of reference."

Now an auditor comes along and starts to control him with Tone 40 auditing, such as "Give me that hand". After a while the preclear says, "I wonder if any of that is addressed to me? Could it be that some of it is addressed to me? In the first place they are not asking me to store up any of this in the bank. Quite the contrary. I am supposed to do this every time. Me? Does the fellow mean me because I don't see anything else around here that will give him my hand. Well, maybe if he does this often enough he is going to install a machine which will give him my hand." Then it becomes sheer duplication and duplication can utterly ruin any machine. The one thing that mental machinery cannot do is to exactly duplicate. Only a thetan can duplicate. He is the only being that can stand the stress and strain of it. So duplication enters into this with heavy control and he finds that he must be the one who is being controlled. Thus he works it out and one gets a back flow of control which is all there is to it. He finds out that there is no great consequence to this and so becomes willing to control something and that is more or less a crude explanation of how control works when used in auditing.

We examine this very carefully and find that control is senior to energy. Energy is the servant of control and not the end goal of control although it could be made so. Energy is energy and if it was just floating about doing nothing there would be chaos, that is if there was no direction to it.

If we take this idea of energy flows as the only method by which anything can be controlled we are in trouble. That is the make-break point of a lifetime. That is the reason why electronic engineers have a rough time. The using of too much and using it too long to control things with energy which they themselves cannot even see, causes this stuck flow which eventually deteriorates into the inability to control and forces them further down to cruder methods yes.

We have a stratum above energy. There is such a thing as controlling by postulate. There is also such a thing as mass without energy, or mass without fields. There can be a mass with no energy and it is not true that that wall is composed of little things that wiggle. It is not composed of space with an idea of little particles. Let's not make the mistake of saying that a mass has no mass. That is what physics got itself into and is in it so deep that it will never dig itself out. When it advanced into higher physics they said that mass has no mass and it made mystics out of the lot of them.

That is a reverse postulate. It is all right to say that there is nothing there, there is something there and behold is. But now there is something there and we say that there is nothing there without vanishing it and we are in trouble because we are telling a lie. Let's get

the isness straight. The universe is real. If you run around saying that it is real it would become less offensive to you, but if you go around on the second postulate and while holding firmly in mind that it is and you say it isn't, you not-is it and become a "what wall" case which is lower than south.

That which makes something is not the thing it made and because you can make energy is no reason that you are energy. Because the wall next to you can make electrical fields when treated properly is no reason that it is an electrical field. In other words, that wall over there is and don't ever think it isn't. If your body runs into it, it will go thump. We then, as a result of this, have to admit two isnesses. The isness of your body and the isness of the wall and some person with more feeling than others would admit a third -- the thump.

One can vary, alter and do all sorts of things such as changing mass and electricity but when you say that it isn't you run into trouble and start going blind. This is actually the total reason 8-C and other processes are so good. You just make the preclear go around and say, "It is. It is. It is," and everything brightens up and is liable to become more solid, stronger and more massive. That is the basic control of this universe. It is. One controls something by holding it in existence. Just by holding something in existence one is controlling it.

Control then even enters into creation. Create and control are next door to each other. If an individual cannot suffer control himself his ability to create is doomed. He may be frantically creating but it doesn't mean that he is going to keep doing this for very long. He is going to hit that stuck flow. If he is creating with postulates and not with energy flows he can go on forever.

The number one trick of control used in this universe on a thetan is to make the thetan postulate that he himself can be damaged. One has to make him conceive that he is energy and that energy can be damaged by which he then has it proven to him that he can be damaged. One can only damage a person thoroughly and enormously by making this identification between a spirit and energy or mass.

Any psychotherapy or practice of religion and philosophy or activity concerning the mind is doomed to failure and will not and cannot work if it is based on the premise that man is mass. The only reason Scientology works is because it disabuses him of this fact. It addresses the being and if we were going around fixing up bodies thinking that man is a body made up of neurons, automaticities, etc., we have said at once that it cannot work, because it is using and confirming this identification.

That is the basic mis-identification necessary to damage a thetan or put him downscale. One just has to convince him that he is mass, energy and can be damaged and you have a foundation for a slave society.

The thetan who is convinced that he is a chair can provenly be damaged. But a thetan cannot be damaged. All you really have to do is disassociate the idea that a thetan was energy and you have 99 per cent of his case right there. People control so much energy that they eventually come to believe that they had better obey the laws of energy and so get stuck in energy. He then thinks he is energy and if he produces something he is the thing.

This situation eventually gets into a stuck flow and the moment you process him, not an energy mass, he starts to disconnect from all this energy without really wrecking his havingness. One cannot hurt his havingness. It is just another idea he found. Havingness works because it exercises his connection with energy. It makes him responsible until he wears out a whole flock of postulates and then feels better.

This, then, is a direct ratio. One would have to convince a thetan that he was energy before one could damage him. He often sets up a postulate that he could be damaged so as to damage another thetan by example. Somebody said, "Hell was paved with good intentions," but it is actually paved with setting an example. You say, "Look what you have done to me,

you brute. You have slaughtered me,” and he says, “WHAT! A living being can be slaughtered? That’s a new thought!” and he goes off worrying about this. You pick yourself up and say, “Guess I got that guy.” Then one day you do it so often that you forget to get the guy or you run into too many others that convinced you. That is just the method of going into agreement.

Hence, down scale cases, difficulty in processing, all these things actually stem from these rather stratospheric postulates and activities which may or may not be reached directly by an auditor. They certainly can be attacked on a gradient scale. If they could be reached just like that one would have a one instant clear.

The whole matter of “I am energy, energy can be damaged, I can be damaged” is actually a necessary channel to create a good solid slave society. A fellow who is energy cannot get out of a skull and must to some degree be conceiving himself to be the content of the skull when you tell him to exteriorize. He is trying to push his brains outside the skull or something of the sort when you say, “Be three feet back of your head.” It is painful and it gives him headaches.

A thetan couldn’t be damaged. His abilities couldn’t be less. We have already demonstrated that it is impossible to reduce an ability. About the only thing you can do is reduce its exercise or the willingness to exercise it.

The answer to all this is to remember and be cognizant all the time that one is processing the thetan and NOT an energy mass or something solid. Only then can change occur.

A thetan has plotted out orders of seniority and top amongst them is surprise. I can make anybody go out of control and actually make his body just start flip flopping madly just by making him run a process that isn’t a process but which is addressed to surprise. “Mock up somebody and have him be surprised.” Just have him do that for a few times and he says, “I am feeling nervous now,” and the next thing you as an auditor see is that he has got all of his clamps about surprise off and all of the surprise which was more or less on automatic goes into full restimulation and he will just flip flop all over the place.

Surprise is one of the methods by which energy could be damaged because a thetan gets that associated with a blow and he has all sorts of interesting mechanisms figured out. But we have to have these basic mechanisms first -one, that one can be damaged and two, that he is energy.

Christianity, for instance, had this failure. Although they were addressing the spirit very broadly they actually brought in this mechanism called hell. There were seven hells originally and these various hells were all places where thetans could be damaged. They did this very interestingly. They said, “your soul,” which, of course, made the operation, “you are energy.”

Punishment and damage were entered in. That wasn’t anywhere near as bad an operation as this dialectic materialism psychology mess that we have inherited in our modern times. Science is going straight ahead on the rocks of “man is energy -- man is mass.” At least Christian practices gave a via on it. They still have some spirit present in their conception of man.

I am more or less prone to believe some of the miracles which occurred in the early days of Christianity in spite of the several Christian churches which now offer large prizes to anyone who can prove that any miracle ever occurred. If you were just to convince somebody that he is a spirit, that he did not “have” a soul but “is” a soul and nothing else, you are liable to get a miracle. He would slip all the way out of being energy and being damaged into being himself.

We thus have control of the spirit as being the highest button of control or processing. Control of spirit would be rather direct without mumbo jumbo and lots of vias such as witch doctoring.

We have come to a point where we can do this quite directly. We can control a spirit. The moment that the preclear himself sees that he is control and that he is not energy, sees that he can receive control, communicate and respond to it, he certainly will pull out of the morass.

Tone 40 works well for some people and rather poorly for others. It has a lot to do with the goals of the auditor and his understanding of what he is trying to do with that process. But we are probably the first -- and this doesn't even include Buddhism -- to overtly address this problem very directly and without superstition and mumbo jumbo.

Direct control of the spirit is our direct goal and when a person can be controlled then he can control and when he sees that there is a two way flow involved he has the situation well in hand.

THE ARC TRIANGLE AND CCH

(Edited from L. Ron Hubbard's Lecture No. 2 of the 18th ACC, Washington, D.C.)

The ARC triangle is our next to the oldest property in Scientology. The oldest is the bank, the engram and the mental image picture. Quite recently this almost forgotten triangle did a terrific resurrection only this time we have it as control, havingness and communication.

Affinity, Reality and Communication are an excellent description of the three basic things on which the universe is built, without which, in balance, life could not exist.

AFFINITY, that is some emotional or felt consideration of proximity, is basically a consideration of distance, but it is that consideration which says that one likes or doesn't like it. In other words, without some liking or disliking, having some things to avoid or to go close to, there would be no game at all.

REALITY, is that sequence which begins with postulates and ends with mass, which we originally defined as an agreed upon thing. Reality is the agreed upon apparency of existence as per the axioms.

COMMUNICATION, is an interchange of ideas between two beings who are aware that the other person is present. We had to introduce with this new simplicity the radical idea that one being could talk to another being and that an interchange of ideas could take place as defined in Axiom 28 and described in "Dianetics 1955" -- the manual of communication.

If you notice an interchange of ideas it is not very feasible unless there is an agreement of some sort or another. The agreement can take the form of having a mass to talk to and we thus get a communication via. At least we know what we are talking to if there is something there -- and that is reality. Of course, we can simply postulate that something is there and talk to it.

Talking to something is better than talking to nothing. When two beings are talking to each other here on Earth, one normally sees the oddity of two beings standing there, not confronting each other and not talking, but a lot of words go back and forth. The reality part of that interchange would be the mass, the platform whether it be Earth or a sidewalk that the two bodies are standing on. The space so far as location is concerned enters into this. Those are located somewhere and therefore we know where the communication goes to and whoever receives it knows where to send the answer back to -- a very necessary part of communication.

Then we get the affinity factor. How far away does a fellow have to be to talk to you? There is more than that to affinity. Affinity is liking and disliking. Understanding requires affinity, reality and communication and if any corner of the ARC triangle is lowered the other two corners lower accordingly.

We know that reality is basically an agreement and we have today the Reality Scale. We have always known that all we had to do was introduce some agreement into the situation. One had to agree at least on what one was talking about in order to talk. There is no communication in progress if there is no agreement on anything. One should have had to establish the existence of one of the other people before communication could have occurred.

Communication occurs simply by R and a little A when two people are together.

Affinity necessitates a control of attention. We have had a lot of processes founded on ARC and they have not in themselves produced tremendous results. They have produced good results but we haven't seen anybody step out of the graveyard and dust his hat.

There must be some counterparts to ARC which are more workable than ARC since if we know ARC is true then how do we (and those are basic considerations) make it work in this universe, on this planet at this time? We know that the three things add up to understanding. How do we get this into a processing level?

In the first place one has to realize blindness when one sees it. One has to realize that South is an awful long way South and the basic entrance of the ARC triangle breaks down to control for A, to which bodies and the G.E. beautifully respond. Any preclear, therefore, would respond to it regardless of his tone level if you were processing him via a body, because this is the body's understanding. It is solid. Therefore A is control.

Somebody comes along and says, "Stand up straighter. Got your heels together. Suck in your guts" and he will say, "The guy loves me." You might phrase it in some other way. You might say, "Damn the sergeant, I could kill him" which means at the G.E. level, "I love him dearly."

Thus we have havingness or solid mass in the place of reality and verbalization in place of communication. So understanding takes place in terms of control, mass and communication.

Understanding mest-wise always takes place in the framework of mass and location thereof, verbalized or electrical or vibratory interchanges, and for affinity, control. If one disliked somebody on a mass level one would simply refuse to control him. The choice I am talking about is to control or not to control.

Unfortunately where there are people firmly connected with mass this then is the level of interchange. If people are going around in bodies, then this is the level to which cases respond.

Don't get me wrong. I am not trying to rephrase or re-do the ARC triangle. I am simply telling you the action level of the ARC triangle when it is in action or you are going to work on a mest level. A becomes control or lack of it. The R becomes mass and its location or lack of it since the complaint is about no mass, and C is some sort of vibratory electrical particle interchange, symbols flying back and so forth -- solid.

If you start adding too much directness at this very low level you are liable to blow the mass up. A thetan learns that. Every once in a while he loses a favorite piece of bank or service facsimile. He said exactly what he meant to the fellow directly with no vias and got himself fired. He was trying to communicate directly on a mest level and threw some particles straight out without the slightest via on them and caused an explosion. One has to have intention with it. There has to be some livingness connected with it. In other words, one has to go upscale in order to make it function optimally.

People who are at the lower end of control don't want mass, can't have communication which becomes "it will be said for me". At this level, when coaxed to put out a control, a communication which is absolutely direct and straight, people discover something fantastic. In order to accomplish this they have to go upscale or shatter themselves in the process of doing so. After they have been shattered a few times they hit a higher tone range. They say, "I belong up here. What am I doing grubbing around here in the mest?" That is basically what an individual understands when he starts doing recent training drills.

ARC, to become extremely workable, has to be coached where you are dealing with masses in terms of control, havingness and communication.

We have said CCH, by which we mean control, communication, havingness or communication, control and havingness, and we have lined them up so that it is instantly discernible that this is the other side to the ARC coin.

Follow ARC down scale as per the Hubbard Chart of Human Evaluation in “Science of Survival” and as you go down you will find an area below the bottom line of the chart That has to do with mass. In other words, to wrap up this whole subject the only responses still extant at the bottom of the Chart can still be phrased in terms of control, havingness and communication. Those responses do not entirely disappear as mentioned on the Chart but become very coarse and massive and don’t entirely disappear.

If life can be awakened into a present it will be awakened into a presence or a location by control, havingness and communication, handled in one way or another. The first CCH process is very old and hardly anybody has recognized its antecedent. I processed a cat until he ate an editor. I processed this cat up to a point where he would strike at my fingers. He was a very timid cat and I got him to reach for my fingers and then each time he would reach I would withdraw my fingers slightly. He would reach further and he got more and more ferocious. So I invited an editor and he ate the editor up. That’s an exaggeration but he really ate the editor’s thetan by scaring the man with his ferocity.

Just by inviting the cat to reach out, no matter how timidly, and strike out at our fingers, gradually so as not to startle or surprise the cat we make our fingers retreat, we get the cat to put out a communication line. Lines are solid at the bottom of the Reality Scale so we are right there at the cat’s reality. The cat can’t have mass, is below mass and is actually trying to connect antagonistically with a solid communication line. So the cat does reach.

“Give me that hand” is just processing the cat. You say, “Give me that hand.” The preclear doesn’t and you reach over and take hold of his wrist, take his hand and thank him for having given it to you. After a while of this he says, “You know, there is some dim, vague possibility that I might have had something to do with that. I wonder if I could possibly reach that far over to your lap.” When he finds out that he can do it, you have achieved a goal for you have got him reaching for the environment, in an 8-C style. When this is done, you as an auditor better have him reach for the mest environment in terms of barriers. You have just got lines recognized and he has to be moved up and out of barriers. So we have 8-C on walls. When we get him above that the auditor puts him back on lines again and we have Hand Space Mimicry. We get him to locate the mass of the auditor.

The preclear cannot disobey these commands. There is no thinkingness involved in it because there isn’t any thinkingness at that level and if you are processing any it is a figure-figure.

That is what ARC becomes after a long time. An individual becomes a body. He agrees that he isn’t anything but a body. People are never anything but bodies and bodies are dead too.

A body is a mass and therefore the realest thing there could be to a body is outright control. If a person had a body then control would be affinity. If he could control something he would like it. An individual who finds out control isn’t killing him turns out to like his auditor. That is an establishment of a reality level and the affinity level at that reality level is control. It goes up and not down the scale. We use good Tone 40 control on him and he will come upscale to having mass.

Let’s look at what this does to communication. The individual, of course, is willing to talk. He is also willing to receive objects and give objects away and so interchanges can occur. We are looking at the ARC where understanding takes place only in the presence of control, havingness and communication on a mest level.

This is the level at which machines of a mest nature, automobiles and so forth, have to be run. An individual cannot adequately control his car and he doesn’t like his car. What does he mean by “like”? Does he mean an emotion? No, he means an ability to control it. It is as solid and mesty as that.

One wonders why some married couples don't get along although she apparently does everything he says. When an auditor decides that he will get her out from under her husband (or vice versa) or bush up this closure of terminals, he will find out that there seems to be some feeling for each other. It is just control going on all the time. One is looking here at where control is affinity. They express their affinity for each other by kicking each other, trying to gain control over each other by fighting. Below that level is love making.

One can understand a lot by just looking at what understanding is at the level of mass. It is control, controlling and being controlled. That is understanding.

Psychosis is something mocked up so that it cannot be handled. Psychos try to make nothing out of their mass all the time. They have mocked up a non-handlability.

People who are below 2.0 on the Tone Scale mock up things that cannot be handled and individuals above 2.0 mock up things, when they do, that can be handled or they simply try to handle anything. There is thus a dividing line on this control. People below 2.0 mock up things routinely which cannot be handled and then brag about it.

Those people are much further down scale than one thinks they are. We say it is above or below 2.0 which seems to be a precise line. It is almost as if we are talking about two different universes. When individuals go around mocking up things that cannot be handled and bragging about it all the time, they give an auditor a pretty bad time. They are just daring the auditor to handle them. You start sawing through with "Give me that hand" and they say, "This can't be handled." They keep offering things that can't be handled. These people are never really successful at anything. They are terribly destructive. They Q and A with mest and they have become mest. They do what mest does.

Here we enter our understanding of life in realizing that there are people around who haven't the slightest desire to handle anything. Everybody's got something in his life that he doesn't think can be handled or thinks that he cannot handle, but these people just mock it up all the time. People or preclears that have given you a hard time have done only that. You cure them of one thing and they mock up something else that you cannot handle. Their whole game is the avoidance of control. But they know how to control other people. That is the Service Facsimile, which is unhandlable and you handle these people by not permitting them to handle the Service Facsimile which is reactive enough for any reactive bank.

One can thus roughly divide mankind above or below 2.0 on the tone scale. Some of them mock up things which can be handled and try to handle other things. These are the people that keep the world running. They don't build clocks that cannot be fixed. The rest of the people simply keep on mocking up things that cannot be handled and every doctor, every practitioner of any kind is confronted by these people all the time because this is the dare.

ARC becomes control, havingness and communication. You recognize that control, havingness and communication are not the bottom because they invert and become no control possible of any kind. This is the "can't handle" it. No mass is admissible or viewable and no communication of any kind acceptable. Therefore no understanding is possible.

We have discovered that rung which solves the inversion. Just as we can raise any person's communication by raising his affinity and reality, as we can raise affinity by raising their reality and communication so we can do these things at the bottom. We can remedy control, inability to handle and so forth in his life and vicinity simply by remedying his havingness. We can do this by talking to him or by using straight control and we can raise his lack of mass by control and communication. We will find that his havingness will increase. Some odd and very complicated consideration about havingness are in the way of all this but it will blow in cognitions which he probably will never mention, but he will come up to CCH.

If a person has got to be identified and connected with mass, he is in terribly good condition when he is at CCH. Therefore CCH is pretty high, but it handles all the inversions of

CCH and this whole mysterious stratum, the bottom sub-stratum of the ARC triangle, is revealed to view and becomes workable in the hands of the auditor.

Control all by itself will level out all lower inversions of the subject of control, havingness and communication. The right kind of communication all by itself will do something for havingness and control. Hand Space Mimicry is a solid line. They will eventually have an auditor.

“Can’t have” on others and “have” on self or the three steps of trio or control trio run one way or another on somebody is also a communication process. If you run “Tell me something your mother can’t have” and get a straight answer, the preclear’s havingness comes up. So does his ability to control and his ability to communicate. You can hit CCH at one of its corners and get the other two to some degree because it permits the auditor to directly address the body and have something happen to the person.

CCH then, should be viewed simply as the workable factors at the lower end of the mass scale. CCH is a pretty high level procedure, but it is a description also of all lower levels, the harmonics of which are processed by straight CCH.

START-CHANGE-STOP

(Refer to "Clear Procedure" by L. Ron Hubbard)

Start, change and stop is the anatomy of control. This is a cycle of action -- create, survive, destroy. There is continue (persist) on the middle of the curve and other cycles within cycles of action, but the important factors are Start, Change and Stop.

Running Start, Change and Stop on an individual brings about greater self-determinism.

Self-determinism in the field of motion consists of, by own power of choice, permitting the object or body to be still or not to be still; permitting a thing to be changed or not to be changed; permitting a thing to be started or not to be started, and it must be rehabilitated in the preclear. In other words, self-determinism consists here of returning the preclear's power of choice over controlling or not controlling at will. The preclear who is obsessively controlling will sooner or later fail to control and then will be controlled by something. The obsession to control, to start, to change, to stop, will be found to enter into the ARC triangle and is what depresses the preclear down scale on the Tone Scale.

These three parts of control are run flat individually, in this order: we run Change flat, and then run Start again very flat and then we run Stop flat. It would be a mistake at this point to say that this process is finished for the excellent reason that if you run Change again you would find further considerations shifting in the preclear and then if you run Start you would find it unflattened. So you would run it again and then run and flatten Stop.

It would not be possible to say how long you would have to run the process altogether. On somebody who was total machinery and who never had been in session, this would be a rough process. On a case that is in good condition, this would run easier. The preclear would consider it interesting and would exteriorize quite easily. The end result of this process is exteriorization. For someone who is compulsively exteriorized, this would be excellent as he would slide into his head and eventually come out of it again, but not on a compulsive basis.

One meets with three conditions in auditing. The preclear who is compulsively interiorized, the preclear who is compulsively exteriorized and the preclear who is buttered all over the universe. The latter case, run on C-S-C would greatly accumulate the ability to collect himself. This might not occur until you have run him for five or more hours on it.

If this process is continued long enough the preclear will be moving his body by postulate -- i.e., from the outside, not by beams, stimulus response, etc.

This process does not go all the way up because of the preclear's attention span. Most preclear's cannot stay on a process for more than a few moments, so you would vary the process a little to keep him interested. His actual response, however, is not important as long as he does it.

There is no such thing as bad control, only non-positive control. Good control is positive control and positive control is not bad control.

We get a lower level there than moving the body. This would be S-C-S on Objects. It is always safest to run this on someone you are trying out or a person who cannot move about a lot such as an invalid. To somebody who has no reality on his body one would run S-C-S using an object instead of his body.

When running this process, the auditor and the preclear should both stand up. This gives reality and the auditor duplicating the preclear (mimicry) will bring about greater ARC. The session always fails when the auditor sits down while running S-C-S.

It runs this way:

The auditor points out a spot on the floor to the preclear and says: "Do you see that spot? Good. We will call that Spot A. Now you stand here. O.K." The auditor now indicates another spot and says: "Now do you see that other spot? Good. We'll call that Spot B. All right, now when I tell you to change the body's position I want YOU to move it from Spot A to Spot B. All right? Good. Change the body's position." "Fine." Then the auditor says: "Do you see that spot? Well, we'll call that Spot C." (We use three spots so that we don't run a duplication process on him.) "Now when I tell you to change the body's position I want YOU to move the body from Spot B to Spot C. Do you understand that? Fine, change the body's position."

You can ask him: "Did YOU change the body's position?" if his case is not too low, for it is not advisable on a low case at first.

Then go back to Spot A. It does not have to be the same spot A each time as it makes the process too much like duplication, brings the preclear to predict the process too easily and he will do it machine-wise.

Each time you make contact with the preclear you give the command in a new interval of time. You don't depend on any former understanding of the command. You clear it each time and give the whole command every time you use it. We make each move in time a new move. He doesn't have to depend on his memory, so the auditor repeats the whole wording as given. This is a most important aspect of running any part of S-C-S.

On Start we emphasize START. The auditor says: "Do you see that wall over there? Good. Now when I give you this command, I want you to move the body in the direction towards that wall. When I say 'start' I want YOU to start the body. All right. Start. Fine."

The preclear may protest that he had to stop the body and change it as well. What is happening here is that the word "Control" is beginning to ungroup and as you get start, change and stop apart and distinct from each other, the individual's ability to control the body increases and he gains more confidence in being able to control it from a greater and greater distance.

The next command would be: "All right, when I tell you to 'start' the body YOU start the body, O.K.? Start the body."

The third command is for STOP, and the auditor says: "I am going to ask you to get the body moving towards that (indicated) wall and somewhere along the line I am going to tell YOU to stop the body. Is that all right?" He agrees and you say, "Get the body moving." You don't say start. He does so and you say "Stop" and "Did YOU stop the body?"

You don't say "your body" but "the body", indicating the body. You emphasize him as a thetan doing it for it increases the preclear's selfdeterminism. You give the commands for each process newly each time.

From S-C-S, which is the three processes given above, there are two other processes called START-C-S and STOP-C-S.

START-C-S has the exact commands as for Start in S-C-S. We emphasize Start here and use Change and Stop only to unflatten Start. The purpose here is to rehabilitate the preclear's ability to get things starting since he has been immobilized a lot in his life when the opposing valences or conditions exercised bad control over him and prevented him from starting.

After a preclear has been run on Start-C-S, which would flatten to some degree each one of the points of control, we run STOP-C-S.

This is a distinctly different process. The commands are the same as used for Stop in S-C-S, but here one specializes in stopping the body.

One has the preclear stop the body over and over and as the preclear becomes more accustomed to doing this one then changes the process on him to this extent -- the auditor asks the preclear in running Stop-C-S to "stop the body absolutely still."

This imposes a new discipline on the preclear and makes the process extremely difficult for him. It is only done when S-C-S and ordinary Stop-C-S have to some degree been flattened.

Following up this "Stop the body absolutely still" one can introduce Change into the process for a few commands in order to unflatten the Stop-C-S that has flattened. In other words, when the Stop of Stop-C-S on an object or the body seems to be flat, one can run a few Change the body or Change the object and unflatten Stop once more with a resultant alteration in the preclear's ability to perform. When Stop-C-S seems flat then it should be unflattened at first by running Change-S-S with the emphasis on Change. When Change no longer upsets his ability to stop it, Starting it should be run as an alternate to Stop-C-S in order to unflatten it again.

Stop is the most important part of S-C-S. The preclear has been told all along the line to stop. He was made effect all the time. How you bring him to just this under his own control and self-determinism and he takes over the automaticity.

The same is true for Change. A psychotic is compulsively changing all the time and CHANGE-S-S will take over the automaticity of "compulsive changing" and make the person more sane.

THE THREAT TO HAVINGNESS

Prepared from the research material of L. Ron Hubbard

The first step to processing a preclear is to find out if he has a present time problem and to handle it adequately enough to proceed with auditing. Often we have a preclear who comes to us basically just to get more able and as we process him we find that we are making no particular progress with this case. He seems to be doing everything just as we expect it to be done with no apparent gain.

The reason for this occurrence is the fact that the preclear is not doing the process in present time and has a present time problem that is interfering, of which he did not tell us. The fact about the matter is that the preclear himself does not really know, is not cognizant of the fact that he has a present time problem and is consequently a very "south" case.

I have found that a preclear who isn't processing real fast on Procedure CCH isn't doing the process because he has something which "threatens his havingness." Since processing and havingness go hand in hand it isn't surprising that the preclear will make sure that he doesn't change since he cannot afford to expend more havingness in cognitions.

So this threat to his havingness is his present time problem of which he may or may not be aware and if you as an auditor didn't handle it at the beginning of the session, it is certain that the preclear is not consciously aware that he has such a problem or is deliberately Lying to you for reason of shame, embarrassment—or that ARC is not fully present.

This threat to havingness is that which most prevents the preclear from having things. It is that which stands in his way to having and is thus a problem to him which he hasn't under control.

What the auditor has to do is to find this problem for the preclear and then to handle it properly. This case is so low on problems that he doesn't even recognize that he has one and his level of problems has to be increased otherwise he will create a problem out of auditing which is what happens when he doesn't change. Auditing itself then becomes a problem to the preclear.

One handles this matter simply by going into *good* two-way communication with the preclear. (One-way communication as-ises havingness, two-way doesn't and actually raises the tone of the preclear.)

One asks him if there is something that "worries him," "presents a difficulty which he would like to handle or which is making life a bit troublesome," or if he is about to "lose" anything (a pending court case, wife, business deal, etc.) or "if there is anything that he would

like to change as it produces some pressure on him” and so forth. But the important question here is: **“What most prevents you from having things?”**

The moment anything arises, go straight ahead and ask him pointed but not evaluating questions about it so that he can define it into a more definite form. Ask him to tell you about it again, how it worries him, exactly what it is that has this effect until he can articulate it clearly and precisely. One can even play stupid so as to make him more lucid until one actually finds the terminal if it is a condition that is worrying him—for we handle terminals and masses only, and not conditions or effects.

After this one can state the problem to the preclear in practically his own words, asking him to listen carefully and correct one if one hasn't repeated it accurately and then ask him to tell one if “it is a problem to him” and if he recognizes it as such. It is surprising that the preclear will look quite pleased to have this problem and will naturally want to hold on to it in spite of his protestations that he wouldn't if you questioned him further about it. It would thus be wrong to suggest to him that it should be “solved” or taken away from him, for a problem is a game and a threat to havingness does and can reveal the hidden game the preclear is compulsively playing. Taking that problem would be robbing him of a game and the preclear would react violently or by not changing, since he thinks you are going to keep on taking all his games from him.

One thus tells the preclear that since he now has a problem it would be better if he had more problems which would be directly under his own control. One then handles this threat to his havingness by taking the terminal to the problem and running **“Invent a problem of comparable/incomparable magnitude to (the terminal).”**

The new problems he invents (if it is done with reality, and it is the auditor's job to see that he does so) will not be aberrative since he has created both the intention and counter-intention that constitutes the problem and is therefore pan-determined in relation to these problems which he then can control. These problems will serve to move his fixed attention from the problem which he doesn't have under control and the auditor can then proceed with Procedure CCH.

There is, however, a note of warning here. The two-way communication must remain “two-way” and also, this process can come dangerously near evaluation which must not occur. It therefore needs clever auditing to have the preclear discover this problem without breaking the Auditor's Code. The auditor can ask “pointed” questions which will reveal it more easily, and even re-state the problem in clearer and concise language, but he must not evaluate under any circumstance.

This type of case, by the way, is a low toned case and needs a great amount of good control, and the first four steps of CCH must be thoroughly flattened before any attention and thinkingness processes are used.

It can be seen from the above that it is important at all times to look out for the things that threaten the preclear's havingness and to handle them with problems of comparable/incomparable magnitude so that auditing doesn't have to become a present time problem to you and the preclear.

WASHINGTON, D.C.

11 JANUARY 1958

HGC PROCEDURE

1. CCH 0 with PT Problem on E-Meter.
 2. S-C-S and Connectedness to get pc under control only.
1 and 2 not “therapeutic” steps.
 3. Step 6 Clear Procedure Connectedness used to extrovert pc now and then.
3 is the therapeutic step.
- Run Intensive with 1 and 2 occupying no more than 1/5 of 25 hrs.

HCO BULLETIN OF 13 JANUARY 1958

HGC RUNNING OF PCS

Use CCH 0 with PT Problem, S-C-S and Connectedness to get pc under auditor control and no longer.

Then use Step 6 of Clear Procedure as soon as possible and until end of intensive. Some Objective Havingness can be run if necessary.

Repair havingness on invisible and black objects in fields which are invisible or black. The test is "Shut your eyes—what are you looking at?" They'll tell you and you establish whether field is invisible or black. Then use the above. Otherwise (if mock-ups are clear) don't use it.

What can you mock up easily? Pc says, "An apple." Do so. (Note meter.) (If reaction on meter choose something else.)

The command then is "In front of that body, you mock up an apple (pause) and keep it from going away. Did you keep it from going away?" Pc says he did. "Thank you." The next command is "Behind that body, etc." The next is "Above that body, etc." The next is "Below that body, etc." The next is "To the right of that body, etc." The next is "To the left of that body, etc." Then one begins the series again with "In front of that body, etc." This is continued until E-Meter no longer registers a surge when pc does it. Now pick a larger object. Test it for surge on the meter. If meter surges, don't use it, pick another, etc. Now go through same series. One runs this on at least 6 objects each one larger until he goes on to next, Hold it still.

Keep it from going away, when flat on many objects, is followed by the same command substituting "Hold it still." This is done before, behind, above, below, to the right, to the left, the same way around and around. When Hold it still is flat one goes to "Make it a little more solid," same command otherwise as before.

If this all flattens, start all over again now with more significant objects. Read Step 6 Clear Procedure.

THE FACTORS BEHIND THE HANDLING OF IQ

*Edited from L. Ron Hubbard's 16th lecture to the 18th American ACC
in Washington, D.C., on 5 August 1957*

This past week has been an eventful one in research. It has culminated a four-year search for the factors which lay behind what is called IQ, or Intelligence Quotient. We have been taking tests here for many years and these tests were mainly used to establish change in preclears. We care nothing about the significance of the test. We do care, however, that these tests mirror change.

Someone may say that a test taken twice will, of course, get a better answer than one taken once. This is not true, since everybody in the MEST universe is on a "mustn't happen again" and we automatically figure that a test taken twice would get a worse grade the second time. We have two different tests marked A and B which are supposed to give identical results. I have been waiting for the people who devised this test originally to say, "Well, you can throw the results in any direction you want to with these tests." But we have given a considerable amount of testing to many, many people and we do find that a test will hold constant on a given person in the absence of processing. If a person is not processed the variability in the profile and IQ is very slight. Somebody who is not getting any results from any treatment or processing will register the same, test after test which is quite unusual.

Testing is a very old subject. It is not newly developed in modern times. One of the first examples of testing that we find is in the early Chaldean times. Testing of all kinds, sorts and descriptions as to honesty, intent, reliability, ability and so forth, have been with Man almost as long as he has been on Earth. In modern times these tests have been more standardized and reduced to writing.

Here, for example, is a test I heard about, from the 18th Century down in Georgia. It was a guilt test. Somebody had stolen something, so they would have all the negroes on the plantation line up and put a rooster underneath a big black kettle. This was a witch rooster or something of the sort. And they would say, "The man who stole it, when he touches the black kettle will make the rooster crow." All the negroes on the plantation would go by the kettle and then the overseer merely had to go by and look at their hands. The negro who didn't have any soot on his hands was, of course, guilty.

All tests, however, have had an end goal, and they of modern times are more or less as covert as this rooster under the black kettle.

Modern tests were originally devised in the total belief that Man could not be changed. From year to year people would get changes of one kind or another from childhood on, which would demonstrate the year's IQ which might be higher or lower than another year's IQ. They

maintained that people advanced in IQ because of age, yet at the same time said that IQ could not change, would never change and could not be influenced by any particular factor.

I am rather astounded to discover that when a person is happy and takes the test, and when this same person is unhappy and takes the test, he practically gets the same curve on his personality profile with the same IQ. It does have a constancy. It was this constancy and an inability to understand the mind prior to 1950 which made people say that it was not possible to change Man or his IQ. A stupid man was stupid and a bright man bright and that was it.

People knew, however, that personality and IQ were not the same thing and were distinct from one another. So there are tests to measure personality and tests to measure intelligence. One of the ways one would observe this would be to take three or four men who had more or less an equal personality. The result of testing would show that they had more or less similar personalities but that their IQs differed. Or one could take men of the same IQ and test them, only to find that their personalities were completely different from each other.

I have known this ever since 1950 when the first testing was done. We either changed their personality or changed their IQ. Very often with a very successful case we changed and improved both. This created a mystery and we wondered why it was that when we ran an intensive on Joe his IQ changed and when we ran the same intensive on Bill his personality changed but not his IQ. In view of the fact that all of our processes were mixed to a large degree, including such things as havingness, 8-C, thinkingness and significance processes, and in view of the fact that auditors were different from one another, we had a sufficient number of factors in each one of these test representations to make it impossible to sort out. I could not sort it out.

Then I started on a project with the HGC auditors last week and wound up with the answer to this problem when I had no intention of doing so at all. It was just accidental that I found the answer.

Here is what happened. We wanted a process that we could write up in a book and send to ministers so that they could counsel easily and well, since the minister is doing a tremendous amount of personal counseling. If he could just sit down, according to these rules as he read them and get some sort of a result we would have been very happy. We called this project "Process July."

We knew one thing about Process July: It was slanted in the direction of getting people to unburden their souls. We wanted to get the overt act-motivator sequence off the case. So we would have the minister write down the names of everybody the person knew and then pick out the most likely candidates and ask just one question about each one of those until we got this person straightened out. It would have been a straight wire question on a present time basis, such as **"Tell me something you could do or say to valence."**

We do know that an overt act-motivator sequence is a reach-withdraw situation, therefore we had to test "withhold" since we obviously had this withhold situation to consider. (Now earlier processes already indicated this, and particularly **"Recall a secret."** Don't confuse this with withhold because they are not the same process at all. We merely wanted the person to open up and talk to the auditor when we were recalling secrets and if we did anything with it, it was totally accidental. But we did learn here about withhold.)

So the first question the minister would ask would be, **"Think of something you could withhold from ____."** Now one of the discoveries that led to this question is that divulgence and confessions had nothing to do with raising anybody's IQ or improving his case. It wasn't the fact that he confessed it or divulged it but the fact that he *erased* it.

We started running this "withhold" command for a couple of days and then went over to **"What could you say or do to ____,"** varied that question around for a couple of days

and returned to **“Think of something you could withhold from (valence),”** and found that the latter was the question that was producing the results.

Withhold is a games condition on communication and is a partner to the process, **“Mock up somebody denying communication.”** People are in an obsessive games condition which they have to play, although they are not aware of it, and on the subject of communication they are naturally going to be withholding obsessively.

We tested this process carefully and found minimal personality changes, but found that the IQs of the preclears changed remarkably. An old lady’s IQ went up from 84 to 105 and everybody knew that her brains were atrophied. It was an “impossible” jump for a person of her age. Another person quite advanced in years, between 70 and 80 years old, got an IQ raise from 109 to 133. An invalid’s IQ went up from 98 to 121 and a student’s from 101 to 126. There was an IQ change on every case on which this process was run.

The theory behind it seems to be this: The individual gets his mind so involved with the problems of some game with some valence or person that his computers are all tied up on that particular subject. When you restore self-determinism on this level you free the individual’s ability to think. An obsessive games condition is to withhold communication from somebody. When we take that off automatic and put it under the control of the preclear so that he is doing it, all of the involved mechanisms start working out.

That is why psychotherapy never worked. You have never seen before and after tests, whether IQ or personality, on a Freudian analysis. It is the ability to withhold communication which advances IQ and makes a person feel better, *not* the ability to divulge it. We’ve been told all our lives that all we had to do was go to somebody and confess. If we were to confess to our mothers and fathers that we did those dirty, nasty little things we would feel so much better. It isn’t true. You probably only felt better to the end of getting your pants spanked. This is an enforced communication and as an enforced communication would break through a games condition, in which a person found himself. It would demand that one communicate with the enemy and would depress one accordingly. Obviously, then, it is not true that divulging or confessing did anything for anybody, because the only improvement he got would be if he regained the ability to withhold that information without being upset about withholding it. The only disturbing element in secrets is the guilt which accompanies them.

For example: You took your old man’s car and it got a wobbly wheel. You put it back in the garage and he came out the next day and looked at it and said, “I wonder how that happened?” You stood there innocently, saying nothing. But you felt guilt. At length you felt as though you were going out of communication with him when these incidents piled up too high. Psychotherapy’s whole answer to this is that you had to throw yourself at your father’s chest and confess all whereupon all would be well. It wouldn’t have done a thing for you. What the bent wheel did was to overcome your ability to withhold communication by making you feel you ought to communicate. It interrupted your self-determinism on the subject of communication.

This is the reach and withdraw mechanism, of must reach, can’t reach, must withdraw, can’t withdraw and these are the two pairs which create the sensation of insanity. As an example, you must run away from the bogey man that’s chasing you through the treacle. He is coming like a mad express train and there you are stuck. That is a nightmare. You must withdraw and cannot withdraw. The glee of insanity is only composed of this. People in asylums are stuck in this so they must withdraw and can’t withdraw, must reach and cannot reach.

All of the past psychotherapies are aimed at getting a person to outflow, and what do we find here? We find that intelligence increases and neurotic personality traits get better when we run withhold communication from valences. It is a fantastic reversal. We found this to be the case: *that people from whom one felt that one could not withhold anything were the most aberrative valences on the case.* We thus have a new definition for aberrative valences, namely

the “cannot withhold from” valence, who is the most aberrative valence on the case. As you run it the preclear will say, “Well,” unreality, unreality, “I don’t seem to be able to withhold anything from Aunt Grace at all.” Ask a criminal what he could withhold from jail and he will find that he cannot withhold anything from jail. He will see facsimiles and other electronic phenomena sweeping towards some spot he considers jail since he is unable to withhold anything from jail.

We are looking at the basic anatomy of the track and the basic process by which one would run a track. You could be sitting in the middle of the trap and just dream it up for a while and say, “How did I get in here? I don’t know.” The only way anybody could keep you in a trap would be to give you the idea that you had to surrender to the trap and the way to undo this would simply be to think of something you could withhold from the trap—or track.

The other side takes care of itself. I don’t know how a thetan can keep from communicating with everything unless he feels he should withhold everything from everything. Remember, you are not trying to erase a lot of things. It is the regaining of the ability to withhold that you are working toward. It is a certainty process, the preclear selectively withholding things from canvas, typewriter or aberrative valence with certainty, because an individual has been in a games condition with the canvas, typewriter, drill press or the valence. It has absorbed all of his ideas and thinkingness and everything else, and they are all stuck and bunched up on the track. He is trying to think, “How can I communicate?” since communication is composed of selective withholding.

One thus gets this kind of activity. One has individuals in a games condition with their highest common denominator of a games condition, and that action is communicate, and they are trying to withhold communication from their opponents. Wherever they have considered an opponent to exist they have withheld communication from the opponent. Having decided to withhold communication from the opponent they now decide to communicate with the opponent because they have to, and you get a denial of self which is, of course, the basic aberrative pattern. We take this circumstance, look it over and discover that the individual has been made to break his own postulate—“I am withholding it”—because he considered this person an opponent and then he said, “I have to talk.”

When you can no longer withhold from a valence you become it, and we have the basic mechanism of valence closure, because what is the one thing that you don’t withhold from something you have become? Yourself. So here is a gradient scale of withholding.

One would run “withhold” this way: You would take an inventory of valences, their professions and habitats. A habitat is a place where the preclear has lived and couldn’t pay rent. In other words, the old homestead, his childhood home. There are a number of tricks by which one can isolate these valences without asking the direct question on the basis of comm lag or the fact that he didn’t mention at all in five people the two most aberrative people or valences on the case.

One would then establish a session with thoroughness and with questioning find out if there was a present time valence with which the person was very deeply involved and run that out with Problems of Comparable Magnitude. One would then move into the session and sandwich valences with Locational Processing. The command here is: “**Think of something you could withhold from (valence),**” not “Recall something.” The preclear would say, “Oh, yes, I can think of lots of things.” Now beware of an automaticity. He might strike a games condition on an automaticity that says, “I can withhold something from (valence).” That has to be flattened. Get to the point where he can withhold rather ordinary and routine things at his own discretion one at a time and that would be the ability to withhold regained, the only thing you are interested in.

When the preclear finally decides that he can withhold things from the valence, go into Locational Processing to orient your preclear in present time, and to command his attention.

Then run the next aberrative valence. This one should be a little more difficult than the last one and so on to the next valence which should be stiffer than the last.

One should then pick up the preclear's professional tools and run these on a similar gradient scale—the easier ones first and gradiently to the difficult ones—until he can withhold anything from his childhood home.

Flatten CCH 0, 1, 2, 3 and 4 fairly well before you embark on this and then use ample Locational Processing for the remainder of the intensive and Lord knows what his IQ will be if you went for broke to this degree.

But remember that the process will not do anything unless you have some goals as to where the process is going, and the goal is to restore the preclear's ability to withhold. This will bring the preclear out of all traps and is quite evidently IQ, and it changes valences only to the degree that it totally snaps the preclear out of that valence.

I hope this information is as valuable to you as it has proven itself to me and the HGC auditors who assisted me with this project.

HCO BULLETIN OF 18 JANUARY 1958

CONTROL

The reason the auditor is having trouble getting off Control and onto Step 6 is that the auditor expects a technique to take control of pc. Auditing depends on the *auditor* taking control of the pc. When this is learned we'll not have 20 hrs devoted to Control processes and 5 to Step 6. We will have 5 hrs to Control and 20 hrs to Step 6.

Control consists of the pc being aware of who and what is controlling him. So Find the Auditor is therefore part of Control.

HUBBARD COMMUNICATIONS OFFICE
WASHINGTON, D.C.

HCO BULLETIN OF 21 JANUARY AD 8

For use of 19th ACC, Staff Clearing & HGC

MEST CLEAR PROCEDURE

1. *CCH 0*: Get PC into communication on the following points:
1) presence of auditor; 2) presence of auditing room; 3) presence of PC; 4) starting of session and when it will end; 5) PC's goals; 6) possibility of help; 7) present time problem—if no blip, or only slight blip on meter, skip it. If needle action severe, use “What part of that problem could you be responsible for?” Run to nul on meter. Use *no other* process for PTP.

NOTE: Use *no* Locational Processing at all during intensive.

2. *S-C-S*: (See *Clear Procedure* for commands [page 185] .)

NOTES: In all commands, use “that body” or “the body”, not “your”.
Run until no step unflattens the other steps.
Be certain to duplicate the full command *exactly* each time.
Acknowledgement is a Tone 40 “Thank you”.

3. *Control Connectedness*: Command: “You get the idea of making that (object selected at random by auditor with auditor indicating the object) connect with you.”
4. *Clean-up of field*: Command: “You mock up a (terminal in the same condition as PC's field) and shove it into the body,” i.e., black field—black mass, invisible field—invisible mass, speckled field—speckled mass.

NOTES: ABSOLUTELY NO HECKLING ABOUT CERTAINTY THAT *HE* MOCKED IT UP.
Use patience, persistence, understanding, and kid gloves.

5. *Creative Processing*: Command: “In front of that body you mock up a (nul object, located on meter) and keep it from going away. Did you? Thank you.” (Tone 40 ack.)

NOTES: The “Did you?” refers *only* to whether he kept it from going away, not to whether *he* mocked it up.

Change the location of the mock-up on *each* successive command by commanding, “Behind that body ... ,” “Above that body ... ,” “Below that body ... ,” “To that body's right ... ,” “To that body's left ...”

When the first object has been run from nul to nul, locate a somewhat larger nul object with the meter. Run it nul to nul on the same command. You will then go on to a 3rd, 4th, 5th and 6th object, each larger than the last, and each run nul to nul on “Keep it from going away”.

When all 6 objects have been flattened on “Keep it from going away”, run each one again *in the original order* on “Hold it still”. When this is flat, run the same 6 objects with “Make it a little more solid”.

NOTES: If a mock-up disappears or flies out of control, don't red herring after it. Just have him mock up the same item again.

If PC becomes extremely introverted during session of Creative Processing, Connectedness may be used to end session. If PC should remain introverted for entire day, go back to Connectedness.

If needle consistently out of pace with supposed command execution, PC has lost auditor, is out of control. Re-establish auditor, or go to bottom again.

If auditor can locate *invisible* nul object or particle, running it will reduce body's susceptibility to germs.

6. *Creative Processing*: repeat 5 with 6 different objects.

7. *Creative Processing*: ditto

HCO BULLETIN #2 OF 25 JANUARY AD 8

REVIEWING WEEK'S PROFILES

In clearing pcs it is necessary for the auditor to cause something.

Abandon any idea of running significant objects ever. Always run non-significant objects.

Free the needle before you run Step 6 when needle is stuck. Two-way Comm and Str Wire will do it.

Totally clear up a field before running Step 6. A field is cleared by running repair of havingness on a terminal like the field. Don't go running pcs on 6 who "think they see a mock-up" or who "have an 'idea' one is there".

FUTURE PLANS

Well, here we begin!

A well schooled auditor can take any volunteering PC and get him under control and run Step 6 of Clear Procedure and we have a Book One Clear.

Future of Research is Operating Thetan and the situation on Earth.

To consolidate this I am doing the following:

1. I am completing the 19th ACC.
2. I will groom up the DC operation until mid-February.
3. In mid-February I am going to London for 3 weeks to get London going on Clearing (because it communicates easily to rest of world). This for sure consolidates SA, NZ and Aust, which Man may need.
4. Returning to DC end of 1st week in March.
5. I will write our next "Book One" bringing us up to date and giving us a book for the book stores that advertises as the solution to Bohdi, the clear everybody's wanted for 2500 years.
6. That done I'll be in DC in late April.
7. The book will be published in June by Vantage Press. It will also be published in UK and France through Vantage contacts.

A pamphlet about Bodhi will be written at once for reply to ads in mystic magazines which announces the goal of 2500 years has been reached. It will be printed like a \$1 or 5s book.

Here's what Scientology Organizations should do:

1. Put announcements at once in all mystic magazines announcing state attainable. Steves has the ad copy.
2. Get pamphlet on clears published as soon as I complete it.
3. Get whole staff cleared by Co-audit and HGC where necessary. (I want all staff everywhere clear by June: easy to do and the results are startling.)
4. Get groomed up for the summer rush and see to it that it is a *rush*.

Well, in AD 8 we've got a kick-off for a much more rapid game. The scope of that game will be apparent to everyone when you start getting clear and making clears.

My game in research is not at end by a long way. For instance in research for OT actions I wrote 15 things the US Govt should do five weeks ago. It has now done 6 of them. When

they've done all 15 I know we're sailing (for the 6 may have been my telepathy or coincidence).

And organization know-how and expansion is a long way from ended. Map a comm center for the nearest ten stars for instance. We'll be on deck to welcome the space ships when they get them!

Here's our program then. REACH 'EM. CLEAR 'EM.

And my actions are all geared to making that adequately possible.

I think we'll all get the notion shortly that we're making it!

Best,

L. RON HUBBARD

HUBBARD COMMUNICATIONS OFFICE

HCO BULLETIN OF 1 FEBRUARY 1958

CLEARING OF FIELDS

Definition:

A field is any *thing* interposing between pc (thetan) and something he wishes to see, whether Mest or mock-up.

Fields are black, grey, purple, any substance, or invisible.

To run Step 6 of Clear Procedure it is necessary to clear up "field".

RULES OF FIELDS

We take a Thetan's ability to see for granted.

His willingness to see may be poor but we increase it by increasing his confidence, decreasing his fear of objects.

Fear of seeing is fear of mass.

A pc can keep himself from seeing by destroying all mass. This is one way mock-ups fail to appear. He has an automaticity which destroys them before they visibly appear. Short duration mock-ups are similarly caused.

A pc that can't see is reacting from a failure (or failures) of having tried to destroy something. He then tries to destroy mock-ups. Failing this he tries to destroy self. This is a scale of survival.

Persistence of mock-ups is therefore dependent upon a pc's willingness to let one survive.

One of the phenomena most in the road of clearing is called a "field". It is a self-protective or destructive device.

For our purposes, however, the question of a field is simple. Common example, pc was held in a dark room. The room kept him from going away. It is an *incident*. The blackness he always sees is the blackness of the room which kept him from going away. This incident or many like it piled up is a "field". It is only necessary to have *him* mock up black rooms, shove them into his body and keep them from going away (pc is cause here where the room was cause before) and the field will change. This is a rule: In any field, a PC was effect in an incident where he was being kept from going away. To clear that field, it is only necessary to have him *create* the incident, shove it into the body and have pc keep it from going away.

The main rule of fields is that pc must be made to reverse cause on the field from field at cause to pc at cause. As all fields are incidents, and as a pc is the one who mocks up these incidents, all fields can be cleared by attaining knowing cause.

Another rule is that a pc will confront anything to the degree that he is made familiar with it. Merely making him find and recognize fields will rid him of them. Merely making him confront objects will rid him of fields.

TESTING FOR FIELDS

Basic Method of Testing for a Field.

Aud: "Close your eyes." "What do you see?"

PC: "Nothing."

Aud: "Look at the room." (Pc eyes still closed) "What do you see?"

PC: "Nothing."

Aud: "Then something must be between you and room. What is it?"

etc. until pc sees field or eyelids or room.

Now repeat the same with a simple mock-up shape. (Egg, ball-bearing, or sugar cube.) Have him mock it up, look at it. If he can't see it, ask what's between him and it. Keep this up until he sees field.

You can also test for partial fields in areas.

CLEARING FIELDS

Basic Methods of Clearing a Field:

A. A "field" is one or more incidents.

Identify and Locate the incident making a field.

Have pc mock up the incident, shove it into the body and keep it from going away.

B. Mock up a terminal same shade as the field and keep it from going away.

C. Mock up a terminal same shade as field and shove it into body.

D. Run "Destroy a mock-up in front of that body. Did you? Thanks."

" " " " behind " " " " " "
" " " " below " " " " " "
" " " " to the right of " " " " " "
" " " " to the left of " " " " " "
" " " " above " " " " " "
" " " " below " " " " " "

E. Take pc outside as in Waterloo Station and have him "Get the idea of destroying that (indicated body or object)."

F. Move pc on time track.

AUTOMATICITY OF FORM SOLUTION

A pc must know he is creating *what* he is creating. He is creating any mental pictures he sees. But he must *know* that he is creating.

Automaticity of form keeps him from believing he is making facsimiles. He has buried the ability to *form* complex objects. He "mocks up a man". The mock-up is his. The *form is* an automaticity. Therefore he feels the mock-up isn't his.

Simplicity of form will conquer this and regain a knowingness of mocking up. An entire clearing, including the handling of fields could be accomplished on a pc by having him do a

gradient scale of forms in mock-ups, always using only mock-ups he is confident are his own *and* recovering his ability to destroy these mock-ups.

What is clearing but regaining awareness that one is himself mocking up all his facsimiles and regaining confidence he can destroy them as well as create them.

CONFRONTING

I want to speak to you about a phenomenon having to do with “enough” and “not enough.” This adds up to meaning “insatiable.” The thetan is insatiable as far as “enough” is concerned.

Just what is enough? That limit has never been agreed upon. For instance, the governments of populations have long since exceeded “enough” with internal revenues. But the fact of the matter is that if you object to taxes it is probably because there are not enough taxes.

I was fascinated to study (and I examined several hundred governments to discover what made them persevere) what people considered a good government to be. There are certain requisites to a good government. People seem to buy governments of tremendous duress; and governments which are very sweet and polite and constructive are all lost. But governments which call in leading citizens, incarcerate them and tear off their toenails with pincers seem to be very well liked on the track. They persevere, not because the police and governments do a good job, but probably only because they can't be confronted.

Justinian, the first great Christian emperor, used to call in the foremost citizens or members of government that had happened to make his wife a little mad and throw them into the nearest dungeon, torture them to death and sell their wives off to the Arabs for slaves. The leading general of this emperor was actually one of the great generals of all time. But every time he won a victory, Justinian would issue some kind of cross mandate depriving the victory of all significance. At the end Belisarius was rewarded by having his eyes put out.

The more people Justinian illegally taxed, burned and tortured, the happier everybody seemed about the whole thing. There was no smell of revolt. But the same people, just a few years before Justinian and just a short while afterwards, had perfectly good emperors with equitable taxes, just courts, and these emperors lasted only a short period before the populace was in revolt all over the place.

Well, what causes this? The answer is: enough government. The populace had an

idea of how much government there ought to be and if you didn't give them that much government, they exploded. But they would have exploded to a much higher level if somebody could have caught them. But nobody ever did and as they came up on the upbound they just got a new tyrant who pushed them down harder.

The only reason I am talking about government is that I want you to see a preclear. Take somebody's wife. He is mean to her and as long as he continues to be mean she doesn't explode. One day he decides to be kinder and she explodes. Here is a husband. He hardly puts his foot in the door and she jerks his pay envelope out of his hand, counts it very rapidly, tells him his supper is on the table—and it is cold mutton ! We get a tremendous amount of duress and then one day she is feeling poorly and doesn't furnish this much duress and he explodes. What does this prove? Unless one applies a tremendous duress and bad 8-C people explode.

A preclear explodes under a mediumly mild 8-C which has regularity rather than a tremendous number of surprises. He has never been given orders he can follow before and all his effort to be orderly goes into restimulation. His efforts to be orderly were manifest at those times when disorder was in his vicinity. You start to handle him well and the disorder to his view goes into automatic and he blows up. This restimulates his efforts to keep a chaotic duress which he first used a long time ago to have an orderly duress against such chaos. You actually start running out the tremendous duress which he has had to apply to keep chaos from exploding. When that runs out you get an explosion of the chaos he has been holding down. You run out, by command, the duress which he has applied to chaotic times of his lives. As a consequence you get an explosion. It looks as though this individual thrives on nothing but chaos, but that is not true. He doesn't want it and he doesn't want anything to do with it. A short period of application of very good 8-C that is positive and won't let him get away with a thing, will run this out.

An individual will apparently sit around in a sort of mucky apathy and be abused for years without anything happening because the abuse he is getting is sort of running out former chaotic periods of his life. It is in restimulation. It convinces him that he cannot handle the wife and that there is nothing one can do about government.

A person who is subjected to a chaotic duress year after year is not getting any place, but, and this seems to be the criteria by which this is judged, he did not revolt.

There is nothing confused about the auditor in a Tone 40 session. If you want a fast blow that will run this all out, you must be very didactic, positive and totally unconfused. He will pull out tricks like origins, then sly tricks and then somatics. None of them interrupt positive control. You just continue to run out all the times when he has tried to control things and has had them blow up in his face.

It is very interesting to watch a child move up into his teens. His parents have been giving him 8-C, family style—did you wash your face, why don't you get a glass of milk, no there isn't any milk, go to bed, no don't go to bed, no get up, go to bed, no don't stand up. When he gets into the teens all of a sudden his parents aren't applying very much duress on him and he revolts. It is not really a feeling, sentient, knowing revolt at all. It is a restimulation of his own effort to take care of the chaos which happened to him years ago. So actually bad control breeds periods of chaos which will someday explode.

The actual appearances that come out of this are quite fascinating. One of them is that the individual needs a lot of dramas. You might say, "Well if the thetan can stand up to that much drama he must like it." He does not like it but it is at least something to do. And that is his misconception of what is worth confronting.

For example, a man had a nice art collection, lived an orderly existence, was an interesting conversationalist and lived in his Maryland village. He never had a caller. One day he died and the whole environment went to his funeral. Obviously a funeral is worth confronting but a live being isn't. Just add this up to what we used to have to say about Acceptance Level. Now we have Confronting Level.

Another man hardly had anybody to talk to him in the office. He did a good job, and there wasn't anybody who ever talked to him particularly. One day he got sick and everybody in the office came to see him clear down at the hospital. If he had got sick from leprosy they all would have come in the first five minutes.

An individual has a concept of what is worth confronting, and all of the chaos which he has been handed has got him so confused that he doesn't understand that things don't have to be horrible, terrible, miserable or dramatic in order to be confronted. He falls this way straight away from confronting the universe around him, and he confronts only the horribleness and nastiness and so on.

Lately the Book Review tells us that a book called *Andersonville* by McKinley Cantor is supposed to be and is advertised as the greatest Civil War novel ever written. I took a look at it. It isn't about the Civil War at all. It is about a prison camp erected in Georgia by Southerners in which they incarcerated damn Yankees. Every nasty foul condition of humanity is delineated, painfully and unartfully at exceeding length. This low tone level is something that is worth confronting.

Have you watched TV lately, some of the 1.5ing and high toned TV actors acting at 1.5? That is evidently worth confronting. If you could just figure out what a lot of people consider to be worth confronting and then give it to them you would probably come up with much greater popularity than anything else. The same thing goes for the circus and screen. Hollywood got the idea and I imagine laid a tremendous multibillion dollar egg with their Vista Vision and Wide Screen. They are getting actors bigger and bigger and bigger and bigger screens, and finally you sit down and begin to feel like an ant crawling on one of the actor's knees.

There is another side of the manifestation. We have the anxiety to be confronted. We get these two things in conflict with each other, and those two things in their adjustment make the drama of life.

Where do we find preclears stuck? They are stuck in drama, and one gets the idea that that is something worth confronting. They go off on a gradient scale to things nobody could possibly confront and which they never did confront and then go anaten.

First he starts facing these things which are, he considers, worth confronting, and if he considers enormous drama the only thing worth confronting then he easily falls into enormous chaos. When he goes over into enormous chaos he gets caught up in the fact that nobody could possibly confront the thing, but he is already stuck on an earlier postulate that there was nothing worth confronting and so he gets no havingness in the physical universe.

People run such tricks on other people's havingness. They tell him nothing around here is worth looking at. "This is a dull town." (I think America invented the small town just to convince people there was nothing worth confronting.) These small communities, with their small minds, work one way or the other on making nothing out of things that a child was willing to confront. So they bred, as the child grew older, a contempt for anything in his vicinity, and he started looking for things that were worth confronting.

Here is a sample process which could go: "**Mock up something that isn't worth confronting. Make it a little more solid. Thank you.**" The person gets streets in his immediate vicinity. He gets havingness and the only things that he could ever get havingness from. Yet his total idea is that none of this is worth confronting and he never sees it. Thus you get your standard homo sapiens, vacant eyed, walking down the street.

As an example: On a lovely cool day people were riding and walking down the street. One lady pushed a little boy in a cart and they were all going along vacant eyed.

All of a sudden the woman pulled the tongue of the little cart up and catapulted the little boy out onto the pavement with a crash. Instantly traffic jammed up. The kid wasn't even hurt, he just cried a little, but all the cars stopped and their passengers popeyed onto this terrifying scene. People stopped walking and crowded around the spectacle. That was worth confronting. The ingredients of blood-curdling drama were added. But when the little boy wasn't hurt and he shut up, looks of disappointment were on all faces and the crowd dispersed quietly to the vacancy of other blocks.

Another process on this line: "**Mock up something that nobody can confront,**" and we discover the favorite games of psychos. Not a productive process at all. By the way, when you get something that nobody could confront you get black minds with ridges, shooting stars and space opera flying around them that they could not make head or tail of.

If you said, **“Invent something to confront. Mock it up and make it a little more solid,”** you would probably get the best process that can be worked out of this morass. The individual would gradually change his mind concerning things there were to be confronted. There are no such things as can't be confronted at all. There are only things which are difficult to confront.

“Mock up something you've got to confront” and you get the standard run of the mill, homo sapiens nonsense such as alarm fires, funerals, etc. We also get work. Work is considered to be about the last thing that anybody should ever be expected to confront. The Anglo-American view is to put a tremendous amount of kick in the pants on this thing called work. The way you work out work as something that is impossible for anybody to confront is to discourage a child when you see him perform any work. You say, “Oh, get out of my way. It's too much trouble to show you. You're in my road.” And by the time he is six or seven he's thoroughly educated that he will not be permitted to work. And then the laws of state keep him from getting jobs and earning money so that he can escape from the tremendous dependency of family. Further up in his teens they realize the police have a vested interest in crime and they have here a good quality juvenile delinquent. Then he is not permitted to work either. We get him in his early twenties and insist he get married and then we show him that he's got to work. Here you've got one of these super duress got-to-confronts. No wonder people get tired, because every time you put them into a “got to confront” you run them into all the emergencies.

What is an emergency? It is something that requires a necessity level. What is a necessity level? It is a heightened willingness—a sudden heightened willingness which untaps a tremendous amount of ability and you get these tremendous feats. Now this cycle of super energy and application winding up with super tiredness gets applied to the work-a-day world of turning a lathe or driving a truck or keeping a set of books. He's got to get the work done and he finally goes into total exhaustion. This is because he has no orientation on what's worth while confronting. This adds up to the fact that Man goes into an emergency level of activity when he has got to confront and his whole lifetime is one long activity at an emergency height. This tells us the reason for the hectic anxiety to get the work done. The human body has its limitations and cannot stand that since it is built on a number of “now I am supposed to's” and every time you have the problem handled you go out in the middle of the Sahara Desert and “now I am supposed to have a drink of water” keys in and you haven't got it licked at all.

“Mock up something you have got to confront” brings to the guy the tools of his trade. Run it a bit further and you'll get women if it is a man, and vice versa. It is a “got to confront.”

You can ask what the solution of confrontingness in the preclear would mean in terms of exteriorization. Things that are impossible to confront, that are not worth confronting, each play their role in exteriorization. A person who is dead in the head knows that he couldn't possibly confront a skull of a body, but he has got to confront one.

I would say that it would take a lot of preparation with the early steps of CCH before one started soaring into those rarefied realms of confrontingness. There is one process called Locational Processing which works out a tremendous amount of confrontingness and controls attention at the same time. It is run Tone 40, with great accuracy and precision by the auditor, who then controls the preclear's attention which was previously controlled by facsimiles. And a steady control like that runs out the preclear's attempts to control. Locational Processing happens to make the thetan make the body confront the wall. This is an objective confrontingness process. As a subjective one, **“Invent something to confront. Mock it up and make it a little more solid,”** is very good, and they are at present the two standard confrontingness processes in Scientology.

HCO BULLETIN OF 3 FEBRUARY AD 8

FREE CLEARING PROJECT

It is vital to have cleared auditors.

The Hubbard Association of Scientologists, International shall offer to its *professional* membership only, the facilities, technique, quarters and schedules adequate to effect clearing.

Anyone reporting to Washington who is an HDA or HCA in good standing with the HASI will be assigned co-auditing facilities. The auditing quarters, technique tapes, scheduling and supervision will be made available without cost. The only expense incurred by the participant would be transportation to, food and living quarters in, Washington.

Clearing on this project would be done on a co-auditing basis with staff supervision. Estimated time is from 3 to 5 weeks. No guarantee of result is made since it is conditional upon participation.

This project is open until the end of April 1958 only.

Charters and franchises will hereafter be given to clears only according to recent board resolution.

This is not an ACC and in no way parallels an ACC.

Only professional auditors—Hubbard Dianetic Auditors and Hubbard Certified Auditors—in good standing are eligible. Reinstatement is attainable on payment of one year's dues of \$15 for those whose membership is not current.

The HASI reserves the right to refuse to enroll persons in the project or to terminate participation of any person with or without cause.

We need thousands of cleared auditors for current projects.

Report to the Registrar FC any Monday.

HCO BULLETIN OF 6 FEBRUARY 1958

HGC CLEAR PROCEDURE OUTLINE

**CCH Ob—HELP IN FULL
STARTING SESSION**

After clearing any pt problem with “What part of that problem could you be responsible for?” run CCH 0 for help. If any difficulty whatever is experienced or *if pc has* field, run CCH Ob in full.

This is formally audited. Each command is cleared with pc word for word. And a bridge is used for every change. Run until E-Meter is flat or field vanishes or both. This is a 9-way bracket.

How could you help yourself? How could you help me? How could I help you? How could I help myself? How could you help another person? How could I help another person? How could another person help you? How could another person help me? How could another person help another person?

This, I think pretty well does away with any difficulty with fields. Note: There went the only randomness in clearing. I nailed this in the 19th ACC where only 7 cases in 36 were not progressing. All these had fields. All these had difficulty with help. Incidentally, a black field is in reality a betrayal. A betrayal is help turned to destruction. The dichotomy of destroy is destroy-help. When help fails destruction occurs, or so goes the most basic consideration behind living. There are many ramifications of this.

HUBBARD COMMUNICATIONS OFFICE
WASHINGTON, D.C.

HCO BULLETIN OF 13 FEBRUARY 1958
(corrected)

**RULES GOVERNING THE RUNNING
OF CCH Ob "HELP"**

When pc has a pt problem, run pt problem as prescribed in HGC Proc of Feb 6. Then use the following.

Thoroughly clear command word for word and every time auditor uses a bridge.

Always bridge no matter how brief number of commands is.

Run on E-Meter on help until needle is loose, not nul.

Help follows laws of flows not terminals. See *Scientology 8-80* for flows. Anaten ensues when one direction of command is run too long.

E-Meter needle that is stuck will run to loose if proper flow direction is selected. If a command is run too long needle will go past a loose state and into a new stick. Reversing command frees needle.

Help also frees valences.

“DEATH”

*Edited from L. Ron Hubbard's 12th lecture to the 18th American
Advanced Clinical Course in Washington, D.C., on 30 July 1957*

The whole subject of death has been one of the more mysterious subjects to Man and it has only been in Scientology itself, and not in Dianetics, that the mechanisms of death have been thoroughly understood. When I say thoroughly understood I mean, of course, only the mechanisms.

We know a great deal about death and we are actually the first people on this planet that do. This is one of the larger wins of Scientology.

It is very easy to forget about death because that is what death is, a forgettingness. However, we do have a considerable amount of information on this subject and you are entitled to that information.

Man is composed of a body, a mind and what we refer to as the thetan. Exteriorization processes give a person a considerable subjective reality on the idea that he himself is a being that is independent of a mind or a body and that there actually is a separateness between them. One doesn't even have to be carried along to a point of where one exteriorizes in processing in order to get a reality on this.

This subject has been fully covered by me since 1952, when I defined the thetan as in Axiom 1 and devised techniques to separate any preclear from his body. This was the first scientific evidence that Man has had on the subject of the human spirit. Man thought he *had* a human spirit. That is totally incorrect. Man *is* a human spirit which is enwrapped, more or less, in a mind, which is in a body—and that is Man, Homo sapiens. He is a spirit and his usual residence is in his head and he looks at pictures and his body carries him around.

When we look at the fact that Man is a spirit which has a mind and a body, and when we describe Man in that fashion, then it becomes extremely simple to understand what his difficulties would be. His difficulties would be basically with his body or with his mind and we can understand that there obviously would be difficulties with him as a spiritual being. He has to think that he can get into a trap, has to get the idea that he can be in danger before he can get into danger. In other words, the thetan has to give permission to be trapped before he can be trapped, and is therefore easily untrapped. The moment he is untrapped he gives birth to all sorts of interesting phenomena which we know as the exteriorization phenomena, all of which are quite easily demonstrated. I actually constructed a meter once that could measure and prove a thetan to have an electrical field around him—independent of energy ridges, bodies and such combinations as that.

What happens to Man when he dies? Basically all that happens is that a separation occurs between the thetan and the body. However, he takes old facsimiles, energy phenomena and bric-a-brac that he feels he cannot do without, with him, and attaches this to the next body he picks up. He does not build a body in this lazy time of manufactured items and Frigidaires and so on. He picks one up off the genetic line, and the genetic line is a series of mocked-up automaticities which produce according to a certain blueprint from the earliest times of life on this planet through until now. Everybody—people even in biology know that there is a definite succession of steps that life takes today, as they announce in their theory of natural selection and evolution. We understand it rather thoroughly that something goes through these steps.

There is the cycle of action in Scientology which is Create, Survive (persist), Destroy. At the shoulder of the curve an individual is mostly interested in surviving, early on the curve he is interested in creating, and at the end of the curve he is interested in the disposition of the remains.

When we apply this cycle of action to the various parts I described, we get a death of the body, a partial death of the mind and a forgettingness on the part of the spiritual being, which is in itself, again, a type of death. Actually bodies stay around for quite a while after death since it takes some time for them to decompose—certain parts before other parts—and the cells in the cuticle and hair evidently live longest.

The first thing one learns about death is that it is not anything of which to be very frightened. If you are frightened of losing your pocketbook, your money, your memory, boy or girl friend, well, that's how frightened you ought to be of dying because it's all the same order of magnitude.

Here we strike the first observable phenomenon when we find out that the mind, in spite of mechanisms which seek to decay and wipe it out, does maintain and preserve mental-image pictures of earlier experiences. With the proper technology and an understanding of this, one can be again in possession of the mental-image pictures of earlier existences in order to understand what was going on. *In view of the fact that we have not restored remembrance to the being, the mental-image pictures usually just continue to be pictures.* We send somebody into a past life and he looks at a mental image picture and you might as well have sent him to the art gallery. He himself has no connection with this because the mental-image picture may be the mind's or the body's. (The body carries around mental-image pictures and the thetan does the same and these two combine to form the mind.)

The mind, then, is a bridge between the spirit and the body, and the mental-image pictures formed by a thetan added to and confused with the mental-image pictures formed by the body is usually how a thetan stays in a head. He confuses the two and therefore demonstration of past existences by running somebody "back down on the time track" and having him look at a picture is not very convincing. He has always had some unreality about it, has no recognition of having ever been anything else before.

The restoration of memory to one of these beings is of great interest to us, since all that is really wrong with him is that things have happened to him which he knows all about but won't let himself in on. Therefore the restoration of memory is done as a matter of course in almost any processing, and in view of the fact that it is part of any processing, it is impossible today to process somebody, well and expertly, without having him sooner or later get some sort of a recall on a past existence with some small reality.

An individual's own will has a great deal to do with this. One should not look for outside sources as to why his memory is shut off. Just as he must grant permission to be trapped, so must he grant permission to be made to remember. He is more or less convinced that a memory would cause him to re-experience the pain he already feels has been too much for him. He is very reluctant to face up again to this mechanism, and facing death, he almost always goes into a bit of amnesia.

The fact that one has lived before is so restrained that it itself is the reason why it is forgotten. The unpopularity of it in other ages and this one brought about a forgetter mechanism which causes an occlusion on the subject of death. The fact that one cannot talk about it is enough, all by itself, to continue to cause the forgetter mechanism.

A way to plot this would be to ask somebody, as an auditing question: **“To whom can you tell the fact that you have been dead?”** It works something like this: **“Tell me the one person in the world who does not believe that you are insane.”** It has a fantastically cataclysmic effect upon a person. He sort of believes he is going wog and spinning and so forth, and when you ask him that question you have broken the agreement chain.

You could ask a similar question, **“Tell me one person in the world who believes you live more than once,”** and you would get a similar reaction.

I have plumbed into this subject very deeply with lie detectors and E-Meters, checking up with grown-ups and children from all walks of life. You can, with the aid of one of these meters, put a person in such an incident. There is a peculiar behavior of the needle. It is a little hunt of the needle, and it just hunts back and forth over a small area quite frantically. It indicates that a person is still sitting in one of these exteriorization incidents.

We know a great deal about havingness and that if a person suddenly ran out of havingness he would die and we would expect so much loss of his possessions and so forth to wipe him out. It doesn't wipe him out. This is what ordinarily occurs. He backs out at the moment of death with full memory. At that moment he knows who he is, where he has been, and so forth. You'd expect a total occlusion but it does not occur at this point. It is not true that a thetan in excellent condition gets some distance from the body and then doesn't care about it any more. That is simply a phenomenon of havingness. When we first found that, we thought this was always the case, but we were striking at thetans ordinarily low on the tone scale. Those who forget about it immediately and do not care have actually gone into the sub-zero tone scale. In support of this you can pick up on the track times when a fellow backed out of his head and was mad and just kicked the stuffing out of the person who killed him.

At a certain level a person who had to “have” tremendously would get just so far from a body and say, “Well, I don't care. I've had a very unhappy time during that life and I'm awfully glad, I don't care.” But that person was so little alive when he was alive that his aliveness after he has died is also negligible. A person a little higher up when somebody knocks off his body, would have an interesting reaction to this. “I'll show them they can't put me out of the game,” and he'll dive halfway across the country, see a maternity hospital and grab the body of a baby. Somebody higher than this would not have been in contact with bodies in the first place.

We get a very fascinating exteriorization here because it is totally cognizant. The person knows who he is and usually has very good perception. He knows where his friends are and for somebody to come around and point out this fantastic spiritual phenomena that somebody has appeared to them after he had died several thousand miles away is something like being terribly surprised because a waitress came to the table in a restaurant. If a person is killed with sudden violence and he is very surprised about the whole thing, he is sufficiently upset and unphilosophical about it that he is liable to go around and see his next of kin and the rest of his friends in an awful frenzied hurry, trying to reassure himself that he hasn't gone to purgatory. (“Purgatory and hell” is a total myth, an invention just to make people very unhappy, and is a vicious lie.)

He has suffered the loss of mass. That is just about the frame of mind the thetan is usually in when he finds his body dead. If he is below 2.0 on the tone scale his major thought is to get another body. This he can do by finding a young child that he could bring back to life. Thetans are very good at this. But the ordinary entrance is some time around what we call the “assumption,” and the assumption occurs within a few minutes after birth in most cases. That is the usual procedure, but the thetan can hang around for some time.

They'll hang around people. They'll see somebody who is pregnant and they will follow them down the street. They'll hang around the entrance to an accident ward and find somebody—some body—that is all banged up and pick up this body and pretend to be somebody else's husband or something of the sort.

It isn't necessarily true that all of this is taped, measured. I am telling you what is standard about this behavior and what is not. It is a case of how fast you can pick up a body before somebody else gets it. So there is a certain anxiety connected with this. Thetans often say very interesting prayers at the moment they pick up a body. They dedicate themselves to its continued growing and they are so pleased with the whole thing that they dedicate themselves to the family and go through all kinds of odd rituals of one kind or another. The odd part of it is, they don't shut their memory off until they pick up another, a new body, and the shut-off of memory actually occurs with the pick-up of the new body.

There is a phenomena series known as the "between-lives" series, and people have some sort of a thing mocked up whereby somebody goes back through a between-lives area. This can be plotted, it is not unusual, but it is certainly not a constant. Until thirteen or fourteen hundred the between-lives area operations weren't thriving at all. Then they started to pick it up more and more. They had to knock witchcraft totally out of Europe before the between-lives area clubs started thriving. They had to knock out any idea about demons and spirits. In other words, they had to make one feel guilty for hanging around and admiring the trees with no body to look through.

They succeeded in doing this. You can make a little child sick by just talking to him about this sort of thing, by mentioning ghosts and spirits and how bad they are and how fearful they are. He gets upset because (1) you are restimulating times when he exteriorized and (2) you are invalidating him and throwing him down tone like mad. He is a ghost, a spirit, a demon. He is all these bad things they have mocked up.

In view of the fact that two exteriorizations take place, it could get very complicated as one looked at it because the GE exteriorizes. I don't know much about that except that there is something that mocks up bodies that we call the *genetic entity* and it skips from life to life. In other words, even a body doesn't live only once. It is so obvious once you look at it that if a body lived only once it would never have learned how. The intricacy of a body, itself, is something that is developed over a long period of time.

When you realize that you have the capability of endowing things with life then we don't even know that the genetic entity is alive. It might just be machinery or computation of one kind or another that goes on and that you continue to endow with life to some degree until you separate from it.

Another interesting phenomenon about death is that a thetan will stay around a body until it is disposed of properly. You can take an E-Meter and any preclear, and you can find times when he has been left out on a cliff and nobody even put a lid on the coffin, and there it was exposed to the wind and rain and he will stay around there until that body is totally dust. Bodies left out in the open decompose. Bodies buried in the ground go to pieces in a hurry. The rate of decay of a body is not really a point in question except that a thetan will try to accelerate it if the body isn't cared for. A thetan doesn't much care concerning the actual disposition of the body as long as it isn't given any more indignity than it suffered in the lifetime. He is apt to be very upset about indignities rendered to a dead body. Even while he is "in a body, alive," when the body is apparently alive and he is taking one around, he gets upset, if he is in any shape at all, about bodies being abused and mistreated. Much lower on the scale he is still upset about indignities to dead bodies and dead things.

He associates the body with his own identity to the degree that every time an indignity is rendered to the body he thinks it is to some degree being rendered to him; therefore he hangs around a body until it is properly disposed of. When people make wills in which they declare a

certain disposition of the body, it is a very wise thing to do, if you want him to live a happy life elsewhere, to carry out those wishes, because that is his idea of what proper care is.

The Egyptians had the idea of living forever and so they wanted their bodies to live forever, but don't think that a thetan hung around just because his body had been mummified. As far as he was concerned he was on some other genetic line and he would not particularly be upset about his body if it had been hauled out of a tomb and been put up in the Metropolitan Museum. He already would have been too far away from it to worry about it. One very worrisome case was that of a thetan whose skull was used by a carnival who put a motor in the jaws to make them keep on opening, and the thetan just couldn't take it. I actually had to unwrap a preclear from that particular skull. He still had a finger on it even though he had another body. People actually become curators of museums just to keep a finger on a body they might have once had.

Mary Sue is the sweetest tempered girl you ever saw. We went into the British Museum, saw a whole bunch of jewels lying there and she went completely 1.5. She just got so mad that even I couldn't talk her out of it. Finally I took her home, put her on an E-Meter and her total conviction was they were still safe in a tomb someplace.

Every once in a while some fellow will go into some area and go completely berserk and not know quite what is wrong with him. Well, he probably got killed there or something of that nature.

The subject of death is never a very serious one to a Scientologist beyond the fact that he feels kind of sorry for himself sometimes. There was somebody of such terrific elan, who made him real happy and this person was thoughtless enough to dispose of the mock-up and go out of communication and the Scientologist feels unhappy about it, for it is a thoughtless thing for a friend to do. This, by the way, is a very early concept of death. You now more or less progress back to death as it was regarded very early on this particular track in this universe. People didn't regard it very seriously.

Death is in itself a technical subject. You can, with considerable confidence, reassure some husband whose wife is dying or has just died that she got out all right and she is going someplace else to pick up a mock-up. If you got there while the person could still talk, still communicate with you MEST-wise, in the last moments they usually have something spotted, something planned.

Now, sometimes a thetan gets so furious that he gets hallucinatory. He goes around killing all his enemies in all directions and they don't even exist. Motto: Have your reality in good condition before you die. There are many processes which exteriorize people and give them high reality on this. Amongst those processes the key process that produces the phenomena without any great shock is old Stop, Change and Start—it produces exteriorization rather easily.

Thetans do not become body cells, walls and can get out of any trap they are in, but sometimes it is better to be in a trap than nowhere, and that is true of most people.

A thetan very often carries with him a theta body, which he mocked up on the past track and which is a number of facsimiles of old bodies he has misowned and is carrying along with him as control mechanisms which he uses to control the body he is using. He eventually develops quite a heavy, thick, automatic-control theta body. They are quite interesting. Many have electronic claws and all sorts of things. Usually the theta body structure has an electronic beam that goes down each of the fingers and he opens and closes his hand with beams. This is going off into structure, but he sometimes pulls out this theta body complete and simply takes it along.

Losing your pocketbook, some treasured possession or your body are all alike, and because of the forgetter mechanism a great mystery is made out of this. But that is death—phenomena of. And I hope sometime or another you may have no use for this whatsoever.

PROCESSES

When running Problems of Comparable (or incomparable) Magnitude, use the following three parts. Do not omit any part:

1. "Invent a problem of comparable (or incomparable) magnitude to (terminal)."
2. "How could that be a problem to you?"
3. "Can you conceive yourself figuring on that?"

Note: Question 2 may be omitted only if the preclear tells you how it could be a problem to him while answering the first part.

CONNECTEDNESS: Insertion of the word "You" in the command:

"Get the idea of you making that (indicated object) connect with you."

Best,

THE SCALE OF WITHHOLD

*Edited from L. Ron Hubbard's 17th lecture to the 18th American
Advanced Clinical Course in Washington, D.C., on 6 August 1957*

CCH 9, Tone 40 "Keep it from going away" is a withhold process. We know it to have a considerable workability. The road to solids, toleration of solids, lies through withhold. Only we never had a straight wire version on this before or anything that clipped it directly and immediately, but we have it here with Tone 40 "Keep it from going away."

CCH 9 proves that we are dealing with the automaticity which goes as follows: everything that comes along is used by a thetan to keep things from going away. He gets a cannonball in the stomach and says, "Ah, that moment of impact kept the body from going away. So I'll make a picture of the impact"—hence the necessity for pictures—"and have it keep the body from going away from here on out."

That is why people hang on to impact engrams. It is fear of loss—fear that they will lose a body. They do other things. They fill the atmosphere around the body with machinery so that other thetans will be afraid to come into it and take it over, take it away.

"Keeping things from going away" is a basic mechanism which guards against loss. As you know the mind runs on a gradient scale from thought through effort to solids. Actually the mind is already graphed on the tone scale. That is the gradient scale of approach between something that is nothing and total solids at the other end. It isn't that the person himself becomes a total solid, but his approach to solids is on a gradient scale through less solids and misemotions and plain emotions and energies, like aesthetics, to just thought.

When an individual gets hold of something like a cannonball in the stomach, he says, "That certainly got there in a hurry. *That I* can directly handle because it handled me so well." He keeps things from going away. He guards against loss with impacts. He also does other things with impacts. He uses them as control mechanisms. It would not be put beyond a thetan to take a cannonball engram on the right to move his body to the left and vice versa. It is handy and requires no effort. He just puts a slight thought into the line and says, "Move to the right." The cannonball goes into restimulation and he moves over to the right. This could be a good system.

He uses these "keep-it-from-going-aways" as control. In other words, he lets the body be shoved around by things and he keeps those things there and thus he can control the body rather easily—but he deteriorates at the same time.

An individual can also very easily take a cannonball engram and hang it on somebody else's head to make him bow. Very often you start to audit a preclear and you find out that you

are auditing a stomach out of his right arm or a head off his left foot. This is the interchange of facsimiles, and thetans do use facsimiles on others.

Way back on the track there is a thing called the Engram Police. It is quite amusing to get a thetan into some kind of condition where he can be policed—to be confined for thirty days in the space opera trap.

Facsimiles have a use and then they have the lovely attraction of also being mass. A fellow who keeps money for its own sake is the type of person who would keep facsimiles for their own sake.

You, as an auditor, start to look for the significance of why this preclear has this thing stuck in front of his face and you may find that he is merely keeping it for its own sake.

Facsimiles either keep you where you are or the body where it is. They are control mechanisms. Sometimes a thetan will get a series of engrams all hooked together—shoulder with an arrow, stomach with a crossbow through it, leg with a spear in it and a few slinging stones that are back of the left eye. That is a nice combination and moves the body rapidly. You start to shift the engram a little and the body jumps, and you move this at somebody else and he jumps as well.

The *service facsimile* is a series of facsimiles which you call *a* facsimile, which can be applied to the control of others very nicely. But after the individual has been on the track for a few billion years using one of these combinations, he sooner or later flops.

If an individual is to have anything to do with facsimiles, he is going to be somewhere between solids and thought. By gradient scales of concatenation and by lots of postulates about association, which gets into identification, finally this scale can become relatively solid. He can think a thought and turn on the solid at the other end of the scale.

We look this over and we see that the movement and the motionlessness of people can easily be handled by facsimile patterns.

Throwing things away or dispensing with them is much inferior to holding on to them. I near killed some preclears trying to find this out. Which side of the reach-and withdraw mechanism is the one which can be audited? I have found that the “reach” one is good and high toned—not games condition activity. That is communication. Unless you have an opponent situation you would certainly run “reach.”

In view of the fact that everybody has some games condition on almost everything we can run withdraw, and withdraw is the side we can run rather endlessly. (By withdraw we mean “withdraw something from” because this builds up and increases havingness.) “Withdraw it from” or “Hold to yourself” the object holds good anywhere up to a couple of hundred hours of processing. *Man will communicate outward to the degree that he can hold inward and the monitoring thing is the “hold inward.”*

Every time a psycho comes into the foundation we find that they cannot separate anything from them. I used to try to process them on getting them to throw away a single scrap of paper and with very good results. That is an extreme case of hold, hold in to self and withdraw it from others. You will find out that as a person heads on down the scale it gets that bad—but what complicates it is that it has inversions, and right above this “clutch it to the chest this tight” would be an inversion of “throw it away.”

Which one solved it—the “throw it away” or the “clutch”? People cannot throw away ad infinitum. They run out of havingness. We are really only concerned with a person’s holdingness to himself. That gives us an engram bank, puts the bank in restimulation and upsets things endlessly.

Now, “hold it in” solves both “hold it in” and “throw it away.” An individual’s communication is raised by holding things in. Here is a nothing that couldn’t duplicate any mass busy holding mass in to himself. He comes to harm because of it. His abilities go to pieces and his penalties and that sort of thing all accumulate on him. Everything a thetan has done wrong he carries around in little pictures to remind himself how guilty he is. It is probably the result of a number of considerations peculiar only to this universe.

We have to increase a thetan’s ability to hold. When this ability to hold is emphatically good and he himself can do it, he will abandon all these cannonballs in the stomach. In other words, he abandons all this lower scale automaticity of having things held for him.

Holding on to, when it becomes automatic, goes out and beyond one’s power of choice, which automatically can start by power of choice, but after that it has to violate it all the way to be automatic. One doesn’t stop an automaticity. An automaticity, when and if it stops, wears out.

If we have everything holding on to things for us, such as gravity, body holding on to you, and all kinds of things holding on for us, we eventually get to a frame of mind where we feel we are being totally cared for. But at the same time we don’t dare reject anything because it might be some of our hold-on-to mechanism and a thetan doesn’t reject.

For a thetan to re-acquire the ability to hold on to things, is not necessarily the same as a thetan having to destroy all automaticities. Automaticities, quite incidentally, fold up when the thetan starts to re-acquire the powers and abilities contained in an automaticity. *We do not take over automaticities to destroy automaticities. We take over automaticities only to rehabilitate the ability of a thetan.* We just take them over because they are robbing the thetan of his ability to perform. (The inflow principle of the universe is being used to hold on to things rather than the thetan’s ability to hold on to them.)

Power is contained in the ability to maintain a position in space.* If you can’t maintain a position in space you will never have any power. If everything is holding things in to you, they will eventually start moving you around and the moment this happens you no longer have power. An individual’s ability to withhold, his ability to hold and his ability to keep something from going away, are part and parcel of his ability to maintain his own position, situation or location.

Some people start confronting and immediately fly out of their heads. Eventually they get so that they can sit there and confront and hold their position. This is a necessary point in confronting. You have to be able to hold the position in the face of something. Higher than this, or lower down since it goes either way, we realize that to keep something from going away is a sort of confrontingness. Keeping things from going away is an ability which gradually cultivates the ability of the thetan to remain where he is.

If you can keep a wall from going away, the ability to hold still in general is regained. One then is able to confront things and can then recognize solids. First you have to acquire this ability to keep things from going away, then finally discover that you yourself can be stationary—which gives you the idea of confronting—and as soon as you are willing to confront then you can make things more solid. And that is why these three processes, CCH 9, 10 and 11, are run in this manner.

The solids and the solidity that you are willing to confront have an awful lot to do with your ability to hold still or hold things still, and your ability to hold things still has a lot to do with your ability to keep things from going away.

But here is a basic ability in the keeping of a secret—being able to withhold things from others. We have a whole span of keeping things from going away, all of which simply begin with the withheld thought, which is what a secret is, and it scales on further to a withheld object.

When an individual has regained his ability to keep certain things from going away, he could then start in on the basis of holding things still, but he will never hold himself still for the excellent reason that he isn't there to be held still. He can only suppose he is in a place. And this depends upon his ability to hold other things still.

Now, "*Keep it from going away*" solves both outflow and inflow. "*Hold it still*" solves motion and no motion. We have motion and no motion and you really don't solve motion with motion. You solve motion with "*hold stillness*." And the ability to *confront and confound solids solves alike something and nothing*. To be able to confront a solid, then, makes a person capable of confronting no-thing.

Here we have six items and their gradient scale. The first two of these items are a pair called "reach" and "withdraw," or "throw it away" and "hold it to you." And that bracket is solved only by running "**Keep it from going away.**" The next one up is "motion" and "no motion"—action and stillness—and those are solved by running "**Hold it still.**" The last bracket, we have somebody who is terribly fascinated with vaporous "nothingness." To solve nothingness we run solids. The person will graduate rather rapidly up to being able to confront nothing if we run solids. But we *don't* run nothings—conceiving statics. We run solids and what we do is pick him out of those places where he is totally convinced of solids and you walk him back to the world of thought. The gradient scale goes from nothing through emotions, through effort and facsimiles into solids, and you get him back up to where he can handle it on the effort band and up above into thought.

These processes can be run by formal auditing and are not necessarily Tone 40. If you have a very figure-figure case you better run it formal. It will run more easily for you. But first flatten CCH 0, 1, 2, 3 and 4 and then run this combination of processes and win like mad.

**REPORT ON TWO CASES THAT HAVE RECEIVED
PSYCHIATRIC AND EURO-RUSSIAN THERAPY
FROM THE GOVERNMENT**

Recently two cases came to the attention of the HGC which had received former mental "therapy" of the Euro-Russian variety.

One of these, a 32-year-old shipworker, had been four years in prison for having committed a crime of violence.

The other was a 46-year-old man who had received a dishonorable discharge from the Army.

Both cases were picked up at random from the general run of workers.

It was found that both had received mental "treatment." The first had been given considerable attention in prison from "clinical psychologists." The second had had "psychiatric interviews" in the Army.

Neither case had been in any way improved. Both had been antagonized. The first committed a "grand theft" after release from prison and was in no sense a safe factor in society. The other case, even though court-martialed and discharged for drunkenness, was still getting drunk and losing jobs.

These two cases had one thing in common—they had been made contemptuous of mental treatments. They had to be forced into session due to their former experiences.

Both were improved by processing and could have been completed as cases. As soon as this was established they were let go as this was all that we cared to discover.

We can assume that Euro-Russian mental treatment is a liability in that it destroys any faintest hope of recovery. We can also notice that money spent by the prison and the Army was wasted.

It is noticeable that neither the prison nor the Army paid any attention to public safety in these cases. Two men were released in a worsened state and permitted to victimize the public. Thus all measures taken were apparently detrimental to public well-being.

We can further notice that our task in Scientology is being made harder by the presence and practice of Euro-Russian psychotherapy and the handling of criminals in government areas.

A time has come for a reform of these matters.

The correction of prison and Army systems of punishment and the introduction of mental methods which do not make cases less approachable are both needful.

In a national disaster the presence of a large number of criminals and insane in our midst, unreformed and loosed upon us, could well mean the fact that gives us defeat.

The time to start is now, not when a man brings chaos to the whole public.

CLEARING REALITY

A new rule.

In the absence or unreality of a terminal the significance in a process will not function.

In other words, the significance of help will not function on a tooth unless the pc is given a reality on the terminal of a tooth.

On a nervous-dispersed case, there is no real gain in running significance until hellos and okays are run on something.

Command "You say hello to that body." "Have the body say okay to that hello." "Have the body say hello to you." "You say okay to that hello."

When pc has misemotion off the interchange, then run help in brackets on the same terminal.

Establish the reality of a terminal before you try to clear it with significance.

A pc in extreme pain can be audited if one clears reality on the hurting terminal and then runs brackets in help on that terminal. Note: Extreme control must be used in attempting this.

The above applies to objective terminals. Subjective might or might not work.

Does Clearing Cancel the Need for Training?

L. Ron Hubbard

To answer the important question “Does Clearing cancel training?” all you need to do as an auditor is clear someone without training him and then say to him, “All right. Go out and clear people.”

You’ll get a blank stare.

Why?

Because Auditing skill is a discipline in living and a know-how of the parts of life which is in itself something new in the universe. Even OTs don’t have auditing skill since there have never been any auditors behind them.

There is such a thing as learning. There are such things as data.

The fact is, that a cleared Zulu is a cleared Zulu. A cleared advertising man is a cleared advertising man. A cleared Zulu is not a cleared advertising man.

Now a Zulu uncleared has scant chance of becoming an advertising man. But a *cleared* Zulu would probably be able to become one rapidly. And there’s the difference.

Being clear gives one the *potential* of being and makes the being rather easy, and fun. Further, being cleared makes it possible to *continue* to be something. There’s nothing wrong with being clear. A person ought to be. The state is so valuable several hundreds of millions of people in the past 2,500 years have concentrated on nothing else.

But how about getting clear and staying clear forever? The auditor alone *with* his data *well learned* could manage that.

Remember, you were clear once—trillions of years ago. Why didn’t you stay that way? Because the traps were well designed and you had no anatomy of traps.

Well, Scientology does have the anatomy of the traps, the Axioms, the discipline and know-how necessary to handle and control the laws of the universe. Scientology is the data necessary to *live*.

If everyone were now to concentrate only on how to get clear and forget all about how to stay clear, we'd be back in the soup in a century.

Oddly enough, the best time to study auditing is when you're aberrated—when the thing looks impossible, when you can achieve subjective reality on the grimness of it.

The best things a person can do are to (1) get trained and (2) get cleared. Auditors will always be senior to clears. Always. That became very obvious in the 19th ACC. People who weren't clear created clears.

If a person gets cleared first, he can, of course, learn very rapidly how to be a good Scientologist. If he is to be a very good being he will be both a good auditor *and* a clear. That combination cannot be beaten.

If we had only clears and no auditors we'd have another slump ahead. Scientology is not in the experience of anyone's back track. It is itself. It is the one thing senior to life because it handles all factors of life. Scientology could not have happened earlier because there was not enough livingness to study. We have arrived near bottom.

There are people getting cleared now all over the world. Just remember that you share the agreement of the society in which you live. You'll have to be able to audit to skillfully handle aberrated persons. And it will take a lot of auditors to have a cleared society.

Right now it's all right to keep your eye on that first dynamic and get clear. You should. But when, suddenly, you find you've achieved clear, remember when I tell you this one thing:

There are eight dynamics.

You cannot stay clear unless you solve things by the equation of the optimum solution: The greatest good for the greatest number of dynamics. Failing to so solve things dug you in to where you were in the first place.

Scientology got you out.

Stay out by knowing Scientology well.

I look forward to seeing your bright, smiling face, clear or not, in the Academy or an ACC, or both, in D.C., or London, New Zealand, Australia, South Africa. A Clear world to be, needs you as a good and skilled Scientologist.

And that's how you're going to help me.

Okay?

L. RON HUBBARD

P.S. When I solve a case I always ask the pc for one unnamed favor. I've never called these favors in. The favor I tell you now for the first time: Whatever else you are, be a good Scientologist and help me clear these Earth people.

PROCEDURE CCH

Compiled from the Research Writings and Taped Lectures of L. Ron Hubbard

(The following series of PABs are devoted to an elucidation of Procedure CCH and should by no means be taken as a complete exposition of that procedure. This course of information will be fully covered in the newly completed but as yet unpublished basic handbook for all auditors: "The Student Manual" by L. Ron Hubbard, which is the most comprehensive book ever issued from the pen of LRH on auditing procedure and all that a Scientologist should know about how to audit and practice.

Further, the numbers of the CCHs don't necessarily agree with "The Student Manual" except from CCH0 to 5, since these PABs are based on a workable procedure called Procedure CCH [Long Form], given by LRH to the HGC staff auditors here in Washington, D.C., in 1957.)

CCH ZERO:

CCH 0 is firstly establishing the Rudiments of the session, discussing the goals of the preclear for the intensive—also established at the beginning of each separate session—handling the present time problem and clearing the auditor for the preclear. The latter has become very important in modern auditing.

One establishes the session by calling the preclear's attention to the room, the auditing environment, to let him know that he has arrived for a session. This can be done by light "Locational Processing." At this point one doesn't have to belabor the Rudiments.

Following this there is a discussion of the preclear's goals for the session and intensive and making sure that these goals are not wild or completely outside the preclear's reality. He may, for instance, want to be an Operating Thetan while hiding in mystery and he will thus not achieve that goal unless he has full reality on it. In other words, the auditor makes sure that the goals which the preclear has set for himself are goals which the preclear can work towards and attain without much difficulty.

The auditor then defines for himself—but does not inform the preclear of—his own goals and intentions for this session so that he does not grope blindly with techniques without knowing which way and why he is guiding the preclear. Often auditors work in the dark without setting goals for themselves toward which to guide the preclear. Best of all is when the auditor can align the preclear's and his own goals for the intensive.

After this the auditor must inquire if the preclear has any pressing present time problem which needs immediate attention. It is fairly safe to say that every preclear on earth today has a present time problem. The more the preclear has the easier they can be handled. If the problem is not pressing and will not interfere with the processing, then the auditor can continue further.

Should there be a scarcity of problems the preclear will hold on to and dramatize that problem and the situation has to be remedied either with Problems of Comparable or Incomparable Magnitude or by Locational Processing.

A lot here depends upon auditor judgment of the case (and it is, of course, best to have preclears tested at the London or Washington Academies to aid the auditor), but should the preclear be too low to handle the present time problem, the auditor should only run Locational Processing to bring the preclear up to present time. Preclears who are very low toned do not even vaguely have their thinkingness under control, and to run “problems” would be a waste of time.

Since many preclears do not know much about their condition or what they are working towards, LRH has found a very good way to clear this matter. This process is a Rudiment called “Clear the Auditor” and known as “Help.” It is surprising, after running this process for an hour or so, to find that many preclears do not believe that they can be helped by anybody and are unclear as to what the auditor can do for them.

This is the best way of clearing the auditor and making the fact that they can be helped to help themselves clear to them.

The commands for this process are as follows:

“Could I help you?” “How?”
“Could you help me?” “How?”
“Can I help anybody else?” “Who?” “How?”
“Could you help anybody else?” “Who?” “How?”
“Do other people ever help other people?” “How?”
“Do men ever help women?” “How?”

and the auditor just does this on a big, long bracket.

Of course, it is necessary to see that the preclear does not give machine answers and that he is fairly sure that this can be done. Two-way communication here is important and a lot of it could be used.

This process becomes a fantastic way of dealing with the preclear and is valuable in many ways. For example, you can take Father and Mother valences which are usually aberrative and run them on Help in brackets.

Running Help is necessary on a case that is hung up, because the only reason he is sitting there is to “waste” help. You can run such a case on any process, no matter how excellent, on a basis of “wasting help” until the case simply cannot find enough ways to waste help and he goes down the tone scale.

One has to understand that the case which isn’t changing is trying to waste help. It isn’t a case of “finding the auditor” in the Rudiments nowadays, but of “clearing the auditor.” The only point on which he can be cleared is “Help”—**“Can I help you?” or “Can you help me?”** and asking “How?” each time to keep the command real to the preclear and applicable. No conditional answers are accepted and the preclear has to find *real* answers.

The whole purpose of CCH 0 to quote from “The Student Manual,” is *“to make known the beginning of a session to a preclear and the auditor so that no error as to its beginning is made; to put the preclear in a condition to be audited.”*

CCH 1:

CCH 1 is known as “Give Me That Hand,” and is one of the most effective entrances to cases yet devised. Apart from having great beneficial effects it is also used as a Rudiment. For

example, soon the preclear finds that there is a mass sitting in front of him (the body of the auditor) and that he is occupying a mass in the chair—and thus the environment takes on a more real shape.

To illustrate this better, here is a brief description from an LRH lecture to the Washington, D.C., HGC staff auditors: “Most preclears are completely unaware of their own body or that of the auditor. GMTH brings the preclear back onto the Scale of Reality, which runs this way (from the top of scale down):

Postulates, Agreements, Solids (masses, terminals), Communication Lines But No Terminals, which dwindles into Confused And Complex Communication Lines, and eventually into No Lines—and you’ve got mystery.

“Applying the Scale of Reality to GMTH, you have a preclear who is in mystery. You take his hand often enough with an acknowledgment (‘Thank you’) at the execution of the command and he slowly, through some dope-off, becomes aware of a solid line of communication—your arm grasping his hand to his arm—and that becomes more solid until he goes through the complexities and confusions of communication lines and gets them straight enough to recognize a solid terminal sitting in front of him (the auditor’s body sitting there, a mass, a terminal). He thus gets into communication with a solid terminal. As he comes upscale he does not have to use solid comm lines to communicate but can do so by agreements (symbols, words) and higher upscale just by postulate.

“As Opening Procedure by Duplication demonstrated the accuracy of the Know to Mystery Scale, so Give Me That Hand proves the accuracy of the Sub-Zero Tone Scale and the Reality Scale. Preclears will go into dope-off and a state of confusion, engrams will fly off as the complexities and confusions of comm lines fade into where his and your hands will become real to him. He will most likely recognize you as the first real terminal he has ever had.”

This is a Tone 40 process.

Tone 40 has been defined as “*Giving a command and just knowing that it will be executed despite any contrary appearances.*” (This is not the 18th ACC definition.) In other words, Tone 40 is positive postulating.

“The Student Manual” has the following to say about the procedure and the running of this unique process: “Physical action of taking hand when not given and then replacing it in the preclear’s lap and ‘Thank you’ ending the cycle. It is Tone 40, with clear intention, one command in one unit of time, no originations of preclear acknowledged in any way, verbally or physically.” However, one can freeze the process after a cycle of action has been completed if one is sure that something is occurring which needs further “fishing” for a cognition.

This is the first step to the control of the preclear’s body, which is the basic element of Control-C-H (CCH). We first have to bring the preclear’s body under your and then his control before we can attempt to bring his attention or thinkingness under control. And processing follows that basic pattern all the time—control of body, attention and thinkingness.

This is a very precise process, being Tone 40, and Tone 40 demands accurate precision into which one has to be trained to be efficient. Further information will be found in “The Student Manual,” which will be published shortly, or in the Validation Courses run in Washington, London or by Gold Seal Certificate holders. As a last note on this process, there is a negative side to this if your preclear is “withholding” communication from you and it smoothly runs in smooth Tone 40 as follows: “**Don’t give me that hand.**” “**Thank you.**”

The preclear will get frantic after a while and want to give you his hand. By telling him to withhold his hand, and acknowledging it so that he receives the acknowledgment, you are telling him to do what he has been doing all his life and consequently ruin that mechanism which has been “withholding” all the while, when you take over the automaticity.

HCO BULLETIN OF 2 APRIL 1958

ARC IN COMM COURSE

There are two types of Auditing. Both include control. They are called "Formal Auditing" and "Tone 40 Auditing".

The first is control by ARC. The second is control by direct Tone 40 command.

The first, Control by ARC, is taught in Comm Course. The second, Control by Tone 40, is taught in Upper Indoc.

The two are never mixed in teaching. Tone 40 is never taught in a Comm Course and is not even permitted. ARC is not taught in Upper Indoc.

The most widespread weakness in auditors prior to this date is an inability to use step one of Clear Procedure (Participation by the pc). This is only good ARC in the Training Drills of Comm Course. Auditors are now too prone to let CCH Ob Help do the work. Auditors fail to make the pc feel they are interested in the pc when they handle him with poor ARC.

We care nothing about ARC in Upper Indoc. We want *command*, we want Tone 40. We do not even handle pc origins in Upper Indoc.

Students must understand that there *are* two types of auditing. They should realize that Tone 40 is for the unconscious, the psycho, the non-communicative, the electric shock case pc. The student should realize that ARC formal auditing is not chatty or yap-yap, but it is itself. It has warmth, humanity, understanding and interest in it.

Academy Dir of Tr, Comm Course and Upper Indoc Instructors should keep this in their hats as needful technical data, since we *must* turn out auditors capable of handling pcs with ARC.

HCO BULLETIN OF 8 APRIL 1958

AUDITING THE PC ON CLEAR PROCEDURE

We must not lose sight of the fact that only TWO processes clear a pc. All others only support these TWO and make it possible to run these two.

These processes are:

1. Help, CCH Ob
2. Step 6, Mock-ups. Keep it from going away, Hold it still, Make it more solid.

First in auditing we have to get pc to sit there and be willing to be audited. We have for this many processes. Best is TR 5 "You make that body sit in that chair" "Thank you".

Next we are continually confronted with keeping pc in session. This is done with good ARC. No process can supplant good auditor ARC. Pc must know auditor is interested in him. This does not mean auditor does not control pc or let him gabble but it does mean that pc and auditor have ARC.

The next condition which must be met is the eradication of present time problems. This is done by "What part of that problem could you be responsible for?"

Psychosomatics may come under head of a p.t. problem. One runs hellos and okays on the terminal to improve reality on it. "Say hello to that (body part)—have it say okay to you. Have it say hello to you. You say okay to it." One can also run "What part of that (body part) can you be responsible for?" One can also have pc mock up "unknown (body part)". One can also clear help on that body part. As a psychosomatic is a concentration of attention it fulfills the condition of a p.t. problem which is "any worry that keeps a pc out of session, which worry must exist in present time in the real universe". One can run all of these on a resistant psychosomatic.

One should clear help on objects and terminals connected with the pc's job.

One should clear help on the terminals of the various dynamics.

With an E-Meter needle nul and free on help, one can go to Step 6. This doesn't mean that one should not later return to help. It may be Step 6 must be approached with S-C-S and Connectedness. The needle will tell. A heavily stuck needle is worse than a wildly surging one. Connectedness clears stuck needles.

Step 6 can be run just as in the book "Clear Procedure." [See page 172.] If it is too tough for pc, run help and responsibility on pictures.

Then complete Step 6 with great thoroughness.

Rising Scale Processing Modern Version is very good. However, even though it works low scale, it is in reality an OT process, not a clear process. Rising Scale can be run on any consideration. The basic is "Get the idea it is impossible to reach anything". "Now Postulate that you can reach everything." There is no fancier version. There are other buttons besides reach. The basic command is get the idea negative. Postulate the positive.

This is clearing. It works as well as one directly approaches the task of clearing with the above.

But clearing cannot happen in the presence of

1. A present time problem not flat.
2. Poor auditor-pc ARC.
3. Putting the pc at the effect end of life in or out of session during an intensive.
4. Detouring into contributory processes in the belief they will clear rather than set up a case. And
5. Leaving untouched zones of irresponsibility and zones of refused help.

I wish you good luck in clearing.

Best,

HCO BULLETIN OF 8 APRIL AD 8
Issue II

A PAIR OF PROCESSES

Now and then I overhaul some old process once in use and see what can be done to make it work.

Op Pro by Dup and Forgetting are a pair that recently showed up as having a possible specific value—i.e. to create a specific effect upon a specific difficulty.

Evidently Admiration and Critical are a dichotomy. Maxine Kozak suggests that Duplication is Admiration. From this I looked over Critical on the APA (OCA) profile and saw that the low critical might be influenced by Op Pro by Dup. A test should be made of this.

The other process is less nebulous in action. The specific for a bad memory is Forgetting run in Brackets. You will ordinarily find an automaticity of forgetting when you ask “Recall something you wouldn’t mind other people forgetting.” This is a “bad memory”. Nothing like a good conscience to retain a good memory.

The commands of Forgetting would be a 6-way bracket.

Recall (or think of) something you wouldn’t mind

1. Forgetting yourself
2. Another person forgetting
3. Forgetting about another
4. Another forgetting about you
5. Other people forgetting
6. Another person forgetting about another person.

Each command is cleared. The commands are run in sequence rather than repetition.

This is a low scale process. Goes lower than “Not know” but graduates into it.

This is a basic on unknowns and fields of whatever kind.

HCO BULLETIN OF 11 APRIL 1958

CCH 88—ENFORCED NOTHINGNESS

When the following command is relatively flat on an auditor or instructor he may run it on HGC pcs and teach it as part of curriculum to students. But it must be somewhat flat on auditors and instructors before use or taught publicly.

The command is a repetitive command. It is used with some 2-way comm to punch cognitions.

The name of the process is Enforced Nothingness. Number CCH 88.

The command is: "Mock up some people who made you want to make nothing of things."

This increases havingness all the way.

The person the auditor wants mocked up will be invisible to the pc and pc should keep on trying to mock the person up, eyes open, until he can do so.

I developed this process to vanquish fields and thus speed clearing. It belongs anywhere prior to Step 6 of Clear Procedure.

In Creative Processing we knew good results were achieved when we used a gradient scale to get the pc to improve an ability to mock up someone. The above command gives the reason this was necessary.

Considerable relief and calmness follows a run on this process.

High critical is cured by this process.

Failure to help is the basis of the collapse of a desire to make nothing of things and the process therefore ranks in importance near to help.

A subjective reality on the process is necessary for skilled use.

The process can in a pinch be self-audited by reading the command off sheet. The process is unlimited.

I think I have discovered in Enforced Nothingness a direct route to bringing any pc who is under some control up to the ability to conceive a static. And therefore the key to all exteriorization, havingness and perception.

The process cures colds, tiredness and psychosomatics.

PROCEDURE CCH CONTINUED

Compiled from the Research Writings and Taped Lectures of L. Ron Hubbard

CCH 2:

CCH 2 is Tone 40 8-C, which has the following commands: **“With that body’s eyes look at that wall.” “Thank you.” “Walk that body over to that wall.” “Thank you.” “With that right hand touch that wall.” “Thank you.” “Turn that body around.” “Thank you.”**

One doesn’t acknowledge any of the preclear’s originations and can only “freeze” the command after a cycle of action has been completed. As with all Tone 40 processes this is a precision process and needs validation training for execution on an optimum level.

The intention or goal of this process is to bring the preclear’s body further under control and to insure that he does “precisely” what you tell him to do, and it is a basic step for getting his thinkingness under your command as well. By showing the preclear you can control his body, you are actually inviting him to control it and to take some responsibility for it.

Don’t be surprised if the preclear exteriorizes quickly on this technique. By taking control of the body, he will go in and out of it and eventually feel that the best way to handle it is from a few feet behind his head. As an auditor one must beware of not-ising this phenomenon and should communicate about it when one “freezes” the session and make sure that the preclear understands this and that it is to be expected.

This is an ambulatory process and the auditor should be next to or with his preclear at all times during the running of this technique.

Don’t avoid this process or not administer enough, since 8-C, Tone 40 or otherwise, has been a stable processing datum for over three years and will continue to remain as such for a considerable period of time.

CCH 3:

This is the process that produces some of those fantastic IQ changes, for it deals directly with the preclear’s learning rate and his ability to duplicate communications. Bringing up his non-language factor in the IQ has the effect of bringing the preclear into a better control of his environment and into handling the people and objects in his immediate surroundings.

Its purpose, according to “The Student Manual,” is *“to bring up preclear’s communication with control and duplication. (Control + Duplication = Communication.)”*

Book Mimicry, as this process is called, is run in the following manner: Auditor tells the preclear that he is going to make a motion with the book and that he wants the preclear to duplicate the auditor's motion mirror-image-wise. He hands the book to the preclear and then waits for the preclear to execute that motion. He acknowledges the execution of that command and then asks the preclear if he **“is satisfied that he duplicated that command.”** If the preclear says he is satisfied, and the auditor is sure he did not do it satisfactorily, the auditor does the same command until the preclear *and* the auditor are both satisfied.

There is a gradient scale of simplicities and complexities here. One first starts with fairly simple commands, graduating into complexities. LRH found that straight lines and angles are simplicities, whereas circles and arcs are complexities. Preclears who like complexities will be able to do the difficult ones with great ease while finding the simple motions burdensome. One keeps on doing both until the preclear can do each with relative ease.

In order to do this process properly the preclear has to be in present time, and that will unstick him from the rest points on the track, and it has been noted by many auditors that engrams and valences turn on, also a lot of dope-off and anaten which must naturally be run flat.

For the preclear who is in manic motion, small, very slow movements will cause a panic and should be done until he can tolerate the no-motion with ease and vice versa.

One must be sure, however, to remember the commands one has given in case the preclear cannot execute them and one has to do it again. Also, we are interested in giving our preclears only wins and one should work closely within that framework. Give the preclear only the commands, on a gradient scale towards difficulties, that he can execute. It does not mean that one cannot make it complex, but one mustn't give impossible commands and so confuse and invalidate the certainty that he can duplicate a communication between himself and another terminal.

This is not a Tone 40 process, but the auditor does not talk until the motion he has made is executed unless the preclear has as-ised the command before he started the motion or finds himself unable to complete it.

Since engrams do appear and odd sensations and somatics turn on, communicate with the preclear about them, but remember the intention of the process and do not go chasing after facsimiles.

CCH 4:

CCH 4 is “Hand Space Mimicry” and the purpose of this process as per “The Student Manual” is *“to develop reality on the auditor using the reality scale (solid comm line) and to get the preclear into communication by control + duplication.”*

It is run as follows: Auditor and preclear sit straight opposite each other. The auditor then raises his two hands with his palms facing the preclear and says, **“Put those hands against mine, follow them and contribute to their motion.”** He then makes a simple motion with his right and then left hand and asks the preclear, **“Did you contribute to the motion?”** **“Good.”** **“Put those hands in your lap.”** After this has been run flat, increase the space between the palms of the auditor's and preclear's hands by half an inch. When this is flat gradually increase the space between the auditor's and preclear's palms until the preclear can follow the motion yards away.

There is a lot of two-way communication during the running of this process, and the auditor must allow the communication which is born from the duplication and control to come forth without restraining the preclear's desires to do so.

The distance factor here (affinity in the communication formula) will affect various preclears in different ways, and it is of interest that the preclear will communicate a lot about love and the second dynamic to the auditor which can then be viewed. There seems to be a certain distance factor here for each preclear, and once the auditor moves out of it suddenly without that gradient increase in space the preclear will go out of communication with the auditor, and the process should therefore be kept to small increases only.

The strained feeling in the preclear's (and sometimes auditor's) wrists is not a tiredness as one may suppose, but will disappear as he gets into communication with the auditor. He will go through a lot of anaten and dope-off, but should come out very bright and in present time and in much better shape than when the session started. HE will be able to communicate and recognize your body as a solid terminal opposite his and will really find the auditor during the process if he has not done so already. His reality level will increase to the point where he can communicate by agreement only and know that he is doing so (see the last PAB on the Scale of Reality).

This is not a Tone 40 process and should not be run as such.

CCH 0, 1, 2, 3 and 4 are the essential basics to the running of every case, and where these are neglected (where control in these facets has been neglected) there will only be failure. It is therefore remunerative in the long run to really flatten each process.

The workability of these processes is astonishing and is a delight in the hands of a Validated Auditor who has been coached on them himself. If ever processes demanded that one knows HOW to run them, these do, for the untrained auditor might just confuse both himself and the preclear if he doesn't know what to expect and how to handle that which is sure to arise from such processes as CCH.

One can run these processes over and over again. Run 0, 1, 2 and either 3 or 4, then back to CCH I—right hand, through the other steps, left hand, through the other steps, both hands, and up again, or instead of using **“Give me that hand”** the auditor can run **“Don't give me that hand”**—right, left and “those hands,” and so forth.

Somewhere along the line one of these processes is going to bite and then each and every one of them will do the same. If nothing happens it means that there is a threat to the preclear's havingness and that the present time problem should be cleared while “help” is run again, after which one of the four CCHs should open up the preclear's bank.

As an example, here is a case history from one of the Washington HGC staff auditors: Preclear, a business man, age 48, who had numerous pressing present time problems in the home environment. His profile proved that he was totally unable to handle his numerous present time problems as his ability to communicate was on the very low minus side. What's more, his profile showed that he should really be a three-week preclear but was accepted on the understanding that since he couldn't possibly afford more time, he would be given this week as an exception to the rule since he came a very long way (the HGC doesn't accept for processing a 25-hour case who really needs 75 hours).

LRH looked at this profile and suggested quite calmly to the auditor that CCH steps 0 to 5 should do it.

The preclear was out of communication. He did not volunteer any information and seemed to get nothing out of the first 7 1/2 hours when the first 5 steps were covered. (His present time problems were handled by Locational Processing.) Since this preclear was withholding information the auditor ran him on **“Don't give me that hand,”** which started biting slightly, a few minor somatics shot through various areas of his body and facsimiles darted in and out of his field, but the preclear still felt that this meant nothing. (His critical level was high and he was making nothing out of the auditing.) But when the auditor arrived at Hand Space Mimicry, the preclear burst open for he couldn't tolerate the close contact with the

auditor and volunteered information about a second dynamic restimulation which blew the aberration out of the way and opened the Case.

After that the preclear exteriorized with full visio and sonic when run on Tone 40 8-C, felt that he could control both his body and his environment much more ably and with greater certainty as to what he was doing.

Further up the line on Control Trio and Trio, the preclear ran each one of the six commands flat in approximately half an hour, with cognitions ranging from the first to eighth dynamic, each intimately related to his own life and livingness, and the preclear is a clear.

This preclear still has his present time problems at home, but feels much more confident about handling them and the auditor reports that he is moving heaven and earth to return for the outstanding two weeks.

This might not have been possible on older technologies since the factor of control wasn't so neatly and exactly organized by LRH as it is now, but the fact remains, much against some people's better wishes, that one has to be *coached* into knowing through experience to fully comprehend the power of Procedure CCH.

VITAL TRAINING DATA FOR TRAINING HATS AND REGISTRAR

Students in the Academy are auditors. They are not preclears. Emphasis is on auditors, not pcs.

The goal of the Academy is to produce auditors of such quality that we would be willing to hire them in the HGC. We don't graduate those we wouldn't.

Training staff can refuse a student at any time on grounds of inadequate financial arrangements. In which event the student applicant is returned to Registrar.

The Academy is not a clinic and concerns about cases belong to the HGC and are so referred.

How We Work on the Third Dynamic

L. Ron Hubbard

It is obvious that a barbarian society, leaving all to chance, believing in luck and irresponsibility, needs direction.

If it cannot receive that direction from its elected leaders, it is soon drowned in confusion.

This is particularly true of *barbarian* societies. By barbarian, we mean, of course, “lacking in social graces.” A nation may have huge machines, projectiles of great violence and stoves that do all the cooking and yet be a complete barbarism socially.

The activities of a barbarism one against another are punishment, revilement, contest for first dynamic supremacy with no thought of the rights of others.

The barbarism solves political problems with brutality, crime with punishment and social ills with degradation.

It is fairly obvious then that the United States of America—and the Western world—is a barbarism, wearing nylon shirts instead of bearskins, lip rouge rather than tattoo tabu marks, but subscribing to the Code of Hammurabi just the same.

The social code used identifies the barbarism and an “eye for an eye” is little better than law for the sake of sadism, mere animalism.

You can know a barbarism by its witch doctors, its concept of the other man’s mind. In this society the mental witch doctor, comfortably enfranchised by the A.P.A., believes sincerely Man is an animal without soul or hope and, following Pavlov and other Russian teachings, that Man works only for reward like “any other dog.”

These are the brands of barbarism. Hate is deified above love, a deterrent to an action is better than a communication, the delusion is more palatable than the truth.

If we place the government on our chart of human evaluation, we find a craven psychotic. What would you think of the sanity of a man who sits in his house all day every day loading guns for fear of some mythical enemy? What would you think of a person who used violence against the weak, the helpless, women and children? What would you think of someone who solved all his problems with threats of violence? You’d be right. Such a person would be insane. Just add up the characteristics of a government today, apply them as if done by an

individual and make up your mind. Governments are insane. It is a big thought and one necessary to digest if you are not going to go around all your life snarling impotently against "government stupidity." The insane aren't always stupid but they are certainly insane.

Of course you could define government as "that body created by the aggregate irresponsibility of a people." The insane are irresponsible. That is why they are insane. If you lump all the irresponsibility in a nation into one body you would then have an insane body. Thus the government temper.

Now it is a fact that help and destroy are opposite ends of the same string. When a person can no longer help he seeks to destroy. Destroy is the same as help to a psychiatrist. Total identification. But more of this elsewhere. It is enough here to demonstrate that if you try to help an insane body it responds by seeking to destroy you. This is nothing to be afraid of since the ability to direct in an insane body is *very* poor. Thus the blows usually go awry. One sees it in government when the police arrest and question the man who was attacked by a thug. The police forget the thug and arrest the innocent.

Now all this comes about only when you have a barbarism, where the social training of each person is so poor as to amount to a collective insanity.

To cure a barbarism one must make men socially grow up. And that is done with individuals. One works with individual people, not with groups.

We in Scientology have done a "power of growing up," me and you both. We are strong in that we have the ability to make other people "grow up." Our target is the individual if we wish to increase the group level of responsibility.

To properly hit the target each of us needs to be (1) a good example in our own case and (2) well trained and secure in our Scientology skills.

All we really have to do to win is to get clear and clear others, the while keeping on with the routine demands of life.

As startling as clearing is today, as impressive as it is to learn Scientology well at the Academy, yet these things can be done rather easily.

Clear is now no esoteric goal. It can be reached in a few weeks of highly skilled auditing.

Getting to be an excellent auditor is a must if one merely wishes to live. But one dynamic isn't enough. It takes all the dynamics to make a freedom. Therefore to be clear is not enough. To be a cleared auditor and to handle and audit people is a must if we wish to be totally free.

Face it. We live in a barbarism. The shiny cars are driven by degraded men. You won't be free unless they are.

It has taken me ten hard years to make clearing everyone an accomplished fact. That I could do it was not enough. That you could do it was part of the major plan.

My purpose is to bring a barbarism out of the mud it thinks conceived it and to form here on Earth a civilization based on human understanding, not violence.

That's a big purpose. A broad field. A star-high goal.

But I think it's your purpose, too.

Best,

SIGNS OF SUCCESS

Whenever we're really winning the squirrels start to scream. You can tell if somebody is a squirrel. They howl or make trouble only when we're winning.

Spectacular success can quadruple the number of complaints. Tell the complainers: "Come in, get clear." Otherwise skip it.

To understand a squirrel, consider the reaction of somebody who could not run the fifth leg of help "How could another person help another person". The thought of this drives some people spinny. That's a squirrel. They can't view other people helping others without going berserk.

There's nothing personal in having squirrels. Even heroes can have lice.

Best,

PROCEDURE CCH CONTINUED

Compiled from the Research Writings and Taped Lectures of L. Ron Hubbard

CCH 5:

This is Tone 40 Locational Processing, and the purpose of this process is to bring the preclear's attention under control and unfix it from the facsimiles which usually control his attention. It is also a most valuable process to run when the preclear's communication is too poor to run the present time problems with Problems of Comparable/Incomparable Magnitude.

It brings the preclear from the problem in which he is interiorized into a recognition of the environment, which gives him havingness, and he can consequently unfix his attention from the problem. It brings him into present time—the 6th dynamic—and he can have mass again.

Since this is a Tone 40 process the auditor does not acknowledge idle chatter from the preclear, but should HE say something, the process may be frozen after a few more commands have been executed and the auditor can discuss or "fish" the cognition. The auditor must point to and clearly indicate the object which he wants the preclear to see and must make sure that his "thank you" stops the preclear from getting stuck on the object at which he looks.

The commands are "**With that body's eyes notice that (indicated object, wall, etc.).**" When the preclear has done so the auditor says "Thank you" with such intention as to stop the cycle of action completely and to start a new command in present time. If the acknowledgment really reached the preclear he will immediately look away from the object at which he was looking and look at you, smile and seem pleased. Incidentally, the auditor points to both *that body* and *that object*.

While using this process in CCH 0, the handling of the present time problem, it can be used as either ordinary or Tone 40 Locational.

CCH 6:

To bring the preclear's attention further and fully under control of the auditor, Opening Procedure by Duplication 1957, with the following commands, is used: (Auditor takes a book and bottle, placing them some distance apart on tables so that the preclear doesn't have to bend.) "**With that body's eyes look at that book.**" "**Thank you.**" "**Walk that body over to that book.**" "**Thank you.**" (Auditor each time with the commands points to "that body" and "that book.") "**With that hand pick up that book.**" "**Thank you.**" "**Put that book down in exactly the same place.**" "**Thank you.**" "**Turn that body round.**" "**Thank you.**" "**With that body's eyes look at that bottle,**" etc.

It is a Tone 40 process and should be run precisely, making sure that the preclear does not anticipate or distort the command. Duplication + Control = Communication is a formula which is well worth remembering during the running of all Tone 40 processes. This does not mean that if the preclear seems to be communicating, he is, for a lot of his machinery will go into restimulation during this process and one must be able to differentiate between the preclear's originations and those of his bank.

This, being one of the most arduous processes in Scientology, should be run in one session until flat; otherwise the preclear will be hung up at the point where the process was ended and it will unnecessarily retard the progress which Procedure CCH brings about.

These two processes, when well run, will bring the preclear's attention under the direction of the auditor. Since duplication will straighten out all the vias and twists the preclear might have in receiving the exact intention of the command which originated from the auditor, the auditor may then proceed to bring the preclear's thinkingness under his control with

CCH 7: Tone 40 8-C—"Keep it from going away,"
CCH 8: Tone 40 8-C—"Hold it still," and
CCH 9: Tone 40 8-C—"Make it a little more solid,"

which should be run as a combo [combination of processes] one after the other until each one is flat.

As with most processes, make sure that the command is cleared before embarked upon, and then after a while, if the preclear doesn't cognite or have any facsimiles, find out "how" and "what" he is doing, for there might still be a possibility that due to semantic difficulties he misunderstood the command and is really running another.

"Keep it from going away" and "Hold it still," apart from the fundamental value in cognitions, are to exercise the preclear's ability to control facsimiles—to keep them from going away and to hold them still when he later is going to run Then and Now Solids, which demands just that. Preclears who have been involved in Eastern teachings will cognite during running "Hold it still" and find out a lot about "serenity" and the eighth dynamic. All the things which the preclear has been keeping from going away will come to view. These are good exteriorizing processes. Refer to earlier PABs for further information regarding these processes.

"Make it a little more solid" is the first exercise in making MEST and facsimiles a little more solid and must be done before the preclear can progress to Then and Now Solids. His abilities to keep things from going away, hold them still and make them a little more solid must be thoroughly checked and rechecked, and the auditor must be sure in his own mind that the preclear has acquired these abilities.

Making things a little more solid is just what it says. The preclear does not have to make things very massive, but he should be aware of an increase in the mass, weight and density of the structure of that which he is making more solid. This process will increase his reality on the Prelogics and reverse the flow of solids. It will remedy the preclear's havingness and push him further up the Scale of Reality.

The commands for the three Tone 40 8-Cs are: **"With that body's eyes look at that (indicated object)."** **"Thank you."** **"Walk that body over to that (indicated object)."** **"With those hands touch that (indicated object)."** **"Thank you."** **"Keep it from going away."** **"Hold it still."** **"Make it a little more solid."** Run each one flat individually.

Since these are Tone 40 processes, precision of execution of commands is closely observed by the auditor.

“These processes include a control of thinkingness of the preclear and therefore should be run with a tremendous amount of auditor trust of the preclear and should not be run until the lower levels of CCH are to some degree flat, as they will give the preclear losses. “—LRH from “The Student Manual.”

CCH 12 and CCH 13:

CCH 12 is known as “Limited Subjective Havingness.” The commands for this set of processes are: **“What can you mock up?”** Preclear answers and the auditor says, “O.K.” to the preclear’s answer and then tells him: **“Mock up (whatever the preclear said he could mock up).”** “O.K.” **“Shove it into yourself.”** Run this flat then proceed in the same way except for then having the preclear **“Let it remain where it is.”** When this is flat enter on the third part, which is **“Throw it away.”**

Have the preclear shove the mock-ups into “himself” and not the body. Remember it is “have” for the thetan and “can’t have” for the body. It is important here to remedy the havingness of the preclear’s bank before going on to Then and Now Solids.

Should the preclear’s field be black, then run the following process until it clears up: Remedy the field with blackness. Have him mock it up, let it remain and throw it away. This preclear is holding on to blackness since he does not have enough blackness. This is remedying the havingness with blackness of which he has a scarcity.

If the preclear’s field is invisibility, put glass objects of all sorts and sizes on a table next to him and one after another have him **“Keep it from going away”** until his field returns.

As with all other processes in Scientology we are only interested in giving our preclears wins, and it is therefore necessary to see that he completes each step successfully before continuing with the next process.

Should none of these processes do what is required, CCH has not been properly applied and steps 0 to 5 should be run once more and the auditor can then run Control Trio, which is being spoken about in a later PAB.

CCH 13 is “Subjective Solids” and the first exercise to make things solid subjectively. The commands for this process are: **“What can you mock up?”** (which is asked every time one changes the type of mock-ups). “O.K.” **“Mock up (whatever the preclear said he could mock up).”** “O.K.” **“Now make it a little more solid.”** When this is done the auditor checks with **“Did you do it?”** for preclears often say they have when they didn’t execute the command.

Start this on a gradient scale. As long as he makes only a few atoms of the mock-up a *little* more solid the auditor should be satisfied. The preclear here will break through Effort on the Know to Mystery Scale and as he proceeds use less and less effort until he just postulates the solidity.

It is most important to ask the preclear what he is doing, how he is doing it to insure that he IS doing it properly.

Smoothness of auditing is essential. One does not desire to break ARC with the preclear, but a certain amount of policing is necessary and this is a “certainty” process. It is important that the preclear find the process “real,” otherwise he is not under control and will not be able to do Then and Now Solids, to which all these other processes lead.

HCO BULLETIN OF 2 MAY 1958

BEINGNESS AGAIN

The best solution to valences is beingness processing.

Help on valences is excellent, even phenomenal and should not be ignored.

Problems of Comparable Magnitude to a selected person cannot be ignored.

But an understanding of valences gives us a new look at processes.

In the first place a valence is a beingness. Bad, crazy or superb, a valence is still a beingness.

A thetan has a basic personality. But if this is too thoroughly invalidated, a thetan assumes some invented valence. And if this is invalidated he then eventually completes the DEI Scale on Beingness.

The things wrong with a thetan are the lower harmonics of the characteristics of a thetan. You could say carelessly that the only thing wrong with a person is himself. Let us say more accurately that the only thing wrong with a person is his abandonment of *self* and the assumption of other selves. Because there is a self, the assumption of *selves* is possible.

We find that the APA or OCA is a picture of a *self* What self is another matter. *All* selves other than *true self* are less honest and ethical since the thetan has a poorer opinion of others than he does of himself in the basic state.

To change an APA or OCA it is necessary to shift *selves*.

It is fascinating that theft of *objects* is really an effort to steal a self. Objects represent selves to others. Thieves and what they steal cannot be understood by the logic of their material needs. They steal tokens of selves and hope to assume thereby another self. It is sometimes not amusing to me to be missing my lecture notes or a book from my shelf. This is covert theft of beingness. People sometimes get anxious to be me—I know not why. They wind up stealing my things. The theft is irrational. The articles were not later cherished and all were put away or thrown away when the beingness did not materialize. Perhaps it is bad taste to mention this from my personal viewpoint but from where else should I look? And it has all happened to you, too. The senselessness of the items selected probably puzzled you when they were stolen. But they were identified with you. You couldn't be stolen, so you lost your wife, your husband or your little trinket, "meaningless" perhaps to anyone but you.

A person has to discover he can't be you before he steals your things without credit. When he discovers he still isn't you, he damns you to all. He finally cannot be you, so he wastes you. And thus the DEI Scale of beingness is completed.

One answer to this is never be a desirable you. And never get famous. A far better answer is to understand it, for by understanding alone you can prevent it.

Thus, the major tears of the world are based on beingness. Insanity, heartbreak, bitter lives all stem from the same source.

There is also an acceptance level of beingness, based on a viewpoint of an already alloyed beingness. Some people can only have the beingness of the criminal or the insane. Thus there is yet another door to cracking cases, another latchstring to the problem of Man.

There is also the problem of acceptable beingness, probably more important than acceptance level. What Beingness is acceptable to various people in the pc's life?

There is also such a thing as taking on another's unwanted beingness to help him or her. Such as taking a psychosomatic.

We have had many beingness processes. Like we did at first with help, we missed a point. The preclear does not know what "help" means. And he does not know what beingness means. He is below cognition level on them. All help or beingness actions he undertakes are reactive, not analytical.

To overcome this, one enters the case of the pc at the Inhibit end of the DEI Scale. He has the pc waste the item in brackets. He asks the pc to waste help, to waste the help of another, to have another waste help for himself and so on.

Thus it is with beingness. Have the pc waste it.

Man tears his idols apart trying to get a bit of desirable beingness. Every thetan wants to heal at sight; so they crucified Christ. *And* sold pieces of the cross.

A pc who assumes the aches of another wishes to be that other. He is short on beingness. He accepts it obsessively.

Wearing Empress Eugenie's hats is understandable. What woman wouldn't be an empress? But wearing the crooked back of the Hunchback of Notre Dame isn't quite so comprehensible—if you don't know Scientology.

One follows knowing assumptions of beingness with unknowing assumptions. The thief knows not why he steals. The bishop knows little of why he cherishes the bit of the True Cross.

And none of them know, so invalidated has it become, that each has a basic beingness, complete. And that beingness is important to you. It is the best beingness there is. And it is important to me, how important can only be viewed through these eyes that see the magnitude of the job. Why should anyone steal when he can have the best there is for the asking? And why steal from me and thee for we alone in all Man's history can give him the priceless gift of himself.

Just as the thief knows not why he steals, so does the archbishop fail to know why he dons a robe.

To abandon life is to waste all beingness. There is the preclear who sits at succumb.

Try it on a pc. You'll be surprised.

This is one of the OT steps on which I am working for the 20th ACC.

Assists in Scientology

L. Ron Hubbard

DEFINITION: AN ASSIST: An action undertaken by a minister to assist the spirit to confront physical, difficulties which can then be cared for with medical methodology by a medical doctor as needful.

An assist is not normally done in a formal auditing session. The way the term has been used is a very simple processing activity to relieve an immediate troublesome difficulty.

An assist is much more specifically and definitely anything which is done to alleviate a present-time discomfort. It is differentiated from auditing at large by defining auditing as an activity directed toward the rehabilitation of the entire individual.

The first moments of every formal session are an assist. Before you undertake further auditing you usually perform an assist. If you are a very clever auditor you do it by scouting what has happened between sessions, or if the person has a present time problem, for the handling of a present time problem in an auditing session is really not auditing because it is addressed to a surface difficulty.

You handle the difficulty which is uppermost and foremost in the preclear's mind. A preclear may say, "Well, my wife and I had a fight last night. She threatened to commit suicide, and now she has a violent headache."

The wrong way to look at what he is saying is to think that it is her headache that is causing the trouble in the session and that you cannot cure her headache as she isn't present. The actual trouble in the session is his concern about her headache. So you run Problems of Comparable Magnitude to relieve his mind to a point where he is quite comfortable and you can get on with the auditing. And that is actually what an assist is.

Since you really do not have the preclear under good control, nor well orientated in the environment, you have to answer this technical question: When does an auditing session begin?

The answer to that question is: An auditing session begins when you *have* a preclear, and when he knows he has an auditing environment and an auditor. There is auditing which is done on a relatively loose basis, which might be out in the street, in the kitchen, or anywhere. An assist could happen almost anywhere. But at the beginning of the session, no matter how formally this session is constituted, you are running an assist.

You have an auditing room. You have a preclear, and you are the auditor. You know all these things, but the preclear doesn't. As far as he is concerned, there isn't a formal session taking place. Don't call it a formal session. Call it an assist. Tell the preclear that it is an assist and that you are not intending anything very strenuous. In rendering an assist you should tell the preclear that "this is just an assist" to try and ease the pain in his hand a little, after which you are going to stop.

The handling of an assist as an auditor is different than the handling of a formal session since the factor of control is notably slackened, sometimes almost completely missing.

One of the factors in assists is that an assist has as a large part of its anatomy, "trying to help." Just remember that you are only trying to help and don't get your heart broken by the fact that the fellow's broken spine doesn't heal instantly.

Another factor is that an assist is differentiated and defined as addressing the game someone knows he is playing.

What techniques would comprise an assist? Anything that would help. And what are these? One of the easiest ones to render is Locational Processing. You tell the person, "Look at that chair. Look at that ceiling. Look at that floor. Look at that hand" (the auditor pointing to the objects), when he has an injured hand and the pain will diminish. This is a very easy assist.

For example, a person has a bad shoulder. You touch his hand of the same arm and say, "Close your eyes and look at my fingers." Make sure that he keeps his eyes closed. You then touch him on the elbow and say, "Look at my fingers." Do this anywhere on his body. Just touch him and say, "Look at my fingers." This is a communication process which eases his attention over from a concentration upon the injury to something else which is quite near the injury and thus doesn't result in too much of a shock. It reduces havingness but it is positive and gets positive results. It can be done by an untrained person.

You can teach this assist to anybody. You say, "If somebody has a bruise, injury, a burn, a cut, the way to handle this is to tell the person to close his eyes, and then you touch the area near and distant from the vicinity of the injured area, asking them, with their eyes closed, to look at your fingers. You contact them this way many times. They will experience sudden pains in the area, and you will discover that the 'psychic trauma' has been discharged."

You will find that people do not have any upset about physical contact. Most people think that this is the thing to do.

Say you wanted to render an assist on somebody who had a very indefinite difficulty. That is the hardest one to render an assist on. The person has a pain but he cannot say where. He doesn't know what has happened to him. He just *feels* bad. Use Locational Processing as such. You will find out that this process will work when other processes fail.

An assist carries with it a certain responsibility. If you give an assist casually to somebody out in the public and do not shove a professional calling card in his pocket, you are making an error. The reason for this is that he will not know from whom and where help came. Therefore, an auditor walking around without a pack of cards is doing a foolish thing. An auditor goes through life and he casts his shadow upon many people and they have really no cognizance of what has happened at all if he is rendering an assist. He says, "Do this, do that"—maybe he wins, or maybe he loses because this is the type of session least calculated to procure orderly results. But in the main these people have been helped. They don't know really by what, except some word that the auditor kept saying. They don't even know that he is an auditor. They don't know anything about it at all. Show a person where he can obtain further assistance, and by whom the assistance was given.

Be yourself. Be positive. Be professional and definite. Have a card and make sure the card is easily enough understood. Don't ask them for permission. Just do it. No reason to

wander around and give them funny notions. If you are going to help some stranger out, help him out. Don't explain to him or any bystander, otherwise you are likely to stand there explaining, waiting for somebody's permission. Don't bother with that. You act as though you are the one in charge and you will be in charge. And this is part and parcel of the knowledge of how to do an assist. You have got to be the person in charge. This has to be so good, as far as you are concerned, that you overcome the informality of the session to a very marked degree. If you do it extremely well, the assist will amount to auditing.

Say, for example, there is a big accident and a crowd of people are pressing around. The police are trying to push the people back. Well, push the people back and then push the policeman back. Say, "Officer, keep these people at a distance." Then you lean over the victim and snap him back to rights. If you are enough THERE, everybody else will realize that you are the ONE that is THERE. Therefore, such things as panic, worry, wonder, upset, looking dreamily into the far distance, wondering what is wrong or what should be done, are no part of your make-up if you are rendering an assist. Cool, calm and collected should be the keynote of your attitude. Realize that to take control of any given situation it is only necessary to be there more than anybody else. There is no necromancy involved. Just BE there. The others aren't. And if you are there enough, then somebody else will pull himself out of it and go on living.

Understand that an auditor when rendering an assist must make up with presence what he lacks in surroundings and agreements. It all comes under the heading of willingness to be there and willingness to control people.

One of the ways of convincing people of beingness and of being there is to exercise control—positive, undeniable Tone 40 exercise of control. Start to control the situation with high enough ARC, enough presence and factuality—there won't be anybody present that won't step back and let you control the situation. You are entitled to it in the first place because of senior "know-how." The control of body attention or thought comprises the majority of your knowledge. The majority in Scientology simply points in this direction. The observable thing is control of attention, objects and thoughts. When you have good confidence of being able to handle these, and when you positively know how to do these, then you can make sure that everybody else knows you can do this, and you make them realize this by doing it. You have all of these things available in rendering an assist.

You might never think of a riot as being a situation which necessitated an assist, or an assist as applicable to a riot, but a riot is simply a psychosomatic momentary injury or traumatic condition on the third dynamic. Could you settle a riot? Well, if you can settle a riot, you can certainly settle one person who is in a riot. The antithesis of any pain, disturbance or tumult is order. The thing which controls tumult is order; and, conversely, the thing which controls order is tumult. You need only bring order into a confused situation and bring confusion into an orderly situation to control everything in the field of motion, action and objects.

This is a fantastic simplicity and one which takes some grasping. Conceive as order, merely a fixed position, idea and attitude. A policeman knows what he is supposed to do. Maybe he will put on a tourniquet or maybe he won't. Keep the people away and stop everything is his idea of how it should be. Now you can aid or abet the order he is creating, or cancel the order by creating a confusion which he cannot handle. Of the two, the first is the best in that situation. You aid and abet and cap the order he is creating. If you were to accuse him of having a confused accident scene, which is by now not at all confused, and ask him to straighten it out, you would channel his attention in the direction it is already gone, and so you control his attention.

Remember, those people are still moving a little bit; they are still breathing. There is still a tiny bit of motion going on. If you were to ask him something on the order of "Can't we have it a little quieter and more orderly here?" he would at once perceive that there was far too much confusion and motion, and he would simply come under your direction because you have simply channeled his attention in the direction it was already going. Therefore, you have taken control.

If you ever want to upset a fixed order, create a confusion. If you want to upset a confusion, create a fixed order. Pick out of the scene those beings in the scene whose attention is channeled in the direction you want attention to go, and you aid and abet that attention which already exists. Or, where you have too many fixed positions and fixed ideas to overcome, you simply take those turbulent individuals in the scene who are creating the confusion against those fixed ideas and channels and you make their confusion much more confused, at the same time yourself imposing another order in another direction.

The mechanics of taking over any confused scene are simply the mechanics of trying to get a preclear to see through the morass of cross-purposes, commands, ideas and environments in which he has lived. And whether that applies to the third dynamic or otherwise, the laws are still there and it tells you then that the imposition of order on a preclear comes foremost in an assist.

In an assist you always count on the fact that the thetan himself would, if he could, do the right thing. If you work on that postulate you will never be wrong. Get the idea that it is something else trying to do the wrong thing. The keynote of a thetan is order.

Where you are giving an assist to one person, you put things in the environment into an orderly state as the first step, unless you are trying to stop a pumping artery— but here you would use First Aid. You should understand that First Aid *always* precedes an assist. You should look the situation over from the standpoint of how much First Aid is required. Maybe you will find somebody with a temperature of 106 degrees. It may very well be that he needs to lie down and be covered up, and though antibiotics are much overrated, he might be better off with a shot of one of these than with an assist at that time.

Auditing will not shut off a pumping artery, but a tourniquet will. If you are going into the zone of accidents, you are going to be in the vicinity of a great deal of destruction and chaos, and you are very foolish not to have your Red Cross First Aid Certificate. You may often have to find some method of controlling, handling and directing personnel who get in your way before you can render an assist. You might just as well realize that an assist requires that you control the entire environment and personnel associated with the assist if necessary.

An assist is auditing on several dynamics. It is, therefore, much harder to do than auditing in a formal room as it requires presence. You must bring yourself to face the fact that you have to give enough presence and enough control to enough dynamics to bring the environment into a compliance with your postulate. If you postulate that somebody is going to pick up his bed and walk, then you have to be willing to move and be capable of moving around the people who are going to watch him pick up his bed and walk.

A good example of an assist would be when somebody is washing dishes in the kitchen. There is a horrendous crash and the person comes down all over the sink, hits the floor and as she is going down, she grabs the butcher knife as it falls. You go in and say, "Well, let me fix that up." One of the first things you would have to do is to wind some bandage around the hand to stop the bleeding. Part of the First Aid would be to pick up the dishes and put them back on the sink, sweep the pieces together into a more orderly semblance. This is the first symptom of control. She becomes introverted into the cut to the point that she wouldn't particularly notice what you were doing. But you relieve the anxiety that all her blood is pouring out; your first attention to the case is attention to the environment.

Next you would make her sit down. To remove her from the scene of the accident is not as desirable as auditing her there. That is directly contrary, perhaps, to what you believe, but it is true. That is why you bring a little order into the environment. You position her and then you are ready for techniques. It is quite remarkable for you have manifested order in a much wider sphere than a cut hand in order to bring about a healing of the cut hand. If you understand that your responsibility always extends much wider than the immediate zone of commotion, you never miss. If you bring order to the wider environment you also bring it to the narrower

environment. If you bring it into the narrow environment, you also bring it to the wider environment. It is a gradient scale of how much order you can bring.

In processing, you have to control or direct attention, objects, person, or thoughts of the injured person. If you are really good on the subject of assists, you will direct an additional thing: his knowingness. You can control a man's knowingness rather easily, but it is hard to see it. About the first thing that you can observe about somebody is his person. You are trying to straighten it out. Don't think that, even though you have this person sitting down, you have straightened it out, because it is still messed up. But there is something that you can straighten out easily—and that is his attention. If you could heighten his attention and his knowingness at the same time, you would really be in wonderful circumstances. You always shift and direct his attention, hence Locational Processing. If he was a Scientologist, with his case in pretty good shape, you could run Trio with considerable success by directing his attention. But you wouldn't run Trio with the command "*Look around the room and find something you could have*," "*You should say, "You look at that chair."*" "*Now decide you can have it.*" "That is a very low order of the Terrible Trio.

You could run the injury out in this fashion: "*Look at that chair.*" "*Decide the injury cannot have it.*" This is directed attention, positively controlled. There is no permissiveness connected with this in any way whatsoever.

Because he is injured you are not going to move his person around. You have got his attention. Don't try to shift his thoughts around at first because they are dispersed and chaotic. This leaves you his attention only.

The above assist is quite satisfactory, but a later development in the line of assists which included the significance of "*Keep it from going away*," "*is much more powerful. In one case a bruise, turned utterly black, and covering this person's entire hip, passed away in 45 minutes of good auditing by "Keeping the right hip from going away," and then "Keeping the left hip from going away."*"

If you run the right eye, you run the left eye as well. If you run one thing, you run another. If you run his head, run his knees as well. The master of all these is the direction of attention. "*Keep it from going away*" is tremendously workable.

You don't run "*Keep it from going away*" first, because you are partially controlling his thoughts and this is not possible in the early stages of an assist. If someone is in terrible condition and he is really writhing around, and you want to render an assist, you don't wait until he stops writhing. He is liable to stop writhing dead. What you do with him is to direct his attention. You tell him, "*Shut your eyes and look at my fingers.*" "*You press your fingers hard enough so that he can't help but put his attention on them.*"

If you want it to come out with no bruise, then you would get him to a point where you can control his thoughts, which are chaotic enough. Have him "*keep the left ankle from going away, the right ankle from going away,*" etc. If the process doesn't seem to be flattening, direct his attention somewhere else because he is not keeping it from going away. In this wise you can always have a successful assist, because assists all come under the heading of control. The beingness of the person and his presence makes the control possible. So part of control is always presence, identity, person, the one who takes charge and has things under control. When you are able to control his attention, his body and thoughts, then he will be in session and you are no longer doing an assist.

Assists dominantly require that you direct the attention of the preclear and dispose his person one way or the other and eventually take over control of his thoughts on the subject. But by the time you have all these three in line, you are no longer doing an assist.

So what you really do is do an assist up to the time the person can handle the incident or pain, put him in a more favorable environment and give him auditing. So the assist is what you

do on the street, and auditing is what you do in the auditing room when he comes to you after your assist has been successful.

AN ASSIST IS NOT A SUBSTITUTE FOR MEDICAL ATTENTION AND DOES NOT ATTEMPT TO CURE INJURIES REQUIRING MEDICAL AID. FIRST, CALL THE DOCTOR. THEN ASSIST THE PERSON AS YOU CAN.

PROCEDURE CCH CONTINUED

Compiled from the Research Writings and Taped Lectures of L. Ron Hubbard

THEN AND NOW SOLIDS:

CCHs 0 to 13 are steps in exercising the preclear's ability to be able to do CCH 14 which is Then and Now Solids. They are a gradient scale of exercises to eliminate all his wrong conceptions and to clear out of the way those considerations which aberrated him into having that unknown, hidden and compulsive game of which he was at the mercy.

The preclear must be in control of his body and environment. He must be able to keep things from going away (especially mock-ups and facsimiles), hold them still and, most important of all, make them a little more solid. We say "*more solid*" for it invalidates the present solidity of whatever the preclear mocked up or touched if we say "make it solid."

The process is run in the following manner with these commands: "Get a **picture—and make it a little more solid.**" "**Thank you.**" "**Look at that (auditor indicates object)—and make it a little more solid.**" "**Thank you.**"

"The commands are given with a tiny pause between the first and second phrase, as it will be found that the glance of the preclear at the object tends to give him the impression that he has already made it a little more solid before the auditor gives the command if this auditing command is broken into two commands." ("The Student Manual" by L. Ron Hubbard.)

The command says get a "picture" and the auditor must explain to the preclear, if he doesn't already know, the difference between facsimiles, dub-ins and mock-ups. We must make sure that he gets a picture (facsimile).

This process combines subjectivity and objectivity (introversion and extroversion) in the preclear's universe and the MEST universe. It handles time. He will have to go into the past in order to get the picture and then come up into the present by making a specific indicated object a little more solid. Its whole goal is to straighten out the preclear's time track, to clear up his reactive bank and disclose his Service Facsimile and Life Computation (and even whole track computations which make him act in a certain manner life after life). It will enable the preclear to handle time and get rid of all the unwanted facsimiles, for by viewing them and making these a little more solid he will get the restimulative facsimiles under his control. He will then be able to handle in its totality the whole reactive mind.

To impress its importance, here is a direct quotation from "The Student Manual": "*HISTORY: Developed from Over and Under Solids, which was developed by L. Ron Hubbard in late 1955 and improved by him in 1956. The process more or less completes the*

work begun on the reactive mind in 1947. It will be noted that many earlier processes and effects are woven into Then and Now Solids. “

The auditor running this process must be capable of handling any emotional situation, however startling and unexpected it might be, with great smoothness and ease. Facsimiles will stand out unexpectedly; the preclear will get sudden somatics and past life enemies will be there in front of his body in metrocolor and three dimensions. He will run up and down that tone scale, dramatize anger or pain to such a degree that the auditor who has not been run on High School Indoc or Hi Hi Indoc might get the scare of his life and take off, leaving the preclear in a spin.

Then and Now Solids demonstrates in its application all that is written in *Dianetics: The Modern Science of Mental Health* and *A History of Man*. It takes into account the basic theory and elements of both Scientology and Dianetics, and only the expert can handle this process well.

Nowhere along the line is the auditor allowed to move from the commands of the process, since it is Tone 40. It does not mean that the auditor must not communicate with the preclear. Indeed, it is most necessary at times, but he must keep the original intention of the process in mind at all times and gently but firmly steer the preclear back on to the route he is leading. The process MUST be run EXACTLY as given.

It is not advised that any book auditor or beginner use this process, for the session will most certainly go out of control if Tone 40 and the TRAININGS (see “The Student Manual”)* are not clearly understood and applied.

This process acts quickly if it is real to the preclear. If these facsimiles do not sometimes stand out with alarming clarity he is not running the process. It should not be run for hours and hours without a break. One can always run it to a flat point and then return to the beginning of Procedure CCH and flatten each command, which by now will take a comparatively short period.

It is not necessary for the preclear to tell the auditor each time what the facsimile was that he found, but it is advisable that the auditor check now and again to see that the preclear is doing it properly. It should be run non-specifically.

The auditor will notice that the preclear will go further and further into the past and then come up nearer and nearer to present time and eventually, after many of the cycles are completed, come wholly into present time.

There are a few developments from Then and Now Solids which can be used on valences, for example. If the preclear has trouble with mother, have him **“Get a picture of mother—and make it a little more solid.”** Then have him **“Notice (an indicated object or wall)—and make it a little more solid.”** (It must remain THEN and NOW solids alternately throughout the whole session.)

Should the auditor suspect that the preclear is stuck in a past life or has recurring facsimiles of past lives during processing, have him get the pictures, make them a little more solid and then make something in present time a little more solid. It will blow. The same procedure applies for any troubles the preclear has regarding men, women, children or other parts of the dynamics.

LRH told an HGC auditor to clear the valences with Then and Now Solids, then the preclear’s own body, and after that to return to general non-specific Then and Now.

CCH 14 is the fastest and most effective process in Scientology if the earlier steps are well accomplished, but it stirs up so much motion and emotion that the auditor better be fully trained before he attempts to run it on an innocent preclear.

PROCEDURE CCH (LONG FORM)

The CCH numbers in the preceding PABs and on this chart do not necessarily coincide with that of "The Student Manual" by L. Ron Hubbard, but is a procedure which LRH gave HGC staff auditors. The numbers by which they are known will be published in "The Student Manual" or may be obtained from the central organizations.

| | | |
|--------------------------------|-----|--|
| | CCH | 0a. Rudiments. 0b. Goals. 0c. Present Time Problems. 0d. Help. |
| CONTROL OF PERSON (Body) | | 1. "Give me that hand" (right, left and both hands). 1a. "Don't give me that hand" (right, left and both hands). 2. Tone 40 8-C. 3. Book Mimicry. 4. Hand Space Mimicry. |
| CONTROL OF MIND (Attention) | | 5. Tone 40 Locational Processing. 6. Opening Procedure by Duplication 1957. |
| CONTROL OF THINKINGNESS | | 7. Tone 40 8-C—"Keep it from going away." 8. Tone 40 8-C—"Hold it still." 9. Tone 40 8-C—"Make it a little more solid." |
| CONTROL OF PERSON | | 10. S-C-S on an object. (Covered in previous PABs.) 11. S-C-S on a person. (Ditto.) |
| CONTROL OF MIND | | 12. Control Trio. 13. Trio |

A COMMENT ON BEINGNESS PROCESSING

I recently received the following from an HGC auditor:

“Dear Ron,

“I am writing to congratulate you on the development of the Beingness processes outlined in HCO Bulletin of May 2, AD 8. ***

“These are wonderful processes and I thank you for them.

“Not as a report, but purely as clinical data I want you to know what happened in seven and a half hours of using them.

“Nine major valences came off the case, including the weak one and the strong one. *All* the important ones stripped off clean. Plus the fact that the service facsimile keyed out. This person is not a clear, yet, but is a brand new person.”

*** HCO BULLETIN OF 2 MAY 1958

Beingness Again

The best solution to valences is beingness processing.

Help on valences is excellent, even phenomenal and should not be ignored.

Problems of Comparable Magnitude to a selected person cannot be ignored.

But an understanding of valences gives us a new look at processes.

In the first place a valence is a beingness. Bad, crazy or superb, a valence is still a beingness.

A thetan has a basic personality. But if this is too thoroughly invalidated, a thetan assumes some invented valence. And if this is invalidated he then eventually completes the DEI Scale on Beingness.

The things wrong with a thetan are the lower harmonics of the characteristics of a thetan. You could say carelessly that the only thing wrong with a person is himself. Let us say more accurately that the only thing wrong with a person is his abandonment of *self* and the assumption of other selves. Because there *is* a self, the assumption of *selves* is possible.

We find that the APA or OCA is a picture of a *self* What self is another matter. *All* selves other than *true self* are less honest and ethical since the thetan has a poorer opinion of others than he does of himself in the basic state.

To change an APA or OCA it is necessary to shift *selves*.

It is fascinating that theft of *objects* is really an effort to steal a self. Objects represent selves to others. Thieves and what they steal cannot be understood by the logic of their material needs. They steal tokens of selves and hope to assume thereby another self. It is sometimes not amusing to me to be missing my lecture notes or a book from my shelf. This is covert theft of beingness. People sometimes get anxious to be me—I know not why. They wind up stealing my things. The theft is irrational. The articles were not later cherished and all were put away or thrown away when the beingness did not materialize. Perhaps it is bad taste to mention this from my personal viewpoint but from where else should I look? And it has all happened to you, too. The senselessness of the items selected probably puzzled you when they were stolen. But they were identified with you. You couldn't be stolen, so you lost your wife, your husband or your little trinket, "meaningless" perhaps to anyone but you.

A person has to discover he can't be you before he steals your things without credit. When he discovers he still isn't you, he damns you to all. He finally cannot be you, so he wastes you. And thus the DEI Scale of beingness is completed.

One answer to this is never be a desirable you. And never get famous. A far better answer is to understand it, for by understanding alone you can prevent it.

Thus, the major tears of the world are based on beingness. Insanity, heartbreak, bitter lives all stem from the same source.

There is also an acceptance level of beingness, based on a viewpoint of an already alloyed beingness. Some people can only have the beingness of the criminal or the insane. Thus there is yet another door to cracking cases, another latchstring to the problem of Man.

There is also the problem of acceptable beingness, probably more important than acceptance level. What Beingness is acceptable to various people in the pc's life?

There is also such a thing as taking on another's unwanted beingness to help him or her. Such as taking a psychosomatic.

We have had many beingness processes. Like we did at first with help, we missed a point. The preclear does not know what "help" means. And he does not know what beingness means. He is below cognition level on them. All help or beingness actions he undertakes are reactive, not analytical.

To overcome this, one enters the case of the pc at the Inhibit end of the DEI Scale. He has the pc waste the item in brackets. He asks the pc to waste help, to waste the help of another, to have another waste help for himself and so on.

Thus it is with beingness. Have the pc waste it.

Man tears his idols apart trying to get a bit of desirable beingness. Every thetan wants to heal at sight; so they crucified Christ. *And* sold pieces of the cross.

A pc who assumes the aches of another wishes to be that other. He is short on beingness. He accepts it obsessively.

Wearing Empress Eugenie's hats is understandable. What woman wouldn't be an empress? But wearing the crooked back of the Hunchback of Notre Dame isn't quite so comprehensible—if you don't know Scientology.

One follows knowing assumptions of beingness with unknowing assumptions. The thief knows not why he steals. The bishop knows little of why he cherishes the bit of the True Cross.

And none of them know, so invalidated has it become, that each has a basic beingness, complete. And that beingness is important to you. It is the best beingness there is. And it is important to me, how important can only be viewed through these eyes that see the magnitude of the job. Why should anyone steal when he can have the best there is for the asking? And why steal from me and thee for we alone in all Man's history can give him the priceless gift of himself.

Just as the thief knows not why he steals, so does the archbishop fail to know why he dons a robe.

To abandon life is to waste all beingness. There is the preclear who sits at succumb.

Try it on a pc. You'll be surprised.

This is one of the OT steps on which I am working for the 20th ACC.

HCO BULLETIN OF 29 MAY 1958

SPECIAL BULLETIN

**STANDARD CLEAR PROCEDURE
AND
AN EXPERIMENTAL ROAD:
CLEARING BY VALENCES**

There have been many roads to clear.

The first was the most simple in description but the most difficult to audit. I never succeeded in teaching it to anyone. All one did was renew the pc's confidence in being able to face sonic, visio, tactile, etc, in the bank by gradient scale and at long last he would be able to confront a bank wholly. When that happened he didn't have a reactive bank. He was clear. It required a *very* gentle touch. That was the way I made all the early clears in 1947 to 1949. Then I had to explain it all to the "scientists" and the fact of clear was lost in the mire of the roadway for some years. I've been accused of wanting it that way to tell the sheep from the goats. The point remains that this route was the first successful route. We did not know how much there was to a bank or its anatomy. We had to know the worst before the sun came up again. It came up in December of 1957 with my development of "help" and Step 6. Suddenly we were making clears. Making them out of both high and low profile cases, out of occluded cases and wide open cases.

Clearing is now an accomplished fact for any *well-trained* validated auditor using a central organization E-Meter.

The further in miles from the central organization the attempt to clear is tried, the more difficulty is being experienced. First the word goes out that clearing is being done, then the how-to-do-it. By the time it gets to Alaska or the Bronx or some distant place, the auditor is uncertain as to the right way and even the fact of clearing. He tries it (or thinks he does) (his version anyway) and laying an egg or two, gives up or thinks it isn't real.

For such an auditor an HAA clearing course is indicated. (1) He'll learn right and (2) he'll *see* some clears around and begin to understand what one is. And he'll *know* there is at least *one* valid road to clear that *he* can take and *do*.

Therefore we do not really need right now more roads to clear and certainly we need no roads to OT while the path to clear is still a thin blazed trail. Good Heavens, what's happened is wonderful enough—and nobody far away has any reality on *that* yet. However I am still on the job looking for (1) Alternate clear roads and (2) Roads to OT.

Standard Clearing Procedure, the procedure that is making clears in skilled hands, is a very set SCP indeed. It alone has made all clears to date by persons other than myself.

SCP is aided here and there by other techniques used to cross a block or two faster. But all older techniques only assist the steps of SCP (and sometimes impede SCP). Of course there are some people who would rather walk in the swamp alongside the causeway just built—that's up to them. If they *know* there's a causeway and still walk in a swamp it's power of

choice. If they haven't seen the big causeway beside them and walk in the swamp, that's stupidity.

Standard Clearing Procedure works as follows:

Requisite for auditor—Validated certificate.

Tools: A quiet room and clearing E-Meter from D.C. or London (not some tin quivering together on the hopes of some tinker nor yet an old Model T E-Meter made in California).

Publications: *Clear Procedure* available from the HCO.

First Action: Start session CCH 0.

Second Action: Search out by meter a p.t. problem and run it by finding "What part of it pc can be responsible for" as a repetitive command, formal auditing.

Third Action: CCH 0 b. Clear help in brackets with a meter, running meter toward a freer needle. Don't over-run a leg of the bracket and get the pc stuck or anaten.

Fourth Action: Run Step 6 of the book *Clear Procedure* and run it flat.

Fifth Action: Reclear help.

Sixth Action: Step 6 until flat, flat, flat and needle free.

That's SCP. It is assisted by SCS and Connectedness on some pcs.

SCP is an accomplished fact only if the auditor has good training and validation. He doesn't have to be clear. But he has to be accurate. The HAA-BScn course teaches Validation and Clearing. HCA-HPA teach the basics of Scientology—you have to know those first.

Thus an experimental road to Clear is today a luxury. But you know me—I'm always cutting corners.

So here is an alternate, still in theoretical stage, which promises to be the 3rd successful road. However it requires even greater auditing skill and understanding than SCP but may be faster for lower cases.

It is called "Clearing By Valences".

Its theory is simple. One can assume that a thetan has all the attributes of clear in his basic personality (see Book I, *Dianetics: The Modern Science of Mental Health* for a discussion of Basic Personality). The action of clearing gives a person back to himself. Therefore the bulldozing of rubble from the basic personality would give us a clear.

I have known for some time that an APA or OCA profile was a picture of a valence or of valences—artificial overlays. I have also known that there *is* a basic personality. When you clear someone you don't get a ghost or a god—you get a distinct personality. Men are not equal even if the highest courts in the U.S. so insist. And neither are clears. It is Commie-psychiatric thinking that each is equal to the next like grains of mush. You can generalize by saying clears are good and able. But some are gooder than others and some are distinctly differently able. So people are different.

But valences (borrowed, artificial personalities) overlay the real self and weaken it. Valences are the sum of overwhelms of the pc. Whenever he lost he got one.

His basic personality was invalidated so he sought new ones. These were invalidated so he sought even newer ones. Like standing between two mirrors facing each other we achieve the multiple pc. But where is the clear? We find him when we scoop away the thousands of others he is being.

The first straight wire run at Elizabeth, N.J., in 1950 succeeded when it knocked off a sick valence. Well we can knock them off wholesale today—with *skilled* auditing.

The clue is the Curiosity-Desire-Enforce-Inhibit Scale run on valences.

That which the pc erases with difficulty is misowned by him. Therefore it is a valence. In the presence of valences he cannot change his mind easily when he misowns the consideration. Therefore all fixed, harmful ideas or aberrations stem from valences.

The process on this would be “Tell me how you could waste a (male) (female) (other) valence.” This would have to be cleared as a command thoroughly and often. That’s the skill.

An auditor can ask a pc about an aberration and spot a valence possibility. And then run it by waste, etc.

People usually have to waste before they can have. A person who can have a valence isn’t subject to it.

This type of command is rounded off with “What part of that valence could you be responsible for?”

The general rules of auditing must be observed. The basics of Scientology must be understood. And great skill and understanding are required of the auditor.

“Tell me how you could waste father’s valence” “. . . a fat valence” “. . . a defeated valence” etc. The list is enormous.

Well there it is in the rough. When it’s made some clears it will be an alternate probably and have a highly polished form like SCP. Right now it is used as an assist to SCP on a difficult case as per the next HCO B.

HCO BULLETIN OF 29 MAY 1958

SPECIAL BULLETIN No. 2

AN EXAMPLE OF CLEARING BY VALENCES

An Experimental Process
Experimental Case C by V No. 2.

Auditor: LRH Pc—Experimental Case. Nervous, restless, heavy somatics.

I started session by attempting to clear a p.t. problem. First he had to clear the command. The pc, very restless, defined a problem as “Something that can’t be solved.” “You can keep trying but of course you can’t solve it.”

I tried in vain to get pc to as-is that computation. It would not change.

I was faced by this: One cannot audit successfully up against a p.t. problem. If one tries to do so without clearing the problem the whole case hangs fire. *Every unchanged profile or case after auditing is unchanged because the auditor left a present time problem partly or wholly unflat and in restimulation.* A pc whose definition of a problem is “something that can’t be solved” and who yet has a p.t. problem could not be audited successfully unless the computation altered.

Trying “What is a problem?” as a repetitive question for half an hour only made the pc nervous, restless and tearful. Obviously the consideration would not change. Therefore, obviously, the consideration was mis-owned. It was a valence, another person the pc was being with complete tenacity and total error. Process abandoned. Decided to strip the valence off.

A discussion of what was a valence finally bore fruit. Pc understood term as meaning a mental package of ideas and considerations really belonging to another person and unknowingly borrowed by pc.

Started in to run a process to at once give greater reality on valences and to hit at the computation.

If pc would fight help so hard then the valence had four considerations that were known to me. (1) It couldn’t be assisted; (2) It considered a problem as “something that could not be solved”; (3) It was steeped in defeatism; and (4) The pc thought of the valence as self.

Just to ease into valences I ran a process as follows “Can you get an idea of somebody that cannot be helped?” Pc could. “Describe the person.” Pc did, thus getting a detached idea of a personality in the mind. “Now what would you say that person’s definition of a problem would be?”

The first dozen people so imagined all had definitions of problems identical with pc’s own. But then there began to be a change in the definition.

Possibly this process would have gotten further but pc was looking brighter and a flat place was reached and I was really trying to clear by valences.

Therefore I bridged, started in on valences directly. I called the valence in which pc was stuck “that valence” (pc thought of it as self). I used the repetitive command “Tell me how you could waste that valence”. Now and then I asked where it was. Pc didn’t know sometimes, sometimes did. (At first it was just back of pc’s eyes and was pc’s thinkingness.)

Terrible somatics cut in after fifteen minutes, all chronic with pc.

I went right on with process for some time (over one hour) when pc suddenly began to cognite on problems. The somatics had ceased entirely fifteen minutes before.

As a process can be left when (a) an ability is regained, or (b) three responses are given with equal comm lag or (c) pc truly cognites in line with process, I could then leave it and bridge.

I bridged over to “What part of that valence could you be responsible for?” for twelve minutes to round process off and keep pc from making “that valence” an enemy if any bit of it remained and to check out somatics. Pc felt very dazed for a moment or two (typical of a separating somatic) but came out of it very bright. Process flat.

Bridged into earlier commands for a few commands each to flatten them and bridged out to begin clearing of session.

Pc could not now consider any of the five initial problems listed as problems now . . . they all seemed simple and routine parts of life.

Ended session.

Time of auditing 2 1/2 hours approximately including one short break.

Goal of session was to clear up problems on the subject of problems. Goal was attained.

Added bonuses—Loss of main thinkingness circuit, loss of chronic somatic and service facsimile, increase of potential, new zest to continue on to clear.

Pc heretofore desiring little auditing, hard to control in session, reactive toward help offered by others. All changed.

SOME MORE CCH PROCESSES

*Compiled from L. Ron Hubbard's Research Writings and Taped Lectures to the
18th American Advanced Clinical Course*

CONTROL TRIO:

After one has run CCH 0 to 5 and has brought the preclear's body and attention under control, there are various ways of handling the case from there on. Here is a series of processes which undercuts Trio and is called "Control Trio."

The commands for Control Trio are:

1. **"Notice that (auditor indicates object) and get me idea of having it."**
2. **"Notice mat (auditor indicates object) and get the idea of permitting it to continue."**
3. **"Notice that (auditor indicates object) and get me idea of making it disappear."**

The processes should be run in that order and each one must be run flat before the next one is attempted. It is very necessary to clear the command before embarking upon the process. Preclears simply understand that "having" means that they must possess something, carry it with them wherever they go—without just leaving the mountain, chair or whatever it is, in its own space-time continuum. He gets it confused with ownership and so forth.

In *Fundamentals of Thought* there is an excellent definition of havingness: "*The essential definition of having is to be able to touch or permeate or to direct the disposition of:*"

During the running of the first command the preclear will come up with cognitions regarding the necessity of having or not having things, its goodness or badness, and will in general run out his earlier training regarding this point. It will change his conceptions which earlier religions may have implanted, such as it is "bad to have," and run out the compulsions of "must, must not, got to, can't have," etc.

Find out what the preclear is doing and how he is doing this, for he should get havingness from this process and his tone should rise considerably. A change should take place within a very short period, otherwise (a) his body and attention are not under control or (b) he doesn't understand the command and is running a different process than that which you intended.

There should be no qualifications or conditions such as “If I had the money I could buy that object and then have it,” or “I don’t like it and thus don’t want it,” or “What shall I do with it once I have got it?” It is just the ability to have without other considerations of goodness, badness, ownership or beauty going with it, and the auditor and preclear should clear such conceptions through good but non-evaluating two-way communication.

The second part of this trio brings the preclear’s sense of active participation of creativity and responsibility out, for he must grant that particular object sufficient life and beingness to allow it to “continue within its own space and time.” Preclears come up with the considerations that they have either tried to not-is objects and/or people or “withheld” something from them or tried to push them out of their environments because they didn’t like them or agree with them. This is an interesting process to put their ideas about what they should have around them back into proper perspective. They will find that there is no harm in permitting the sixth dynamic to continue in present time right where it is.

The third part of the trio is the most effective and more will be said about it in a following PAB. It is a very good exteriorizing process and the preclear will come up with many cognitions on his own and the rest of the dynamics. Here the idea is just to “get the idea of making the object disappear” instead of to dispense with it or not-know or not-is it.

This cycle can be run over and over again until it is flat, within a few minutes after the command has again given the preclear some gains.

After this, Trio (old-time Terrible Trio) can then be run with great advantage on a case who couldn’t do it before. Control Trio, which undercuts Trio, will bring out its reality level.

GOALS:

With every preclear it is most necessary to establish goals that are REAL for the PRECLEAR. You want him to have some goals which are HIS and not what grandma, father or schoolteacher desires for him. Preclears who have no real goals are working on other people’s determinism and we have to (a) *establish the certainty of a future for the preclear*, and (b) *get him to put things in that future that he WANTS, so that he can have a future.*

There is a gradient scale of processes which will establish goals which are REAL to the preclear by casual two-way communication, using the following questions:

1. **“What are you absolutely sure will happen in the next two minutes?”** one hour, three days, one week, three months, one year, etc.

Complete certainty on each time span is necessary before the auditor continues to the next time span. This is done by two-way communication, and the auditor must all the time be sure that the preclear is certain that these things are going to happen in the next two minutes (or whatever the time span is) to ensure that the process really bites.

2. **“Tell me something that you would like to do in the next two minutes,”** one hour, etc., is the next process that would put doingness and more time into that future.

On some preclears the following questions may be realer and bite faster. This is putting the accent on *have* instead of *do*, since we work from the bottom up on the Be, Do, Have triangle. They are:

3. **“Tell me something you are sure will be there in two minutes, etc.,”**
and
4. **“Tell me something you would like to have in two minutes, etc.”**

The last two processes really undercut the above and are thus lower level processes and it is advisable to run them on preclears whose ability to communicate and reality level are low.

Watch out for the preclear attaching all sorts of conditions to his answers. Also work towards positive goals of “things” and not conditions such as “I want to get rid of my fears and somatics.” The latter type of preclear is working towards nothing rather than towards something. (A more positive goal of something would be “I want a stick of candy or a glass of water.”) Check for certainty at all times, for certainty strengthens reality and the reality of a future for the preclear is most essential if auditing is to succeed all the way.

LOSSES:

Why doesn't a preclear exteriorize easily and stay exteriorized? And “Why does he get sick when one asks him to conceive a static?” is the accompanying question. The answer to this is “Losses.” The preclear associates a static with loss, and he says, “All right, if there is nothing there I've lost it.”

Conceiving a static is therefore painful, and whenever he lost anything something disappeared. An individual cannot conceive a static if he associates static with a loss-if it is painful. So we have to cure him of the painfulness of loss, consideration of, before we can exteriorize him easily.

We do this by going back to automaticity. The universe has been taking things away from the preclear. It has become an automaticity known as “time.” Time itself is a consecutive series of losses. So we have to cure this preclear of losses before we can get him to appreciate time, otherwise he would be so afraid of losing it that he'd park himself on the track, and this is the “stuck on the track” phenomenon.

This is done with the process “**Recall a moment of loss,**” sandwiched with havingness (Control Trio, Trio or Locational Processing). This gets the preclear to take over the automaticity of all of the losses which he has experienced unwillingly.

When an individual has no visio, has never seen anything, couldn't see anything, the only thing that he is looking at is a “stuck” loss.

Recall a Moment of Loss and Goals are a lower harmonic of running Then and Now Solids and are at the moment making a bid for our chief exteriorization processes. Recall a Moment of Loss should be run with two-way communication, but not too much outflow of the preclear. Communication must at all times remain two-way. Ask the preclear “when” this happened now and again, unless, of course, he told you when he recalled the loss.

Control Trio, Goals and Recall a Moment of Loss are a combination of processes and should be run as a combination to secure the best gain for the preclear.

A Scientologist is one who controls persons, environments and situations.

Scientology means knowing in the fullest sense of the word.

Scientology is used on Life and its forms and products.

A Scientologist operates within the boundaries of the Auditor's Code and the Code of a Scientologist.

The chief uses of Scientology are in the fields of education, organization, mental disability and religion. Scientology is the first to give scientific meaning to these.

A Scientologist is considered a professional if he uses Scientology in any of these fields and has been thoroughly trained in Scientology.

A Scientologist is a first cousin of the Buddhist, a distant relative to the Taoist, a feudal enemy to the enslaving priest and a bitter foe of the German, Viennese and Russian defamers of Man.

The religion of the Scientologist is freedom for all things spiritual on all dynamics which means adequate discipline and knowledge to keep that freedom guaranteed.

We are the people who are ending the cycle of homo sapiens and starting the cycle of a good earth.

There is no barrier on our path except those we make ourselves.

Our ability belongs to all worlds everywhere.

“Offbeat” Processing

L. Ron Hubbard

Experimental auditing has its place. Indeed, we got where we are because of experimental processes. *Every* process was once experimental.

BUT when you want results you had better use standard techniques and procedures. After all, I have sweated through their testing for years and we now KNOW what will ease or clear a preclear.

Most clearing “failures” are caused by use of non-standard techniques and procedures. Also, such failures can be caused by ignorance. An auditor *thinks* he is using standard material. He isn’t sufficiently trained to know.

Such an auditor who has had failure, should take a leaf from New Zealand. Frank Turnbull wasn’t getting the results he wanted way “down under.” So he grabbed a plane and came halfway around the world for a two-day briefing. Frank was right. They weren’t using techniques properly—and their old-style E-Meters weren’t even working and they didn’t know it.

Now if a smart, clever auditor like Turnbull can doubt his command of the subject, I am sure other auditors would experience no disgrace in following through and getting squared around. For clearing is *easy if you* know how.

Such stories as an auditor who “clears his pcs each week” are more tragic than funny. And rather costly to luckless pcs.

Some auditors don’t understand “What is a Clear” and get confused with their own cases—but that doesn’t mean a Clear doesn’t have a precise definition, an exact and distinct beingness—and very worthwhile, as any clear can assure you.

Perhaps the saddest case of experimental auditing to come to my attention was the case of a young man whose wife was depressed. She was making such difficulty in the family that he could not work. He had had training as an auditor but felt he could not help her. He had no money for auditing from a professional.

I reviewed the case and asked him why he did not at least try to help her, and recommended he use standard auditing and procedures. This he did with adequate results and

his efforts succeeded very well so that he was able to resume his work, his wife sharing his responsibilities.

And then it seemed to him that he might go a bit further faster. That is the usual stumbling block—anxiety to do it all at once.

But preclears cannot do it all at once and the thoroughly experimental approach he used, born out of his own basic lack of reality, was not successful. He “audited” his wife downward into a condition almost as low as she had been in before, thus canceling over two-thirds of his gain.

Now none denies his right to undo what he had done to help her, *but* his intention was to help her swiftly and spectacularly. Had he read his PABs he would have found as of three years ago a mention of his “discovery” as an unworkable approach, in defiance of the principles which make Scientology function.

Once more he had to quit his job and his wife has lost confidence in his willingness to assist her.

Fortunately, another auditor has now volunteered to assist—and he will use *standard*, proven, tested techniques and procedures.

You see, there is a thing called Scientology. It has axioms. It has principles. It has the goal of empowering a thetan to overcome his own problems. This standard Scientology we don’t change every day. The uninformed, not knowing that a *standard* exists see in each new release a new subject. So they say, “Why don’t I experiment on my pcs?” And they experiment with the *standard* background, not with a further reach of old, tried, principles.

Without a guiding central organization Scientology would fall into an anarchy of *opinions* in a week for there are too many who can go through the motions of auditing who do not know their basics. They think a new thing, Scientology, is an experimental thing. It is not. The basics are inflexible and have been for years.

We know now just exactly what clears people. And we know exactly what a clear is. And we know exactly how to train and process. These are hard won riches. Don’t waste them and your time, too.

This is the way out! Are some people so fond of the trap they avoid the flaming beacons which show the entrance? Or are they afraid to set Man free?

HCO BULLETIN OF 4 JUNE 1958

RUNNING VALENCES

1. Never leave one half flat. Stupidity is then in restimulation.
2. Always run a specific valence.
3. Past track valences are preferable to run over present life valences.
4. Thetan valences are preferable over body valences.
5. "Invent a (valence)" is a milder form, less effective but often more real to PC than "Waste a (valence)." Commands for Invented valences: "Invent a (specific valence)." "Think of a problem that valence could have." "Thank you."

Commands for Wasting Valence: "Tell me (Think of) a way to waste a (specific valence)."

"Does that really waste it?" (occasional use) "Thank you."

Types of valences that can be run: Formula—Invent and/or Waste valences on eight dynamics from 8 to 1.

Goals for Clearing by Valences: Uncover basic personality. BP is, of course capable of all attributes of clear. OT is an educated BP.

Wind up all valences you have run with "What part of that could you be responsible for?" which puts him back at cause (since he elected as cause any valence you ran).

Clearing by Valences is probably the 3rd step (with Help and Step 6) of Clearing. C by V doesn't neglect or supplant Help or Step 6.

Always pick bad or contra-survival valences. Never run pro-survival. Differentiation is on this basic:

A contra-survival valence physically injured pc.
A pro-survival valence never did.

Pcs pick out for their randomness stuck flows on help.

E-Meters don't register well on valences. They stick and several valences mentioned will only stick more. A valence *sticks*. It must be freed up on meter.

8th and 7th Dynamic area of valences produce wildest results.

Chief characteristic of formula 8 to 1 is to produce judgement.

HCO BULLETIN OF 14 JUNE 1958

STANDARDIZATION OF CLEAR PROCEDURE

FOR GUIDANCE AND USE OF THE HGCs

- (a) Stress 4 pts of error.
- (b) Run Help, Step VI.
- (c) Standardize Valences.
- (d) Eliminate Wasting Help.

(a) 4 pts of Error

1. Profile, IQ unchanged = PT Problem left in restim, or not located at all. Cure = Understand, Locate and Flatten PT Probs.
2. Profile dropped = Auditor code break, real or imagined, unrepaired by auditor. Cure = Repair any code breaks with 2-way comm & Help.
3. Unstable Gain = Too many processes or processes not flattened. Cure = Increase confidence on auditor's part. Get him off of a total effect need.
4. Auditors unable to produce good results = Introduction of new processes which auditors then use without sufficient reality. Cure = Use only processes on which auditor personally has a reality.

(b) Clear Procedure

Clear Procedure consists of Help in Brackets on any terminals and Step VI. There are no other certain processes at this time.

(c) Standardize Valences

Valence splitting is most reliably done by running Help in Brackets on the valence.

There are two valence processes now under test which *seem* to be better than others. They are still experimental.

Experimental (a)
Invent a being who could not be helped.
What problem could that being have? Ack.

Experimental (b)
Invent an unconscious being (person).
What problem could that being (person) pose? Ack.

All other tested valence processes have so far failed.

(d) Waste Help

This process violates rule of terminals, "Run terminals, not conditions".

HCO BULLETIN OF 14 JULY 1958

Not for general use.
HGC Auditors may find
of interest.

20TH ACC TRAINING PROCEDURE

The first day on auditing the student checks out as many other students for clear as possible with Clear Check Out Sheets and E-Meter. Text: Ability and HCO Bulletins. Purpose: To learn to check out clears. The way to learn clear check-out is to check out many non-clears.

How to clear a command. Clear each word *once* only so that the word means something to pc. Only repeat if the pc says he doesn't understand. Never ask *twice* "What does Help mean to you?" Clearing a command is not a repetitive process. There is no other right way to clear a command in any case. Clear the command for all sides of a bracket before running one.

All auditing and check-outs are actual. There is no student coaching except on TRs.

1. CCH 0 with emphasis on goals and PT Problem. Done thoroughly at start of every session.
2. ARC Straight Wire using following type command only—"Recall a time when you communicated with something." Run as a complete 9 way bracket one command each side. Use communicate only. Run until needle of meter is relatively free. Pay attention to cyclic aspect of answers. Purpose: To loosen up bank and screens and to teach student use of a bracket and give him practice. This permits student to ease into a rather strict and exacting auditing activity without an instruction to him from an instructor upsetting preclear as it would if Help were being used instead. Avoid beefy processes where correction, supervision and general instruction are involved. Auditor requires no verbal answer from pc, only a head nod, but checks now and then as to *when* the communication being recalled took place.
3. Start-C-S oldest version. Emphasis on *start* and *stop*. Run *change* when the start or stop seem flat and only to unflatten them. Purpose: Smoothness of auditor control; accomplishment by pc of really controlling body. You start that body, etc is emphasized.
4. Connectedness, control version. Sole command: "You get the idea of making that (object) connect with you." No other side of bracket. Purpose: Havingness, unsticking needle, directing pc's attention.
- 4b. Student should scout pc's track looking for the "rock", spot it or something like it in minimal time, stick it good and free with Connectedness. Purpose: Giving student and pc confidence that some sticky business can be plowed into and gotten out of readily by use of Connectedness.
5. Help. 5 or 9 way bracket in general to groove pc in. "How could help you?" On a sticky item run one side of bracket after another, never repeat any one side twice.

Use whole track type commands, never localized this lifetime.

- 5a. Run "auditors" and "preclears" as subjects for Help. 5 way bracket. First run auditors, then pcs, then auditors, then pcs, etc. Purpose: Clean up all past auditing.
- 5b. Isolate whole track "rock" and run 5 or 9 way bracket on it. This is an adroit matter. It requires that one know the pc and audit this particular pc. It doesn't mean forcing one's

own “rock” on the pc. It requires judgment and a knowledge of valences. It may be necessary to unburden the “rock” with several items before it appears. Free the needle on the “rock”. Command must be phrased to include whole track version of pc’s rock. Purpose: To locate largest reality of pc and to hit squarely on what he is always mocking up obsessively.

5c. Scout Help with a general bracket to see if it is freer.

6. Step 6 as in Clear Procedure. Use simple forms.

Repeat 5, 5a, 5b, 5c and Step 6 alternately until clear.

COMMAND SHEET FOR HGC

CLEAR PROCEDURE

ON ALL COMMANDS: BEFORE AUDITOR GIVES THEM, HE MAKES CERTAIN HE HAS PC'S ATTENTION ON HIM AGAIN AND OFF LAST QUESTION.

CCH 0—Starting Session:

“Is it all right with you if we begin the session now?” “The session is started.”

GOALS: “What goal might you have for this session?”

(Be certain to end session with “Have we gained anything of your goal at the session's beginning?”)

PT PROBLEM: (Caution: Problem itself, not just its terminals, must exist in pt.) “Do you have anything worrying you so much that you will have a difficult time keeping your attention on auditing?”

(If pc has)

“Describe the problem to me.”

(Pc does.)

“Does that problem exist in present time now?”

(If pc thinks it does): “What part of that problem could you be responsible for?”—or, “Invent a problem of comparable magnitude to that problem.” (Repetitive questions.) (No further descriptive name is allowed auditor in this command.)

Auditor frequently asks, “Describe that problem to me now.”—“Does that problem now exist in present time?”

ARC Break: “Have I done something you feel is wrong in this session?” “Describe it to me.”

Plenty of acknowledgement to pc, no further apology and certainly no explanation. Object is to get pc's attention on auditor in present time, not earlier in session. Goal of TR 2, of goals, PT Problem *and* auditing is to get pc's attention into present time, so don't stack commands on the track or park pc somewhere in session or leave him in an out-of-session problem.

S-C-S: (Note: All formal auditing, *except* for final acknowledgement of cycle, which is Tone 40.) Commands:

START: "I am going to tell you to start. And when I tell you to start, you start the body in that direction. Do you understand that?" "Good." "Start." "Did you start that body?" "Thank you."

STOP: "I am going to tell you to get the body moving in that direction. Somewhere along the line I will tell you to stop. Then you stop the body. Do you understand that?" "Good." "Get the body moving." "Stop." "Did you stop the body?" "Thank you."

CHANGE: "Do you see that spot?" "Good. We will call that Spot A. Now you stand here. O.K." (Auditor indicates another spot.) "Now do you see that other spot?" "Good. We'll call that Spot B. All right, now when I tell you to change the body's position, YOU move it from Spot A to Spot B. All right?" "Good. Change the body's position." "Did you change the body's position?" "Thank you." "Do you see that spot?" "Well, we'll call that Spot C. Now when I tell you to change the body's position, YOU move the body from Spot B to Spot C. Do you understand that?" "Fine." "Change the body's position." "Did you change the body's position?" "Thank you, "

(NOTE: Change is run only to unflatten START and STOP, when both are flat.)

CONNECTEDNESS: Use: Only to unstick pc on meter when meter can't be read well or when auditor desires to clear an object wrongly chosen as rock in order to look for another.

- (a) "You get the idea of making that (object) connect with you." (Auditor points.)
- (b) (If pc isn't looking at object with Mest body's eyes, use following:) "Look at that (object)." "You get the idea of making that object connect with you."
- (c) (On blind humans:) "Feel that (object)." "You get the idea of making that object connect with you."

HELP:

1. SCOUTING. This is a 2-way comm activity.

- (a) "How do you feel about .. ?" Vary any object that sticks by asking about specialized form. If a specialized form frees, go back to object that stuck. Gradually sort object that consistently sticks from objects that stick by association with it only.
- (b) If pc reads high on Tone Arm, gets inconsistent lie reaction, use following: "What have you had to be responsible for?"

To be sure pc is reacting, turn Sensitivity knob very high.

Guide him carefully around his life until he gets on a sticky point. Then sort it out, attempting to get parts of it to clear up. Do not let pc linger on matters which do not stick.

Responsibility sorts the matter out. His realization (cognition) of various zones is what does him good.

This is not necessarily a repetitive command. It can be varied with "What part of that (discovered area or item) have you had to be responsible for?"

Large area of current lifetime can be freed up and with clues from what he has stuck on repeatedly and using what would not free, return to a standard scout as above.

By using part (b) a pc can be brought down on the Tone Arm and can be made to react more normally on meter.

2. Running Help in general: USE generalized items, not specific people or objects (don't pin pc in current life).

General Help bracket: 9-way:

“How could you help yourself?”
“How could you help me?”
“How could I help you?”
“How could I help myself?”
“How could you help another person?”
“How could I help another person?”
“How could another person help you?”
“How could another person help me?”
“How could another person help another person?”

Running Help on an item:

“How could you help a?”
“How could ahelp you?”
“How could another person help a?”
“How could ahelp another person?”
“How could ahelp itself?”
“How could you help yourself?”
“How could I help you?”
“How could you help me?”

Run in sequence as above. Do not give same command twice.

CLEARING COMMANDS: Clear each word and the full phrase once each with the following:

“What is the usual definition of the English (or other language) word?”

Do not ask for definitions over and over as a repetitive command. If pc's definition is poor, clear command every few commands.

Clear only each different word in a bracket. Don't clear each line in a bracket.

STEP SIX:

Select simple non-significant objects. Run:

“In front of that body you mock up aand keep it from going away.” “Did you?” “Thank you.”

Then use all directions from the body—“Behind that body...,” “To the left of that body . . . ,” “To the right of that body . . . ,” “Above that body . . . ,” “Below that body”

Run 6 objects each on six sides of the body on “Keep it from going away,” then proceed to “In front of that body you mock up aand hold it still.” Same procedure, then “In front of that body you mock up a.....and make it a little more solid.” (There is no acknowledgement by auditor after pc mocks it up and keeps it from going away, etc, or the “Did you?”—there is acknowledgement only after full command is executed. Otherwise acks will thin pc's mock-ups.)

Note: The objects should be simple at first, leading on up to complexity. But at first, keep them simple and non-significant.

THE ROCK

The Rock is a Reach-Withdraw mechanism and the phenomenon of a stuck needle is the ridge so created.

The Rock is: That which a person has used to reach people or things with and is determined in value by its creativeness or destructiveness. It is simply the reach and withdraw mechanism which makes a ridge and this causes the stuck of the needle.

The Rock is AN OBJECT—it is NOT a significance. And you determine a scout by what the pc shies away from as well as what he sticks on—and a theta bop always winds up in a stuck needle if pursued in a scout.

CYCLE OF THE ROCK (object) A person (I) failed to communicate himself; (2) started using something to communicate with; (3) put the last item on automatic and it created for him; (4) it failed.

The Rock itself, when first located, will be a solution to many earlier cycles as described above. And so, a Rock is peeled off cycle by cycle as above.

The rule is to find the last cycle that is real enough to the pc to stick a needle and this is true of locating and running any lock of the Rock.

Be careful during a scout not to choose an object which makes the needle rise slowly, as this is an *addition* to the Rock which is being done gratuitously by the pc. (This factor is an indicator but it must not be run.) The Rock stick does not rise—it just sticks.

L. RON HUBBARD

HUBBARD COMMUNICATIONS OFFICE
WASHINGTON, D.C.

HCO BULLETIN OF 5 AUGUST AD 8
Issue 2 Revised

The basic locating question of the Rock (primary aberrative object) is:

“What is a People Pleaser?”

It can also be run just like this: “How could you help a People Pleaser?” as an item bracket.

Do not “kid around with” or invalidate this Rock.

The new item bracket is as follows. It has been designed to preserve A-R-C and to be used in this exact order one command at a time:

The Rock Bracket:

How could ahelp itself?
How could you help a?
How could ahelp you?
How could I help a?
How could ahelp me?
How could another person help a?
How could a help another person?
How could others help a?
How could ahelp others?
How could you help yourself?
How could I help myself?
How could you help me?
How could I help you?

Command words but not as a whole phrase are cleared often (every three brackets) and the pc is asked for his *opinion only* of the word “help” and the item. His answer is not challenged.

Only ARC breaks can hide Rock again after found—clear them well. CLEAR ALSO environmental ARC breaks on the Rock between sessions.

HCO BULLETIN OF 10 AUGUST AD 8

ACC AUXILIARY PROCEDURE

For Optional Use

THIS IS A ROUGH DRAFT

1. Start Session.

2. Clear auditor with pc—"Who should I be to audit you?"

"What is it all right for me to do?"

"Look at me. Who am I?"

3. Get pc into session.

Establish goals for session.

"What question shouldn't I ask you?" Handle resultant answers with Straightwire as indicated.

"Do you have anything worrying you so much that you will have a difficult time keeping your attention on auditing?"

Handle pt problem by Responsibility or Problems of Comparable Magnitude. "Invent a problem of comparable magnitude to that problem." "Describe that problem to me." "Does that problem exist in present time now?"

Run two-way bracket on Help. "How could you help me?" "How could I help you?" Flatten for the session. (Every time you audit somebody this should be touched on and flattened so that it will stay flat at least for that session. To flatten it for all time or for all sessions would be impossible.)

Check for ARC breaks. If they exist, take them up two-way comm, and also re-flatten above two-way bracket on Help.

WHEN AUDITOR AND PC ARE CLEARED FOR SESSION, ONLY THEN BEGIN ON CASE. THIS IS TRUE OF ALL SESSIONS AND ALL CASES. KEEP PC IN SESSION WITH ABOVE STEPS, USED WHENEVER PC WANDERS OFF IN SESSION. OF COURSE, DO NOT INTERRUPT UNFLATTENED PROCESS TOO SUDDENLY TO GET PC BACK INTO SESSION. ALWAYS USE COMM BRIDGES WHENEVER YOU CHANGE THE COURSE OF THE SESSION.

CLEAR ALL COMMANDS. ASK FOR OPINION OF KEY WORDS BUT NOT IN SUCH A WAY AS TO MAKE THIS ASKING A PROCESS. THE PC'S IDEA OF WHAT THE KEY WORDS ARE IS THE PC'S IDEA, AND A REPETITIVE ASKING FOR OPINION IS NOT A PROCESS BUT AN INVALIDATION.

4. Where pc's idea of the following words is obviously impossible to make any process move, do the following on the words CHANGE, PROBLEM, HELP, CREATE, RESPONSIBILITY, PLEASED. A mis-definition on these words can keep a whole case from moving. It is not necessarily true that clearing these words clears a person. To reorient these

words run the following process: “Invent a person” (and when pc has, do not acknowledge, but add:) “Tell me his idea of (key word).” This is a repetitive question.

5. Clear up psychosomatics as feasible with “What sort of a (limb, organ, body) would please people?” “Tell me a person that that would please.” This is actually one command with two questions which are used repetitively until psychosomatic or illness is markedly alleviated. This is done to give pc confidence in the auditor and certainty that something can happen in processing. It will only work if the first four steps are complete and in good working order.

6. Clear up desires about new or different states of mind with “What sort of a mind (personality as needful with those who cannot understand what a mind is) would please people?” “Tell me a person that that would please.” This is actually one auditing command with two questions. There is no acknowledgment after the first question, only after the second. This is used repetitively.

7. Isolate basic Rock by any method. Run Rock Help bracket on it.

Or, boost out with “What sort of a (Rock as found) would please people? Tell me a person that that would please.” See above for running directions.

8. Run general Help and Step 6 as given, first one then the other until case is clean, taking up any of above as needful to keep auditor and pc cleared and in session.

If you do these things with any case you should wind up with a clear. The length of time it takes depends upon the auditor’s skill in getting the auditing done and is much less modified by “severity of case”.

HCO BULLETIN OF 20 AUGUST 1958

PRESENT TIME PROBLEM—RUNNING OF

Auditors are occasionally unsuccessful in running present time problems, life computations and service facsimiles because they themselves are not alert to the definition of a problem.

A problem is two-terminaled. A single terminal cannot make a problem. The basic problem is Postulate-Counter Postulate. Therefore, when the preclear says his wife is a present time problem and the auditor runs "A problem of comparable magnitude to a wife", he is not running a problem at all. He is running a condition. For this to be a problem the wife would have to include another terminal.

An auditor should make the preclear define the problem accurately as a problem, not as a condition or situation. The problem of "my wife's desire for another man" is a problem. The problem of "my husband's fooling around with machinery" is a problem.

Wherever a PT problem arises it is up to the auditor to locate an actual problem and get the preclear to describe it. He then runs "Invent a problem of comparable magnitude to that problem." Thereafter frequently he says, "Describe that problem to me" and makes sure each time he does that the problem is described as a problem, not a single terminal or a condition. When running a PT problem he also asks, "Does that seem to be a problem to you now?"

Failure to get the preclear to define the problem as a problem will result in a failure to relieve the PT problem and the auditor and the preclear may proceed into the session believing implicitly that they have run the PT problem when, as a matter of fact, they have not even touched it but have in actuality run the conditions of a single terminal.

Probably the biggest holdup in all intensives is this fact of mis-definition of problems.

And in passing it may be remarked that given Clear Procedure the biggest delay on clearing is the failure of the auditor to run PT problems and ARC breaks. It might also be said that the preclear only protests violently about ARC breaks under one of the two following conditions: (1) the auditing is actually very bad and (2) the PT problem has not been run. As a rough rule of thumb it could be said that given well-intentioned auditing, a preclear only protests about ARC breaks when a PT problem has not been isolated and run. The problems connected with "being audited", "being a preclear", "the auditor", have been rather uniformly overlooked by auditors, and cases which tend to hang up in processing are usually hung up on these.

HUBBARD COMMUNICATIONS OFFICE
WASHINGTON, D.C.

HCO BULLETIN OF 20 AUGUST 1958

OUT OF SESSIONNESS

The mechanisms used by the preclear in living to keep his attention off the Rock are: to get involved with many present time problems, and ARC Breaks.

We used to believe that a thetan had to have problems. This is not true. A thetan thinks he needs problems to keep his attention exteriorized from the Rock chain and when the Rock is not run out he will continue to dream up problems in present time to keep his attention enforcedly fixed elsewhere than the Rock chain. A thetan will also dream up ARC Breaks to exteriorize his attention from a present time problem.

The common denominator of all locks on the Rock is ARC Breaks. Therefore, in running the Rock, expert auditing is necessary since in this case as in no other, the preclear will dream up ARC Breaks. When his attention flicks back to the Rock when he is between sessions, he will get himself involved in present time problems and ARC Breaks obsessively to keep his attention from going back on to the Rock chain.

Thus, we have the answer to the fact that a session will not progress unless the present time problem is run and alleviated and we also have the answer to the ARC Break difficulties. If the preclear is unsuccessful in keeping his attention off the Rock by a present time problem, he will then dramatize the Rock chain, which is another combination of motives which explains preclear behavior.

The moral of this story is to run out pt problems and to patch up all ARC Breaks or you will not find and run any Rocks.

THE AXIOMS OF DIANETICS

BY

L. RON HUBBARD

AXIOM 1. THE SOURCE OF LIFE IS A STATIC OF PECULIAR AND PARTICULAR PROPERTIES.

AXIOM 2. AT LEAST A PORTION OF THE STATIC CALLED LIFE IS IMPINGED UPON THE PHYSICAL UNIVERSE.

AXIOM 3. THAT PORTION OF THE: STATIC OF LIFE WHICH IS IMPINGED UPON THE PHYSICAL UNIVERSE HAS FOR ITS DYNAMIC GOAL, SURVIVAL AND ONLY SURVIVAL.

AXIOM 4. THE PHYSICAL UNIVERSE IS REDUCIBLE TO MOTION OF ENERGY OPERATING IN SPACE THROUGH TIME.

AXIOM 5. THAT PORTION OF THE STATIC OF LIFE CONCERNED WITH THE LIFE ORGANISMS OF THE PHYSICAL UNIVERSE IS CONCERNED WHOLLY WITH MOTION.

AXIOM 6. THE LIFE STATIC HAS AS ONE OF ITS PROPERTIES THE ABILITY TO MOBILIZE AND ANIMATE MATTER INTO LIVING ORGANISMS.

AXIOM 7. THE LIFE STATIC IS ENGAGED IN A CONQUEST OF THE PHYSICAL UNIVERSE.

AXIOM 8. THE LIFE STATIC CONQUERS THE MATERIAL UNIVERSE BY LEARNING AND APPLYING THE PHYSICAL LAWS OF THE PHYSICAL UNIVERSE.

SYMBOL: The symbol for the LIFE STATIC in use hereafter is the Greek letter THETA.

AXIOM 9. A FUNDAMENTAL OPERATION OF THETA IN SURVIVING IS BRINGING ORDER INTO THE CHAOS OF THE PHYSICAL UNIVERSE

AXIOM 10. THETA BRINGS ORDER INTO CHAOS BY CONQUERING WHATEVER IN MEST MAY BE PRO-SURVIVAL AND DESTROYING WHATEVER IN MEST MAY BE CONTRA-SURVIVAL, AT LEAST THROUGH THE MEDIUM OF LIFE ORGANISMS.

SYMBOL: The symbol for the PHYSICAL UNIVERSE in use here - after is MEST, from the first letters of the words, Matter, Energy, Space and Time, or the Greek letter Phi.

AXIOM 11. A LIFE ORGANISM IS COMPOSED OF MATTER AND ENERGY IN SPACE AND TIME, ANIMATED BY THETA.

SYMBOL: Living organism or organisms will hereafter be represented by the Greek letter LAMBDA.

AXIOM 12. THE MEST PART OF THE ORGANISM FOLLOWS THE LAWS OF THE PHYSICAL SCIENCES. ALL LAMBDA IS CONCERNED WITH MOTION.

AXIOM 13, THETA OPERATING THROUGH LAMBDA CONVERTS THE FORCES OF THE PHYSICAL UNIVERSE INTO FORCES TO CONQUER THE PHYSICAL UNIVERSE.

AXIOM 14. THETA WORKING UPON PHYSICAL UNIVERSE MOTION, MUST MAINTAIN A HARMONIOUS RATE OF MOTION.

The limits of LAMBDA are narrow, both as to thermal and mechanical motion.

AXIOM 15, LAMBDA IS THE INTERMEDIATE STEP IN THE CONQUEST OF THE PHYSICAL UNIVERSE.

AXIOM 16. THE BASIC FOOD OF ANY ORGANISM CONSISTS OF LIGHT AND CHEMICALS.

Organisms can exist only as higher levels of complexities because lower levels of converters exist. Theta evolves organisms from lower to higher forms and supports them by the existence of lower converter forms.

AXIOM 17. THETA, VIA LAMBDA EFFECTS AN EVOLUTION OF MEST.

In this we have the waste products of organisms on the one hand as those very complex chemicals which bacteria make, and, on the other hand, we have the physical face of the earth being changed by animals and men, such changes as grass holding mountains from eroding or roots causing borders to break, buildings being built and rivers being dammed. There is obviously an evolution in MEST in progress under the incursion of THETA.

AXIOM 18. LAMBDA, EVEN WITHIN A SPECIES, VARIES IN ITS ENDOWMENT OF THETA.

AXIOM 19. THE EFFORT OF LAMBDA IS TOWARD SURVIVAL.

The goal of Lambda is survival. The penalty of failure to advance toward that goal is to succumb.

DEFINITION: PERSISTENCE IS THE ABILITY TO EXERT CONTINUANCE OF EFFORT TOWARD SURVIVAL GOALS.

AXIOM 20. LAMBDA CREATES, CONSERVES, MAINTAINS, REQUIRES, DESTROYS, CHANGES, OCCUPIES, GROUPS AND DISPERSES MEST. LAMBDA SURVIVES BY ANIMATING AND MOBILIZING OR DESTROYING MATTER AND ENERGY IN SPACE AND TIME.

AXIOM 21. LAMBDA IS DEPENDENT UPON OPTIMUM MOTION. MOTION WHICH IS TOO SWIFT AND MOTION WHICH IS TOO SLOW ARE EQUALLY CONTRA- SURVIVAL.

AXIOM 22 THETA AND THOUGHT ARE SIMILAR ORDERS OF STATIC.

AXIOM 23. ALL THOUGHT IS CONCERNED WITH MOTION.

AXIOM 24. THE ESTABLISHMENT OF AN OPTIMUM MOTION IS A BASIC GOAL OF REASON.

DEFINITION: LAMBDA IS A CHEMICAL HEAT ENGINE EXISTING IN SPACE AND TIME MOTIVATED BY THE LIFE STATIC AND DIRECTED BY THOUGHT.

AXIOM 25. THE BASIC PURPOSE OF REASON IS THE CALCULATION OR ESTIMATION OF EFFORT.

AXIOM 26. THOUGHT IS ACCOMPLISHED BY THETA FACSIMILES OF PHYSICAL UNIVERSE, ENTITIES OR ACTIONS.

AXIOM 27. THETA IS SATISFIED ONLY WITH HARMONIOUS ACTION OR OPTIMUM MOTION AND REJECTS OR DESTROYS ACTION OR MOTION ABOVE OR BELOW ITS TOLERANCE BAND.

AXIOM 28. THE MIND IS CONCERNED WHOLLY WITH THE ESTIMATION OF EFFORT.

DEFINITION: MIND IS THE THETA COMMAND POST OF ANY ORGANISM OR ORGANISMS.

AXIOM 29. THE BASIC ERRORS OF REASON ARE FAILURE TO DIFFERENTIATE AMONGST MATTER, ENERGY, SPACE AND TIME

AXIOM 30. RIGHTNESS IS PROPER CALCULATION OF EFFORT.

AXIOM 31. WRONGNESS IS ALWAYS MISCALCULATION OF EFFORT.

AXIOM 32. THETA CAN EXERT ITSELF DIRECTLY OR EXTENSIONALLY.

Theta can direct physical application of the organism to the environment or through the mind, can first calculate the action or extend as in language, ideas.

AXIOM 33. CONCLUSIONS ARE DIRECTED TOWARD THE INHIBITION, MAINTENANCE OR ACCELERATIONS OF EFFORTS.

AXIOM 34. THE COMMON DENOMINATOR OF ALL LIFE ORGANISMS IS MOTION.

AXIOM 35. EFFORT OF AN ORGANISM TO SURVIVE OR SUCCUMB IS PHYSICAL MOTION OF A LIFE ORGANISM AT A GIVEN MOMENT IN TIME THROUGH SPACE.

DEFINITION: MOTION IS ANY CHANGE IN ORIENTATION IN SPACE.

DEFINITION: FORCE IS RANDOM EFFORT.

DEFINITION: EFFORT IS DIRECTED FORCE.

AXIOM 36. AN ORGANISM'S EFFORT CAN BE TO REMAIN AT REST OR PERSIST IN A GIVEN MOTION.

Static state has position in time, but an organism which is remaining positionally in a static state if alive is still continuing a highly complex pattern of motion, such as the heart beat, digestion, etc.

The efforts of organisms to survive or succumb are assisted, compelled or opposed by the efforts of other organisms, matter, energy, space and time.

DEFINITION: ATTENTION IS A MOTION WHICH MUST REMAIN AT AN OPTIMUM EFFORT.

Attention is aberrated by becoming unfixed and sweeping at random or becoming too fixed without sweeping.

Unknown threats to survival when sensed cause attention to sweep without fixing.

Known threats to survival when sensed cause attention to fix.

AXIOM 37. THE ULTIMATE GOAL OF LAMBDA IS INFINITE SURVIVAL.

AXIOM 38. DEATH IS ABANDONMENT BY THETA OF A LIFE ORGANISM OR RACE OR SPECIES WHERE THESE CAN NO LONGER SERVE THETA IN ITS GOALS OF INFINITE SURVIVAL.

AXIOM 39. THE REWARD OF AN ORGANISM ENGAGING UPON SURVIVAL ACTIVITY IS PLEASURE.

AXIOM 40. THE PENALTY OF AN ORGANISM FAILING TO ENGAGE UPON SURVIVAL ACTIVITY, OR ENGAGING ON NONSURVIVAL ACTIVITY IS PAIN.

AXIOM 41. THE CELL AND VIRUS ARE THE PRIMARY BUILDING BLOCKS OF LIFE ORGANISMS.

AXIOM 42. THE VIRUS AND CELL ARE MATTER AND ENERGY ANIMATED AND MOTIVATED IN SPACE AND TIME BY THETA.

AXIOM 43. THETA MOBILIZES THE VIRUS AND CELL IN COLONIAL AGGREGATIONS TO INCREASE POTENTIAL MOTION AND ACCOMPLISH EFFORT.

AXIOM 44. THE GOAL OF VIRUSES AND CELLS IS SURVIVAL IN SPACE THROUGH TIME.

AXIOM 45. THE TOTAL MISSION OF HIGHER ORGANISMS, VIRUSES AND CELLS THE SAME AS THAT OF THE VIRUS AND CELL.

AXIOM 46. COLONIAL AGGREGATIONS OF VIRUSES AND CELLS BE IMBUED WITH MORE THETA THAN THEY INHERENTLY CONTAINED.

Life Energy joins any group whether a group of organisms or group of cells composing an organism. Here we have personal entity, individuation, etc.

AXIOM 47. EFFORT CAN BE ACCOMPLISHED BY LAMBDA ONLY THROUGH THE CO-ORDINATION OF ITS PARTS TOWARD GOALS.

AXIOM 48. AN ORGANISM IS EQUIPPED TO BE GOVERNED AND CONTROLLED BY A MIND.

AXIOM 49. THE PURPOSE OF THE MIND IS TO POSE AND RESOLVE PROBLEMS RELATING TO SURVIVAL AND TO DIRECT THE EFFORT OF THE ORGANISM ACCORDING TO THESE SOLUTIONS.

- AXIOM 50. ALL PROBLEMS ARE POSED AND RESOLVED THROUGH ESTIMATIONS OF EFFORT.
- AXIOM 51. THE MIND CAN CONFUSE POSITION IN SPACE WITH POSITION IN TIME (COUNTER- EFFORTS PRODUCING ACTION PHRASES.)
- AXIOM 52. AN ORGANISM PROCEEDING TOWARD SURVIVAL IS DIRECTED BY THE MIND OF THAT ORGANISM IN THE ACCOMPLISHMENT OF SURVIVAL EFFORT.
- AXIOM 53. AN ORGANISM PROCEEDING TOWARD SUCCUMB IS DIRECTED BY THE MIND OF THAT ORGANISM IN THE ACCOMPLISHMENT OF DEATH.
- AXIOM 54. SURVIVAL OF AN ORGANISM IS ACCOMPLISHED BY THE OVERCOMING OF EFFORTS OPPOSING ITS SURVIVAL. (NOTE COROLLARY: FOR OTHER DYNAMICS.)
- DEFINITION: DYNAMIC IS THE ABILITY TO TRANSLATE SOLUTIONS INTO ACTION.
- AXIOM 55. SURVIVAL EFFORT FOR AN ORGANISM INCLUDES THE DYNAMIC THRUST BY THAT ORGANISM FOR THE SURVIVAL OF ITSELF, ITS PROCREATIONS, ITS GROUP, ITS SUB-SPECIES, ITS SPECIES, ALL LIFE ORGANISMS, MATERIAL UNIVERSE, THE LIFE STATIC AND, POSSIBLY A SUPREME BEING. (NOTE: LIST OF DYNAMICS.)
- AXIOM 56. THE CYCLE OF AN ORGANISM, A GROUP OF ORGANISMS OR A SPECIES IS INCEPTION, GROWTH, RE-CREATION, DECAY AND DEATH.
- AXIOM 57. THE EFFORT OF AN ORGANISM IS DIRECTED TOWARD THE CONTROL OF THE ENVIRONMENT FOR ALL THE DYNAMICS.
- AXIOM 58. CONTROL OF AN ENVIRONMENT IS ACCOMPLISHED BY THE SUPPORT OF PRO - SURVIVAL FACTORS ALONG ANY DYNAMIC.
- AXIOM 59. ANY TYPE OF HIGHER ORGANISM IS ACCOMPLISHED BY THE EVOLUTION OF VIRUSES AND CELLS INTO FORMS CAPABLE OF BETTER EFFORTS TO CONTROL OR LIVE IN AN ENVIRONMENT.
- AXIOM 60. THE USEFULNESS OF AN ORGANISM IS DETERMINED ITS ABILITY TO CONTROL THE ENVIRONMENT OR TO SUPPORT ORGANISMS WHICH CONTROL THE ENVIRONMENT.
- AXIOM 61. AN ORGANISM IS REJECTED BY THETA TO THE DEGREE THAT IT FAILS IN ITS GOALS.
- AXIOM 62. HIGHER ORGANISMS CAN EXIST ONLY IN THE DEGREE THAT THEY ARE SUPPORTED BY THE LOWER ORGANISMS.
- AXIOM 63. THE USEFULNESS OF AN ORGANISM IS DETERMINED THE ALIGNMENT OF ITS EFFORTS TOWARD SURVIVAL.
- AXIOM 64. THE MIND PERCEIVES AND STORES ALL DATA OF THE ENVIRONMENT AND ALIGNS OR FAILS TO ALIGN THESE ACCORDINGLY TO THE TIME THEY WERE PERCEIVED.

- AXIOM 65. THE PROCESS OF THOUGHT IS THE PERCEPTION OF THE PRESENT AND THE COMPARISON OF IT TO THE PERCEPTIONS AND CONCLUSIONS OF THE PAST IN ORDER TO DIRECT ACTION IN THE IMMEDIATE OR DISTANT FUTURE.
- COROLLARY: THE ATTEMPT OF THOUGHT IS TO PERCEIVE REALITIES OF THE PAST AND PRESENT IN ORDER TO PREDICT OR POSTULATE REALITIES OF THE FUTURE.
- AXIOM 66. THE PROCESS BY WHICH LIFE EFFECTS ITS CONQUEST OF THE MATERIAL UNIVERSE CONSISTS IN THE CONVERSION OF THE POTENTIAL EFFORT OF MATTER AND ENERGY IN SPACE AND THROUGH TIME TO EFFECT WITH IT THE CONVERSION OF FURTHER MATTER AND ENERGY IN SPACE AND THROUGH TIME.
- AXIOM 67. THETA CONTAINS ITS OWN THETA UNIVERSE EFFORT WHICH TRANSLATES INTO MEST EFFORT.
- AXIOM 68. THE SINGLE ARBITRARY IN ANY ORGANISM IS TIME.
- AXIOM 69. PHYSICAL UNIVERSE PERCEPTIONS AND EFFORTS ARE RECEIVED BY AN ORGANISM AS FORCE WAVES, CONVERTED BY FACSIMILE INTO THETA AND ARE THUS STORED.
- DEFINITION: RANDOMITY IS THE MIS- ALIGNMENT THROUGH THE INTERNAL OR EXTERNAL EFFORTS BY OTHER FORMS OF LIFE OR THE MATERIAL UNIVERSE OF THE EFFORTS OF AN ORGANISM, AND IS IMPOSED ON THE PHYSICAL ORGANISM BY COUNTER EFFORTS IN THE ENVIRONMENT.
- AXIOM 70. ANY CYCLE OF ANY LIFE ORGANISM IS FROM STATIC TO MOTION TO STATIC.
- AXIOM 71. THE CYCLE OF RANDOMITY IS FROM STATIC, THROUGH OPTIMUM, THROUGH RANDOMITY SUFFICIENTLY REPETITIOUS OR SIMILAR TO CONSTITUTE ANOTHER STATIC.
- AXIOM 72. THERE ARE TWO SUB-DIVISIONS TO RANDOMITY: DATA RANDOMITY AND FORCE RANDOMITY.
- AXIOM 73. THE THREE DEGREES OF RANDOMITY CONSISTS OF MINUS RANDOMITY, OPTIMUM RANDOMITY AND PLUS RANDOMITY.
- AXIOM 74. OPTIMUM RANDOMITY IS NECESSARY TO LEARNING.
- AXIOM 75. THE IMPORTANT FACTORS IN ANY AREA OF RANDOMITY ARE EFFORT AND COUNTER- EFFORT. (NOTE: AS DISTINGUISHED FROM NEAR-PERCEPTIONS OF EFFORT.)
- AXIOM 76. RANDOMITY AMONGST ORGANISMS IS VITAL TO CONTINUOUS SURVIVAL OF ALL ORGANISMS.
- AXIOM 77. THETA AFFECTS THE ORGANISM, OTHER ORGANISMS AND THE PHYSICAL UNIVERSE BY TRANSLATING THETA FACSIMILIES INTO PHYSICAL EFFORTS OR RANDOMITY OF EFFORTS.

- DEFINITION: THE DEGREE OF RANDOMITY IS MEASURED BY THE RANDOMNESS OF EFFORT VECTORS WITHIN THE ORGANISMS OR BETWEEN ORGANISMS AND THE PHYSICAL UNIVERSE.
- AXIOM 78. RANDOMITY BECOMES INTENSE IN INDIRECT RATIO TO THE TIME IN WHICH IT TAKES PLACE, MODIFIED BY THE THE EFFORT IN THE AREA.
- AXIOM 79. INITIAL RANDOMITY CAN BE REINFORCED BY RANDOMITIES OF GREATER OR LESSER MAGNITUDE.
- AXIOM 80. AREAS OF RANDOMITY EXIST IN CHAINS OF SIMILARITY PLOTTED AGAINST TIME. THIS CAN BE TRUE OF WORDS AND ACTIONS CONTAINED IN RANDOMITIES. EACH MAY HAVE ITS OWN CHAIN PLOTTED AGAINST TIME.
- AXIOM 81. SANITY CONSISTS OF OPTIMUM RANDOMITY.
- AXIOM 82. ABERRATION EXISTS TO THE DEGREE THAT PLUS OF MINUS RANDOMITY EXISTS IN THE ENVIRONMENT OR PAST DATA OF AN ORGANISM, GROUP OR SPECIES MODIFIED BY THE ENDOWED SELF- DETERMINISM OF THAT ORGANISM, GROUP OR SPECIES.
- AXIOM 83. THE SELF- DETERMINISM OF AN ORGANISM IS DETERMINED BY ITS THETA ENDOWMENT, MODIFIED BY MINUS OR PLUS RANDOMITY IN ITS ENVIRONMENT OR ITS EXISTENCE.
- AXIOM 84. THE SELF-DETERMINISM OF AN ORGANISM IS INCREASED BY OPTIMUM RANDOMITY OF COUNTER- EFFORTS.
- AXIOM 85. THE SELF-DETERMINISM OF AN ORGANISM IS REDUCED BY PLUS OR MINUS RANDOMITY OF COUNTER- EFFORTS IN THE ENVIRONMENT .
- AXIOM 86. RANDOMITY CONTAINS BOTH THE RANDOMNESS OF EFFORTS AND THE VOLUME OF EFFORTS. (NOTE: AN AREA OF RANDOMITY CAN HAVE A GREAT DEAL OF CONFUSION BUT WITHOUT VOLUME OF ENERGY, THE CONFUSION ITSELF IS NEGLIGIBLE.)
- AXIOM 87. THAT COUNTER- EFFORT IS MOST ACCEPTABLE TO AN ORGANISM WHICH MOST CLOSELY APPEARS TO ASSIST ITS ACCOMPLISHMENT OF ITS GOAL.
- AXIOM 88. AN AREA OF SEVERE PLUS OR MINUS RANDOMITY CAN OCCLUDE DATA ON ANY OF THE SUBJECTS OF THAT PLUS OR MINUS RANDOMITY WHICH TOOK PLACE IN A PRIOR TIME. (NOTE: SHUT-OFF MECHANISMS OF EARLIER LIVES, PERCEPTICS, SPECIFIC INCIDENTS, ETC.)
- AXIOM 89. RESTIMULATION OF PLUS, MINUS OR OPTIMUM RANDOMITY CAN PRODUCE INCREASED PLUS, MINUS OR OPTIMUM RANDOMITY RESPECTIVELY IN THE ORGANISM.

- AXIOM 90. AN AREA OF RANDOMITY CAN ASSUME SUFFICIENT MAGNITUDE SO AS TO APPEAR TO THE ORGANISM AS PAIN, ACCORDING TO ITS GOALS.
- AXIOM 91. PAST RANDOMITY CAN IMPOSE ITSELF UPON THE PRESENT ORGANISM AS THETA FACSIMILES.
- AXIOM 92. THE ENGRAM IS A SEVERE AREA OF PLUS OR MINUS RANDOMITY OF SUFFICIENT VOLUME TO CAUSE UNCONSCIOUSNESS.
- AXIOM 93. UNCONSCIOUSNESS IS AN EXCESS OF RANDOMITY IMPOSED BY A COUNTER-EFFORT OF SUFFICIENT FORCE TO CLOUD THE AWARENESS AND DIRECT FUNCTION OF THE ORGANISM THROUGH THE MIND'S CONTROL CENTER.
- AXIOM 94. ANY COUNTER- EFFORT WHICH MIS-ALIGNS THE ORGANISM'S COMMAND OF ITSELF OR ITS ENVIRONMENT ESTABLISHES PLUS OR MINUS RANDOMITY OR, IF OF SUFFICIENT MAGNITUDE, IS AN ENGRAM.
- AXIOM 95. PAST ENGRAMS ARE RESTIMULATED BY THE CONTROL CENTER'S PERCEPTION OF CIRCUMSTANCES SIMILAR TO THAT ENGRAM IN THE PRESENT ENVIRONMENT.
- AXIOM 96. AN ENGRAM IS A THETA FACSIMILE OF ATOMS AND MOLECULES IN MISALIGNMENT.
- AXIOM 97. ENGRAMS FIX EMOTIONAL RESPONSE AS THAT EMOTIONAL RESPONSE OF THE ORGANISM DURING THE RECEIPT OF THE COUNTER- EFFORT.
- AXIOM 98. FREE EMOTIONAL RESPONSE DEPENDS ON OPTIMUM RANDOMITY. IT DEPENDS UPON ABSENCE OF OR NON- RESTIMULATION OF ENGRAMS.
- AXIOM 99. THETA FACSIMILIES CAN RECOMBINE INTO NEW SYMBOLS.
- AXIOM 100. LANGUAGE IS THE SYMBOLIZATION OF EFFORT.
- AXIOM 101. LANGUAGE DEPENDS FOR ITS FORCE UPON THE FORCE WHICH ACCOMPANIED ITS DEFINITION: , (NOTE: COUNTER-EFFORT, NOT LANGUAGE, IS ABERRATIVE.)
- AXIOM 102. THE ENVIRONMENT CAN OCCLUDE THE CENTRAL CONTROL OF ANY ORGANISM AND ASSUME CONTROL OF THE MOTOR CONTROLS OF THAT ORGANISM (ENGRAM, RESTIMULATION, LOCKS, HYPNOTISM).
- AXIOM 103. INTELLIGENCE DEPENDS ON THE ABILITY TO SELECT ALIGNED OR MISALIGNED DATA FROM AN AREA OF RANDOMITY AND SO DISCOVER A SOLUTION TO REDUCE ALL RANDOMITY IN THAT AREA.
- AXIOM 104. PERSISTENCE OBTAINS IN THE ABILITY OF THE MIND TO PUT SOLUTIONS INTO PHYSICAL ACTION TOWARD THE REALIZATION OF GOALS.

- AXIOM 105. AN UNKNOWN DATUM CAN PRODUCE DATA OF PLUS OR MINUS RANDOMITY.
- AXIOM 106. THE INTRODUCTION OF AN ARBITRARY FACTOR OR FORCE WITHOUT RECOURSE TO NATURAL LAWS OF THE BODY OR THE AREA INTO WHICH THE ARBITRARY IS INTRODUCED BRINGS ABOUT PLUS OR MINUS RANDOMITY.
- AXIOM 107. DATA OF PLUS OR MINUS RANDOMITY DEPENDS FOR ITS CONFUSION ON FORMER PLUS OR MINUS RANDOMITY OR ABSENT DATA.
- AXIOM 108. EFFORTS WHICH ARE INHIBITED OR COMPELLED BY EXTERIOR EFFORTS EFFECT A PLUS OR MINUS RANDOMITY OF EFFORTS.
- AXIOM109. BEHAVIOR IS MODIFIED BY COUNTER- EFFORTS WHICH HAVE IMPINGED ON THE ORGANISM.
- AXIOM 110. THE COMPONENT PARTS OF THETA ARE AFFINITY, REALITY AND COMMUNICATION.
- AXIOM 111. SELF-DETERMINISM CONSISTS OF MAXIMAL AFFINITY, REALITY AND COMMUNICATION.
- AXIOM 112. AFFINITY IS THE COHESION OF THETA.
- Affinity manifests itself as the recognition of similarity of efforts and goals amongst organisms by those organisms.
- AXIOM 113. REALITY IS THE AGREEMENT UPON PERCEPTIONS AND DATA IN THE PHYSICAL UNIVERSE.
- All that we can be sure is real is that on which we have agreed is real. Agreement is the essence of reality.
- AXIOM 114. COMMUNICATION IS THE INTERCHANGE OF PERCEPTION THROUGH THE MATERIAL UNIVERSE BETWEEN ORGANISMS OR THE PERCEPTION OF THE MATERIAL UNVERSE BY SENSE CHANNELS.
- AXIOM 115. SELF-DETERMINISM IS THE THETA CONTROL OF THE ORGANISM.
- AXIOM 116. A SELF DETERMINED EFFORT IS THAT COUNTER-EFFORT WHICH HAS BEEN RECEIVED INTO THE ORGANISM IN THE PAST AND INTEGRATED INTO THE ORGANISM FOR ITS CONSCIOUS USE.
- AXIOM 117. THE COMPONENTS OF SELF-DETERMINISM ARE AFFINITY, COMMUNICATION AND REALITY.
- Self-determinism is manifested along each dynamic.
- AXIOM 118. AN ORGANISM CANNOT BECOME ABERRATED UNLES IT HAS AGREED UPON THAT ABERRATION, HAS BEEN IN COMUNICATION WITH A SOURCE OF ABERRATION AND HAS HAI~ AFFINITY FOR THE ABERRATOR.

AXIOM 119. AGREEMENT WITH ANY SOURCE CONTRA- OR PRO-SURVIVAL POSTULATES A NEW REALITY FOR THE ORGANISM.

AXIOM 120. NON-SURVIVAL COURSES, THOUGHTS AND ACTIONS REQUIRE NON-OPTIMUM EFFORT.

AXIOM 121. EVERY THOUGHT HAS BEEN PRECEDED BY PHYSICAL ACTION.

AXIOM 122. THE MIND DOES WITH THOUGHT AS IT HAS DONE WITH ENTITIES IN THE PHYSICAL UNIVERSE.

AXIOM 123. ALL EFFORT CONCERNED WITH PAIN IS CONCERNED WITH LOSS.

Organisms hold pain and engrams to them as a latent effort to prevent loss of some portion of the organism. All loss is a loss of motion.

AXIOM 124. THE AMOUNT OF COUNTER- EFFORT THE ORGANISM CAN OVERCOME IS PROPORTIONAL TO THE THETA ENDOWMENT OF THE ORGANISM, MODIFIED BY THE PHYSIQUE OF THAT ORGANISM.

AXIOM 125. EXCESSIVE COUNTER-EFFORT TO THE EFFORT OF LIFE ORGANISM PRODUCES UNCONSCIOUSNESS.

COROLLARY: UNCONSCIOUSNESS GIVES THE SUPPRESSION OF AN ORGANISM'S CONTROL CENTER BY COUNTER-EFFORT.

DEFINITION: THE CONTROL CENTER OF THE ORGANISM CAN BE DEFINED AS THE CONTACT POINT BETWEEN THETA AND THE PHYSICAL UNIVERSE AND IS THAT CENTER WHICH IS AWARE OF BEING AWARE AND WHICH HAS CHARGE OF AND RESPONSIBILITY FOR THE ORGANISM ALONG ALL ITS DYNAMICS.

AXIOM 126. PERCEPTIONS ARE ALWAYS RECEIVED IN THE CONTROL CENTER OF AN ORGANISM WHETHER THE CONTROL CENTER IS IN CONTROL OF THE ORGANISM AT THE TIME OR NOT.

This is an explanation for the assumption of valences.

AXIOM 127. ALL PERCEPTIONS REACHING THE ORGANISM'S SENSE CHANNELS ARE RECORDED AND STORED BY THETA FACSIMILE.

DEFINITION PERCEPTION IS THE PROCESS OF RECORDING DATA FROM THE PHYSICAL UNIVERSE AND STORING IT AS A THETA FACSIMILE.

DEFINITION: RECALL IS THE PROCESS OF REGAINING PERCEPTIONS.

AXIOM 128. ANY ORGANISM CAN RECALL EVERYTHING WHICH IT HAS PERCEIVED.

AXIOM 129. AN ORGANISM DISPLACED BY PLUS OR MINUS RANDOMITY IS THEREAFTER REMOTE FROM THE PERCEPTION RECORDING CENTER.

Increased remoteness brings about occlusions of perceptions. One can perceive things in present time and then, because they are being recorded after they passed THETA perception of the awareness unit, they are recorded but cannot be recalled.

AXIOM 130. THETA FACSIMILES OF COUNTER- EFFORT ARE; ALL THAT INTERPOSE BETWEEN THE CONTROL CENTER AND ITS RECALLS.

AXIOM 131. ANY COUNTER- EFFORT RECEIVED INTO A CONTROL CENTER IS ALWAYS ACCOMPANIED BY ALL PERCEPTICS.

AXIOM 132. THE RANDOM COUNTER- EFFORTS TO AN ORGANISM AND THE INTERMINGLED PERCEPTIONS IN THE RANDOMITY CAN RE- EXERT THAT FORCE UPON AN ORGANISM WHEN RESTIMULATED.

DEFINITION: RESTIMULATION IS THE REACTIVATION OF A PAST COUNTER- EFFORT BY APPEARANCE IN THE ORGANISM'S ENVIRONMENT OF A SIMILARITY TOWARD THE CONTENT OF THE PAST RANDOMITY AREA.

AXIOM 133. SELF-DETERMINISM ALONE BRINGS ABOUT THE MECHANISM OF RESTIMULATION.

AXIOM 134. A REACTIVATED AREA OF THE PAST RANDOMITY IMPINGES THE EFFORT AND THE PERCEPTIONS UPON THE ORGANISM.

AXIOM 135. ACTIVATION OF A RANDOMITY AREA IS ACCOMPLISHED FIRST BY THE PERCEPTIONS, THEN BY THE PAIN, FINALLY BY THE EFFORT.

AXIOM 136. THE MIND IS PLASTICALLY CAPABLE OF RECORDING ALL EFFORTS AND COUNTER- EFFORTS.

AXIOM 137. A COUNTER-EFFORT ACCOMPANIED BY SUFFICIENT (ENRANDOMED) FORCE IMPRESSES THE FACSIMILE OF THE COUNTER-EFFORT PERSONALITY INTO THE MIND OF AN ORGANISM.

AXIOM 138. ABERRATION IS THE DEGREE OF RESIDUAL PLUS OR MINUS RANDOMITY ACCUMULATED BY COMPELLING, INHIBITING, OR UNWARRENTED ASSISTING OF EFFORTS ON THE PART OF OTHER ORGANISMS OR THE PHYSICAL (MATERIAL) UNIVERSE.

Aberration is caused by what is done to the individual, not what the individual does, plus his self-determinism about what has been done to him.

AXIOM 139. ABERRATED BEHAVIOUR CONSISTS OF DESTRUCTIVE EFFORT TOWARD PRO-SURVIVAL DATA OR ENTITIES ON ANY DYNAMIC, OR EFFORT TOWARD THE SURVIVAL OF CONTRA SURVIVAL DATA OR ENTITIES FOR ANY DYNAMIC.

AXIOM 140. A VALENCE IS A FACSIMILE PERSONALITY MADE CAPABLE OF FORCE BY THE COUNTER- EFFORT OF THE MOMENT OR RECEIPT INTO THE PLUS OR MINUS RANDOMITY OF UNCONSCIOUSNESS.

Valences are assistive, compulsive or inhibitive to the organism.

A CONTROL CENTER IS NOT A VALENCE.

- AXIOM 141. A CONTROL CENTER EFFORT IS ALIGNED TOWARD A GOAL THROUGH DEFINITE SPACE AS A RECOGNIZED INCIDENT IN TIME.
- AXIOM 142. AN ORGANISM IS AS HEALTHY AND SANE AS IT IS SELF DETERMINED.
- The environmental control of the organism motorcontrol inhibits the organisms ability to change with the changing environment, since , the organism will attempt to carry forward with one set of responses when it needs by self-determinism to create another to survive in another environment.
- AXIOM 143. ALL LEARNING IS ACCOMPLISHED BY RANDOM EFFECT.
- AXIOM 144. A COUNTER-EFFORT PRODUCING SUFFICIENT PLUS OR MINUS RANDOMITY TO RECORD IS RECORDED WITH AN INDEX OF SPACE AND TIME AS HIDDEN AS THE REMAINDER OF ITS CONTENT.
- AXIOM 145. A COUNTER- EFFORT PRODUCING SUFFICIENT PLUS OR MINUS RANDOMITY WHEN ACTIVATED BY RESTIMULATION EXERTS ITSELF AGAINST THE ENVIRONMENT OR THE ORGANISM WITHOUT REGARD TO SPACE AND TIME. EXCEPT REACTIVATED PERCEPTIONS.
- AXIOM 146. COUNTER-EFFORTS ARE DIRECTED OUT FROM THE ORGANISM UNTIL THEY ARE FURTHER ENRANDOMED BY THE ENVIRONMENT AT WHICH TIME THEY AGAIN ACTIVATE AGAINST THE CONTROL CENTER.
- AXIOM 147. AN ORGANISM'S MIND EMPLOYS COUNTER- EFFORTS EFFECTIVELY ONLY SO LONG AS INSUFFICIENT PLUS OR MINUS RANDOMITY EXISTS TO HIDE DIFFERENTIATION OF THE FACSIMILES CREATED.
- AXIOM 148. PHYSICAL LAWS ARE LEARNED BY LIFE ENERGY OR BY IMPINGEMENT OF THE PHYSICAL UNIVERSE PRODUCING RANDOMITY, AND A WITHDRAWAL FROM THAT IMPINGEMENT.
- AXIOM 149. LIFE DEPENDS UPON AN ALIGNMENT OF FORCE VECTORS IN THE DIRECTION OF SURVIVAL AND THE NULLIFICATION OF FORCE VECTORS IN THE DIRECTION OF SUCCUMB IN ORDER TO SURVIVE.
- COROLLARY: LIFE DEPENDS UPON AN ALIGNMENT OF FORCE VECTORS IN THE DIRECTION OF SUCCUMB AND THE NULLIFICATION OF FORCE VECTORS IN THE DIRECTION OF SURVIVE IN ORDER TO SUCCUMB.
- AXIOM 150. ANY AREA OF RANDOMITY GATHERS TO IT SITUATIONS SIMILAR TO IT WHICH DO NOT CONTAIN ACTUAL EFFORTS BUT ONLY PERCEPTION.
- AXIOM 151. WHETHER AN ORGANISM HAS THE GOAL OF SURVIVING OR SUCCUMBING DEPENDS UPON THE AMOUNT OF PLUS OR MINUS RANDOMITY IT HAS REACTIVATED. (NOT RESIDUAL)

- AXIOM 152. SURVIVAL IS ACCOMPLISHED ONLY BY MOTION.
- AXIOM 153. IN THE PHYSICAL UNIVERSE THE ABSENCE OF MOTION IS VANISHMENT.
- AXIOM 154. DEATH IS THE EQUIVALENT TO LIFE OF TOTAL LACK OF LIFE-MOTIVATED MOTION.
- AXIOM 155. ACQUISITION OF PRO-SURVIVAL MATTER AND ENERGY OR ORGANISMS IN SPACE AND TIME MEANS INCREASED MOTION.
- AXIOM 156. LOSS OF PRO-SURVIVAL MATTER AND ENERGY OR ORGANISMS IN SPACE AND TIME MEANS DECREASED MOTION.
- AXIOM 157. ACQUISITION OR PROXIMITY OF MATTER, ENERGY OR ORGANISMS WHICH ASSIST THE SURVIVAL OF AN ORGANISM INCREASE THE SURVIVAL POTENTIALS OF AN ORGANISM.
- AXIOM 158. ACQUISITION OR PROXIMITY OF MATTER, ENERGY OR ORGANISMS WHICH INHIBIT THE SURVIVAL OF AN ORGANISM DECREASE ITS SURVIVAL POTENTIAL.
- AXIOM 159. GAIN OF SURVIVAL ENERGY, MATTER OR ORGANISMS INCREASE THE FREEDOM OF AN ORGANISM,
- AXIOM 160. RECEIPT OR PROXIMITY OF NON-SURVIVAL ENERGY, MATTER OR TIME DECREASE THE FREEDOM OF MOTION OF AN ORGANISM.
- AXIOM 161. THE CONTROL CENTER ATTEMPTS THE HALTING OR LENGTHENING OF TIME, THE EXPANSION OR CONTRACTION OF SPACE AND THE DECREASE OR INCREASE OF ENERGY AND MATTER.
- This is a primary source of invalidation, and it is also a primary source of aberration.
- AXIOM 162. PAIN IS THE BALK OF EFFORT BY COUNTER-EFFORT IN GREAT INTENSITY, WHETHER THAT EFFORT IS TO REMAIN A REST OR IN MOTION.
- AXIOM 163. PERCEPTION, INCLUDING PAIN, CAN BE EXHAUSTED FROM AN AREA OF PLUS OR MINUS RANDOMITY STILL LEAVING THE EFFORT AND COUNTER-EFFORT OF THAT PLUS OR MINUS RANDOMITY.
- AXIOM 164. THE RATIONALITY OF THE MIND DEPENDS UPON AN OPTIMUM REACTION TOWARD TIME.
- DEFINITION: SANITY, THE COMPUTATION OF FUTURES.
- DEFINITION: NEURTIC, THE COMPUTATION OF PRESENT TIME ONLY.
- DEFINITION: PSYCHOTIC COMPUTATION ONLY OF PAST SITUATIONS.
- AXIOM 165. SURVIVAL PERTAINS ONLY TO THE FUTURE.
- COROLLARY: SUCCUMB PERTAINS ONLY TO THE PRESENT AND PAST.

- AXIOM 166. AN INDIVIDUAL IS AS HAPPY AS HE CAN PERCEIVE SURVIVAL POTENTIALS IN THE ,FUTURE.
- AXIOM 167. AS THE NEEDS OF ANY ORGANISM ARE MET IT RISES HIGHER AND HIGHER IN ITS EFFORTS ALONG THE DYNAMICS.
- An organism which achieves ARC with itself can better achieve ARC with sex in the future; having achieved this it can achieve ARC with groups; having achieved this, it can achieve ARC with mankind etc.
- AXIOM 168. AFFINITY, REALITY AND COMMUNICATION CO-EXIST IN AN INEXTRICABLE RELATIONSHIP.
- The co- existent relationship between affinity, reality and communication is such that none can be increased without increasing theother two ,and none can be decreased without decreasing the other two.
- AXIOM 169. ANY AESTHETIC PRODUCT IS A SYMBOLIC FACSIMILE OR COMB[NATION OF FACSIMILES OF THETA OR PHYSICAL UNIVERSES IN VARIED RANDOMITIES AND VOLUMES OF RANDOMITIES WITH THE INTERPLAY OF TONES.
- AXIOM 170. AN AESTHETIC PRODUCT IS AN INTERPRETATION OF UNIVERSES BY AN INDIVIDUAL OR GROUP MIND.
- AXIOM 171. DELUSION IS THE POSTULATION BY THE IMAGINATION OCCURANCES IN AREAS OF PLUS OR MINUS RANDOMITY.
- AXIOM 172. DREAMS ARE THE IMAGINATIVE RECONSTRUCTION OF AREAS OF RANDOMITY OR THE RE-SYMBOLIZATION OF THE EFFORTS OF THETA.
- AXIOM 173. A MOTION IS CREATED BY THE DEGREE OF OPTIMUM RANDOMITY INTRODUCED BY THE COUNTER-EFFORT TO AN ORGANISMS EFFORT.
- AXIOM 174. MEST, WHICH HAS BEEN MOBILIZED BY LIFE FORMS, IS IN AFFINITY WITH LIFE FORMS THAN NON- MOBILIZED MEST.
- AXIOM 175. ALL PAST PERCEPTION, CONCLUSION AND EXISTENCE MOMENTS INCLUDING THOSE OF PLUS,OR MINUS RANDOMITY ARE RECOVERABLE TO THE CONTROL CENTER OF THE ORGANISM.
- AXIOM 176. THE ABILITY TO PRODUCE SURVIVAL EFFORT ON THE PART OF AN ORGANISM IS AFFECTED BY THE DEGREES OF RANDOMITY EXISTING IN ITS PAST. (THIS INCLUDES LEARNING)
- AXIOM 177. AREAS OF PAST PLUS OR MINUS RANDOMITY CAN BE READDRESSSED BY THE CONTROL CENTER OF AN ORGANISM AND THE PLUS OR MINUS RANDOMITY EXHAUSTED.
- AXIOM 178. THE EXHAUSTION OF PAST PLUS OR MINUS RANDOMITIES PERMITS THE CONTROL CENTER OF AN ORGANISM TOEFFECT ITS OWN EFFORTS TOWARD SURVIVAL GOALS.

- AXIOM 179. THE EXHAUSTION OF SELF- DETERMINED EFFORT FROM A PAST AREA OF PLUS OR MINUS RANDOMITY NULLIFIES THE EFFECTIVENESS OF THAT AREA.
- AXIOM 180. PAIN IS THE RANDOMITY PRODUCED BY SUDDEN OR STRONG COUNTER- EFFORTS.
- AXIOM 181. PAIN IS STORED AS PLUS OR MINUS RANDOMITY.
- AXIOM 182. PAIN, AS AN AREA OF PLUS OR MINUS RANDOMITY, CAN RE-INFLICT ITSELF UPON THE ORGANISM.
- AXIOM 183. PAST PAIN BECOMES INEFFECTIVE UPON THE ORGANISM WHEN THE RANDOMITY OF ITS AREA IS ADDRESSED AND ALIGNED.
- AXIOM 184. THE EARLIER THE AREA OF PLUS OR MINUS RANDOMITY THE GREATER SELF-PRODUCED EFFORT EXISTED TO REPEL IT.
- AXIOM 185. LATER AREAS OF PLUS OR MINUS RANDOMITY CANNOT BE RE-ALIGNED EASILY UNTIL EARLIER AREAS ARE RE- ALIGNED.
- AXIOM 186. AREAS OF PLUS OR MINUS RANDOMITY BECOME INCREASED IN ACTIVITY WHEN PERCEPTIONS OF SIMILARITY ARE INTRODUCED INTO THEM.
- AXIOM 187. PAST AREAS OF PLUS OR MINUS RANDOMITY CAN BE REDUCED AND ALIGNED BY ADDRESS TO THEM IN PRESENT TIME.
- AXIOM 188. ABSOLUTE GOOD AND ABSOLUTE EVIL DO NOT EXIST IN THE BEST UNIVERSE.
- AXIOM 189. THAT WHICH IS GOOD FOR AN ORGANISM MAY BE DEFINED AS THAT WHICH PROMOTES THE SURVIVAL OF THAT ORGANISM.
- COROLLARY: EVIL MAY BE DEFINED AS THAT WHICH INHIBITS OR BRINGS PLUS OR MINUS RANDOMITY INTO THE ORGANISM WHICH IS CONTRARY TO THE SURVIVAL MOTIVES OF THE ORGANISM.
- AXIOM 190. HAPPINESS CONSISTS OF THE ACT OF BRINGING ALIGNMENT INTO EITHER TO RESISTING PLUS OR MINUS RANDOMITY. NEITHER THE ACT OR ACTION OF ATTAINING SURVIVAL, NOR THE ACCOMPLISHMENT OF THIS ACT ITSELF, BRINGS ABOUT HAPPINESS.
- AXIOM 191. CONSTRUCTION IS AN ALIGNMENT OF DATA.
- COROLLARY: DESTRUCTION IS A PLUS OR MINUS RANDOMITY OF DATA.
- The effort of construction is the alignment toward the survival of the aligning organism.
- Destruction is the effort of bringing randomness into an area.
- AXIOM 192. OPTIMUM SURVIVAL BEHAVIOUR CONSISTS OF EFFORT IN THE MAXIMUM SURVIVAL INTEREST IN EVERYTHING CONCERNED IN THE DYNAMICS.

AXIOM 193. THE OPTIMUM SURVIVAL SOLUTION OF ANY PROBLEM WOULD CONSIST OF THE HIGHEST ATTAINABLE SURVIVAL FOR. EVERY DYNAMIC CONCERNED.

AXIOM 194. THE WORTH OF ANY ORGANISM CONSISTS OF ITS VALUE TO THE SURVIVAL OF ITS OWN THETA ALONG ANY DYNAMIC.

THE AXIOMS OF SCIENTOLOGY

by

L. RON HUBBARD

- AXIOM 1. LIFE IS BASICALLY A STATIC.
- Definition: a Life Static has no mass, no motion, no wavelength, no location in space or in time. It has the ability to postulate and to perceive.
- AXIOM 2. THE STATIC IS CAPABLE OF CONSIDERATIONS, POSTULATES, AND OPINIONS.
- AXIOM 3. SPACE, ENERGY, OBJECTS, FORM, AND TIME ARE THE RESULT OF CONSIDERATIONS MADE AND/OR AGREED UPON BY THE STATIC, AND ARE PERCEIVED SOLELY BECAUSE THE STATIC CONSIDERS THAT IT CAN PERCEIVE THEM.
- AXIOM 4. SPACE IS A VIEWPOINT OF DIMENSION.
- AXIOM 5. ENERGY CONSISTS OF POSTULATED PARTICLES IN SPACE.
- AXIOM 6. OBJECTS CONSIST OF GROUPED PARTICLES.
- AXIOM 7. TIME IS BASICALLY A POSTULATE THAT SPACE AND PARTICLES WILL PERSIST.
- AXIOM 8. THE APPARENCY OF TIME IS THE CHANGE OF POSITION OF PARTICLES IN SPACE.
- AXIOM 9. CHANGE IS THE PRIMARY MANIFESTATION OF TIME.
- AXIOM 10. THE HIGHEST PURPOSE IN THE UNIVERSE IS THE CRE - ATION OF AN EFFECT.
- AXIOM 11. THE CONSIDERATIONS RESULTING IN CONDITIONS OF EXISTENCE ARE FOUR FOLD.
- a. AS-IS-NESS is the condition of immediate creation without persistence, and is the condition of existence which exists at the moment of creation and destruction, and is different from other considerations in that it does not contain survival.
 - b. ALTER-IS-NESS is the consideration which introduces change, and therefore time and persistence into an AS-IS-NESS to obtain persistency.
 - c. IS-NESS is an apparency of existence brought about by the continuous alteration of an AS-IS-NESS. This is called, when agreed upon, Reality.

- d. NOT-IS-NESS is the effort to handle IS-NESS by reducing its condition through the use of force. It is an apparency and cannot entirely vanquish an IS-NESS.

AXIOM 12. THE PRIMARY CONDITION OF ANY UNIVERSE IS THAT TWO SPACES, ENERGIES, OR OBJECTS MUST NOT OCCUPY THE SAME SPACE. WHEN THIS CONDITION IS VIOLATED (PERFECT DUPLICATE) THE APPARENCY OF ANY UNIVERSE OR ANY PART THEREOF IS NULLED.

AXIOM 13. THE CYCLE OF ACTION OF THE PHYSICAL UNIVERSE IS CREATE, SURVIVE (PERSIST), DESTROY.

AXIOM 14. SURVIVAL IS ACCOMPLISHED BY ALTER-IS-NESS AND NOT-IS-NESS, BY WHICH IS GAINED THE PERSISTENCY KNOWN AS TIME.

AXIOM 15. CREATION IS ACCOMPLISHED BY THE POSTULATION OF AN AS-IS-NESS.

AXIOM 16. COMPLETE DESTRUCTION IS ACCOMPLISHED BY THE POSTULATION OF THE AS-IS-NESS OF ANY EXISTENCE AND THE PARTS THEREOF.

AXIOM 17. THE STATIC, HAVING POSTULATED AS-IS-NESS, THEN PRACTICES ALTER-IS-NESS, AND SO ACHIEVES THE APPARENCY OF IS-NESS AND SO OBTAINS REALITY.

AXIOM 18. THE STATIC, IN PRACTICING NOT-IS-NESS, BRINGS ABOUT THE PERSISTENCE OF UNWANTED EXISTENCES AND SO BRINGS ABOUT UNREALITY, WHICH INCLUDES FORGETFULNESS, UNCONSCIOUSNESS, AND OTHER UNDESIRABLE STATES.

AXIOM 19. BRINGING THE STATIC TO VIEW AS-IS ANY CONDITION DEVALUATES THAT CONDITION.

AXIOM 20. BRINGING THE STATIC TO CREATE A PERFECT DUPLICATE CAUSES THE VANISHMENT OF ANY EXISTENCE OR PART THEREOF.

A perfect duplicate is an additional creation of the object, its energy and space, in its own space, in its own time, using its own energy. This violates the condition that two objects must not occupy the space, and causes vanishment of the object.

AXIOM 21. UNDERSTANDING IS COMPOSED OF AFFINITY. REALITY AND COMMUNICATION.

AXIOM 22. THE PRACTICE OF NOT-IS-NESS REDUCES UNDERSTANDING.

AXIOM 23. THE STATIC HAS THE CAPABILITY OF TOTAL KNOWINGNESS. TOTAL KNOWINGNESS WOULD CONSIST OF TOTAL ARC.

AXIOM 24. TOTAL ARC WOULD BRING ABOUT THE VANISHMENT OF ALL MECHANICAL CONDITIONS OF EXISTENCE.

AXIOM 25. AFFINITY IS A SCALE OF ATTITUDES WHICH FALLS AWAY FROM THE CO-EXISTENCE OF STATIC, THROUGH THE

INTERPOSITIONS OF DISTANCE AND ENERGY, TO CREATE IDENTITY, DOWN TO CLOSE PROXIMITY BUT MYSTERY.

By the practice of IS-ness (Beingness) and Not-is-ness (refusal to be) individuation progresses from the Knowingness of complete identification down through the introduction of more and more distance and less and less duplication, through Lookingness, Emotingness, Effortingness, Thinkingness, Symbolizingness, Eatingness, Sexingness, and so through to not-Knowingness (Mystery). Until the point of Mystery is reached, some communication is possible, but even at Mystery an attempt to communicate continues. Here we have, in the case of an individual, a gradual falling away from the belief that one can assume a complete Affinity down to the conviction that all is a complete Mystery. Any individual is somewhere in this Know-to-Mystery scale. The original Chart of Human Evaluation was the Emotion section of this scale.

AXIOM 26. REALITY IS THE AGREED-UPON APPARENCY OF EXISTENCE.

AXIOM 27. AN ACTUALITY CAN EXIST FOR ONE INDIVIDUALLY BUT WHEN IT IS AGREED WITH BY OTHERS IT CAN THEN BE SAID TO BE A REALITY.

The anatomy of Reality is contained in Is-ness, which is composed of As-ness and Alter-is-ness. Is-ness Is an apparency, it is not an Actuality. The Actuality is As-is-ness altered so as to obtain a persistency.

Unreality is the consequence and apparency of the practice of Not-is-ness.

AXIOM 28. COMMUNICATION IS THE CONSIDERATION AND ACTION OF IMPELLING AN IMPULSE OR PARTICLE FROM SOURCE- POINT ACROSS A DISTANCE TO RECEIPT- POINT, WITH THE INTENTION OF BRINGING INTO BEING AT THE RECEIPT-POINT A DUPLICATION OF THAT WHICH EMANATED FROM THE SOURCE - POINT.

The formula of Communication is: Cause, Distance, Effect, with Attention and Duplication.

The component parts of Communication are Consideration, Intention, Attention, Cause, Source-point, Distance, Effect, Receipt-point Duplication, the Velocity of the impulse or particle, Nothingness or Somethingness. A non-Communication consists of Barriers.

Barriers consist of Space, Interpositions (such as walls and screens of fast-moving particles), and Time. A communication, by definition does not need to be two-way. When a communication is returned, the formula is repeated, with the receipt-point now becoming a source-point and the former source-point now becoming a receipt point.

AXIOM 29. IN ORDER TO CAUSE AN AS-IS-NESS TO PERSIST, ONE MUST ASSIGN OTHER AUTHORSHLP TO THE CREATION THAN HIS OWN. OTHERWISE, HIS VIEW OF IT WOULD CAUSE ITS VANISHMENT.

Any space, energy, form, object, individual, or physical universe condition can exist only when an alteration has occurred of the original As-is-ness so as to prevent a casual view from vanishing it.

In other words, anything which is persisting must contain a "lie" so that the original consideration is not completely duplicated.

AXIOM 30. THE GENERAL RULE OF AUDITING IS THAT ANYTHING WHICH IS UNWANTED AND YET PERSISTS MUST BE THOROUGHLY VIEWED, AT WHICH TIME IT WILL VANISH.

If only partially viewed, its intensity, at least, will decrease.

AXIOM 31. GOODNESS AND BADNESS, BEAUTIFULNESS AND UGLINESS, ARE ALIKE CONSIDERATIONS AND HAVE NO OTHER BASIS THAN OPINION.

AXIOM 32. ANYTHING WHICH IS NOT DIRECTLY OBSERVED TENDS TO PERSIST.

AXIOM 33. ANY AS-IS-NESS WHICH IS ALTERED BY NOT-IS-NESS (BY FORCE) TENDS TO PERSIST.

AXIOM 34. ANY IS-NESS, WHEN ALTERED BY FORCE, TENDS TO PERSIST.

AXIOM 35. THE ULTIMATE TRUTH IS A STATIC.

A Static has no mass, meaning, mobility, no wave-length, no time, no location in space, no space.

This has the technical name of "Basic Truth."

AXIOM 36. A LIE IS A SECOND POSTULATE, STATEMENT OR CONDITION DESIGNED TO MASK A PRIMARY POSTULATE WHICH IS PERMITTED TO REMAIN.

Examples:

Neither truth nor a lie is a motion or alteration of a particle from one position to another.

A lie is a statement that a particle having moved did not move, or a statement that a particle, not having moved, did move.

The basic lie is that a consideration which was made was not made or that it was different.

AXIOM 37. WHEN A PRIMARY CONSIDERATION IS ALTERED BUT STILL EXISTS, PERSISTENCE IS ACHIEVED FOR THE ALTERING CONSIDERATION.

All persistence depends on the Basic Truth, but the persistence is of the altering consideration, for the Basic Truth has neither persistence nor impersistence.

AXIOM 38. 1: STUPIDITY IS THE UNKNOWNNESS OF CONSIDERATION.
2: MECHANICAL DEFINITION: STUPIDITY IS THE UNKNOWNNESS OF TIME, PLACE, FORM AND EVENT.

Thus we see that failure to discover Truth brings about stupidity.

Thus we see that the discovery of Truth would bring about an As-is-ness by actual experiment.

Thus we see that an ultimate truth would have no time, place form or event.

Thus, then, we perceive that we can achieve a persistence only when we mask a truth.

Lying is an alteration of time, place, event, or form.

Lying becomes Alter-is-ness, becomes Stupidity.

(The blackness of cases is an accumulation of the case's own or another's lies.)

Anything which persists must avoid As-is-ness. Thus anything, to persist, must contain a lie.

AXIOM 39. LIFE POSES PROBLEMS FOR ITS OWN SOLUTION.

AXIOM 40. ANY PROBLEM, TO BE A PROBLEM, MUST CONTAIN A LIE. IF IT WERE TRUTH, IT WOULD UNMOCK.

An "unsolvable problem" would have the greatest persistence. It would also contain the greatest number of altered facts. To make a problem, one must introduce Alter-is-ness.

AXIOM 41. THAT INTO WHICH ALTER-IS-NESS IS INTRODUCED BE- COMES A PROBLEM.

AXIOM 42. MEST (MATTER, ENERGY, SPACE, TIME) PERSISTS BECAUSE IT IS A PROBLEM.

It is a problem because it contains Alter-is-ness.

AXIOM 43. TIME IS THE PRIMARY SOURCE OF UNTRUTH.

Time states the untruth of consecutive considerations.

AXIOM 44. THETA (THE STATIC) HAS NO LOCATION IN MATTER, ENERGY, SPACE OR TIME. IT IS CAPABLE OF CONSIDERATION.

AXIOM 45. THETA CAN CONSIDER ITSELF TO BE PLACED, AT WHICH MOMENT IT BECOMES PLACED, AND TO THAT DEGREE A PROBLEM.

AXIOM 46. THETA CAN BECOME A PROBLEM BY ITS CONSIDERATIONS, BUT THEN BECOMES MEST.

A problem is to some degree MEST. MEST is a problem.

AXIOM 47. THETA CAN RESOLVE PROBLEMS .

AXIOM 48. LIFE IS A GAME WHEREIN THETA AS THE STATIC SOLVES THE PROBLEMS OF THETA AS MEST.

AXIOM 49. TO SOLVE ANY PROBLEM IT IS ONLY NECESSARY TO BECOME THETA, THE SOLVER, RATHER THAN THETA, THE PROBLEM.

- AXIOM 50. THETA AS MEST MUST CONTAIN CONSIDERATIONS WHICH ARE LIES.
- AXIOM 51. POSTULATES AND LIVE COMMUNICATION NOT BEING MEST AND BEING SENIOR TO MEST CAN ACCOMPLISH CHANGE IN MEST WITHOUT BRINGING ABOUT A PERSISTENCE OF MEST. THUS AUDITING CAN OCCUR.
- AXIOM 52. MEST PERSISTS AND SOLIDIFIES TO THE DEGREE THAT IT IS NOT GRANTED LIFE.

THE PRELOGICS

- Q. 1. SELF DETERMINISM IS THE COMMON DENOMINATOR OF ALL LIFE IMPULSES.
- Q. 2. DEFINITION OF SELF-DETERMINISM: THE ABILITY TO LOCATE IN SPACE AND TIME ENERGY AND MATTER, ALSO THE ABILITY TO CREATE AND LOCATE ENERGY AND MATTER.
- Q. 3. THE IDENTIFICATION OF THE SOURCE OF THAT WHICH PLACES MATTER AND ENERGY AND ORIGINATES SPACE AND TIME IS NOT NECESSARY TO THE RESOLUTION OF THIS PROBLEM AT THIS TIME.
- Q. 4. THETA CREATES SPACE, ENERGY AND OBJECTS BY POSTULATES.
- Q. 5. UNIVERSES ARE CREATED BY THE APPLICATION OF SELF DETERMINISM ON 8 DYNAMICS.
- Q. 6. SELF-DETERMINISM, APPLIED, WILL CREATE, ALTER, CONSERVE AND POSSIBLY DESTROY UNIVERSES.
- Q. 7. THE ACTION CYCLE IS ONE OF THE ABILITIES OF A THETAN. AN ACTION CYCLE GOES FROM 40. 0 TO 0. 0 ON THE TONE SCALE. AN ACTION CYCLE IS THE CREATION, GROWTH CONSERVATION, DECAY AND DEATH OR DESTRUCTION OF ENERGY AND MATTER IN A SPACE. ACTION CYCLES PRODUCE TIME.

THE LOGICS

- LOGIC 1. KNOWLEDGE IS A WHOLE GROUP OR SUB-DIVISION OF A GROUP OF DATA OR SPECULATIONS OR CONCLUSIONS ON DATA OR METHODS OF GAINING DATA.
- LOGIC 2. A BODY OF KNOWLEDGE IS A BODY OF DATA, ALIGNED OR UNALIGNED, OR METHODS OF GAINING DATA.
- LOGIC 3. ANY KNOWLEDGE WHICH CAN BE SENSED, MEASURED OR EXPERIENCED BY ANY ENTITY IS CAPABLE OF INFLUENCING THAT ENTITY.
- COROLLARY: THAT KNOWLEDGE WHICH CANNOT BE SENSED, MEASURED OR EXPERIENCED BY ANY ENTITY OR TYPE OF ENTITY CANNOT INFLUENCE THAT ENTITY OR TYPE OF ENTITY,
- LOGIC 4. A DATUM IS A FACSIMILE OF STATES OF BEING, STATES OF NOT BEING, ACTIONS OR INACTIONS, CONCLUSIONS, OR SUPPOSITIONS IN THE PHYSICAL OR ANY OTHER UNIVERSE.
- LOGIC 5. A DEFINITION OF TERMS IS NECESSARY TO THE ALIGNMENT, STATEMENT AND RESOLUTION OF SUPPOSITIONS, OBSERVATIONS, PROBLEMS AND SOLUTIONS AND THEIR COMMUNICATION.
- DEFINITION - DESCRIPTIVE DEFINITION: ONE WHICH CLASSIFIES BY CHARACTERISTICS, BY DESCRIBING EXISTING STATES OF BEING.
- DEFINITION - DIFFERENTIATIVE DEFINITION: ONE WHICH COMPARES UNLIKENESS TO EXISTING STATES OF BEING OR NOT BEING.
- DEFINITION - ASSOCIATIVE DEFINITION: ONE WHICH DECLARES LIKENESS TO EXISTING STATES OF BEING OR NOT BEING.
- DEFINITION - ACTION DEFINITION: ONE WHICH DELINEATES CAUSE AND POTENTIAL CHANGE OF STATE OF BEING BY CAUSE OF EXISTENCE, INEXISTENCE, ACTION, INACTION, PURPOSE OR LACK OF PURPOSE.
- LOGIC 6. ABSOLUTES ARE UNOBTAINABLE.
- LOGIC 7. GRADIENT SCALES ARE NECESSARY TO THE EVALUATION OF PROBLEMS AND THEIR DATA.

This is the tool of infinity valued logic: Absolutes are unobtainable. Terms such as good and bad, alive and dead, right and wrong are used only in conjunction with gradient scales. On the scale of right and wrong, everything above zero or center would be more and more right, approaching an infinite rightness, and every- thing below center would be more and more wrong approaching infinite wrongness. All things assisting the survival of the survivor are considered to be right for the survivor. All things inhibiting survival from the viewpoint of the survivor can be considered to be wrong for the survivor. The more a thing assists survival, the more it can be

considered right for the survivor. The more a thing or action inhibits survival, the more it is wrong from the viewpoint of the intended survivor.

- COROLLARY - ANY DATUM HAS ONLY RELATIVE TRUTH.
- COROLLARY - TRUTH IS RELATIVE TO ENVIRONMENTS EXPERIENCE AND TRUTH.
- LOGIC 8. A DATUM CAN BE EVALUATED ONLY BY A DATUM OF COMPARABLE MAGNITUDE.
- LOGIC 9. A DATUM IS AS VALUABLE AS IT HAS BEEN EVALUATED.
- LOGIC 10. THE VALUE OF A DATUM IS ESTABLISHED BY THE AMOUNT OF ALIGNMENT (RELATIONSHIP) IT IMPARTS TO OTHER DATA.
- LOGIC 11. THE VALUE OF A DATUM OR FIELD OF DATA CAN BE ESTABLISHED BY ITS DEGREE OF ASSISTANCE IN SURVIVAL OR ITS INHIBITION TO SURVIVAL.
- LOGIC 12. THE VALUE OF A DATUM OR A FIELD OF DATA IS MODIFIED BY THE VIEWPOINT OF THE OBSERVER.
- LOGIC 13. PROBLEMS ARE RESOLVED BY COMPARTMENTING THEM INTO AREAS OF SIMILAR MAGNITUDE AND DATA, COMPARING THEM TO DATA ALREADY KNOWN OR PARTIALLY KNOWN, AND RESOLVING EACH AREA, DATA WHICH CANNOT BE KNOWN IMMEDIATELY MAY BE RESOLVED BY ADDRESSING WHAT IS KNOWN AND USING ITS SOLUTION TO RESOLVE THE REMAINDER.
- LOGIC 14. FACTORS INTRODUCED INTO A PROBLEM OR SOLUTION WHICH DO NOT DERIVE FROM NATURAL LAW BUT ONLY AUTHORITARIAN COMMAND, ABERRATE THAT PROBLEM OR SOLUTION.
- LOGIC 15. THE INTRODUCTION OF AN ARBITRARY INTO A PROBLEM OR SOLUTION INVITES THE FURTHER INTRODUCTION OF ARBITRARIES INTO PROBLEMS AND SOLUTIONS.
- LOGIC 16. AN ABSTRACT POSTULATE MUST BE COMPARED TO THE UNIVERSE TO WHICH IT APPLIES AND BROUGHT INTO THE CATEGORY OF THINGS WHICH CAN BE SENSED, MEASURED OR EXPERIENCED IN THAT UNIVERSE BEFORE SUCH POSTULATE CAN BE CONSIDERED WORKABLE.
- LOGIC 17. THOSE FIELDS WHICH MOST DEPEND UPON AUTHORITATIVE OPINION FOR THEIR DATA LEAST CONTAIN KNOWN NATURAL LAW.
- LOGIC 18. A POSTULATE IS AS VALUABLE AS IT IS WORKABLE,
- LOGIC 19. THE WORKABILITY OF A POSTULATE IS ESTABLISHED BY THE DEGREE TO WHICH IT EXPLAINS EXISTING PHENOMENA ALREADY KNOWN, BY THE DEGREE THAT IT PREDICTS NEW PHENOMENA WHICH WHEN LOOKED FOR WILL BE FOUND TO EXIST, AND BY THE DEGREE THAT IT DOES NOT REQUIRE THAT

PHENOMENA WHICH DO NOT EXIST IN FACT BE CALLED INTO EXISTENCE FOR ITS EXPLANATION.

LOGIC 20. A SCIENCE MAY BE CONSIDERED TO BE A LARGE BODY OF ALIGNED DATA WHICH HAS SIMILARITY IN APPLICATION AND WHICH HAS BEEN DEDUCED OR INDUCED FROM BASIC POSTULATES.

LOGIC 21. MATHEMATICS ARE METHODS OF POSTULATING OR RESOLVING REAL OR ABSTRACT DATA IN ANY UNIVERSE AND INTEGRATING BY SYMBOLIZATION OF DATA, POSTULATES AND RESOLUTIONS.

LOGIC 22. THE HUMAN MIND* IS AN OBSERVER, POSTULATOR, CREATOR AND STORAGE PLACE OF KNOWLEDGE.

LOGIC 23. THE HUMAN MIND IS A SERVOMECHANISM TO ANY MATHEMATICS EVOLVED OR EMPLOYED BY THE HUMAN MIND.

* The human mind by definition includes the awareness unit of the living organism, the observer, the computer of data, the spirit the memory storage, the life force and the individual motivator of the living organisms. It is used as distinct from the brain which can be considered to be motivated by the mind.

NOTE: The primary step in resolving the broad activities of man could be considered to be the resolving of the activities of the mind itself. Hence, the logics carry to this point and then proceed as axioms concerning the human mind, such axioms being substantiated as relative truths by much newly discovered phenomena. The ensuing axioms, from Logic 24, apply no less to the various "ologies" than they do to de-aberrating or improving the operation of the mind. It should not be thought that the following axioms are devoted to the construction of anything as limited as a therapy, which is only incidental to the resolution of human aberration and such things as psychosomatic illnesses. These axioms are capable of such solution as has been demonstrated, but such a narrow application would indicate a very narrow scope of view.

POSTULATE - THE HUMAN MIND AND INVENTIONS OF THE HUMAN MIND ARE CAPABLE OF RESOLVING ANY AND ALL PROBLEMS WHICH CAN BE SENSED, MEASURED OR EXPERIENCED DIRECTLY OR INDIRECTLY.

COROLLARY - THE HUMAN MIND IS CAPABLE OF RESOLVING THE PROBLEM OF THE HUMAN MIND.

The borderline of solution of this science lies between WHY life is surviving and HOW life is surviving. It is possible to resolve HOW life is surviving without resolving WHY life is surviving.

LOGIC 24. THE RESOLUTION OF THE PHILOSOPHICAL, SCIENTIFIC AND HUMAN STUDIES (SUCH AS ECONOMICS, POLITICS, SOCIOLOGY, MEDICINE, CRIMINOLOGY, ETC.) DEPENDS PRIMARILY UPON THE RESOLUTION OF THE PROBLEMS OF THE HUMAN MIND.

CHANGE AUDITOR'S CODE

6. Do not process a preclear who is improperly fed or who has not received enough rest.
16. Maintain two-way communication with the preclear.
17. Never use Scientology to obtain personal and unusual favors or unusual compliance from the preclear for the auditor's own personal profit.
18. Estimate the current case of your preclear with reality and do not process another imagined case.

Staff Auditor Hats

POST CASE ANALYSIS ROUTINE

When pc has been taken to the Director of Processing or case analyst (third party enters auditing picture in any way) the auditor must then

RE-ESTABLISH THE AUDITOR with

1. Two-way comm on analyst person.
2. "Who would I have to be to audit you successfully?"
3. "What am I doing?"

This is to avoid pc transferring to case analyst as auditor and then not coming back to session.

This is also done when pc has coffee shop auditing between sessions.

HAVINGNESS—NEW COMMANDS

The value of havingness has not diminished. However, it needed new commands. I have now developed these. They are remarkably more effective than Trio.

FACTUAL HAVINGNESS

“Look around here and find something you have.”

When this can be left—

“Look around here and find something that you would continue.”

When this can be left—

“Look around here and find something you would permit to vanish.”

Then return to first again.

The order may be reversed. Some cases may run 250 of the third before finding one of the first or second.

MORE ON TRAINING DRILL TWO

Avoidance of Double Acknowledgement is vital if you ever hope to keep pc in session.

Double Acknowledgement occurs when pc answers up, the auditor then acknowledges, *and* the pc then finishes his answer, leaving the auditor with another acknowledgement to do (and also leaving the auditor with no session).

Wrong:

Command: "What could you say to your father?"
PC: "I could say, 'Hello'."
Auditor: "FINE."
PC: "... 'Father, how are you?' I could say that."
Auditor: (weakly) "Good. What could you say to your father?"
PC: "I could say, 'Are you feeling well?'"
Auditor: (desperate by now) "GOOD!"
PC: "... 'enough to go fishing?'"
Auditor: "Well, okay all right. Now"

A pc is not always sure he has answered the question so he often changes his mind. If the auditor gives him Tone 40 or any ack at all in between a pc's reply the *auditor is wrong*.

You just don't "encourage" a pc with a lot of agreement okays and yes in the midst of answers. The pc answers, the pc is *sure he has answered* and the auditor then acknowledges. After all, it's the pc that must be satisfied.

There are many ways to mis-acknowledge a pc. But any mis-acknowledgement is only and always a failure to end the cycle of a command—auditor asks, pc replies and knows he has answered, auditor acknowledges. Pc knows auditor has acknowledged. That is a full auditing command cycle. Don't forget it and expect a process to work, it won't. The roughest spot in most students is TR 2, not so much *how* to acknowledge but *when*.

An auditor running into this with a pc should handle it this way.

Auditor: "What could you say to your father?"
PC: "I could say, 'Are you feeling well?'"
Auditor: "Did that answer the question?"
PC: "Well, no. I could say, 'Are you feeling well enough to go fishing?'"
Auditor: "Did that answer the question?"
PC: "Yes, I guess it did. He always liked fishing and sympathy."
Auditor: (sure pc is through) "Good! What could you say to your father?"

And there's the way of it. If the pc is not sure he has answered and that the auditor has accepted the answer, the *pc will get no benefit from the auditing*. And that's how important that is.

You can always spot a bad auditor. He does two things: he talks too much to the pc and he stops the pc from properly answering.

Add all the above to all training of students.

HCO BULLETIN OF 15 OCTOBER AD 8

ACC CLEAR PROCEDURE

The Goal of the Auditor: to help the preclear re-establish confidence in his ability to confront Thetans, Thought, Time, Life, Energy, Matter and Space.

The theory of auditing: the preclear has lost confidence in his ability to face existence and its parts and has difficulty in participation. He is trapped in many of those things he has failed to confront or has been prevented from confronting or has prevented others from confronting or didn't exist.

By gradient scales his confidence in confronting Thought, Time, Life, Energy, Matter and Space is improved. The rule is, "Find something the preclear can confront and improve that ability." This normally begins with some part of an auditor. In less able cases, it begins with a thought of the auditor's or the preclear's.

Auditing is not erasure. Erasure dramatizes lost things to confront.

Where an auditor can be confronted and makes corny errors, the preclear stops being able to confront—hence the graph goes down on ARC breaks only. Therefore, the stress on smooth auditing.

A present time problem makes it hard for the preclear to confront the session. Therefore the stress on handling present time problems.

Auditing has as its sole liability confronting on a via—it may look to the auditor that he is using the pc (preclear) to confront things and this can be restimulative if the auditor doesn't know what he is doing. If the auditor is actively preventing the pc from confronting anything or has as his goal never permitting the pc to confront, there's trouble to hand.

ARC, in auditing, is:

A = the ability to be in or at a distance from something.

R = the ability to co-exist with something.

C = the ability to transmit thought between two or more points.

Thus we see that the minimum of two anything is needed for the conditions of ARC to occur.

In actuality the thetan incurs no liability in confronting or not confronting, being in or not being in things and thus a total confronting or total non-confronting are attainable goals. The thetan believes things about confronting or necessities to confront or not to confront and so becomes aberrated (not straight-lined). To confront, knowing is necessary. Unknown confronting or not confronting, when uncovered, gives us the phenomenon of "cognition"—and that is the definition of it.

Auditing is that process which restores confidence in confronting and undoes necessity to confront Thought, Time, Life, Energy, Matter and Space.

Theory of Auditing

It should be realized that an optimum Clear Procedure should take a preclear from the lowest possible levels up to clear. Earlier procedures (1957-1958) did not attempt to address every case but were content to handle about 50% of the preclears. The remainder had to have special address just as cases. Therefore, auditors adopted the idea that on one hand there was Clear Procedure and on the other hand low level procedure—they did not place one above the other in a gradient scale to clear. This particular Clear Procedure does that.

In use it should be realized that different cases require different emphasis. An easy case would not demand a tedious command clearing, suspicious probing to break non-existent occlusions or emphasis on the lower steps. Indeed, these lower steps could be skipped up to CCH 0.

It is all a matter of judgment, how long and hard to run which. Two errors are potential: both rest on accurate case estimation. The commonest is to overestimate the level of the case. And not uncommon, to audit a high level case with very low level processes. The answer is to audit the case one is auditing, not some other case or one's own case.

Since estimation and auditor-sensitivity are subject to variety and error one cannot cleanly estimate the length of time required to clear anyone. Only approximations are possible and these are varied by possible environmental difficulties of the preclear during auditing: i.e., daily present time problems of crushing magnitude.

We are not today in the area of thousands of hours, however. We are in the area of hundreds of hours in any case, sane or insane. I cite an example: a woman suffering from a postpartum psychosis was audited 600 hours on CCH 1, 2, 3, 4 before she turned sane long enough for the auditor to snap off the case the valence of her dying brother, at which moment she turned stably sane. Only then could she have been audited on less fundamental steps. However, auditors are not concerned with the insane but often address relatively unconscious people. This example is cited as the most extreme time in auditing we have on record with modern technique.

I would not be surprised that, with all variables introduced, some case required 800 hours to clear. On a jigsaw puzzle test such a case would have failed to have fitted a single piece in the first 30 seconds, by our present method of estimation.

There are several means of establishing an idea of length of time in processing from present state to clear. The minimum in any case would be three weeks (75 hours); the probable maximum would be 1,000 hours. Between these extremes, we have most people. The peak of the cure would probably be around 250 hours, as estimated by older clearing methods.

Anxieties to attain faster push-button clearing defeat most research. These speed methods violate the reality of the preclear and too thoroughly evaluate for him. *In all cases* of clearing it is only the reality of the preclear which milestones the gains. That reality requires a certain speed of advance. While being audited, also, a preclear is living, and his surroundings require his attention. Man is somewhat cautious. He must adjust himself within his own ideas of security. The auditor always knows what is wrong with the preclear long before the preclear finds out. One must permit the preclear to find out! That discovery is only assisted, never blackjacked into being (see *Psychiatry: The Greatest Flub of the Russian Civilization*, by Tom Esterbrook). The patient is part of the therapy—a lesson the Russ school never learned.

Therefore, Clear Procedure starts where it should, CCH 1.

In running the CCHs, a set procedure is followed not only with the single process but with the series. One will discover that only one of the series of CCH 1, 2, 3, 4 bites the first time through. It is useless to run very long on the ones that don't bite. Example: An auditor does CCH 1 for an hour—no bite. He does CCH 2 for an hour or so—no bite. He does CCH 3 and it *bites*. He does it for a few hours and CCH 3 levels off a bit. Now he returns to CCH 1 and finds it bites. He flattens it a bit, does CCH 2 for an hour, CCH 3 for a couple of hours and when he starts CCH 4, now this one bites! He flattens it in a few hours, goes back to CCH 1, etc.

The processes CCH 1, 2, 3, 4 are all of a piece. They are done in series fashion, not as individual items.

CCH 1, 2, 3, 4

Number: **CCH 1**

Name: Give me that hand, Tone 40.

Commands: "Give me that hand." Physical action of taking hand when not given and then replacing it in preclear's lap. And "Thank you," ending cycle. All Tone 40 with clear intention, one command in one unit of time, no originations of preclear acknowledged in any way verbally or physically. May be run on right hand, left hand, both hands, each one flattened in turn.

Position: Auditor and preclear seated in chairs without arms, close together. Auditor's knees both to auditor's left of preclear's knees, outside of auditor's right thigh against outside of preclear's right thigh. This position reversed for left hand. In both hands preclear's knees are between auditor's knees.

Purpose: To demonstrate to preclear that control of preclear's body is possible, despite revolt of circuits, and inviting preclear to directly control it. Absolute control by auditor then passes over toward absolute control of his own body by preclear.

Training Stress: Never stop process until a flat place is reached. To process with good Tone 40. Auditor taught to pick up preclear's hand by wrist with auditor's thumb nearest auditor's body, to have an exact and invariable place to carry preclear's hand to before clasping, clasping hand with exactly correct pressure, replacing hand (with auditor's left hand still holding preclear's wrist) in preclear's lap. Making every command and cycle separate. Maintaining Tone 40. Stress on intention from auditor to preclear with each command. To leave an instant for preclear to do it by own will before auditor does it. Stress Tone 40 precision. To keep epicenters balanced. CCH 1(b) should also be flattened.

History: Developed by L. Ron Hubbard in the 17th ACC, Washington, D.C., 1957.

Number: **CCH 2**

Name: Tone 40 8-C.

Commands: "Look at that wall." "Thank you."
"Walk over to that wall." "Thank you."
"With the right hand, touch that wall." "Thank you."
"Turn around." "Thank you."

Run without acknowledging in any way any origination by preclear, acknowledging only preclear's execution of the command. Commands smoothly enforced physically. Tone 40, full intention.

Position: Auditor and preclear ambulant, auditor in physical contact with preclear as needed.

Purpose: To demonstrate to preclear that his body can be directly controlled and thus inviting him to control it. Finding present time. Havingness. Other effects not fully explained.

Training Stress: Absolute auditor precision. No drops from Tone 40. No flubs. Total present time auditing. Auditor turns preclear counterclockwise, then steps always on preclear's right side. Auditor's body acts as block to forward motion when preclear turns. Auditor gives command, gives preclear a moment to obey, then enforces command with physical contact of exactly correct force to get command executed. Auditor does not check preclear from executing commands.

History: Developed by L. Ron Hubbard in Washington, D.C., in 1957 for the 17th ACC.

Number: **CCH 3**

Name: Hand Space Mimicry.

Commands: Auditor raises two hands, palms facing preclear, and says, "Put your hands against mine, follow them and contribute to their motion." He then makes a simple motion with right hand, then left. "Did you contribute to the motion?" "Good." "Put your hands in your lap." When this is flat the auditor does this same thing with a half inch of space between his and the preclear's palms. When this is flat auditor does it with a wider space and so on until preclear is able to follow motions a yard away.

Position: Auditor and preclear seated, close together facing each other, preclear's knees between auditor's.

Purpose: To develop reality on the auditor, using the reality scale (solid communication line). To get preclear into communication by control + duplication.

Training Stress: That auditor be gentle and accurate in his motions, giving preclear wins. To be free in two-way communication.

History: Developed by L. Ron Hubbard, in Washington, D.C., in 1956, as a therapeutic version of Dummy Hand Mimicry. Something was needed to supplant "Look at me. Who am I?" and "Find the auditor" part of rudiments.

Number: **CCH 4**

Name: Book Mimicry.

Commands: Auditor makes a simple or complex motion with a book. Hands book to preclear. Preclear makes motion duplicating auditor's mirror-image-wise. Auditor asks preclear if he is satisfied that the preclear duplicated the motion. If preclear is and auditor is also fairly satisfied, auditor takes back the book and goes to next command. If preclear says he is and auditor is fairly sure preclear isn't, auditor takes back book and repeats command and gives book to preclear again for another try. If preclear is not sure he duplicated any command, auditor repeats it for him and gives him back the book. Tone 40 only in motions. Verbal two-way quite free.

Position: Auditor and preclear seated facing each other a comfortable distance apart.

Purpose. To bring up preclear's communication with control and duplication. (Control + duplication = communication.)

Training Stress: Stress giving preclear wins. Stress auditor's necessity to duplicate his own commands. Circular motions are more complex than straight lines.

History: Developed by L. Ron Hubbard for the 16th ACC in Washington, D.C., 1957. Based on duplication developed by LRH in London, 1952.

CCH 0

(1) *Start Session* by saying “Start of Session”. Don’t discuss things and then start session and startle preclear, who thought he was in session all the time. To do this throws pc out of session. Also, you can’t end a session that was never started.

(2)(a) *Establish Auditor*. Clear auditor with pc. Discuss any successful auditing in the past, even successful doctoring. Shake pc loose from heavy ARC with past practitioners, not by running down practitioners, but getting pc to realize he has been helped. Develop this into process, “Who should I be to help you successfully?” Get it flat, then run “What am I doing?”

(2)(b) *Establish Preclear*. Put preclear more in session with goals—“What would you like to accomplish through Scientology?” “What would you like to accomplish in this session?” The foregoing two we care little about. We now hit this hard: “What are *you willing* to have happen in this session?” We get a final clear answer to this even if it takes an hour of two-way comm. Then we establish, “What are you absolutely certain will happen in (finite period of time such as ten minutes or one hour)?”

(2)(c) *Establish problems, if any*. Run “Is there any place you would like to be more than here?” When this is threshed out, “Is there any place you *should* be rather than here?” This may bring any present time problem to view. If it does, audit it with “What part of that problem could you be responsible for?” If pc is too agitated to run this or if two-way comm cuts his havingness badly, run Factual Havingness: “Look around here and find something you have.” When this can be left, “Look around here and find something that you would continue.” When this can be left, “Look around here and find something you would permit to vanish.” Then return to first again. (The order may be reversed. Some cases may run 250 of the third before finding one of the first or second.) Factual Havingness can resolve present time problems, which are always and only threats of loss.

If preclear seems hard to audit, is in propitiation, does obsessive agreement, has hypnotic eyelid flutter, or in general seems unnatural about talking or not talking, you can put pc into session and get present time problem most rapidly by spending real time on this: “What question shouldn’t I ask you?” and sort it out on a meter, with two-way comm, then ask question again, etc., until pc is really talking to the auditor. The goal of present time problems or problems is to get pc in session. The goal of this, “What question shouldn’t I ask you?” is not to learn the pc’s secrets but to get pc to talk freely to auditor. Accomplishing this one thing on a hitherto non-advancing pc is a great thing and will make the pc advance faster than anything else. *Get the pc to talk to you honestly.*

Then take up present time problems directly: “Do you have a present time problem?” Preclear says he does but needle on meter doesn’t move. Ask question a few more times—“Is there anything worrying you?” you can say for variation. If needle still doesn’t drop, forget it. IF NEEDLE DROPS pursue it and *run only the problem that drops*. Don’t run problems that don’t drop! Keep your eyes on the meter while handling pc with present time problems, expand what falls, not something else. Pc can’t confront his problems, therefore the drop vanishes easily, comes back and drops again. This can fool an auditor badly if he doesn’t watch his meter and take up to run and discuss only the drop. (Note: If the meter is “Stage Four” [idle swing, not clear but pc can’t affect meter, which only swings up, *sticks*, falls and so forth on same pattern—a Stage Four needle has a stick in the top of its oscillation, a clear needle doesn’t] or if it is too stuck to show a fall on a problem, play safe, run Factual Havingness or Connectedness.)

This exact way to run a present time problem can make a full intensive.

Command (when problem located): “Describe that problem to me now.” Make sure pc does. ACCEPT ANY VERSION PC GIVES YOU, BUT ONLY FOLLOW THROUGH ON A VERSION THAT DROPS ON METER. If the version drops, run the following for two or five commands, “What part of that problem could you be responsible for?” Then whether drop on

meter vanishes or not, say, “Describe that problem to me now.” If the described problem did not drop, buy it but don’t run it, say again, “Describe that problem to me now.” If you can handle this type of problem-handling, if you got pc to really talk to you, you can practically clear a case on this since it gets out of case the *succumb postulates* that war against betterment. This is the scale of succumb problems from the bottom up: How to go unconscious; How to feel nothing; How to go insane; How to escape; How to die; How to get shed of responsibilities so one can die; How not to care; How to endure; How to get better; How to Live; How to live better. There are inner levels. The basic problem is a “whether” (all problems are “whether” or “how”): *Whether to Survive or Succumb*. Decisions to do either are, if obsessive, the stable data in the center of the major confusions. When a pc is sitting there in heavy succumb postulates his goals and the auditor’s goals are on opposite vectors. Therefore, preclears who don’t get better *aren’t* trying to get better no matter how much they say they are. Hence a whole case can run on this provided some havingness is also run from time to time.

In brief, this is where running a present time problem well gets to.

Remember, a problem is not a condition or a terminal. It is a “how” or “whether”. It is a doingness, not a person. “My wife” is no answer to a present time problem question. “How to live with my wife” is a problem. “Whether or not to live with my wife” is a problem. “My wife’s illness” is not a problem. “How to cure my wife’s illness” is a problem.

Sometimes a pc will come right down on an old stable decision about the problem and say, “It isn’t a problem to me now.” The auditor must not buy this. He wants to know “Why?” until pc is off the old solution and can go on describing problems.

How to be audited. How to stay in session. Whether the auditor has pc’s interest at heart. Such present time problems are very much in order to ask about.

To completely flatten any problem it is necessary to run not “responsible for” but “Invent a problem of comparable magnitude to that problem.” This is run in the same way as above, but is given more commands for each version handed out by the pc. This is the problem command if you want it flat forever. Don’t lose this process or command from your repertoire.

(2)(d) *Getting Auditor and Pc established*. Take up any ARC breaks with pc or any breaks between pc and past auditors. Always clear away ARC breaks. Don’t dodge them as an auditor.

Explaining why the break occurred is an Auditor’s Code violation—Evaluation.

Saying that the ARC break didn’t occur or was the pc’s fault is an Auditor’s Code violation—Invalidation.

When an auditor fails to take responsibility for the ARC break he loses the responsibility of running the session—which, of course, causes a session to cease to exist.

The relative destructive value of an ARC break is greater than the failure.

ALWAYS HANDLE CCH 0 in every session well except when giving not a session but an Assist only.

TR 11

TR 11. ARC Straight Wire. That process best calculated to orient pc in his past is ARC Straight Wire.

Commands: “Recall something that was really real to you.” “Thank you.” “Recall a time when you were in good communication with someone.” “Thank you.” “Recall a time when you

really liked someone.” “Thank you.” The three commands are given in that order and repeated in that order consistently.

Position: Auditor and preclear seated facing each other at a comfortable distance.

Purpose: To give the student reality on the existence of a bank. This is audited on another student and is audited until the other student is in present time. It will be found that the process discloses the cycling action of the preclear going deeper and deeper into the past and then more and more shallowly into the past until he is recalling something again close to present time. This cyclic action should be studied and understood and the reality on the pictures the preclear gets should be thoroughly understood by the student. The fact that another has pictures should be totally real to the student under training.

History: Developed by L. Ron Hubbard in 1951 in Wichita, Kansas. This was once a very important process. It has been known to bring people from a neurotic to a sane level after only a short period of application. It has been run on a group basis with success but it should be noted that the thinkingness of the individuals in the group would have to be well under the control of the auditor in order to have this process broadly beneficial. When it was discovered that this process occasionally reduces people’s havingness, the process itself was not generally run thereafter. It is still, however, an excellent process with that proviso, a reduction of havingness in some cases.

Many cases have achieved their first step upward with the process. It is a process which, known, gives the pc the comfortable feeling that he at least has stopped getting worse and that there is something that permits him to hold his own.

In the 20th ACC Lectures I described how all entheta receives its charge from theta. ARC in the bank makes ARC breaks possible. A re-orientation of ARC can be more important than one realizes. The way to blow ARC breaks can be more ARC. Even a psychotic may rise up to merely neurotic on ARC Straight Wire.

The cyclic aspect of ARC Straight Wire must receive attention.

You don’t want to know *what* when he recalls something, you want to know *when*. Ask, “When was that?” frequently and you will see pc slide into past and then return to present time as a regular cycle. Don’t end the process while pc is still in past. Don’t finish the process with a comm bridge that leaves him in the past. Just warn him that the process will soon end, and stop it when pc’s recall was of a near present time thing.

You get lots of past lives in view this way. Buy them.

Lasting and easily obtained results were gained in 1956 by using just two processes. With the 1958 Theory of Auditing (above) it is easy to see why. These are basically confrontingness processes. They were S-C-S and Connectedness.

I developed these two for use in combination for a standardization of processing for a whole firm that was having its employees processed in London in 1956. The results were so good that Mary Sue Hubbard, while Director of Processing London, used the same regimen on *all* preclears with uniformly astonishing results.

The exact regimen used in that period was as follows: simple S-C-S on objects with pc and auditor seated at a table. Then S-C-S on the body. Then “Keep it from going away” and “Hold it still” on two small objects with pc seated, using first one object then the other and always touching them with his hands at command. Finally, subjectively, on facsimiles, “Keep it from going away,” and “Hold it still.” Throughout, Connectedness was used to bolster havingness as needed with the command, “You make that (indicated object) connect with you.”

The regimen as given here was superseded because auditors, unsupervised, tended to complicate the processes and not until a short time ago did we learn that the best answer to an auditor's desire for "more information" was a repetition of what he was told the first time. He didn't understand the original and so wanted a new one. Further, in supervised processing, there has been a frailty in that the auditor sometimes reported, "I did what you said and it didn't work." An unwary supervisor then gives him a *new* process to do. A wary one says in reply to the above, "*What* didn't work?" and usually discovers that the supervisor's directions were neither remembered nor run. This set of factors has accounted for many abandonments of SOPs (standard operating procedures) which were in actuality working like mad, only the people they were given to never used them, only said they did, and fed bad data back. It is the role of a supervisor to get the process he gave out *run*, not another version of it.

CCH 3(c)

The rationale behind S-C-S was simple: it placed the pc in the auditor's control. And it placed the pc's body under his own control. But there is more to S-C-S than this since it is also a confrontingness process.

CCH 3(c)

Name: S-C-S on a person. (Start, change and stop on a person.)

Commands: There are three sets of commands, each one of which is run until it is relatively flat. The commands are as follows: "Now we are going to start the body.

When I say start, you start that body in this (indicated) direction. All right, Start." The commands for "Change" are as follows (indicating four positions on the floor one after the other): "This we are going to call Spot A. This we are going to call Spot B. This we are going to call Spot C and this we are going to call Spot D. Do you have that? All right, when I say Change, I want you to change the position of that body from A to B. All right, Change." (The same applies for the other positions.) The commands for "Stop" are as follows: "Now I want you to get that body moving in (indicated) direction, and when I say Stop, I want you to stop that body. All right, move that body. Stop." Each one of the commands is followed with the question, "Did you start that body?" "Did you change the position of that body?" "Did you stop that body?"

Position: Auditor and preclear ambulant. Auditor accompanies preclear as he walks and occasionally touches him and turns him around manually as needed to assist the preclear.

Purpose: To give the preclear good control of his body and to exteriorize him.

Training Stress: Stress is on precision of the motion and command.

History: Developed by L. Ron Hubbard in 1955 as an exteriorization process. First discovered in 1952 was the fact that a person, which is to say a thetan, stays as close to an object as he has confidence in his controlling of it.

GP-3

Connectedness. The basic form of any havingness process is Connectedness. After one flattens S-C-S, one then runs Connectedness on the preclear.

Commands.

(a) "You get the idea of making that (object) connect with you." (Auditor points.)

(b) If pc isn't looking at object with Mest body's eyes, use following: "Look at that (object)." "You get the idea of making that object connect with you."

(c) On blind humans: "Feel that (object)." "You get the idea of making that object connect with you."

There is a new version of havingness called Factual Havingness. It is used in conjunction with any subjective process such as those subjective processes which follow.

Factual Havingness Commands.

"Look around here and find something you have."

"Look around here and find something that you would continue."

"Look around here and find something you would permit to vanish."

Confrontingness

The earliest clearing process, made more workable by repetitive commands and a broad understanding achieved in the ensuing 11 years, is made part of the most modern (1958) procedure.

I was clearing people in 1947 by getting them to look at locks, secondaries, engrams, circuits and the physical universe. I cleared a lot of people in about 100 hours each. All I did was renew their confidence in being able to "look at" their pictures. I turned on sonic, tactile, the works, with renewing confidence, lessening fear.

Three years later, *Dianetics: The Modern Science of Mental Health* was written. Its processes are slanted toward teaching people to audit and are the result of people not doing and saying they did. *Dianetics: The Modern Science of Mental Health* processes are good. They are the best training processes re banks there are. They train an auditor better than they clear a pc.

We now return to earliest clearing with what we now call *Confrontingness*. See "Theory of Auditing" above.

In general, we persuade the pc to confront things at his own gradient scale of willingness.

We find an ability to confront and we improve it.

Body Confrontingness

This is close to a specific for a chronic somatic.

Auditor: "What part of that body can you confront?"

Pc: "Elbow."

Auditor: "What part of that elbow can you confront best?"

Pc: "The wrist."

Auditor: "Thank you."

This is the whole cycle of the command. The auditor does not correct the pc when "part of" becomes some other part of the body.

Subjective Confrontingness

General version:

“What mental view can you confront?” “What part of it can you confront best?” “Thank you.”

The above wording allows for dark fields and other phenomena and runs easily on an occluded case.

For a person who has pictures and sensations, a more specific form using “pictures”, as well as “emotions”, “feelings”, “sounds”, “thoughts”, etc., can be used.

There can be and will be many versions of confrontingness given. Suffice here that the above work well and can form an entirety of clearing. They are a refinement, a simplification of the first version of clearing and should work as well today.

Participation

We must not overlook the factor of *participation* in life. *Participation* in session is necessary for processing to work. It is achieved by bettering the factor “Confronting”.

Auditing toward the goal of total non-confront is eventually to achieve total non-participation. This is highly undesirable.

Destruction as an impulse has as its goal the removal of the need to confront. When one can confront he does not need to destroy. Unwillingness to confront is the source of most “*have to be processed*”. One is asking the auditor to destroy “all these horrible things”. Obsessive confronting is almost as bad. “Can’t confront it so I’ll prove I can by confronting it forever—and I’ll keep on creating it to prove I can confront it.” The mechanics of the bank can be worked out on such a basis.

Participation is only possible when one can also confront. Gradient scale of confronting can lead to participation without being overwhelmed.

Survival

All processes since the earliest endeavors in this search have aligned on “Survive”. Continuance in Factual Havingness expresses this factor. The postulate to Survive is invalidative of the fact that a thetan cannot do otherwise. The whole key to brainwashing and punishment is that they make a thetan postulate survival which is “continuous confronting”. This is handled by various versions of confronting.

Creating

A reactive bank comes from obsessive creating. A thetan’s answer to being threatened or struck is to create. His basic training is all aligned along creating something. This factor is used in various ways in processing, usually inherent in a process.

Help

Probably the first thing that will have to be taken up in some cases is the subject of Help. To this degree Help is part of CCH 0 in establishing an auditor-preclear relationship. People who do not volunteer to be audited at all will require help orientation as the first step. Five hours on Help with such a person, using a two-way bracket, is often well spent. But such a bracket must be exceptionally well audited, without ARC breaks, to begin an intensive or to repair ARC breaks.

Aside from the above, Help is of vast importance.

The first burning question, when we approach Help as a process, is, “What condition would you have to be in to get help?” This is usually the condition the pc is in. The repetitive command for this is, “Mock up (or invent) somebody in such a condition that they would receive help.”

HELP ON THE ROCK

The “Rock” is the thing the preclear uses to reach people. It is an object far back on the track. It is confrontingness on a via.

The E-Meter is used to locate a stuck object. This is a “lock on the rock”. (The stuck can be freed by using Connectedness on the room, always.)

Help Bracket on the Rock

Use in this exact order, one command at a time:

- How could a _____ help itself?
- How could you help a _____ ?
- How could a _____ help you?
- How could I help a _____?
- How could a help me?
- How could another person help a _____?
- How could a _____ help another person?
- How could others help a _____?
- How could a _____ help others?
- How could you help yourself?
- How could I help myself?
- How could you help me?
- How could I help you?

The command words, but not as a whole phrase, are cleared often (every 3 brackets) and the pc is asked for his *opinion only* of the word “help” and the item. His answer is not challenged.

General Help Bracket

- How could you help yourself?
- How could you help me?
- How could I help you?
- How could I help myself?
- How could you help another person?
- How could I help another person?
- How could another person help you?
- How could another person help me?
- How could another person help another person?

Responsibility

The basic clearing process using responsibility is, “You make a picture for which you can be wholly responsible.”

This, flattened, can make a clear.

It uses the fact that a person is making his whole bank anyway and it persuades him to realize it.

Some version of responsibility is required to end all clearing.

Assignment of responsibility is at the bottom of the search for phenomena and magic to clear people.

Answers

Everyone who does not change in processing is being an answer. He “has it made”.

Therefore, there is an opposite side to problems. That is answers.

“Mock up a problem for which you are (or your condition is) the answer.”

Origins (Originations)

The original version was: “What origin of yours has been mishandled?” “Recall a time when you were pleased with that person.”

A shorter version is, “What origin of yours has been handled properly?”

Any creation is an origin in a communication line, for the purposes of auditing. Hence the importance of origins.

THE BUTTONS

There are certain buttons which depress clearing if the pc has erroneous definitions for them. These are:

CHANGE, PROBLEM, HELP, PLEASED, CREATE, RESPONSIBILITY, CONFRONT.

Various processes redefine them in action. This is such a process:

“Invent a person who likes (the button).”

STEP 6

A cleared person is no longer in confusion about Help or who makes the mock-ups. “Help and Step 6” were the early 1958 clues to clear. These are still used as tests and even when their running is brief, they must be run.

Caution: It is almost fatal to run Step 6 if the rock is not out.

How to Run Step 6:

Select simple nonsignificant objects. Run: “In front of that body you mock up a _____ and keep it from going away.” “Did you?” “Thank you.”

Then use all directions from the body—”Behind that body . . . ,” “To the left of that body . . . ,” “To the right of that body . . . ,” “Above that body . . . ,” “Below that body”

Run 6 objects each on 6 sides of the body on “Keep it from going away,” then proceed to “In front of that body you mock up a _____ and hold it still.” Same procedure, then “In front of that body you mock up a _____ and make it a little more solid.” (There is no acknowledgment by auditor after pc mocks it up and keeps it from going away, etc., or the “Did you?”—there is

acknowledgment only after full command is executed. Otherwise acknowledgments will thin the pc's mock-ups.)

Note: The objects should be simple at first, leading on up to complexity. But at first, keep them simple and nonsignificant.

Read and understand *Scientology 8-8008*, and use an E-Meter throughout.

A valuable side process here: "Decide to make a mock-up. Decide that will ruin the game. Decide not to do it." Also this one: "Decide to make a mock-up everyone can see. Decide that would ruin the game. Decide not to do it."

* * *

In the above there are several roads to Clear. But there are also several levels of case to be cleared. Experience tells one what to run. Auditing skill alone gets the experience across.

The original 1947 processes were defeated in the hands of others by lack of auditing drills and skill.

Help and Step 6 do not work on low level cases to make clears of everyone—hence the CCHs.

By doing all of the above on every case you would certainly have clears in all cases. As your experience increases you can begin to omit steps.

You will finally be able to adjust the processes to the exact cases you do.

Get the preclear in session, run something. You'll win.

PROCEDURE CCH

(This lecture is a final summing up of the previous CCH PABs [interrupted at PAB No. 138] and should be read after those have been digested. It was given by L. Ron Hubbard to the HGC staff auditors in Washington, D.C. on 23 August 1957.)

Thinkingness in general should not be suspected to be under anybody's control. It is probably more under the auditor's control than it is under the preclear's.

When I say or ask "Is the preclear's thinkingness under control?" I want you to understand that it is less under the preclear's control at any time than under the auditor's. The auditor can certainly control the preclear's thinkingness better than the preclear can. But before you can do this you must first get the preclear's body and attention under control.

A condition to running Trio is: Is the person and attention under your control? To assume that the power of choice is also under the preclear's control—much less his thinkingness—is, of course, completely wrong.

This condition then moves Trio way up on the present scale of processes. In order to give the preclear some havingness after CCH 0 to 5 has been flattened, I have developed an undercut to Trio.

Trio is a directive process and should be prefaced by "**Get the idea of having that clock.**" "**Get the idea of having that picture (indicated picture on the wall),**" etc. That's highly directive and would keep thinkingness of a rough case under control.

The second version is: "**Get the idea that it is all right to permit that (indicated object) to continue.**" It is also just an indicating process.

The third section of this trio is the clincher: "**Get the idea of making that (indicated object) disappear.**" One runs "disappear" instead of "dispense with" or "not-know."

Small objects are much easier for the preclear to make disappear than large ones. You have not told him to make it disappear but only to "get the idea of making it disappear." Preclears usually literally interpret you and try like mad to make it disappear—and it usually does for a short time.

I have solved the enigma of exteriorization. Why doesn't a preclear exteriorize easily and stay exteriorized? We ask the accompanying question: Why does a preclear get sick when one asks him to conceive a static? Obviously we would have to get somebody to conceive a static before he could himself stay comfortably outside his body's head.

The answer to this problem is contained in the process **“Recall a moment of loss.”** Loss prevents the preclear from conceiving a static. He associates a static with loss. He says, “All right, if there is nothing there I’ve lost it,” or “I’ve lost something there, therefore I’d better not conceive a static.”

Conceiving a static is therefore painful. The truth of the matter is whenever he lost anything, something disappeared. All right. The funny part of it is that he never noticed that he didn’t lose totally every time. He still had other objects. He lost his tie pin, but he still has his tie. He’s still got the floor, the room, this universe, space, etc., but he never realizes this in these instances and that is why we run this process “Recall a moment of loss” to accustom somebody to conceiving a static very directly on loss and to get him to exteriorize.

An individual cannot conceive a static if he associates static with loss—if the loss is painful. So we have to cure him of the painfulness of loss, consideration of, before we can exteriorize him easily.

We do this by going back to automaticity. The universe has been taking things away from him. It has become an automaticity, and we find that the universe has an automaticity known as time and time itself is a consecutive series of losses. So we have to cure the preclear of losses before we can get him to appreciate time, otherwise he would be so afraid of losing it that he’d stick himself on the track and we get the “stuck on the track” phenomenon.

The process “Recall a moment of loss” aimed at this, but the third command of Control Trio (as this series of processes had better be called), **“Get the idea of making that (indicated object) disappear,”** handles it very well. This gets the preclear to take over the automaticity of all of the losses which he has unwillingly experienced.

The universe has been taking the things away from him, and just spotting objects and getting the idea that they are going to disappear or are disappearing takes over the automaticity of losses, and he becomes accustomed to it after a while.

All of the invisible masses that preclears have around them are actually simply symptoms of mass—loss, mass—loss. When an individual has no visio the only thing that he is looking at is a “stuck” loss. He is looking at the nothingness of something that was there.

So one takes over that automaticity with the third command of Control Trio and one therefore has a very highly directional, workable set of processes.

Each part of that Trio would be run relatively flat and go on to the next part, and I would say that one would run each part certainly not a hundred commands each and the auditor should endeavor to stay in that order of magnitude and just run it round and round.

Take somebody with glasses, for example. His eyesight will do more tricks in less time on this third command of Control Trio than one can imagine. Things will go black. Well, why do things go black? Blackness makes things disappear and one takes over the automaticity of blackness to make things disappear. Night grabs, the way of the universe, once in every 24 hours on earth here. This is the process we have been looking for to turn on visio.

If you want to turn on sonic with this you would have to go down to a noisy part of town and just run Trio on sound, but you wouldn’t dare run Control Trio on sound if the preclear did not already have it flat on objects. Visio turns on before sonic.

There are many things one could do with this process. People who have anaesthetized areas in their body—like they have no chest, etc.—do weird things during this process.

I wanted to tell you particularly about this particular process because it is a specific and will be found to be very useful to you. We had to find out if one version of this would run without killing a preclear and that is “Recall a moment of loss.” Actually “Recall a moment of

loss” should act as a havingness process because it as-is all of the lost points on the track and it should be a havingness process all by itself; but we didn’t want to be so bold as to run it with no havingness.

(Until I find out differently, this Control Trio and “Recall a moment of loss” are making a bid for our chief exteriorization processes.)

Now here is a process which is based on our old **“Recall a secret.”** The version is entirely straight wire. The auditor explains to the preclear that he is not looking for hidden data to evaluate it. He is only asking the preclear to look at the data. He then makes a list of valences, paying great attention to those the preclear considers “unimportant” or is very slow to divulge. Then the auditor takes this list and runs repetitive straight wire (1951) as follows: **“Think of something you might withhold from (valence).”**

The auditor repeats this question over and over until no communication lag is present. He *never* says **“something else** you might withhold from valence” because the auditor wants the preclear to think of some of these many times.

Before selecting another valence the auditor runs a little Locational or Trio. He then takes the next valence the same way. The list is covered once and then the same list is covered again. The object is speed. Cover many people. Given time the auditor can do the same thing on all dynamics.

There is a variation. Instead of a valence, body parts may be used. **“Think of something you might withhold from that (body part).”** Leave sexual parts or obvious psychosomatic difficulties until *last*. Don’t begin on a withered arm, for example.

It is amusing to realize that this process overlords all early psychotherapies, but they, using this effort to locate secrets, thought that divulgence and confession were the therapeutic agents. These have no bearing on workability. Further, early efforts naively thought there was one secret per case. Actually there are billions. It is easy to get into past lives on this. A basic secret is that one lived before.

Whenever you run “withhold” on a valence you finish up with “can’t have” on the valence and “have” for the preclear. It flattens off better that way.

You will often find that it is more advantageous to run Locational Processing than Problems of Comparable or Incomparable Magnitude at times. A Problem of Comparable Magnitude is all right, but it is a thinkingness process and on a case that is having an awful lot of trouble with it, it gives them hell to run Locational Processing, but nevertheless it does run out the present time problem, which is most fascinating.

Any one of the Rudiments is an excellent process. Two-Way Communication is great and does not as-is havingness. You have to keep the reality of two-way comm very high, though, and be willing to interrupt obsessive outflows and silences of the preclear. It is establishing a high level of reality. It consists of the auditor feeding experimental data to the preclear to have him look it over and decide about it one way or the other. You don’t let the preclear in Two-Way Comm as-is everything he knows, thinks, or wants to do.

The latest addition to the Rudiments is “Clearing the Auditor.” Actually the crudest way known of clearing the auditor is **“Who do I remind you of?” “Tell me something you like about me.”** The best way of clearing the auditor we know of is in Training 15, which is **“Could I help you?” “How?” “Could you help me?” “How?” “Could I help anybody else?” “How?” “Could you help anybody else?” “How?” “Do other people ever help other people?” “Do women ever help women?” “Do men ever help men?” “Do men ever help women?”** etc. You beat it to pieces on a big long bracket.

This goes so far that it becomes a fantastic process in itself. You take father and mother valences and they are usually quite hot. You can run this on “Help.” This is usually quite necessary on a case that is going to hang up because the only reason he is sitting there is to waste help.

One has to understand that this case is trying to waste help, and it isn’t a matter of “Find the Auditor” in the Rudiments today, but “Clear the Auditor” and the only point on which he is cleared is “Help”—“Can I help you? Can you help me?”

We use *Handbook for Preclears* to give the preclear some homework at the Hubbard Guidance Centers and it has been helping out just to the degree that it does some clarification on goals and gets the preclear stirred up. It simply stirs up the case so that it will run out.

I was running over a phrenological questionnaire, and it said people are never permitted to do anything they want to do and this is the best goal of discipline. I got this tangled out in one way or the other. I got thinking about it from the standpoint— this was about 20 years ago—of “I wonder if there is anybody around that could articulate with great conciseness what he would like to do?” And I have found on all hands a failure to articulate was the main difficulty. A person had the feeling that he wanted to do something and that it would be wonderful, but it was all in a sensory capacity. If he could have been made to articulate this it would really have been something. And I experimented on it a little bit and we see that today in the *Handbook for Preclears*.

If you can get a person to articulate in a session anything about the future you have won the subject of goals. But it must be in the alignment of this person’s frame of reference. It must be aligned with his life—not aligned with something we think he ought to live.

So let’s take a look at the clearance of goals. Goals would not be likely to run on a high generality. In other words, they are specific, personal and intimate. It is **“What do you think? What do you want? What is aligned to your life?”**

Let’s look at Goals as a process. One could run Goals for 25 hours with the greatest of ease. One could run the Present Time Problem for 25 hours, and we just had a report of a terrific win here on a preclear who was run on Locational for 25 hours. So it looks as though the Rudiments could be the session.

We discover a preclear in the terrible condition of not wanting any auditing, not going any place and all of his goals being somebody else’s goals. Two things can be done immediately: Clear the auditor and then run Goals.

Goals could be run with two-way comm in this manner. You ask the preclear what he is absolutely sure would happen in the next couple of minutes, the next hour, a day from now, a week from now, one month from now and one year from now. We want something that the preclear is absolutely sure would happen.

We are running right there the reverse process of atomic bombs which say “no future—no future—no future.” That is basically what is wrong with a person. Why does he get jammed on the track? It is because of “no future.” He had been denied to a point where his loss was so great that he dared not own.

I had a case, by the way, which was one of the roughest cases I have ever run into. He put on the total appearance of being sane—dramatized sanity—and yet the case would make odd remarks like “I really think people are crazy.” “Well, why do you think people are crazy?” I would say. “Well, because people say they can tell right from wrong and you know there’s no difference.” It was fascinating. He would make odd remarks like this from time to time.

One day he made a remark on goals: “Well, it’s really best to tell people that things cannot happen to them because otherwise they might hope they could and then they would be disappointed.”

This person was stark, staring mad and had no future of any kind. Five hours just this one question, “Is there anything going to happen in the remainder of this afternoon?” “Will *anything* happen the rest of today?” “Is there anything going to occur any place in the world the rest of today?” was run on him and his confident answer, with great certainty was, “No. No. No.”

Finally we broke through it and I finally got the person to admit that there was some slight possibility that there would be a room here for the rest of the day. That busted the case. It read from total no-future up.

This case was an isolated one as we have had occasionally. Now and then an inspirational sort of process cracked them through. Well, now we see this process of Goals on the basis of futures and a person without futures cannot have a fancy future called a goal and all a goal is is a fancy future determined by the person. If he has no future at all determined by anybody, then he isn’t going to go anywhere from that point and any goal he has is totally unreal.

The best way that I know of to clear up a goal is as follows (with two-way comm): **“Is there anything that is going to happen in the next couple of minutes?”** We get this thrashed out until he has got some great big certainty that there will be something a couple of minutes from now. Then we gradiently move it up and we get certainties at each one of these stages and levels—regardless of on what.

The person knows there is going to be a future there. Now let’s have him put something in this future he has now created. He has created a future and has certainty on it. Now let’s put some desire in the future and we get a goal.

“Now what would you like to have happen in the next couple of minutes?” or “What would you like to do in the next couple of minutes, tomorrow, next week, etc?” We will get weird things which have no desire in them; they will all be get-rid-of’s, and if you finally plowed him down on it he would get down to the bottom of the ladder, which is “Knock this body off right now.” And when he says, “I would like to get over my fear of darkness, I would like to get over feeling bad every time my mother screams at me,” these aren’t desires. These are run-aways, flinches. These are “Let’s not confront it,” “Let’s get out of the universe; let’s scam,” and the final result is the basic postulate, “If I could just get rid of this body right this instant I would be all right.”

So that process doesn’t even vaguely get flat unless there is a real goal like “I’d like to have a stick of candy.” *That is* a goal, a real goal.

Preclears will modify their goals in some way or another: “Of course, I can’t because I have to work and I don’t have any money,” and “yak, yak, yak.” They are modified goals, and as long as they modify them they don’t have a goal because they are making a postulate and the MEST universe is kicking the postulate in on them. So we do this on a gradient scale of time so that goals become real to them.

Field Offices
Washington

**HOW TO READ PROFILES ON OCA: COMPARING
CURRENT WEEK PROFILE WITH WK BEFORE**

Drop on Critical—havingness drop.

Whole line (or majority of points) drops—ARC breaks with auditor.

Line doesn't change (same as before)—p.t. problem not touched by auditor.

Rough auditing—reduction of havingness.

Drop in Responsibility from former week—Auditor evaluation.

Drop in Composed—loss of auditor. Poor CCH 0 in Find the Auditor.

Drop in Comm Level—double acknowledgement by auditor, putting pc off before finished.

Drop in Appreciative—lowered reality level.

Nervous is toughest point to raise on a graph. It is done by finding the auditor. This is a primary point to watch in low profiles. Did preclear find auditor. CCH 3 and CCH 4 are the indicated processes for these low ones. They were designed to find the auditor.

COMMUNICATION COURSE

I want to welcome you to the Communication Course. It seems that a Communication Course is necessary as the first step to an auditor. And if an auditor doesn't successfully pass the Communication Course, then to the end of any curve he has as an auditor, there will be something wrong with his auditing.

It is very odd that one of the highest levels of indoctrination, Tone 40 on an Object, is most often unsuccessfully approached by a student at the HPA or HCA level when he has flunked the one I am going to talk about right now, which is a newcomer's first look inside the Academy at communication. And that is Dear Alice, part A.

It would have amused you the other day to have found a former Director of Training of an organization being sent back by the HCO Board of Review coach in his coaching to Dear Alice so that he could get good enough to pass Tone 40 on an Object. But it was absolutely necessary that this happen, because he had for some reason or another, being an old-timer and having been in it for a long time, never hit Dear Alice. It had been omitted from his training. In spite of all the auditing he had done and all the experience he had had, at the end of this time we find him sitting up in the coaching room, good as gold, perfectly comprehensible, doing Dear Alice, part A—a man who has probably audited two or three thousand hours' worth. But everywhere he had difficulty with a preclear, that difficulty stemmed from an inability to do Dear Alice, part A, which is in effect to deliver an auditing command in a unit of time as a completed cycle of action—he delivered an auditing command.

Well now you have to get up to step 2 and even step 3 before you can call it a full cycle of action. But as far as the auditor is concerned in Dear Alice, part A, only, his job is done when he has delivered an auditing command to a preclear. He didn't deliver it over the hills and far away or to the window; he delivered it to a being and he delivered it from where he was to where the preclear was—and it's so easy.

Anyone to whom this was described briefly, insufficiently, out in the street would, flunking it at the same time, tell you, "Of course I can communicate to people! Well, yes! There's nothing to it. I'm a salesman, you know. I run the Atomic Energy Omission. I'm a big man! Of course I communicate to anyone." We look in that man's vicinity and nobody's heard anything he's said since the days of Noah's Ark. He never said it to anybody in the first place. He sort of throws things out, you know, and he just hopes they land. Well, that's what passes for communication, and it isn't by a long ways—he throws out a statement of some sort or another and he thinks he's communicating with somebody.

It's a great oddity, but I must confess to you at this moment that the third dynamic is simply an agreement. It is an agreement which people have agreed to and therefore it has an existence and we certainly cannot live in this world without it, but it's a violation of the communication formula. A violation of it. The only thing that you can talk to in the final

analysis is a living being, and all third dynamics are composed of individual dynamics. And you can summate them and you can say this is a third dynamic, and that is the agreement on which we go, and it is quite factual and they are quite actual unless we stress them with the communication formula—so that you don't talk to all preclears, you talk to *a* preclear.

There was a fellow by the name of Franklin Delano Roosevelt that never talked to the nation—he never talked to the nation—he talked to an individual citizen. And therefore he communicated.

There was another fellow who spoke the most beautiful English I have ever heard, almost incomprehensibly parsed. Perfect. Would have passed any Oxford English Professor's most critical look, and that was Herbert Hoover. And I don't think Herbert Hoover ever said hello to a dog. I don't think in his whole life he ever said anything to anybody anywhere. And when this man uttered pronunciamentos they pronounced nothing to anybody anywhere. And therefore he couldn't lead a nation out of a depression. He couldn't lead anything for an excellent reason. He had no concept in the final analysis of talking to an individual, of getting his communication to land right there.

Now this is a touchy point that I open up. You say, "Well, how about you, Ron? You talk to an awful lot of people." Well, that's the whole secret of Scientology—I don't talk to an awful lot of people—I talk to you. I haven't any concept of a large multitude that reads my books or listens to my lectures. I can get a multiple concept of talking to a great many at the same time by talking to every one of them individually. Therefore I perhaps add a little conceit to the line, but I do communicate.

Therefore someone wanting to know how to speak to a crowd would first begin with Dear Alice, part A. So it is very, very far from an unimportant step. It is not just the entrance step that you have to get through to get your Communication Course over so you can really learn something. That is not what it is. It is the first door that opens and that door opens when it opens, and it opens when you can communicate a statement from you to a person. We won't worry about a preclear, because really the person in dummy auditing who is sitting there as preclear is really a coach, you know. But you've got to get something across from you to that person. And it has to be from you to that person—it has to be *a* communication. And when you can do that, well, you're all set.

I once told somebody that if he had a very difficult student—not you—but if he had a very very difficult student, the thing to do with this difficult student would be to put him through seven weeks of dummy auditing and then teach him in the last week to remedy havingness and turn him loose with a certificate and it would be a safe investment. We would be perfectly safe in doing that. But to give him one week when he needed two or three on dummy auditing and then try to cram him full of data and hope that the processes would carry him through somehow didn't make an auditor, it made a liability—both to himself and to preclears.

So this first step is not just an easy one—it is the toughest step you'll perform in Scientology and that's why it's right at the beginning. It's to say something to somebody with the full confidence that they will receive it. And that's quite a trick.

All right. How exactly is this done? We give a person a book. The book is *Alice in Wonderland*. Why *Alice in Wonderland*? Well, that's just because it is. No further significance. We give him this book and he is supposed to find any sentence in that book that he cares to find. (These people who just want to read the book consecutively to the preclear are not doing dummy auditing. They again are not in communication with the preclear.) He is supposed to find a line. Now he doesn't put "Alice said" or "The Queen said" or something like that on the line. He just puts the statement itself, you see. "Why do they run so fast?" Well the book says, " 'Why do they run so fast?' the Queen asked." Well we don't use "the Queen asked." We just say, "Why do they run so fast?"

All right, he picks that up out of the book. Why out of a book? Why not out of his head? Oh, remember. Remember something—in using the English language, you are not using your own ideas, you did not invent the words. You only helped invent the words that compose the English language. You are already using somebody else's ideas. Now there is nothing wrong with your composing these into new ideas of your own, but remember you are already using somebody else's ideas when you're speaking English.

All right. Now let's get it a little bit further. We are given a set pat process. Oh I know I dreamed it up, I found it one way or the other, but an awful lot of auditors worked with this. It's had a lot of looking at, and it's become phrased in a certain way, and that certain way might very well be taken by you out of the textbook and given to the preclear, and it won't ever work if you do. "Do fishes swim?" is not a therapeutic procedure—it's not. The repetition of it can be very good for an auditor, but it's not a therapeutic procedure. But the statement "Do fishes swim?" is not yours really, at the beginning, is it? You got it from the instructor or off of a book, and then you used it. Well when does it become yours? Well, any idea is yours that you make yours. We won't go along with dialectic materialism and say that no ideas are new, because that's not true. There can be new ideas. But if you get an idea from someone else, it is not still their idea. It's your idea. There is nothing wrong with mis-owning ideas, there's no mass in them to get you confused.

You take an idea out of a book, it becomes your idea, and then as your idea you relay it to the preclear. And that is all there is to it. It is coached this way. It is not from the book to the preclear. It is from the book to the auditor, and then the auditor, making it his own idea, expresses that idea to the preclear in such a way that it arrives at the preclear. So it's from the auditor to the preclear. But we give him the book as the third via because most of the material he is going to handle in communication is from a source outside himself. You've just got to get used to the idea that there is nothing wrong with using another person's ideas.

I always know what someone's state of learning is in Scientology when they speak of Scientology as "your" ideas. They say, "I've been reading your ideas." I know at once this person can't communicate. It's a great oddity. It's quite wonderful. Because they reveal at once that they cannot take this first basic step of taking an idea and then communicating it to someone else. They are standing back looking at the world in some large sense and they are not any part of it, because they can't own any of the world's ideas. If they can't own any of the world's ideas, then they won't own any of the world, because the easiest thing to own is an idea. No mass to impede it.

So, we coach just exactly in this way. We want the person to find a phrase in *Alice in Wonderland* and then, taking that as his own idea, communicate it directly to the preclear and he can say it over and over, the same phrase if he wishes, in any way he wishes to say it, until the preclear (who is really a coach) tells him that he thinks it has arrived.

Now sometimes the preclear, the first day, feels just a little bit strange about these communication lines, too, and sometimes has his entire criticism based upon the erudition, the pronunciation, the way the auditor holds his little finger while he announces the phrase—this has nothing to do with it. It is the intention that communicates, not the words. And when you have the intention to communicate to the preclear, and that intention goes across, it will arrive. If you broadcast that intention, no matter if you're saying it in Chinese, if you're a Scientologist, it will arrive.

One of the steps of the much higher indoctrination level, Tone 40 8-C, consists entirely and completely of saying things in funny voice tones while one is communicating an intention—using very odd voice tones; well, this is not part of Dear Alice. The voice tones are unimportant; pronunciation is unimportant. It's whether or not the person could take that idea out of that book, own it, and then communicate it. And the intention must communicate. And it must be communicated in one unit of time. That is to say, it isn't repeated from the last time it was repeated. It is new, fresh, communicated in present time. The fifty-fifth command of "Do fishes swim?" is the fifty-fifth, not the first repeated. So we have one unit of time, one

command, and the intention. And when we have those things relayed across, then he can find another phrase and communicate that. And that is the way we do that, and I hope you find it helps communication.

HCO BULLETIN OF 13 NOVEMBER 1958

1 each Staff Member
Field Offices

TRAINING INSTRUCTORS, HCO SEC

TR 9 (b) and TR 9 (c)

HCO was asked for a TR number for “Handling ARC Breaks and Opening and Closing a Session”.

TR 16 is assigned to “Handling ARC Breaks”. Below are TR 9 (b) and TR 9 (c) as contained in the unpublished Student Manual.

Number: Training 9 (b)

Name: Starting the Session

Command: No formalized command except that auditor must make sure that the pc is cognizant of the fact that a session has started.

Position: Auditor and pc seated a comfortable distance apart.

Purpose: To make known the beginning of a session so that no mistake as to its beginning is made. To differentiate between an assist (erasing a surface difficulty) and formalized auditing. To let both auditor and pc know that a session has started.

Training Stress: To bring about the purpose of this rudiment. To begin sessions, not just let them happen an-l when pc goes out of session to re-establish and start the session again. To demonstrate that if a pc doesn't realize that a session has started, he doesn't get audited and change consequently does not take place.

History: Developed by L. Ron Hubbard in London, England, in 1955.

Number: Training 9 (c)

Name: Ending the Session

Commands: A gradient scale of two-way communication to “End of Session” first giving the pc adequate warning that the session is going to end shortly.

Position: Auditor and pc seated a comfortable distance apart.

Purpose: To make known the end of a session and prevent pc from being either stuck in a session or self-auditing. To end the cycle of action of being audited.

Training Stress: To teach the student the importance of ending the session, of completing the cycle of auditing to the degree that the pc is cognizant of this. To illustrate that pc will be left stuck on the time track if this isn't done or done too abruptly. To do this gradually, warning the pc beforehand that it is going to end. To teach auditor not to end session where pc has somatic, dope-off or any restimulation brought about by use of a technique.

History: Developed by L. Ron Hubbard as parts of the Rudiments of Auditing in London, England, in 1955.

HCO TECHNICAL POLICY LETTER OF 25 NOVEMBER 1958

ACADEMY TRAINING BULLETIN

All Area
Offices

TECHNIQUES TO BE USED ON HGC PRECLEARS

Effective Dec. 1, 1958 in all Area Offices

The following techniques are the only techniques to be used on HGC preclears, effective Dec. 1, and continuing. These produce clears in the hands of most auditors.

Deviations by Director of Processing or staff auditors are violations of the Code of a Scientologist under No. 2 and Auditor's Code under No. 3.

Where needed:

CCH 1

CCH 2

CCH 3

CCH 4

On all other Pcs:

1. Rudiments (not CCH 0) Establish: Auditor, pc, room, session to start.
2. Start-Change-Stop on a person or object.
3. Factual Havingness.
4. What can you confront? (Repetitive Command)
5. You make a mock-up for which you can be wholly responsible.
6. General Help. Help on the Rock.
7. Step 6 of Clear Procedure.

Exception: Only where staff auditor has been trained in an ACC given to running engrams only (1st such ACC was 5th London October-November 1958) may the staff auditor run engrams or use CCH 0. Early Dianetic auditors are not, repeat not, included in this exception. It is a matter of judgment here that in event of question about engram running the auditors not specially trained in 1958 or later to do so will make more clears by the above than by "running engrams". The running of engrams by Scientology, rather than Dianetics, is splendid and speeds clearing but only where specially trained. There is too much new data about it for assimilation short of an engram running ACC. 20th ACC graduates are not qualified to run engrams.

DUMMY AUDITING

Step Two: Acknowledgment

Compiled from the Research Material and Taped Lectures of L. Ron Hubbard

Dummy Auditing, Step Two, Acknowledgment, is the second part of the communication cycle. Now the actual fact is when you have gotten a thought over to a preclear it is customary to prove it. The whole stress of acknowledgment is entirely and completely upon making sure that the preclear receives the auditor's acknowledgment. That is the entire stress.

Now why all this stress on acknowledgment? Well, acknowledgment is a control factor—I'll just let you in on a secret right here at the beginning. If you acknowledge a preclear well, you will have the preclear under much better control. Now, why? The formula of control is Start, Change and Stop. And that's just it—an acknowledgment is Stop. If you said to him "Keep going" or "Keep talking," you would not be acknowledging him. The perfect acknowledgment communicates only this: *I have heard your communication*. That's all there is to it—*I have heard what you said*. It signalizes that the preclear's (or person's, since Scientology applies to life, not just to an auditing room) communication to you has been received. But when you use it as an auditor you use it also as a control factor. And it says this: *Your communication has been received—and that is all there is to it, and that is the end of that cycle of action, thank you*. That's what it says, and you have to put that whole intention into a "Yes" or an "Okay" or anything else you use. It isn't the word, it's the intention that ends it. *Your communication has been received and I have now decided to stop that cycle of communication and your communication is therefore under my control*. Those things which you stop, very crudely, are things which you control. You have to be able to stop things if you control them. If you cannot control a preclear's communication line you can't control the preclear.

I'll give you an example of this. Let's say we're auditing Mrs. Gotrocks, the wife of the executive manager of Fleabite Dustpowder or something, and she is bored (the only thing wrong with her), and she's crazy (that's the only other thing wrong with her), and she never had anything to do, and she's just been Lying around, and she has ailments. She comes into the auditing room and she starts to talk to you. She says, "Oh, I've been to this specialist and that specialist and it cost this much money and that much money and I've been here and I've been there and what's really wrong with me and what you really should take up is so and so rah rah rah" It's none of your business. The longer you let such a person talk, the less havingness they have. You can watch them go straight down the ARC tone scale if you keep on letting them talk. Obsessive communication—obsessive outflow. And the first major use that you will make of this, the first time you really understand what this acknowledgment is all about, is when somebody starts this on you and starts talking, talking, talking, talking, and you want to get a session started, and you get the intention real good and you say to them, "Good."

And they stop talking. Your intention was such that they knew that you had received their communication. And if you can do this very well, if you can get that acknowledgment just right and if it does exactly what it is supposed to do, very often the person will look at you fixedly and say, “You know, I don’t think anybody has ever heard me before.”

Why is this person talking obsessively? They are trying to make up in quantity what they lack in audience. There’s nobody listening to them. They are not talking to anyone. And you all of a sudden come up with an acknowledgment and say, “Hey! I heard you. I heard that. You have communicated to me, and that’s it, now.” And they say, “Wow. I don’t think I’ve ever talked to anybody before.” It’s quite amazing. I have seen an auditor on an obsessive outflow case get down in front of the preclear, fix him with an eye, move his finger back and forth just in front of the preclear’s nose and say, “Good; I heard that,” and have the preclear all of a sudden say, “Ooooh. Geeeeeee. You are there, aren’t you!” So a good acknowledgment can actually wind up the entire goal of the process and find the auditor—that’s how important it is.

Now, that is a specialized use, stopping a compulsive outflow. Its general use is putting a period to the communication cycle. It ends the moment of time in which you gave the command you learned how to give, we hope, in Dear Alice, part A. You said something, the preclear heard it, and we understood then that the preclear had heard it, and we said, “Good.” Now the exact way Dear Alice, part B (which is Dummy Auditing, Step Two), is done is this. The coach—or a person acting as a preclear—takes *Alice in Wonderland* and reads random phrases out of it. And, reading the phrase in any old way, we don’t care how (we’re not disciplining the preclear, you know; we never do that, we merely control them within an inch of their lives), in this particular case this person says something out of *Alice in Wonderland* and the auditor has to say, “Good,” “Fine,” “Okay,” “I heard that,” *anything*—in such a way as actually to convince the person who is sitting there acting as the preclear that he has heard it.

Now there is a specific way to do this. That is to *intend* that the communication cycle ends at that point and to end it there. Anything that you do to make that come about is, of course, legitimate, unless it utterly destroys ARC. But it finishes a cycle of communication. So what could the auditor in this case do? You see, there sits the auditor, no book; there sits the preclear with a book; and the preclear is reading, “And the Mad Hatter dipped his watch into the teapot,” and the auditor says, “Good.” But that ends that, you see. Now, in view of the fact that the preclear is reading a continued story which goes on sentence after sentence after sentence, the auditor will have a tendency to treat this as “in passing,” and that is not an acknowledgment. The auditor *could* say, “Well, read some more.” That’s not an acknowledgment—it didn’t stop it, did it? “Continue, go ahead”—no, that’s not an acknowledgment at all. An acknowledgment says, “Stop”—“Whoa”—“Air brakes”—“Period”—“End”—“Heard you”—“You’ve communicated”—“That’s the end of that moment of time”—“Final cycle”—“That’s it”—“You’ve had it.” You get that?

So the auditor has to say “Good,” “Fine,” “Okay,” in such a way as to receive the communication in the preclear’s eyes. The preclear has to know that the auditor has received the communication, and that’s the only point on which they are coached— at first.

Then we could start to bear down and say, as an instructor, “Well, did you acknowledge that preclear’s communication? Did you?” And the auditor says, “Well, uhh....” “Did you do a perfect acknowledgment?” “Well—certainly.” And the answer to that would be “No.” The preclear is still reading, still got the book in his hands, still going on with it, still sitting in the chair, and he’s still not in this universe.

What is this all about? What are we actually trying to do? Well, we’re not trying to reach the ultimate in an acknowledgment because that would be the end of the universe. If somebody could say “Yes,” “Good,” or “Okay” with enough intention behind it, all communications of this universe from the moment of its beginning would then be acknowledged, totally. (Except that this would violate the communication formula because they weren’t all addressed to him, although lots of people think they were.) But what does the auditor actually feel called upon to do? Well, he feels called upon to put a period to that cycle of communication. It actually started,

you see, with the auditor's phrase to the preclear, then the preclear signified with some kind of wince or grunt or something that it had been heard, and then the auditor says, "Well, that's the end of that. Good. Fine. That finished that." You see?

But an acknowledgment ends the cycle of the communication which you read about in *Dianetics 1955*, and that is the Bill-Joe cycle. "Good," says the auditor. This is fantastic. If you got good enough at this, a traffic cop would drive up and say something to you and you would acknowledge the fact that he had spoken and he would simply get back on his bike or go back to the station house and turn in his badge and retire. You see, that would be the end of that. That would be it. As a matter of fact, it actually staggers people to have an acknowledgment come to them—it staggers them, really to get it through. People who are having a hard time, particularly. It's a good thing, and it's very therapeutic for a person to know that he has been acknowledged. I know that you will be around in the local stores, maybe stopping a pedestrian on the street and suddenly looking at him and saying, "Good"—acknowledging him. And you will have some fantastic things occur if you do. An acknowledgment is a very, very powerful sixteen-inch gun in the communication formula; and you shouldn't use it sparingly, you should use it to end cycles of communication. I hope you learn to do that very, very well.

HOW TO RUN AN ENGRAM

Brief Summary for HGC Use

First—only graduates of ACCs including the 5th London October 1958, and after are qualified to run engrams by Scientology processes. This does not include Dianetic processing of engrams which can be done by anyone but is not allowed in HGCs. Reason: Scientology processing of engrams is too strong for most untrained personnel and better results are obtained by HGC wholly repetitive processes. Stable Data: The HGC has the responsibility of using only the processes which obtain the highest results. A Director of Processing must bring about only the use of the best processes.

For wholly repetitive command clearing processes, see other bulletins. Engram running with Scientology processes in *unschooled* hands does not bring about bettered cases by actual test. This is evidently due to the roughness of the auditing and failures to handle ARC breaks. ACC trained personnel therefore, are the only ones qualified or permitted to run engrams in an HGC.

Locating the Engram

Finding the engram necessary to resolve the case is done by an E-Meter and finger snaps. The E-Meter is the final check. If an E-Meter is stuck on the pc or Stage Four (rises, sticks, falls in a repetitive cycle and reacts on nothing else) CCH processes may be used or preferably, the 3 commands of Factual Havingness (8 of vanish, 2 of continue, to one of have).

The experience necessary to resolve the case is the engram asked for. It is run back in time and located exactly in time. The falls of the needle are the equivalent of a “yes” answer to the auditor’s question. Only the *time is* isolated, not the content. The time may turn out to be a span of years. The incident may be even a century in length.

In a rough case some current lifetime “lock” may be the incident. In a very rough (unreality) case, the “engram” necessary to resolve the case may be the moment the pc walked into the room.

In a majority of cases however the “engram necessary to resolve the case” is a past death, complete with its accompanying overt act. Its place *in time is* the concern of the auditor. Questions such as “Greater than five hundred years?” “Less than five hundred years?” narrow the time down precisely. Several incidents may be located in passing.

Run that incident which has the steepest fall. Don’t run the earliest necessarily. In case of doubt as to which of two falls most pick a later incident (closer to p.t.) as it will actually be easier for the pc to confront it.

With this incident selected, don’t then change it or let the pc change it. Don’t start to run one incident and then change to another ever. What you pick, *flatten*. To change is to pretty well lose the whole case. We aren’t interested here in the significance of what running it does for the case.

DUMMY AUDITING

Step Three: Duplication

Compiled from the Research Material and Taped Lectures of L. Ron Hubbard

This interesting, interesting dummy auditing step has a villainous and vicious goal. It makes somebody duplicate. 'Way back in 1950 we found out that auditors, in order to be interesting, would vary their pattern; and every time the pattern was varied, every time the auditing command changed, the preclear received a little jolt. There was an upset because of it. A long time ago we would have considered it fairly legitimate for an auditor, using the auditing command "Do fishes swim," to say, "By the way, do finny creatures wiggle in the water?"—and next time to say, "Say! does the funny tribe bathe?"—and the next time to say, "What brands of fishes are there that progress from point A to point B in liquid habitats?" That possibly would have been legitimate then, but we don't do that today. We do a horrible thing. The auditor says, "Do fishes swim?" And, just to vary it, he then says, "Do fishes swim?" And, just for good wild variation, he then says, "Do fishes swim?"

This is where we learn why we were so insistent on one command in one moment of time back in Dear Alice, part A, because we don't repeat the first "Do fishes swim" another thousand times. No auditing command should ever depend for any of its meaning on any other auditing command ever uttered. Each one exists, theoretically and purely, in its own moment of time and is uttered itself in present time with its own intention.

Now this is quite important. Do you know that the basic auditing process of CCH does not work unless each command is in a separate unit of time? If you run it this way, "Give me your hand—thank you; give me your hand—thank you; give me your hand—thank you," it's not very therapeutic and nothing happens to the preclear. Why? Well, we've got a machine which is simply repeating the first "Give me your hand" over and over again. We're not saying it—there's no intention there. Do you know that if you told somebody to give you his hand with enough intention behind it his body would respond without any via through the thetan? The body doesn't obey the words, the body obeys the intention to extend a hand. Therefore, when you are asked to express an auditing command with the same words over and over and over, each time you must express it in present time as itself with its intention. It isn't just a long duplication of it. Just duplicating something over and over and over is sometimes so trying that people wonder how auditors ever arrive at all. Nobody could sit in a chair and say each time with a new intention, "Do fishes swim," for seventy-five hours. It's beyond human possibility, according to some people. But the trick is that if it's always uttered in present time it could be said for a thousand and seventy-five hours. It's only when it's repeated—only when the first command is repeated over and over and when no new intention arrives—that it becomes very arduous. Only when it goes on to a machine does it become almost impossible to do.

Communication is reached by control plus duplication. At first you find that to make each utterance of the command different in its own unit of time you use different voice inflections. But as you come up the line on this you find out that you actually can pattern the same tone and each time have it entirely new. It would be very, very incorrect to teach this, to have the auditor each time duplicate his own voice tones as they were the last time, because that is making an auditing command depend on the last auditing command. We couldn't care less; and, after a while, you couldn't care less, either, what voice tone you're uttering, but each intention is new and fresh. The intention is to ask and get an answer to this question, "Do fishes swim?" and, each time you utter it, it is uttered newly and in its own area of time. That's really the only stress there is. One command per unit of time. Each command separate, and each command containing the words, quite incidentally, "Do fishes swim?"

Here we learn a great deal about the duplicative factors of communication. We find out that, in having to duplicate, we think we actually lose some of the communication at first. It's utterly idiotic—how could you possibly maintain ARC and therefore, of course, interest, asking a person over and over again this silly question, "Do fishes swim?" Who could do this? Well, interest in communication has everything to do with the intention to be interesting and very little to do with text. Furthermore, it is not the auditor's job to be interesting. Being interesting is a part of the communication formula, but to an auditor the least possible part, as far as the preclear is concerned. He's not there to interest and intrigue the preclear. Right away, people think they are. Place two people in chairs facing each other and each one of these two people feels the compulsion to be interesting to the other. That's not auditing, that's being interesting, that's being social and so on. So if a person had any difficulty doing Step Three, Do Fishes Swim, the instructor would be perfectly in order if he simply told the person to sit in that chair and told some other student who wasn't doing too well, or just some other student, to sit in the other chair, and told them just to sit there and look at each other without saying a thing or being embarrassed or anything else. Interesting drill, if you think of it. We do have variation, and therefore interest, in the first and second dummy auditing steps; but now we reach this one and it is utterly devoid of interest. We're saying the same thing over and over and over and over. And if a person can't do this he probably has a compulsion to vary, to alter-is, to be interesting, and he wouldn't find it easy just to sit in a chair and face another human being and not say a word and not do a thing but just sit there and look at the other human being. And if I were coaching someone that had difficulty in repetition of steps, I would do that for an hour or two that day.

All right. It is absolutely necessary that an auditor be able to duplicate. But answer me this: Is a person who is saying something in present time each time really duplicating the last moment of time? He really isn't, is he? And so this duplication that we do in Scientology means only the ability apparently to duplicate while being in present time.

The greatest motto of experience and the life we have lived is this: *I won't ever do that again*. This is the one thing your mama wanted you to promise. If you did nothing else, if you lived a completely sinful life, why, mama still wanted you to learn by experience; which is to say that when you did something wrong, or did *something*, you weren't ever to do it again. She hoped perhaps you would eat enough candy to make you so sick that you wouldn't "wolf" candy again; that you would eat enough ice cream so that ice cream would make you so green that you wouldn't make a pig of yourself over ice cream again; that you would become so embarrassed and lose so many friends that you would not do that evil thing again, whatever it was you did; and thus learn by experience never to do it again. And this is experience talking. One thing you must understand—that experience teaches you—is never to do anything the second time. This doesn't necessarily mean that all experience is painful, but people who are having a hard time tend to believe that it is; and when they begin to depend upon experience and stand by this lesson of never doing it again, they can no longer duplicate. And what do you know—they can't communicate. Also, their bank jams. All sorts of interesting things occur. All moments become one moment. One moment becomes all moments. Identification occurs all over the place. And just the action of repeating something like "Do fishes swim?" as an auditor, with a full intention, has a tendency to unjam the time track.

You should know that this is what this step is up against. It is violating all of that hard-won experience that you have accumulated in the last seventy-six trillion years-if you believe an E-Meter, you're seventy-six trillion years old. And all that hard-won experience, all that wonderful, wonderful lot of mess that you got into, added up completely to *Never do it again*. And so you've been taught not to live, which is what happens when you get experience. And when you can duplicate an auditing command over and over again, you will find out that auditing does not become a painful experience. A person who can do this well, by the way, never gets restimulated. Why should he—he's not in the moment of time in which the restimulation took place.

There is a more basic step to this particular one, by the way. This is to pat the wall five times and then distinguish one of the pats from the rest. An instructor can do that on a student with some profit. Pretty soon the student can tell all five pats apart, and when the student can tell them all apart, even though they sounded all the same, he can also duplicate an auditing command in present time all the way. I've broken cases with that one.

BASIC POSTULATE OF OVERT ACT-MOTIVATOR SEQUENCE

The inability to restrain dramatization of past experience only occurs when one has decided he can do nothing about such an experience. Thereafter he is the effect of all similar pictures.

Test: Pick up a moment in the past when you decided you could do nothing about a certain thing—then examine later experience on same subject.

This is the make-break point of reactivity.

This is the bridge between cause point and effect point on any given subject.

“I have to do something about it—I can do nothing about it” are the basic postulates of the overt act-motivator sequence. Straight Wire against an E-Meter on times one felt one could do nothing about it works to resolve very difficult cases.

**AUDITING ARC BREAKS ON REGISTRAR
AND ASSISTANT REGISTRAR**

I have found it desirable to run TR 5N (ARC Breaks) fully on both Registrar and Assistant Registrar in new comm line.

A good auditor who can handle 2-way comm is needed.

The commands are, "What has anyone done wrong to you?" and "What have you done wrong to people?", and other ARC Break questions.

Getting the overts of the pc is important.

It is necessary to remove, in this special case, ARC Breaks between Registrar and Assistant Registrar with—

1. Students
2. Instructors
3. Auditors
4. Preclears
5. Field Auditors
6. The Central Org
7. Groups
8. Customers
9. Salesmen
10. LRH

Get out what each of the above did to the Registrar or Assistant Registrar and what the Registrar and Assistant Registrar have done to or thought about doing to each of the above.

This will make it possible for them to (1) live in their operating climate and (2) write warmer, more forward "invasion of privacy" letters.

HCO BULLETIN OF 20 DECEMBER 1958

(An article for any Scientology Magazine authorized by a Central Organization)

PROCESSING A NEW MOTHER

The handling of a woman during and after pregnancy has a specific successful drill which should be generally known. This is not an attempt to give all the known data concerning pregnancy, delivery and child care. I will someday summarize all these. At this time I wish to give you only the processes and general use.

First, a woman should not be processed on engrams after the early months. Therefore a pregnant woman should be processed toward clear early and well. In other words she should be gotten into good shape soon in the pregnancy. Old Expanded Gita on babies, husbands, wives, bodies is definitely indicated.

After the sixth month only havingness and general Scientology processes can be run without injuring the baby—no engrams.

Next, the delivery itself should carry as little anaesthetic as possible, be as calm and no-talk as possible and the baby should not be bathed or chilled but should be wrapped somewhat tightly in a warm blanket, very soft, and then left alone for a day or so.

At once after delivery the woman should have simple havingness run—"Look around here and find something you have"—preferably by the husband. One hour of this at once, one more hour same day, two hours following day, all havingness and havingness only should be run.

After two days run the following:

"Invent something worse than—a delivery" (flatten it), ". . . a baby" (flatten it), ". . . a doctor" (flatten it), ". . . a nurse" (flatten it), ". . . a delivery room" (flatten it), ". . . a mother" (flatten it), ". . . a husband" (flatten it), ". . . an abdomen" (flatten it), ". . . a womb" (flatten it).

This should be done in next many days following the delivery. This and more factual havingness (all 3 commands) should straighten up the mother. It would be well if the six buttons and inventing were cleared away in early pregnancy so the post pregnancy processes will run easily. She shouldn't face a new processing idea in the first few days after delivery, so if the processes are early prepared, all will be well.

On the baby, perhaps the best thing is *no* processing for three days. Then talk to the baby, tell the newcomer he or she is welcome, then make friends. Various things can be done—touch assist is best. Even the birth engram can be run but that's a little adventurous in a lot of cases.

The most to know about the baby is not to tire him or her unduly for a week or two, feed a protein formula if mother not breast feeding. This formula is most like human milk. I picked it up in Roman days and have used it since—15 ounces of barley water, 10 ounces of homogenized milk, 3 ounces Karo syrup (this can be multiplied by any number according to the number of bottles desired but the ratio remains the same). Evaporated or condensed milk

and heavy sugar make fat not bone. *Protein* is the thing that heals and makes strong growth. Modern hospital formulas and patent mixes for babies are not just bad, they are criminal.

Then the next important thing for a baby is to know he or she is winning. Don't expect him or her to do more than a baby can do. Grant beingness to a *baby*.

"You make that body lie in that cradle" is wonderful on babies up to six months.

Let the child see Mama and Daddy both at least once a day. Never quarrel or argue in front of a baby or a child—it destroys security.

Always treat mama and baby with courtesy and respect and they'll thrive. After all, they *have* done something. They're keeping the human race going.

HUBBARD COMMUNICATIONS OFFICE
WASHINGTON, D.C.

HCO BULLETIN OF 22 DECEMBER 1958

To all staff

NEW HGC PROCESS

A New Straight Wire

(This can be used in any official Scientology Magazine)

There is a new process allowed in HGC. It is—

ARC Break Straight Wire

This process belongs after S-C-S and Factual Havingness and before What Can You Confront.

ARC Break Straight Wire is a form of TR 5 ARC Break. Its processing number, however, is CCH-50.

Any and all rules governing Straight Wire apply, including—

- (a) The pc cycles into past and back to pt. Therefore, ask and pin point *when*.
- (b) Stop the process only with the pc near pt. Put in a bridge, therefore, without specified number of “more times”. Wrong: “I am going to ask this question three more times and end the process.” Right: “I am going to ask this question until your answers are close to present time and then end it if that’s all right with you.” Then check *when* on each reply, get pc into present time and say, “Are you near present time? All right, this is the end of the process.”

The Command to a Scientologist is, “Recall an ARC Break.” This is for an unlimited type process. “Recall an ARC Break between us”, or “. . . in an auditing session” or “. . . with your mother” to limit process to this life. The first form is preferred. The second form is used on a sticky valence that has been isolated.

The unlimited version rapidly dives for whole track and into engrams. This is all right. But don’t stop and change the process. Just continue to run “Recall an ARC Break” when the pc gets into heavy weather.

Be very careful with this process to keep the Auditor’s Code. Otherwise, 50% of the time is spent getting rid of ARC Breaks in the session itself—and with this process these are heavy. (However, two auditors co-auditing who are a bit clumsy can use this process better than other processes and it and Factual Havingness should be the total activity of an auditor who is having trouble with a pc who is having trouble with ARC Breaks.)

The pc, in diving for whole track, gets into and out of heavy incidents. So long as he answers the question, fine. Don’t let him fail to answer every question.

Reality on the whole track leaps up with this process. This is the first process that accomplishes this easily.

In running it, remember that the overt act is as important as the motivator (see *A History of Man*, Chap. 9). The reason A gets mad at B is as often because A has done something to B as it is because B has done something to A.

Here is a fine, smooth process that is a one-shot Clear, and can be used by auditors not ACC-trained to run engrams.

ARC Break Straight Wire is very useful in husband-wife co-auditing teams and, with Factual Havingness, is the *only* process that should be used in a co-auditing relationship that is already intimate to a point of easily gathering ARC Breaks.

From two standpoints the process is the best we have ever had—

- (a) It handles touchy pcs well, and
- (b) It is the first to open up whole track in general with as great a reality or greater than the R on present life.

From two other viewpoints the process is vulnerable:

- (a) It requires strict observance of the Auditor's Code if you don't want to waste 50% to 75% of the auditing time.
- (b) It runs the pc into heavy incidents and the process must be continued until pc is again in pt-making an uncertainty in session timing.

However, the shortcomings are far outweighed by the value of ARC Break Straight Wire.

There is one "bug" in the process. The non-Scientologist does not readily grasp the command-and there is no substitute for a quick question.

ARC Break means, "The assignment of responsibility for a sudden drop in Affinity, Reality or Communication." Thee and me have a "feel" for this.

Substitute commands are many, none as good. "Recall something you have done to a person"—"Recall something that has been done to you" is fair but misses by a mile.

History: This process is, in genus, very old. I introduced its rudiments at the June 1952 first Congress in Phoenix, Arizona. ARC is even older and goes to July of 1950. The present version in a narrower form was first used by Mary Sue Hubbard in 1958.

The valuable lesson this gives us is that Mary or Joe or Pete may be mad at us because Mary or Joe or Pete did something to us. We may or may not have done anything to Mary or Joe or Pete to make them mad at us. In other words, the pc who comes back into session furious with the auditor, may have committed an overt act against the auditor *out* of session and not prompted by an action of the auditor. The wife may be mad at the husband because of something she did to the husband. She talked about him behind his back (prompted by some old engram about husbands) and, now having committed this overt act, she becomes furious with the husband. Etc. Etc. The person mad at Scientology may only be motivated by having done something *to* Scientology. Etc. Etc. A whole new view of human behaviour opens when you see this point. Therefore, caution the pc to "pick up his overt acts against things, too" while he's running it, if he's only getting overt acts against him.

The only reason the process won't work is that the pc isn't doing it, but only pretending to, or he doesn't understand it.

But all in all, we've a wonderful weapon here to straighten out a lot of lives. Use it with wild abandon and get the results in. It's *good*.

THE FIRST FIRST DYNAMIC PROCESS

All processing to date has been in the main third dynamic processing.

For the first time I have worked out a purely first dynamic process. It is used by the Auditor on a pc with lots of attention to ARC Breaks, havingness and, of course, smooth skill.

The process is “Invent something worse than you.”

Theoretically this is a “one shot clear” process. It directly changes the being that is making the bank—the thetan.

It does not hope for a change of the person via a change of the bank.

The HGC and any validated Auditor can use this with great profit.

2 cautions: Do not permit a pc to escape “invent”. Do not let him do something else (such as see how he is to find if something is “worse than”).

The process does not work unless “Invent Something” is workable. Therefore, to run it, one makes sure first that the pc knows he can invent something.

The process does not work if the pc also does something else. Ask the pc “What are you doing exactly” now and then and make the pc do only the process.

Patch up any ARC Breaks with “What have I done wrong”. And follow that with “What have you done to me” to get both motivator and overts in the session.

This is a wonderful process—simple to run and do, with good results—if it is done right. It is easier to run than ARC Break Straight Wire.

SHORT SESSIONING

One of the simplest ways to get a case moving is a technique known as “Short Sessioning” which I developed for the 20th ACC.

The 20th was the last ACC to teach clearing without engram running and as such had several lagging cases. I studied one of these carefully against the basic auditing rule, “Find something the pc can do and then improve his ability to do it.”

The case under study defied all known processes. It was “unreality, unreality, unreality”, and “ARC Break, ARC Break, ARC Break”.

ARC Straight Wire old style was also unreal. Imagine that!

However, even when all else was lost, I still had the idea that this pc could be run on something and finally had a long blue spark—the pc *would* start and end sessions.

Probably this was the sole ability, Scientology-wise, of this pc. So I made the auditor start and end ten-minute sessions. And it worked. It worked even though the auditor never really cognited on the value of it! I had to heavy-8c the auditor a bit to keep the auditor from “running *something*”. Short sessioning was evidently not something to do. Only a process was *something*

Anyway, everybody won. The pc got brighter, the auditor got a win and we got a new technique. That’s the way with Scientology, everybody wins—even the people who claim I’m too enthusiastic for their point five.

The exact way to do “short sessioning” is as follows.

One uses old rudiments if he isn’t comfortable with CCH 0. Or he uses CCH 0 as given in ACC Clear Procedure. It doesn’t matter much which since he is depending on starting and ending sessions rather than “running something”. Therefore, the auditor should use that with which he is the most comfortable.

The auditor gets the pc’s agreement to start a very short session and says, “Start.”

Then he clears up some small thing like an ARC Break in the session or a pt problem without really getting into anything hot. (Finds auditor and pc.)

The auditor then does something objective with the auditing room such as “How does this room differ from an ideal environment?”

Probably by this time the ten minutes are up, so the auditor tapers it off and bridges to session end. “Is it all right with you if we end this session shortly?” “Is there anything you’d like to say before we do?” “All right. End of session.”

The auditor makes the pc get up and take a break for a few minutes. Then he gets the pc back and does it all over again more or less as above.

The idea is not to try to get benefit from a process but to get the pc less and less nervous about *doing* something. The pc *will* begin and end sessions. Anything between is pure gravy if it works *but* the in-between may not work at all. It does not matter. Starting and ending sessions is what is wanted for the pc.

Short sessioning works for many reasons. It injects *time* into the picture, for one thing. It breaks up habits on the cycle of action. It gets the pc used to the auditor. You could think of many more reasons but basically whatever the reasons, it works.

Try it on that case that ARC Breaks on you all the time. Try it on the pc that has it all unreal-unreal-unreal. You’ll be amazed at what short sessioning, smoothly run and without crude auditor flubs, can do for almost any case, not just bad ones.

Several difficult cases have improved markedly with this alone. Simple, isn’t it? Well, most good things are.

DUMMY AUDITING

Step Four: Handling Originations

Compiled from the Research Material and Tape Lectures of L. Ron Hubbard

The fourth thing an auditor has to do (in that order) is to handle an origin from the preclear. It is actually true that when you are handling Tone 40 processes, you do not handle the preclear's originations. But if you will look on the HCA/HPA chart you will find that these Tone 40 processes are in the minority amongst processes, and *in all processes not Tone 40 a preclear's originations are handled*—remember that. Don't let anybody talk you out of it. If you are handling Tone 40, which is just pure, positive postulating, you, of course, are not worried about anybody's opinion, origin, condition, or anything else—you simply want him to do certain things, and he finds out that his beingness can be controlled and therefore that he can control it.

What do we mean by an origin of the preclear? He volunteers something all on his own; and do you know that is a very good index of case—whether the person volunteers anything on his own? An old-time auditor used this as a case index. He said, "This fellow isn't getting any better. He hasn't offered up anything yet." You see, he didn't originate—he didn't originate a communication. Do you know that that is the hardest thing to get an organization to do: to originate a communication?

You actually could- work in the direction of getting a preclear to originate a communication, in spite of the fact that you just previously were running him on Tone 40 processes. He originated the communication that his arms and legs felt like they were just going to fall off, and you said, "Give me your hand—thank you." Preclear says, "My head's coming off now! I know it's going to fall on the floor!" Auditor: "Give me your hand—thank you." Good Tone 40. But on control of person, the first two processes are Tone 40, but Book Mimicry and the next process up the line from it, Hand Space Mimicry, are not Tone 40, and originations by the preclear are not only handled but encouraged.

So remember that we have not lost out of the galaxy of processes the fact that the preclear is as well as he can originate a communication. That means he can stand at Cause on the communication formula. And that is a desirable point for him to reach. You see, in controlling people we are really only showing them that they can be controlled, that it is possible for their possessions to be controlled. And then they eventually decide that these are controllable and that people are controllable and that things are controllable and their bodies are controllable, and they say, "Wonderful! Look, I'll try!" And before that they didn't even try.

So we are controlling a person's possessions or body only until this person then himself decides to take a hand in it, too. And then he finds out that control is possible. But most people

don't originate. Circuits originate, computers originate, compulsive outflows originate. And when you first start to use Tone 40 on a person you will apparently see originations—but they are not originations, they are restimulations being dramatized. There is a big difference between a restimulation being dramatized and an origination. It's whether or not the thetan said it. Did *he* say it, or was it just a circuit starting up? Well, you can start up circuits and actually throw them into being and you will see that these are not originations.

But when an origination appears in anything but a Tone 40 process, you handle it. And you must handle it well and conclusively. There are preclears who have had astonishing things happen to them, who have tried to communicate them to the auditor, who have failed to do so and have then sunk into apathy and just gone right on out of session because their communication origination was not handled properly by the auditor. There are instances of this, and many of them. Tone 40 processes do not particularly violate this. An understanding of what they are takes place rather rapidly with the preclear and he doesn't expect you to. But if he has graduated into being a human being and he's getting up there and he originates something and you answer it, now he's liable to say the most astonishing things to you. And if you don't handle them he's liable to drop into apathy about the whole thing.

So you must handle them well because they're always unexpected. I would say that unexpectedness actually should be part of the definition of an origination, because they are quite often completely off the subject, they take you completely by surprise, they are apparently not at all what you expected him to say. The fellow says, "Huh! I'm eight feet back of my head!" Well, what do you do? In the old days, we might have gone right onto Route One, but we don't today—we handle the origination. (By the way, this used to be an old technical phrase, "He Q-and-A'd." In other words, he did what the preclear did. Any time the preclear changed, the auditor changed. That is the deadliest crime in auditing. The preclear changes because he is being processed and the auditor changes the process. Q-and-A—the preclear changed, the auditor changed. Well, that isn't what you do.) He says, "You know, the whole back of my head feels like it's on fire." Once upon a time we might have handled this. We might have gone right in there and said, "Oh, that's very good." We had finally gotten a somatic on this fellow and we would have handled it in some fashion or other and questioned him about it and audited it, and so on. But we found out that this stuck people on the time track. Therefore, we do not do that any more. So what do we do when he says, "The back of my head is on fire!"—do we ignore it? Well, if we are running Tone 40 processes, we ignore it. But if we are auditing any other process, of which there are many in CCH, we *handle the origin*. And an auditor who has not been trained to do this will often find himself very embarrassed.

But how about in the walk-away world—the world that is ambulant and moving around and spinning quietly, or noisily, as the case may be? Do you ever have to handle an origin in it? Well, I dare say that every argument you have ever got into was because you did not handle an origin. Every time you have ever got into trouble with anybody, you can trace it back along the line you didn't handle. If a person walks in and says, "Whee! I've just passed with the highest mark in the whole school," and you say, "I'm awfully hungry, shouldn't we go out and eat?"—you'll find yourself in a fight. He feels ignored. He originated a communication to have you prove to him that he was there and he was solid. Most little kiddies get frantic about their parents when their parents don't handle their originations properly. Handling an origination merely tells the person, "All right, I heard it, you're there." You might say it is a form of acknowledgment, but it's not; it is the communication formula in reverse. But the auditor is still in control if he handles the origin—otherwise, the communication formula goes out of his control and he is at effect point, no longer at cause point. An auditor continues at cause point.

So let's look this over. The handling of an origin has a great deal of use and, until recently, it was the least pat step in Scientology. How did you handle an origin? And we finally found out. I finally had a cognition myself. I tried for a long time to communicate this to people and they still blundered on it occasionally. And I finally found out something that did seem to communicate.

There are three steps in handling an origin. Here is the setup: The preclear is sitting in the chair and the auditor is sitting across from the preclear, and the auditor is saying, “Do fishes swim?” or “Do birds fly?” and the preclear says, “Yes.” Here is the factor, now, entering: “Do fishes swim?” The preclear doesn’t answer *Do fishes swim*, the preclear says, “You know—your dress is on fire,” or “I’m eight feet back of my head,” or “Is it true that all cats weigh 1.8 kilograms?” You see, wog, wog—where did this come from? Well, although it is usually circuitry or something like that at work when it’s that far off beam, it is, nevertheless, an origin. How do you handle it? Well, you don’t want the preclear to go out of session, and he would if you handled it wrongly, so (1) you answer it; (2) you maintain ARC (you don’t spend any time at it, but you just maintain ARC); and (3) you get the preclear back on the process. One, two, three. And if you spend too much time in (2), you’ll be doing wrong.

What is an origin? All right, he says, “I’m eight feet back of my head.” It’s an origin; what are you supposed to do with it? Well, you’re supposed to answer it. In this particular case, you would say to him something in the order of, “You are?” (You mean something like, “I’ve heard the communication—it’s made an effect on me.”) Now, in maintaining ARC you can skip that second one if you handle the third one expertly enough. The least important one is the second one, but the most deadly thing you can do is utterly to neglect the second one of maintaining ARC. That’s deadly. But you can skip it if you really punch it into the third one, which is to say, get him back into session. So he says, “I’m eight feet back of my head,” and you say, “YOU ARE???” (What he said really hit, you know.) He’s kind of wog-wog about this—he’s not sure what this is all about. You say, “You are?” and the fellow says, “Yes.”

“Well!” you say. “What did I say that made that happen?”

“Oh, you said ‘Do birds fly,’ and I thought of myself as a bird and I guess that’s the way it is, but I am eight feet back of my head.”

“Well, that’s pretty routine,” you say—reassure him, maintain the ARC. “Now, what was that auditing question?”

“Oh, you asked me ‘Do birds fly?’ “

And you say, “That’s right. Do birds fly?”

Back in session, you see.

You can’t do this: You can’t put it into a can and put a label on it and say *This is how you do it always*, because it’s always something peculiar; but you can say these three steps are followed.

I will give you another example. You say, “Do birds fly?” and he says, “I have a blinding headache.”

“You do?” you say. “Is it bothering you (that’s the ARC) too much to carry on with the session (and you’ve reached number three at once)?”

“Oh no—it’s pretty bad though.”

“Well, let’s go on with this, shall we?” you say. “Maybe it’ll do something with it (maintaining ARC).”

He says, “Well, all right,” and you’re right back onto it again: “Do birds fly?”

One of the trickiest of these is “What in my question reminded you of that?” The fellow says, “Well, so and so,” and he explains it to you and you say, “Well, good. Do birds fly?” and you’re right back in session again.

Three parts, and—that is the important thing—you have to learn how to handle these things.

At the same time that we are doing this, we can get much more complicated, particularly toward the end of the session, by just trying out a communication bridge. A communication bridge from “Do birds fly” to “Do fishes swim” and from “Do fishes swim” back to “Do birds fly.” A communication bridge is a very easy thing. It simply closes off the process you were running, maintains ARC, and opens up the new process on which you are about to embark. If you could look at it as two V’s, the points facing each other, with a line between the bottoms of the two V’s, you would see that one process, which you have been running, is closed on down to nothing, easily, by gradients. You say, “How about running this just three or four more times, and then we’ll quit—okay?” We give him warning, you see, that we’re closing the process off, and we do run it three or four more times. Then we say, “How are you doing?” (We never ask people, by the way, “How do you feel?”—this as-ises havingness.) We say, “How are you doing?” and he says, “Oh, not too badly,” and so on. “Well, did anything happen there while we were running ‘Do fishes swim?’” And he says, “I don’t know. I got a little bit of reality—I felt like a fish for a couple of moments there.” Auditor says, “How do you feel about that?” and so on. “Is it okay? Are you doing all right now?” The preclear says, “Not too badly.” You say, “Well, let’s go over onto ‘Do birds fly?’ It’s an interesting process and it just goes like this—I ask you, ‘Do birds fly’ and you answer me. How about running that?” and he says, “Well all right, okay.” You establish agreement again and away we go. Actually, it is three contracts in a row. The first contract is: to stop the process we are running; the next contract is: we are in an auditing session, binding this as a continuing auditing session; and the third contract is simply: we have a new process we would like to run, and I want your signature on this dotted line that you will run it. That actually is a communication bridge. The reason we do this is so a preclear will not be startled by change, for if we change too rapidly in a session we stick the preclear in the session every time. We give him some warning; and that is what a communication bridge is for.

The handling of origins, however, is most important. Learn how to handle origins, and you’ll never be taken by surprise by a preclear. You’ll be right in there pitching, and the session will keep on. I have seen an auditor sit with his mouth open for twenty or thirty seconds after some preclear said something fantastic. He just didn’t know what to make of it. Well, you answer it, you maintain ARC, and you get him back in session.

What Are Clears?

L. Ron Hubbard

There are three known grades of *Clear*.

The first is the Book One Clear. This is called Mest Clear. An adequate description of this is to be found in Book One.

The second is a Theta Clear. This has been known for years but has only recently been obtained through engram running as taught in the 5th London and 21st American ACCs and is done in the Processing Department of the Central Organization.

The third is called OT or Operating Thetan and is a rather esoteric level, hard to reach, hard to describe in full.

Any confusion about the state of clear is a confusion of these three terms: Mest Clear, Theta Clear and OT.

An uninformed public thinks a Mest Clear should act like an OT with magical attributes. It is not enough that the general auditor can now approximate a Book One Clear. The public, striving for unattainable attributes, wants an OT who eats buildings. The two states if on the same scale are not the same states.

A Mest Clear knows he has reached the bottom rung of the ladder on his way up. He also knows the rest of humanity uncleared is below this state but that they don't know that they are.

A Mest Clear still thinks of himself more or less as a body and is more or less subject to one. All engrams are effectually keyed out without being examined. For practical purposes they are erased. He has excellent recalls. They may or may not be eidetic. Book One Clears are a bit below the Mest Clear standard of today.

If the person making the picture required in eidetic recall makes the picture, he has to know first what is in it. So why make a picture. A picture is memory on a via. So the argument about eidetic recall is a rather dull one at best.

It is not my purpose, thank God, to prove I was right. It is my purpose to blaze a trail into zones and heights Man has not known before. I can tell you only what is as I know it now.

And I know that eidetic tests of recall do not prove a Mest Clear. Only freedom from keyed-in engrams proves a Mest Clear.

Theta Clear is another thing—much higher than a Book One or Mest Clear. This is a real triumph and I'm proud of it. The fact of a real Theta Clear is only a few months old.

A Theta Clear has no obsessive engrams whatever. They aren't. *But* he can put back at will his reactive bank or any engram in it and blow it off again at a glance. Now *that is* news. A Theta Clear does not have to depend on the body line for his "survival." He does not have engrams of any kind unless he creates them. He does not have to be in a head. *And* the state can be obtained in at least 80% of all cases in about 350 hours of auditing or more depending on the auditor's skill. Only the Processing Department of the Central Organization or the graduates of the 5th London ACC or the 21st American ACC are doing this one.

Mest Clear, however, is a way station on the road to Theta Clear or OT so it doesn't much matter what auditor starts you on the way—your HAS co-auditor, a professional HCA, an HCS or BScn or a new ACC graduate. You'll win with them all toward the same goal. Lately I even developed a co-auditing formula that reaches near Mest Clear.

OT, of course, remains theoretical and is reached through lower clear states.

So here we go. We built a bridge. And built it better than we hoped. It's time to start if you've been hanging back. The best way to see this elephant* is from inside!

Clearing is wonderful conversational material. It is a better experience.

HCO BULLETIN OF 6 JANUARY 1959

FIELD ACTIVITIES

To: All Scientologists

For Scientology to go well in any area, it is only necessary for the trained auditor in that area to follow the following steps:

1. Get good results on every pc processed individually.
2. Operate a group and do PE and Group Processing.
3. Keep the group recruited.

It is not necessary that a field auditor has great sums of money to finance his activity. All *successful* Scientology activities have financed themselves. In extreme, an auditor with no pcs to keep him going can get a job and run a group evenings until the income of the group activity makes the job unnecessary.

The keynote of handling any area is to *bring order*. Every time you put some order into a pc or a group, or society, a little confusion blows off. Ignore the confusion. It is transitory. Order is not. It *stays*. Therefore the more *order* (not necessarily the more *activity*) you put into things the more continuance you have. This is new data, extremely important and should be carefully gone over again and again and applied. It is data that brings big wins in a society, a group or a pc. Bring a little order.

Get the pc to see that he can bring order into his affairs. Ask him bluntly, "What order could you bring into your life?" And his case will start resolving. The highest ability of a thetan is to *Bring Order*. Therefore, orderly processing brings results, disorderly processing does not. All an ARC break is is a disorder.

What order, then, can a trained auditor bring into his area? Into his own life? Into his pc's? Into his group? *That is* the question worth answering.

The confusion that flies off when the order is entered in seems so *important* to many auditors that they Q and A with it. They stop pursuing order and *start* pursuing confusion. *Never* change from order to disorder just because confusion blows off. Let the confusion *go*. If you want it all gone, just put more *order* into it. That's why CCH works when properly used.

An auditor who just starts a group blows some disorder out of a society. The disorder flies into view. Ignore it. Just put some more well-run, exactly scheduled group there. More disorder discharges. Order put in too suddenly always discharges disorder too fast. That's an explosion. You don't want that. Leave explosions to the government (its highest level of entering order is to blow everything up).

Here's a program. Get hold of all the people you have processed in the area you are in. Give them an interview. In it, ask each one, "What order are you trying to bring into your life?" "What part of your life?" Tell them that's what Scientology is trying to help them do. You'll have more pcs. Weld them into a group. Give them some group processing Tone 40. Bring order into their lives.

Take responsibility for every pc's whole life. Take responsibility for all the reactive banks in your area. Clear them up by bringing more order.

Money cannot flow back to you on disorderly lines.

AUDITOR CONFIDENCE

Every field auditor has had some loses. These cut down his confidence. He should rebuild his confidence. He should rebuild his confidence as his first step. He failed where he failed to bring order into lives. Therefore, he had better now discipline himself to use *one* simple process and use it right and without change until he has won with it. Don't change the process because it blows off disorder. To the devil with the disorder—put the order in regardless of how much disorder it blows off.

KEY REHABILITATION PROCESS

1. Start session.
2. Find out if the pc has an auditor.
3. Find out if the pc has an auditing room.
4. Ask pc (goals), "What part of your life would you like to bring some order into?" Two-way comm on it for no more than five minutes. Get into session then.
5. For one hour at the beginning of each session every session run "Look around here and find something you have." Only that command. If pc originates, *understand* and *acknowledge*. DON'T DO ANYTHING ELSE ABOUT IT.
6. For remainder of session run "Recall something you have done." When he says he has, acknowledge only.

Session after session run nothing else but this. And you'll bring order to a pc, believe me. And he'll have great case changes and he'll be moving forward toward clear.

This process will give you wins unless you do something else to vary it.

The only people it doesn't work well on are nearly unconscious. On these only CCH 1, 2, 3 and 4 work. If the process doesn't bite at all, use CCH 1, 2, 3 and 4. But don't worry, it will bite—if you keep your mouth shut and don't flub.

Now you want some wins. Don't talk to the pc much during a session. Use TR 4 whenever he talks. Keep him reassured, happy, comfortable and don't let him out of session until you end it. And you'll win. If you lose, it's because you got fancy or chopped the pc up.

Factual Havingness will ease off p.t. problems and ARC breaks. That's why you use it for an hour always.

If a process regimen comes along that's simpler or better than the above I'll let you know right away. Until then, this is the very best you can do.

GROUP RECRUITING

Groups fall apart on sloppy scheduling. They need one night a week at the minimum. Always the same night, same hours. That's order. Always a one hour lecture and one hour

group processing Tone 40. We have new phonograph records of lectures for you. They're cheap. Buy them.

When you have a group processed a while get people into an HAS Course. Teach them TRs 0 to 9 and then let them co-audit on exactly the above regimen.

By permitting co-auditing, the trained auditor actually gets more pcs. Charge for co-auditing consultations. Keep them at it.

We're taking the lid off. The country is *full* of people. They should be in groups and co-auditing. In that way we'll bring enough order to the country to make even it survive.

By the way, HCO Washington, D.C., will issue a Hubbard Apprentice Scientologist certificate to anybody you guarantee has passed TRs 0 to 9 without charge to you. We trust you to make sure they're *good*.

In recruiting a group, keep explaining Scientology as something that helps people bring order into their lives. You'd be amazed how little order they believe they can inject. Call on new people. Run an ad for your group: "Tired of Being Human?"

Scientology Group Clears People," or "Does Life Seem Disorderly? Join the Scientology Group and begin to win for a change."

We need action. In an all but leaderless world, somebody has to make some people. Let's begin.

L. RON HUBBARD

HUBBARD COMMUNICATIONS OFFICE
WASHINGTON

HCO BULLETIN OF 10 JANUARY 1959

(Supersedes all Earlier Directives for HGC Processes)

HGC ALLOWED PROCESSES

The Director of Processing of an HGC is the person who indicates the processes to be used by auditors on pcs.

The following plan is furnished for the information and guidance of the D of P and HGC auditors.

LOW PCS

All pcs who lie markedly below the center line of an APA/OCA graph should be run on CCH 1, 2, 3 and 4.

Not all auditors, even when they know these, can get results with them. Therefore, use an auditor who does get results with the CCHs.

MEDIUM PCS

Pcs who lie on either side of the center line respond easily to Fac Havingness and benefit well from it.

Fac Hav with all three commands (as per ACC Clear Procedure) should be run solely and only with good case gain.

Flatten each command on such a case about an hour at a time in rotation.

If no comm lag develops, run 8 vanish, 2 continue, 1 have in that order until case changes for the better. Then run an hour each on each of the three in rotation.

These can also be run on "Recall something you have done".

HIGH PCS

Pcs who lie mostly or entirely above the center line can be run on "Recall something you have done".

However, if you have auditors trained to run engrams, by all means start this pc on engrams at once and run according to 5th London or 21st American procedure.

OTHER PROCESSES FOR ALL

Any help process runs on almost any pc except the very low pc. Therefore, particularly to get sessions started, "help on auditor and pc" is valuable.

ARC Break Straight Wire works well on medium level pcs, but only an auditor who is expert with an E-Meter and in locating in time incidents can be trusted with it.

GENERAL NOTES

HGC auditors have to be checked out on CCH 0 before being permitted to run it. The process is a great invitation to spend half an intensive talking. Fac Hav or TR 10 also run problems and should be used if auditor doesn't check out on CCH 0.

Auditors must not be permitted to use TR 13, fishing a cognition. Use TR 4 instead or the ACC TR accepting pc's answers. (TR 4 and the ACC TR are quite similar.)

Use TR 5N handling ARC Breaks only when auditor is checked out on it and handles it well.

The most trouble you get in an HGC is same as field. Auditors won't use TR 4. They always have to *do* something about what pc volunteers. After a while pc gets afraid of volunteering data and goes out of session.

In general auditors talk too much. Cut it down unless auditor really knows *when* to talk. Auditors who are always dragging pc's attention to auditor are a liability in an HGC. On a new auditor in HGC you can ask "What process has gotten you best results?" And whatever he says, you'll win better, until he's grooved in, by letting him run it. Otherwise, give him Fac Hav and no comments to pc and you will get a fair showing.

RESULT RETARDERS

ARC Breaks mostly retard results. The less talk, from auditor, the less breaks. Good TR 4 avoids them.

PT Problem stalls cases. Handle it with *good* CCH 0 as per ACC Clear Procedure, or, if auditor not checked out—with Fac Hav, or in extreme low cases TR 10.

CLEARING PROCEDURES

It is fruitless to embark on straight clearing until the case is up. So, all the above applies to clearing.

When case is well up, after using the above processes, use Confront and Help as per ACC Clear Procedure, or, better, run engrams.

SUMMARY

To get gains, use processes gauged to case, handle PT Problems and prevent ARC Breaks by checking auditor comments.

To clear, run engrams and make *Theta Clears* where you can.

If not all your auditors can run engrams, have lower cases set up by them and when in shape, pass to an engram running auditor to finish off.

If you have *no* engram running auditor, clear by this bulletin plus ACC Clear Procedure.

TONE OF VOICE—ACKNOWLEDGEMENT

Mood can be expressed by an acknowledgement. Evaluation can also be accomplished by acknowledgement, depending on the tone of voice with which it is uttered.

There is nothing bad about expressing mood by acknowledgement, except when the acknowledgement expresses criticalness, ridicule, or humor.

THE FIVE LEVELS OF INDOCTRINATION

Compiled from the Research Material and Taped Lectures of L. Ron Hubbard

I am now going to give you the five levels of Indoctrination very rapidly. We already have the five dummy processes which form the first level—the five dummy auditing processes.

The second one up the line is 8-C—plain 8-C. It is given without stress on control or anything of the sort. You don't touch or handle the person. It is an old process done this way. The auditing commands of 8-C in this particular instance have suffered change recently because no auditing command must depend upon any other auditing command or it won't be in present time. So each auditing command depends upon itself, and the commands of 8-C are: **“Look at that wall. Thank you.” “Walk over to that wall. Thank you.” “With your right hand touch that wall. Thank you.” “Turn around. Thank you.”** There is no “let go” there or other direction.

If we have not directed him to do something and he does it, if the way he does something is a little different from what we expected, we really have no basis for objection; and the training stress is only this: to get a person to walk another body than his own around the room. There is nothing to this. It is NOT High School Indoctrination. At this level he must be able to duplicate the command, and it is run to a point where a person does not make a mistake on the commands and stops feeling nervous about walking a person's body around. That is the training stress.

Now we move up to the next level of Indoctrination, which might look like 8-C at the first glance, but is not. This is *High School Indoctrination*. The commands of High School Indoctrination are the same as those for plain 8-C, but this is entirely and completely a training process and it is only run for this reason: to keep an auditor from being stopped by a preclear by devious and diverse statements and actions. The “preclear” (we can't really call him a preclear at all, for he is actually the coach) runs on this “auditor” anything he can think of to stop him, and the auditor must at no time permit himself even to be halted or falter in any way. He must be able to continue a clear, free-flowing 8-C on this person who is getting down on the floor and barking like a dog. He mustn't be permitted to go down on the floor. You let a man get below the level of your shoulders and he is going to get down on the floor—that's for sure. You have to catch him before that. He is going to try not to walk across the room. He is going to try and run across the room. He is going to try and do anything. You told him to walk: walking fast is allowable but running is definitely not allowable. The training stress is entirely upon getting an auditor to persevere against any trick mechanism anybody could think of or react to, or any circuitry or dramatization in 8-C. It is total auditor persistence. We don't ask the auditor to do it smoothly—we only ask him to do it constantly and consistently.

That is High School Indoctrination, one of the great steps of Scientology. If we had had this a few years ago, it would have made the world of difference in several cases I can think of. A fellow would sit down in the middle of the floor and he wouldn't do anything. We depended totally on our voices, and these people weren't in communication.

The coach in this case has a role to play. He is the preclear. He has two signals, one "flunk" and the other "that's it," which are effective. Anything else he says does not count. Of course, he says "Start" and they go on with it, but when the coach (who is the final judge) considers that the auditor has blundered, has been stopped, and has waited too long, then the coach says "Flunk."

What happens when the coach says "Flunk"? They go back to the beginning of the nearest cycle of action of 8-C. They do not take it from where they were, but go back to the beginning. They leave that cycle incomplete. The auditor in this case is not permitted to override a flunk. When the coach says "That's it," he means "We are through. We are going to take a breather. What I say now counts." And that ends it. It doesn't begin again until the coach says "Start."

This is 8-C done on a very heavy body contact: the coach being lugged around and doing anything he can think of to stop this fellow. It is interesting what will stop some auditors. If you understand your business as a coach, you will understand that it is the soft ones and the unexpected ones that count. It isn't the heavy ones, it isn't the preclear just lying down on the floor and refusing to budge and exerting every muscle and having to be dragged from there on. This is perfectly allowable, but it isn't the one that catches the auditor. It is the subtle unexpected actions that "flunk" an auditor.

High School Indoctrination is a marvelous training process. Several hours should be spent on this and one shouldn't run it just with one coach but with two or three others as well, because everybody develops his own abreactive pattern. It is a wonderful opportunity to abreact your insanities. An auditor will very swiftly learn how to stop one preclear, but take two or three more, swapping teams around, and he eventually gets a smooth look at the whole thing. There isn't such a thing as being too tiny to handle too big a preclear.

The next level of Indoctrination is *Tone 40 on an Object*. (Actually all these are groups and a number of techniques of indoctrination could be evolved from each one of these. I am simply giving you those that have to be passed.) In this Tone 40 on an Object you can have a number of commands and variations of one kind or another, but the one we use is this: You take an object—a small doll, ashtray, Coke bottle—and the auditor tells it to "**Sit down in that chair**" or "**Sit on the table**" and thanks it. Then he tells it to "**Stand up,**" and thanks it. "Sit down on the chair" or "Sit on the table"—then the auditor moves it with his own hands. He does all this while the coach is just standing there heckling him, and he has to do it so that his intention is so good that he gets perpetually surprised that the thing, the object, didn't sit down in the chair or sit on the table, or didn't stand up. The furthest extremity of this would be that the object *would* do so without any further contact with the auditor than his intention. That point may be reachable—I must tell you that.

A person does this until his tone in giving the commands is Tone 40. There are many little drills that come into this. One is to make him put the intention into it and squeak and not say a word at the same time, but put the intention into it and alter his voice all over the place until he finds out that his intention doesn't have anything to do with his voice or tone. He will eventually discover what Tone 40 is. Tone 40 is a positive postulate with no counter-thought—expected, anticipated, or anything else; that is, total control. Actually, today we use the word "control" very loosely. What we really mean is "positive postulation"; what the world means by control is, if he doesn't do it, shoot him. Not Tone 40, but Tone .4.

In order to get Tone 40 on a Person going, you can continue Tone 40 on an Object; but whether this belongs to Tone 40 on a Person or belongs to the last end of Tone 40 on an Object doesn't much matter. It is not a separate level, but it is a separate command. You give the 8-C

commands to an object and lug it around for a little while—i.e., having the object move over and touch the wall, etc.—but that is only getting the person used to these commands in that tone. That is the only reason there is for it. We don't use the 8-C commands to get his drill in because he is going to get heckled.

What does the coach do on Tone 40 on an Object? At first he is really helpful and tries to get the auditor to get the intention in there until he can put the intention in without speaking. When the fellow is getting too good the coach must remember that this Tone 40 on a Person is going to be up against somebody with counter-thought, counter-effort and counter-action of one kind or another and the coach furnishes it. He doesn't do it loudly or obstreperously, but he does furnish it. "Is that Tone 40? Are you absolutely sure that was Tone 40? What do you mean by Tone 40?" etc.—this is when the coach isn't being helpful. The coach is supposed to furnish randomness as a substitute for the randomness of the environment. The person can do this in spite of the fact that something or somebody is resisting him, heckling him and messing him up. You could go much further with this. As I say, one can go much further with each one of the five levels of Indoctrination, but I don't advise it.

On *Tone 40 on a Person*, we do 8-C at Tone 40 and that is a total, accurate estimation of effort, with no halts or jagged motions—that is, smooth. Your estimation of effort must be absolutely perfect; your estimation of intention must also be perfect—which is sometimes rather hard on a coach because somebody can get so good that a coach's body starts to walk around and obey the commands rather easily and you find almost all coaches on Tone 40 on a Person are much more docile than on High School Indoc. They really want to be rougher but the technique is rather overweighing this, is too strong.

Those are the five levels of Indoctrination and they are only doing this: placing an auditor into a frame of mind and an ability where his postulates can be positive and his command is no longer diffident, where he can control and handle somebody, where he can assume the attitude that is necessary to an auditor. And a person is all through with these when the instructor is sure that the auditor in training can do this.

HCO BULLETIN OF 20 JANUARY 1959

**ACC PREPARATORY PROCESS SCHEDULE FOR
RUNNING ENGRAMS**

RECOMMENDED FOR NEW AUDITORS IN HGCs

SELECTED PERSONS OVERT ACTS

The student is started in the following fashion: "Find a person you feel you have failed to help." By two-way comm, not repetitive. Several persons may be located. Select one that is real to the pc (not wholly unreal) and run the following process:

"Recall something you have done to (selected person)." This is a repetitive command. The auditing is done "muzzled". The auditor is not permitted to say ANYTHING to pc except the command and to acknowledge that command's answer, once the process is started. If the pc originates the auditor is permitted to nod only. If pc seems to have lost the command, or originates, the auditor nods and says, "I'll repeat the auditing command" and does so. No discussions, or rudiments beyond START and END OF SESSION are employed.

When several persons so selected in the pc's life are apparently flat, the process may be considered flat. Some reality should have been gained by both auditor and pc.

OVERT ACT STRAIGHT WIRE

When several selected persons pc "could not help" have been run with the above, the auditor broadens the process to the command, "Recall something you have done to somebody". This is also run "muzzled". When pc originates, the auditor does not speak, he only nods his reply. When the preclear seems to be without a command, the auditor repeats it as above. No further two-way comm is allowed.

ARC BREAK STRAIGHT WIRE

When the pc shows signs of being easy with the above process, the process used becomes ARC BREAK STRAIGHT WIRE run in the following fashion. For the first time, E-Meters are employed. The sole use of the E-Meter is to locate incident in time, BC-AD dates to be used only, "Is it greater than. . .?" "Is it less than. . .?" "Is it such and such a date?" A forbidden question is "How many years ago" as this is the sole criteria used in between-life implants where they say things are "Thousands of years ago. . .trillions of years ago. . .etc."

The question "When?" is the only thing the auditor solves and only when needed, and he tells the pc about the drop he gets.

The command is "Recall an ARC break". The pc does. The auditor says "When?" Any time statement by the pc is accepted except "I don't know". If pc says this, the auditor resolves it with the E-Meter to the best of his ability, tells the pc the date or character of drops, and then continues the process. Any other origin by pc is met with a nod only. The auditor may make no comments.

This process goes very easily into whole track. If a whole track incident is located in time it de-intensifies or goes back on the track. By locating the incident in time the pc is not made to

plow through an engram with this command only, which is poor stuff. Therefore, no departure is allowed from the above regimen and no two-way comm is permitted beyond locating the incident in time. The process will be found to open up a track into greater and greater reality.

As ARC Break Straight Wire will give pc 3D spots on the track it can be followed by “What can you confront?” or regular engram running.

Full distribution

NOT-IS STRAIGHT WIRE

Those persons on whom a process works once and those who have either dub-in or occlusion, process easily, if dramatically, on Not-Is Straight Wire. (See Axioms 11D, 18 and 22.)

Pcs divide into three general classes:

1. Those who have 3D pictures and good time sense.
2. Those who are occluded with black, colored or invisible fields and poor time sense.
3. Those who dub-in and have no time sense.

The scale of deterioration of a case is as above. First there are 3D copies of the real universe, then there is the action of not-ising these pictures (while they're still there) and finally, while not-ising, substituting false pictures.

This process is aimed at case types 2 and 3 above. (ARC Break Straight Wire also handles type 2 but not so well as type 3.)

Types 2 and 3 press into invisibility pictures by making them "unimportant". This is the clue word to unreality, stupidity, occlusion and dub-in. (See the Logics.)

The cycle which occurs is that the person gets overwhelmed with other people's declared importance. They counter by not-ising the importance of others. The reverse cycle of others reducing the pc's own importances is not run in Not-Is Straight Wire as it reduces havingness.

The commands of Not-Is Straight Wire are only these and no other:

"Recall a time you implied something was unimportant." Pc does. "When?" Pc says or auditor assists him by pegging it on an E-Meter.

This is run for about an hour. Then a second command only is run.

"Recall a time when somebody *else* thought something was important' Pc does. "When?" Pc says or auditor assists him by locating on E-Meter.

Acknowledgement is used. TR 4 is reduced to a nod.

An hour of one is followed by an hour of the other.

There's dynamite in this process. It is good, clean and unlimited. But *don't* chicken on it and pull out and don't quit because the pc gets uncomfortable.

Here may be the QED for all occlusion and dub-in cases.

LRH:gn.rd

L. RON HUBBARD

5901C22 21ACC-1 How a Process Works

“[The auditor] has to find out what the PC did with the auditing command and what he did when he executed the command.

In the absence of communication, nothing ever happens, which is why people who are out the bottom don't communicate, hoping to be safe. This doesn't work if you are trying to do other things. You must get the process communicated across to the PC and you must get the PC to communicate.

The first thing to know about pictures is that anything the PC is looking at is a picture. A bank doesn't do anything except be there, and whatever strange thing is happening in the bank is a picture of whatever strange thing is happening in the bank. That's all you have to know to unocclude an occluded case. Black fives look sane sometimes, because they haven't got anything to dramatize except looking at blackness -- not that they wouldn't dramatize if they were looking at something else.

When a PC is stuck in too heavy a picture, it is impossible to turn on other pictures on the track. The basic process for occlusion is, “Come up to present time.” If that doesn't work, there are seven other processes.

1. There are several things a person can do with pictures. He may use not-isness to make them disappear as soon as they show up. Other obsessive doingnesses can be used to get rid of one's pictures (a “solution” to pictures). This case can be approached using O/W Selected people, because if he's not-ising pictures, he's not-ising people too. In so doing, he finds himself surrounded by “ghosts”. First run, “What have you done to [withheld from?] _____?”, using the person you've selected.

2. Then run general O/W to catch some more of the automaticity of this outflow.

3. ARC break straightwire is used to knock out the cause of not-isness. “All locks on the Rock are ARC breaks.”

4. Next, we would use not-is straightwire (Recall a time you thought something was unimportant; Recall a time someone else thought something was important). If you run it reverse-wise, it takes away the PC's havingness and spins him in. This works on not-ising other's importance's. [I.e. it as-ises times he did this.]

5. Factual havingness (also called “third rail”), the “vanish” command of this. This also handles not-isness.

6. “What can you confront?”: This because at this stage, the person doesn't wipe something out before he looks at it.

7. “You make a mockup for which you can be totally responsible.” This is a top of the line process. Any of these processes turn on pictures. These processes, plus CCH's handle all occluded cases.

A Campaign for Ethical Auditing

L. Ron Hubbard

General ethical standards in America are at their low-low ebb.

When we see what the peers of “healing” do to make a dishonest dollar, when we see “mental healing” relegated to mental torture and destruction we find at the same time that the local and the national governments enforce the vicious practitioners, the antibiotic quack and the electric shock witch doctor.

If Scientology is to make any progress whatever its own ethical standards must be without reproach. Why Q and A with a caved-in society? One of my “hats” is ethical standards.

HCO is Hubbard Communications Office. It is the office that helps me wear my hats. Therefore one of the three principal hats of HCO is Ethical Standards, the keeping of the codes. The other two are Technology and Awards.

There are many HCO offices throughout the world. But nowhere do they have the problems of magnitude in the field of ethics that they have in America.

Succumbing to the general low tone of the society, there are persons about who:

1. Do not care to have the actual skill necessary to get results;
2. Do not scruple in their promises to pcs and
3. Work against the best interests of the Central Organization and other auditors.

Heretofore I have been relatively unaided in this problem. I have tried many ways to solve it. All failed in America. These solutions worked elsewhere but not in America. Fortunately HCO has come of age. I am getting help.

An HCO Secretary is a well-trained Scientologist. After that she is my own secretary in the area. She has a motto “Bring Order”—the motto of HCO. HCO staff are dedicated Scientologists, the best, carefully selected.

Today any unethical practitioner in Scientology is beginning to feel uneasy. And rightly. HCO (to say nothing of Central Organizations) is breathing down his neck.

Today ethical auditors, doing their jobs and well, are feeling easier. HCO is backing up their activity and making them secure in their gains by, for instance, keeping roving auditors out of ethical areas and the squirrels gasping their last.

An ethical auditor does the following:

1. He helps the good repute of Scientology.
2. He keeps dissemination up with a healthy part of his income.
3. He gets results when he processes somebody.
4. He charges standard fees, no cut-rate.
5. He stands in well with his fellow auditors.
6. He makes no wild promises to pcs he can't back up.
7. He never *tells* a pc the pc is now clear.
8. He uses standard processes.
9. He keeps his own case improving toward clear on higher levels.

An *unethical* auditor is earmarked by the following:

1. He lives on the good repute of Scientology but downgrades it.
2. He profits by the dissemination of others or the Central Organization and pockets what he should contribute as "profit."
3. He processes people without caring about results, only profit.
4. He cut-rates his processing or grossly overcharges.
5. He is despised by other auditors.
6. He makes any promise he has to to get a pc to buy processing.
7. He tells pcs they are clear no matter what *they* think.
8. He uses any process that happens to occur to him and avoids standard proven processes.
9. He shuns personal auditing on himself.

And there you have what's holding us back.

When the New Year of Year Nine came, I made a resolution. I had the administrative machinery set up, the needful comm lines. And I resolved to "Take steps to take full responsibility for field auditors in America."

I don't care whether this resolution is popular or unpopular. It's got to be done. Here's how it is: I tell people about recent results and about clears. Some creep, already in bad with me, yet finds ways of "profiting" by "cashing in." Trouble is, these couldn't audit out a sore finger on a clear. What do they know about my goals or ethics. Yet they use the name and rake in cash—and spoil areas with their stupid blundering. They fail to help cases. They are parasitic upon the dissemination done by others. They take money that should go into sound future and waste it.

HCO is vitally interested in this campaign. The HCO goal is "Get the field auditor to get results in America, and get the show on the road." And HCO can spend thousands to do it.

Any area that is being victimized by an unethical auditor will soon feel the influence of HCO. We mean business. And America has been asking for it hard.

Scientology is the greatest movement on Earth today, the only honest movement with real hope for Man's future. It must not be stalled by the prevailing low of American ethics.

It is shameful that I can only guarantee Scientology results in America where HCO or myself can directly supervise the processing. This must change. A professional auditor's certificate must continue to mean honesty, results and adherence to the codes.

This is no sudden campaign that will be forgotten. There are HCO offices all over the world, more than in America. I'm winning. HCO is winning. It's about time the field won too. For Scientology is winning a new life for Man the world around.

C. C. H.

(Continued from P.A.B. No. 152 of 15 January 1959
on "The Five Levels of Indoctrination")

Compiled from the Research Material and Taped Lectures of L. Ron Hubbard

WE GO NOW INTO CCH. CCH could not even vaguely be attempted without the five levels of Indoctrination having been run. Nevertheless, early in the HPA or HCA Course you will discover that an individual hasn't yet had Tone 40, so, although CCH starts with Tone 40, the training continuity of CCH does not. Training starts with dummy auditing in the Communication Course and then goes to the second level of Indoctrination, which is simple 8-C, and they coincide at that point. The order of learning these processes is therefore different from the order in which they are given to a pc. You don't have to remember the order of learning, but you do have to remember the order of giving them to a pc. However, I am going to give them to you in the order of training.

We have simple 8-C (which I have already given you) at the second level. The commands of simple 8-C are very simple and they do not depend on any other command. In simple 8-C the commands are: **"Look at that wall. Thank you."** **"Walk over to that wall. Thank you."** **"With your right hand touch that wall. Thank you."** **"Turn around. Thank you."**

The second process we deal with in training is *Locational Processing*, and this, as you can see at once, is a command of attention process. The commands are: **"Notice that _____. Thank you."** This is very simple Locational Processing and, by the way, an interestingly therapeutic process. The training stress is simply this: the direction of attention must not be disturbed by other mechanisms of attention direction. The auditor must do this smoothly. We are trying to get the auditor to get the preclear's attention to go smoothly to the object indicated. What we have here is one person handling another person's attention—this is quite unusual, and must be done very smoothly. We don't care how well the commands are getting across, beyond, of course, that they should get across as well as a person learned to get across a command in dummy auditing. The auditor picks out objects and says, **"Notice that ____."** He normally points, and the preclear merely turns his head. There are no cautions to be used with this except that, if the preclear gets very restimulated, flatten it.

The third is called *Locational, Body and Room*, and here we have the first example of extraversion-introversion. The commands are: **"Look at that _____. Thank you. Look at your (foot, hand or knee). Thank you."** There is an alternative set of commands on this: **"Notice the chair. Notice your hand Notice the wall. Notice the floor."** They actually have a difference. A person who is pretty dead in his head had better be told to "notice," because the strain and stress which will come on him through trying to get out of his body and "look" at his head is so great he will start pulling ridges to pieces. So, of the two, the

safest is “Notice.” The other will exteriorize somebody. They are two different sets of commands, two different objects. “Look at that wall, look at your hand,” etc., is liable to find a person out there five feet outside his head. But if a person would not normally exteriorize by his build, bank behavior, etc., you would use “Notice.” In training we use “Notice,” but we must remember that the process works fabulously well with “Look.”

That’s an extraversion-introversion process. We have the sequence of it as “Look in on yourself. Look at yourself. Look at the environment. Look at yourself. Look at the environment”—alternating it. This is what is known as an alternate command. It is necessary to call your attention to that bit of terminology because in “Give me your hand” Tone 40, we run it on the right hand and we run it on the left hand, but it is not an alternate. We don’t say, “Give me your right hand. Give me your left hand.”

The next one of these is *Objective Show Me*. Here the preclear does a little demonstrating. The reason this is put in here is because it is one of the more miraculous therapeutic processes. It is the reason why a person’s bank is invisible to other people. It is the reason why people have secrets, they pull banks in on themselves, and the reason why they don’t dare show it to anybody else. The commands are: **“Show me that ____ . Thank you.”** The auditor points to the object he wishes to be shown. Only when that is running fairly well will you run it on an extrovert-introvert basis, and the next series of commands on it could be **“Show me that . Show me your ____.”** (I.e., “Show me that table. Show me your foot. Show me that ceiling. Show me your hand.”) This, by the way, opens the door to mock-ups and facsimiles anybody could see. If there is some method of achieving that, this is the process to do it. A person overcomes his unwillingness to show things, and he realizes that he is not still on Arcturus and you are not the space police from Saturn. He is being made unwilling by life to show anybody anything.

Actually, I would omit this process under training. I wouldn’t show a person how to do this early in his training. I would let him find this one up the track somewhere. That is why I have not given it out in training earlier. But you must know that it exists because it is a very important process and has to be handled very delicately—that is why at this level of training it isn’t used.

Instead, we use a mild one called *Attention by Duplication 9, Number 4*. This is a very old process, but we don’t run it in the old manner. We place a book in one location and a bottle in another location (never more than five feet apart), and we say, **“Look at that book. Walk over to that book. Pick up that book. Put the book down in exactly the same place.”** The same goes for the bottle. You could add a “Turn around” in there, but you have then graduated this to Tone 40 Book and Bottle.

Tone 40 Book and Bottle is not Opening Procedure by Duplication. You have to be ready to assume total control of the preclear to run Tone 40 Book and Bottle. The commands are the same, except that you never acknowledge anything but the execution of the auditing commands. Then we would only have to add the command **“Turn around.”** He is really not supposed to do anything else we have not told him to do. (In training we use Opening Procedure by Duplication and later on will have to show somebody what we mean by Tone 40 Book and Bottle.) The training stress on this is precision. The auditor must not make any mistakes or omissions on this command. It is one of the most arduous processes to run known to man. If an auditor adds into it the randomness of getting his commands mixed up, he can practically finish a preclear. It is one of the number one exteriorization processes. If Opening Procedure by Duplication 1957 will exteriorize somebody (and it will), Tone 40 Book and Bottle is likely to send him on his way. You have no latitude for mistakes here. The training stress is the exact duplication of the commands. One of the cautions that must be observed in running this is that it is not left unflattened and mustn’t be faltered if it begins to run. If the process is biting it must not be stopped simply because there is a class schedule involved. If you were unfortunate enough to begin Opening Procedure by Duplication 1957 at 3 p.m. and it was running on the preclear, you have no choice if it is still running at 2 a.m. in the morning—Auditor’s Code or not, you are still going to be there running it. I couldn’t possibly tell you that

emphatically enough. We remember this from way back when. The most fatal thing that can happen is to be interrupted during this process, which may never bite again. And if it isn't flattened, it is liable to leave somebody hung right there. It is a major auditing error to start Opening Procedure by Duplication 1957 and not flatten it. When you start that one, don't have any other dates. Most of these processes under training sooner or later will be left unflattened on somebody, but that one must never be.

HCO BULLETIN OF 3 FEBRUARY 1959

HGC CURRENT PROCEDURE

SELECTED PERSONS OVERTS STRAIGHTWIRE

If you want an undercut on Selected Persons Overts Straightwire, run people close to present time and if you want to undercut it further, downscale its command to: "Think of something you have done to" The preclear does not have to talk to run this process. He can just think of something.

Additional note: ARC Break Straightwire cannot be run on a case that is motivator hungry. Overt acts must *be* owned up to thoroughly on the lower processes before you can get ARC Break Straightwire to run properly. Bad auditing is much easier to do with ARC Break Straightwire than the other two processes. Bad auditing is the limitation of ARC Break Straightwire. It gives the auditor much more chance to make mistakes than either Selected Persons Overts or Not-Is Straightwire.

The two biggest single auditor crimes are:

1. Rough and choppy auditing.
2. Overestimating the level of case.

When either of these two crimes is committed you get reduced profile readings. If a profile reduces, the answer is in either one or two above.

The remedy for rough auditing is muzzled auditing. This gives the auditor wins, thus improving his judgement and gives the preclear wins.

Muzzled auditing is best run on:

1. Selected Person Overts Straightwire
2. General Overts Straightwire
3. Not-Is Straightwire.

ARC Break Straightwire belongs between General Overts Straightwire and Not-Is Straightwire in the scale of things, but is generally omitted because it requires smooth auditing; *however*, it produces the best results if case reality is up to it.

GRADUAL SCALE OF PROCESSES

The lowest is:

1. Selected Person Overts Straightwire: "Recall a time you did something to
2. General Overts Straightwire: "Recall a time you did something to somebody."
3. ARC Break Straightwire: "Recall an ARC Break." "When?"

4. Not-Is Straightwire: “Recall a time you implied something was unimportant” alternated with “Recall a time somebody thought something was important.”

5. Factual Havingness:

“Look around here and find something you would permit to vanish.”

“Look around here and find something you would continue.”

“Look around here and find something you have.”

The results to be achieved by the above scale compare favourably to the CCHs and are faster.

When part of the profile gain lags on the OCA or APA, the person is found to have a dropped havingness, thus Factual Havingness (Third Rail—run 8-2-1) can be combined with the above, using the third command, VANISH, first. In any event, the fifth process in the above order is “Third Rail” (run 8-2-1) of Factual Havingness.

I would like to see this run extensively by HGCs. I would like to see this gradient scale run *in full* after every engram is flat, and before starting a new engram.

This will keep auditors from being fooled by dub-in. Dub-in can occur in a different lifetime, even when it was not present in the lifetime just run. Dub-in is a continuous characteristic of a person in a single lifetime and may not be present in the ensuing lifetime.

HCO BULLETIN OF 3 FEBRUARY 1959

FLATTENING A PROCESS

A process is flat when:

1. There is the same lag from the moment the command is given until the time the preclear answers the command at *least* 3 times in a row.
2. A cognition occurs.
3. An ability is regained.

HCO BULLETIN OF 4 FEBRUARY 1959
Originally issued from London

OP. PRO. BY DUP.

Use two objects—a book and a bottle.

Have the pc look them over and handle them to his satisfaction. Then have him place them at some walking distance apart in the room, on a couple of tables or similar locations.

The commands:

“Look at that book.”
“Walk over to it.”
“Pick it up.”
“What is its colour?”
“What is its temperature?”
“What is its weight?”
“Put it down in exactly the same place.”

Repeat with the bottle.

Do not vary the commands in any way. Use Tone 40. “Thank you” acknowledgment. The basic commands should never be departed from, and never, never trick the preclear by using the book again when you knew he was just about to start toward the bottle. The purpose of the process is duplication. Good control should be used.

Accept the pc’s answers whether they are logical, silly, imaginative, dull or unlawful. In starting the process you can discuss with him what you are about to do and make sure you have got the rudiments established. Run the process until the comm lags are flat.

This process is an HPA/HCA requisite.

C. C. H. (Concluded)

Compiled from the Research Material and Taped Lectures of L. Ron Hubbard

The next process in training order is *Subjective Havingness*. One way to run this is to ask the preclear what he can mock up. Then have him mock up what he can, and shove it into his body. That is the most elementary way of running this. Remedy of Havingness and Havingness in general are the most therapeutic levels of processing when they work. You run CCH so the fellow can have, and here you are directly doing it. Quite important. You can always get a black case to mock things up and you can always get somebody to throw something away. This is not even a problem today.

The way you crack up a black case is to have him mock up something in the blackness and push it in until the blackness cracks up. He will go anaten; but because he goes unconscious is no reason to stop auditing him.

There is a way to crack up the "invisible" case, who cannot see mock-ups (they have no field and do not see anything when they close their eyes; everything is invisible, they have no facsimiles, no mock-ups). The most spectacular crack-up of an invisible case was occasioned by putting a number of glass objects on a table and, one after the other, just repetitively round and round, the preclear was asked to "Keep each one from going away"; and, when he succeeded in doing this for a few rounds, he no longer had an invisible field. That invisible field of his had been impervious to all other attacks by auditors for five years or longer.

The next one is *Book Mimicry*, its commands being totally motion. All the processes up to this moment (we have mentioned Book and Bottle Tone 40, but it is not taught or run at this level of training) are simply communicative. We could talk to the preclear. This is also true of Book Mimicry and Hand Space Mimicry. Don't get this mixed up because your first process in CCH is Tone 40 "Give me your hand" and this is followed by Tone 40 8-C and then followed by Book Mimicry and then followed by Hand Space Mimicry; you are liable to believe that Book Mimicry and Hand Space Mimicry are Tone 40. They are not. They are just common, ordinary, run-of-the-mill routine—be a good fellow, pick up the ARC, remember your dummy auditing sort of processes. You can talk to the preclear. It is necessary that you do so.

Book Mimicry is run this way: You sit facing the preclear, rather close together, your knees a few inches from his knees. You take in your hands a book—not another object—and you make a motion with this book, preferably not the most complicated motion in the world and preferably not the simplest motion.

And remember, you, the auditor, have to be able to remember any motion that you make with that book so that you can do it again. So it is sometimes necessary for an instructor to make somebody take the book and wave it around in certain patterns and make him wave it

around again before he lets him run this on anybody. Just check him out so that he can wave the book the same way twice, because, if he can't, he can't run this process.

You make the motion with the book and give the book to the preclear, and he, with a mirror image, takes the book and makes as near as he can the same motion with it. If you are not satisfied with it, you take the book back and make the same motion that you made before with the book newly and in present time and give him the book once more and he makes the same motion back. You do the motion *until you and he, but particularly he, are satisfied that a duplication has occurred*. The auditing commands of this process aren't commands—they are patter. There is comment. There is talk. And one of the lines that undoubtedly should be part of your patter should be, "Well, did you do it?" "Are you satisfied?" If he isn't, you do it again and ask him again. It is the preclear that has to be satisfied that a duplication took place, not the auditor. It is completely different from dummy auditing. Remember, we are not dummy auditing now, we are auditing for keeps. You can talk all you want to, acknowledge what he says, but don't you dare let that looseness in conversation interfere with the tremendous precision of the motions of the process itself. In other words, the motions are the commands, and these must not be interfered with by the speech, but the speech can, and should, take place.

Number seven is *Hand Space Mimicry*, and again it is the motion that is the command. The training stress on Hand Space Mimicry is to do good, useful hand space mimicry. The auditor sits in the same position as in the last process, and puts one or two palms up against the preclear's hands and he says, "I am going to make a motion with my hands and I want you to contribute to that motion"; and we make some simple little motion to which he contributes. We do this for a while until it is more or less flat or we can leave it for the moment. Then we bring the auditor's and preclear's hands half an inch apart, and we do the same thing, and we say the same thing. You may lead him out to four or five feet away by these tiny gradients, another inch at a time, without his ever becoming aware of the fact that you have left him, and he is definitely aware of his auditor. This is modern "Look at me, who am I?" It finds the auditor. The Scale of Reality is employed here, and this is why it is done. (Scale of Reality: At the bottom there is nothing; above that there is a communication line, the line becomes more solid, then above that terminals begin to materialize lightly and the line becomes less solid, then above that you have the terminals and you don't have any lines, and above that the terminals are there mostly by agreement; above that there is agreement, and above agreement there is consideration, individual consideration, and above that there is postulate. That is the Scale of Reality.) You will see this Scale of Reality take place, for what are these hands against these hands but communication lines to the preclear? So we play it in this fashion. We begin to break it down and we become less a line and more a terminal.

Next one is *Trio*, a famous old process which is included here because it is too good to miss. The commands of Trio were originally "**Look around the room and find something you could have.**" A very non-control sort of process, but that's the Trio. It has an opposite: "Look around the room and find something that your body cannot have." It is "have" for the preclear, "have not" for any other object, person, being, valence, or anything else than the preclear. You do numbers of things with the Trio. You have to know the Trio because it is a fast patch-up for almost any process there is except Op. Pro. by Duplication 1957. (The only thing that patches up Op. Pro. by Duplication 1957 is Op. Pro. by Duplication 1957. Tone 40 Opening Procedure by Duplication will run out Opening Procedure by Duplication 1957, and any Tone 40 process will run itself out. There is no dead-end street there.)

Trio will run out almost anything in the entire bank if it is biting at all. If a person can have anything, or if he can get the idea of "something can't have," it will run anything out. It is slow and reliable, and an auditor must always have it.

HCO BULLETIN OF 16 FEBRUARY 1959

**HGC PROCESSES FOR THOSE TRAINED IN ENGRAM RUNNING
OR TRAINED IN THESE PROCESSES**

STARTING A CASE: BEGIN EVERY SESSION AS FOLLOWS WITH THESE
RUDIMENTS.

USE RUDIMENTS. FIND THE AUDITOR, FIND THE PC, FIND
THE AUDITING ROOM.

ESTABLISH A GOAL FOR THE SESSION. ASK FOR PRESENT
TIME PROBLEM.

PRESENT TIME PROBLEM:

If PTP exists then run it as follows and in no other way. Do not yak around about it. Just ask if there is one, see if one registers on the meter. On the PT PROBLEM THAT REGISTERS ON THE METER (not some other one) do the following.

Ask for and write down all the persons connected with this problem. That problem includes the preclear. On each of these persons, one after the other, beginning with the one most real to the pc, run this:

“Think of something you have done to (selected person).” “Think of something you have withheld from (selected person).”

These commands are run one after the other until the selected person chosen is somewhat flat. (Pc begins to repeat things he has recalled before.)

Do this to each person involved in the problem.

PT PROBLEMS WERE CUT OUT OF HGC BECAUSE AUDITORS BURNED UP HALF AN INTENSIVE ON THEM. A PT PROBLEM NEVER REQUIRES MORE THAN A COUPLE OF HOURS TO FLATTEN. NO “WHEN” IS USED WITH PT PROBLEM BY SELECTED PERSONS.

USE RUDIMENTS AND CHECK PT PROBLEM EACH SESSION AND HANDLE AS ABOVE.

DYNAMIC STRAIGHT WIRE:

Do a survey, one time on the pc, not every session, to discover any errors in their dynamics. This is done with an E-Meter. On pcs not familiar with Sci. terms use the following words: Self, sex, family, children, groups, mankind, the animal kingdom, birds, beasts, fish, vegetables, trees, growing things, matter, energy, space, time, spirits, souls, gods, God. Assess with this question only, “Tell me something that would represent (each of the above, one after the other).” When one changes the pattern of the needle action or when it is definitely balmy, write it down. When list is completed, take those items written down and run:

“Think of something you have done to (selected terminal you wrote down).”

“Think of something you have withheld from (selected terminal, same one).”

Run these questions on each, one after the other, until pc seems flat.

IF NO DAFFY TERMINALS ARE FOUND ON SURVEY, SURVEY IT ALL AGAIN.
IF NONE ARE FOUND THIS SECOND TIME, SKIP THIS PROCESS.

DO THIS ONLY ONCE PER AUDITOR PER PC.

PAST AND FUTURE EXPERIENCE:

This process goes rapidly into engrams but can be continued even if engrams are contacted.

Run these two questions one after the other, one time per each.

“What part of your life would you be willing to re-experience?”

“What part of the future would you be willing to experience?”

KEEP AN ACCURATE RECORD OF ANY ENGRAMS CONTACTED. WHEN ENGRAMS PERSIST IN THE PC'S VIEW, CAREFULLY SPOT THEM IN TIME FOR HIM.

ENGRAM RUNNING:

Find the engram necessary to resolve the case. ONCE YOU HAVE CHOSEN IT AND HAVE BEGUN TO RUN IT, BE SURE YOU HAVE THE MOTIVATOR AND THE OVERT AND THEN DO NOT DO NOT DO NOT DO NOT DEPART FROM THAT INCIDENT TO RUN ANOTHER THAT “DROPS BETTER” OR COMES UP. IN OTHER WORDS ONCE YOU HAVE FOUND AN INCIDENT STAY ON IT UNTIL IT IS FLAT.

NOT-IS STRAIGHT WIRE:

When you have flattened an engram thoroughly with all five commands gone over twice, run Not-Is Straight Wire between incidents. In other words, flatten an engram, then run Not-Is Straight Wire, get that a bit flat and locate and run the next incident.

Selected Person Overt Withhold, and General Overt and Withhold can be run on a pc only if they are biting. This is also true of Not-Is Straight Wire.

STAFF AUDITORS' CONFERENCE OF FEBRUARY 16, 1959

REGARDING HCO BULLETIN OF FEBRUARY 16, 1959:

*HGC PROCESSES FOR THOSE TRAINED IN ENGRAM RUNNING
OR TRAINED IN THESE PROCESSES*

Nearly everyone here has been trained in these exact processes and, if anyone here hasn't been trained in these processes, then everything on this Bulletin applies except Engram Running. The whole bulletin applies except Engram Running.

There will be a staff Theta Clearing Course, and those auditors who are on staff who have not been trained by an ACC in Engram Running will have an opportunity to get that training; and not too many months will go by before they are up to this, too. So this will apply at that time. Maybe it will have shifted slightly by that time, but I don't think very much.

Now what you are looking at here is the aggregate know-how that was gained and assembled on the 21st American ACC.

UNDERCUTTING CASES:

Now the undercuts of cases became a vital necessity. This whole ACC was devoted to the R factor plus Engram Running. It was discovered that the thing that keeps individuals from running engrams adequately was their R factor, and when their R factor was very poor they could not run an engram adequately. Now the funny part of it is that an engram can be contacted and run and, if done persistently and well without ARC breaks, can run the following Scale of Confront. Here is the Scale of Confront, just to refresh your minds:

DUB-IN: Lowest scale. This scale could possibly invert, and down below that you might have a black dub-in. Once you had run blackness, you would find a dub-in case. But the scale we are mostly interested in, because that is the one we most commonly see, begins at the bottom with dub-in, runs up, turns
BLACK. Runs through blackness, turns
INVISIBLE. Runs from invisible to
ELSEWHERE—a desire to be elsewhere. The way they solve things is elsewhere-ness.
Runs up from elsewhere-ness to
ABILITY TO CONFRONT. Runs from confront to
EXPERIENCE or PARTICIPATE. And only then are you up to
BEINGNESS.

Now this is the Confront Scale, and it is the scale of disintegrating Reality. It is how a person handles terminals or a situation. A person handles terminals and situations above all this by not having to participate, by not having to confront, finding no necessity to do anything about it unless he chooses so on his own determination; and if he did so, could do so with no personal liability. He could experience or not as the case may be. Now you'll find a lower harmonic on this in some philosophic level of somebody saying, "Yap, yap, well, I could, or I couldn't, and that's my choice," etc, well, he hasn't got any power of choice. He's just using this as the final escape mechanism—a philosophic escape mechanism.

If I said "bottom"—the bottom mechanism—it would be the one most commonly contacted. But you are apt to get a mechanism which is philosophic, which is simply a figure-figure mechanism about a situation, and the individual feels that if he could just figure it out he would be all right. In other words, this is a thought-thinkingness figure-figure, and he not-ises

by figure-figure. Such a case, not-ising by figure-figure, will turn into a dub-in case as soon as you start curing his figure-figure; would turn into a black case; would turn into an invisible case; would turn into a confront case; would turn into an experience case. Which is quite interesting.

Now it is true that an engram could be found, started, and, if the auditor were good and held the individual right on the time period and had the time period well spotted, and had the overt and motivator, no matter how crazy they seemed or sounded, contacted, he could theoretically, just by running that engram, run a person through the totality of this Reality Scale. See? So there's another approach here. You get a guy who is figure-figure, find the engram necessary to resolve the case. First he figure-figures about it, and he'll run it, and run it just with the auditing commands—the five auditing commands to run an engram—he figure-figures about it, then after a while he dubs-in about it, then after a while it all goes black; and then after a while it eases into an invisibility—it's just not there—somatics are, and discomfort and other things are, but it's not there—and its not-thereness suddenly turns into little flicks—little flicks of confront. And boy, he goes elsewhere. It just starts to turn on and he gets it for the least little Flick and he goes elsewhere. And then pretty soon he can confront the thing; then pretty soon he can participate—he can run it in valence, squarely in valence, right in its moment of time, at which time it becomes pretty damn real. And then he goes to being able to put it there or not put it there, and its importance-unimportance factor flattens out so that it's neither important nor unimportant. And that engram is licked.

Theoretically, this could happen. That is actually the way I run engrams. But you will find in auditing in the HGC that the public expects of you a different thing than is expected of you by students. And that's why I wanted to talk to you for a few minutes. They expect a different thing. They expect you to be interested in their case. And that is quite amusing—because it's your job to get *them* interested in their case. But they want you to be interested in their case. All right, any case is interesting, so that's a pretty easy one. But you can get so interested in their case that you do a lot of talking to them and burn up an awful lot of auditing time. So there is some point where your interest becomes an indulgence, and on the happier side of that, where the pc is pleased you're interested in his case, and that's enough. Then you get him interested in his case.

All right. Now, we have for a long time not used PT problems. I'll tell you why very bluntly. It was not unusual for an auditor to burn up twelve and a half hours on a PT problem. It was not unusual. He did this with two motives: one just yak, letting the pc go on and on, poor control, not controlling the pc's comm outflow, letting the pc get into non-essentials. And the other side of it: he was trying to run the whole case with the PT problem. Well, wonderful—you can run a whole case with a PT problem—but why? Since it's slow freight. That's a very slow way to go about it. So we take a PT problem now and handle the session in this fashion:

We establish the rudiments every time we establish a session. Find the auditor, find the pc, find the auditing room, establish a goal for the session. Do that rapidly. We don't care what goal it is, so long as he has some kind of a goal. And then we ask for a PT problem. And we take an E-Meter (up to that time we didn't care whether the pc was handling the cans or not) but we take an E-Meter, and we have this PT problem appear on the E-Meter, or we don't run it. Got it? And we run the PT problem that appears on the E-Meter. So we get him to state this problem, and we don't care how he states the problem, because all we want to know is “Did it drop?” That tells you at once you won't run a PT problem on a stage-4 needle. Didn't drop-see, that's all within the requirements—it didn't drop, so skip it. It isn't going to be real to the pc anyhow. You'll have to do something else with this case. He's probably got thousands of problems; probably all of life is a problem. Probably every time he walks in a room he installs an engram. You know, the furniture's there—that's an engram. Get the idea? So why worry about a problem?

But if you got a PT problem that drops, you should remove yourself at that moment from all temptation. As soon as the problem drops, and as soon as he states that it is a problem to

him and is worrying him *in present time*, you take the cans away from him and put the thing aside. Just lay the E-Meter aside. You're not interested in an E-Meter from there on. The reason why is because you'll increase the drop, you'll increase more drop and more drop as you ask him about it. You're already running it. And the problem is going to change. You have seen this phenomenon. You're not interested in a problem changing. The fact of your laying aside the E-Meter will rather convince him that you have found it and that's it. And you only want to know this: the personnel associated with that problem. You don't want to know more about the problem. You just want to know the personnel associated with that problem. His wife, his mother, and his wife's boy friend, or something of that sort. And that's the personnel associated with the problem. You just check that off.

Now, I'm going to ask you to take a notebook and a ball-point into the auditing room, because you've got two or three things to do here that require a list. I want you to get accustomed to establishing a list and then flattening it, not trying to run the case all over new again every time the case changes. That's one of the ways to waste time. You run one terminal, and of course the case changes, the problems change, everything changes on the case. If you re-assessed it at this time to find a new terminal, you'd for sure find new terminals. Well, the devil with it. Let's just flatten what we contact, and when we're contacting and scouting and using cans and the E-Meter, just write down what we find. Then put the E-Meter aside and run what we've found until we get rid of all of that. Now you're going to do something new—give him back the E-Meter cans. Got the idea?

Pcs don't much like to hold onto these E-Meter cans forever. Furthermore, they become restive, and they want to scratch their heads, and they want to do this, and they want to rassle around, and most pcs you get are slightly nervous in this direction. Why should you worry about it? Because the E-Meter is only going to give you a certain amount of the information that is quite valid. Now, you're going to write down the personnel connected with this PT problem. You're going to take SELECTED PERSON OVERT-WITHHOLD on each one of these people. And the commands for this are right here:

“Think of something you have done to (_____),” and
“Think of something you have withheld from (____).”

And you are going to run one of those commands and the next command, and then the next command—first command again, then the second command, first command, second command. In that way, you'll never lay an egg on an unbalanced flow. No flow will unbalance on you. They'll always stay there more or less stable. The case won't suddenly turn black when it's not supposed to turn black, and so forth. You won't ever over-run a flow and the pc will never get upset.

Now, let's look at this again. You have written down “wife”, “his mother”, and “his wife's boy friend”. Which one do you run first? You have to ask this question to establish that terminal: “Which one of these things do you think is the most real to you?” The individual says, “Oh, Mother, of course.” Who cares? That's what he says. All right, so that's the first one you take. Then you take the two remaining ones: “Which one is most real?” That's the one you knock out. That leaves you one more person. Knock that one out.

Now, there is something that is not stated here. I just typed this up rapidly for you—I didn't have a backing sheet, so there are typographicals because I couldn't even see what I was typing. This has a criterion, and it is an old criterion of all PT problems—it is, they are *PT* problems. By definition, a PT problem must exist *right now* in the physical universe. By definition. So therefore, the personnel involved in a PT problem must exist right now in the physical universe. He will tell you halfway through the run, that “It was actually my mother who influenced me this way”—ah skip it. That's not a PT personnel in that problem. His mother isn't really *part of*, let us say—it was her mother that was part of the PT problem. In other words, the people have to be actually associated with the problem and existing *at this time in this pc's life* influencing that problem, for this to be a PT problem. So therefore, we don't dive in any direction to pick up any new personnel we don't care about.

We get this problem flat. It is only flat if it answers this question: “Now, what do you have to do about that problem now?” And the pc says, “Nothing.” It’s flat. For our purposes, it’s flat. The only reason we’re running it is we’re trying to get rid of the obsession he has to jump out of the auditing room and go *do* something about this problem. If he doesn’t have to do anything about it, it’s flat. But if he says, “Oh, it’s flat, because I could go and talk to my wife’s boy friend now, and I could handle him.” No. Start right back over from the beginning—the first person you wrote down—and run that person again for a short time—next person for a short time—next person for a short time—on these exact auditing questions. “Now, what do you have to do about the problem?” He’ll tell you, “Well, I don’t have to do anything about it just now.” That’s enough. You consider that flat. Got it?

All right. This will keep you out of all kinds of trouble. And it will keep the pc from being all hung up in trying to go elsewhere in an auditing session. So much for that.

This is done at the beginning of every session. That first section there—it says, “STARTING A CASE: AND BEGIN EVERY SESSION”. Well, you not only start each intensive with this, but you start every session with this, and you do the same thing.

If it takes you two hours to flatten the PT problem, I will think something is hung up. This is a rapid one. This is not a slow one. If it takes a couple of hours, well, something’s really haywire here. He didn’t say the problem, or he didn’t do something, or he’s holding something back. But notice we have said, “Think of something you have done to” and “Think of something you have withheld from”. This will also get the pc talking to you, because it gets rid of the withhold. Got that? All right. So much for that.

Now, DYNAMIC STRAIGHT WIRE you were taught in the 21st American, but the commands for the general public were not given to you. And they are given to you here on this sheet, this HCO Bulletin. Now, the only thing you are looking for is a represented substitute. In other words, you’re looking for substitutes. You ask him for a substitute for himself, and you ask him for a substitute on the basis of “Tell me something that would represent yourself.” And he says, “Represent myself? Oh, that’s very, very easy—a tree.” Get your ball-point busy at that point and put down “tree”. Got it? Now, if he even says “toothbrush”, get your ball-point busy. The proper answer, of course, is “Myself”. It’s just as simple as that. But the more a case is daffy on this line, the more attention you’re going to pay to it. So you just run this whole assessment right straight on through: Self, sex, family, children, groups, mankind, the animal kingdom, birds, beasts, fish, vegetables, trees, growing things, matter, energy, space, time, spirits, souls, gods, God. Just one question. Each time you say this you just take one of those: “Tell me something that would represent, for instance, souls.” The individual says, “Running water.” Get the ball-point busy. Write it down. When you have got this whole list assessed, take the list you have written and run:

“Think of something you have done to (a toothbrush).”
“Think of something you have withheld from (a toothbrush).”

You’ll be amazed, but they have actually done something to a toothbrush, and they have actually withheld something from a toothbrush. This is pretty terrific. Quite amazing. But you are only looking for daffiness on this, and a sensible answer you don’t pay much attention to. You say, “Tell me something that would represent trees.” And the fellow says, “Leaves.” Now, there’s a matter of judgment involved here. What if he said, “Shadows”? Well, I don’t know. That’s a matter of judgment. Try to run it or not try to run it, as the case may be. If it looks daffy to you, run it. You’re the judge. Got the idea?

Now don’t let it look daffy to you when you say, “Tell me something that would represent spirits,” and he says, “Souls.” When you say “souls”, he says “spirits”. That’s not daffy.

But how about this guy that gives you the perfect representation all the way down the line like a little wound-up doll? You already, in looking him over, find out he has a sticky needle,

he's registering at 6 on your E-Meter when you first put the cans in his hands, and he gives you all the answers perfectly. That case is giving you an intellectual response which has nothing to do with any reality under the sun, moon or stars. Something he read in a book and a machine is rattling it off. So you do the assessment again. The second time you go through you're liable to trip him on something. Got the idea? So, if you get a perfect assessment, run it again. I actually don't care how many times you run it, but you're apt to be wasting time, because by two-way comm and definition alone you may not get anywhere with a very badly machined case. Nevertheless, a couple of times through, he should trip somewhere. Machine case generally does.

The rule governing Dynamic Straight Wire is: That which doesn't fall out by two-way comm just on assessment. He says it, and then it looks funny to him, and he laughs, and he thinks this is for the birds, and he says, "Oh, no, that wouldn't be one-actually, a substitute for a tree would be a leaf, or a small tree," or something like this. That's fine. Nothing wrong with letting him correct himself, because you are actually auditing him just by asking him the question. People, when they straighten out things in their own categories, very often recover very, very easily.

All right. Let's take up this next one here. That's an easy way to run Dynamic Straight Wire, isn't it, huh? I would ask you to do this, however, in view of the fact that you are doing a professional job of auditing for the public mainly, and that is, I'd ask you to memorize that list—rather than hold a bulletin in your hand and read it.

Now, the next thing we're going to run into here is PAST AND FUTURE EXPERIENCE. This is a bid for two things: One, the lowest level case there is—because experience, to him, is a dub-in, usually. Or it's a figure-figure, or it's something, so it compares to the Reality Scale. His definition of experience compares with the Reality Scale.

His definition of experience is a direct index to the Reality Scale, by the way. What does experience mean? He'll say, "Experience—that's very easy. To consider." There you've got your figure-figure level. "What does experience mean?" Well, "To write about it or make something out of it—experience is that thing which you use to manufacture the future." He's dub. "Now, what is an experience?" "Well, experience is that which you try not to have." That's probably black or invisible. Or, "It's the thing you forget," would be blackness. "Experience is something you try to forget"—invisibility level. "Experience is something you have to cope with." Obsessive confront. "Experience is—ah—well, experience—that's pretty hard to define—experience. I guess it's to go through something." You're getting a fairly sane response—to go through something. To have an actual adventure, something of this sort. You're getting a fairly sane reaction to experience.

So don't think that Past and Future Experience is pegging up at the highest level of the Reality Scale. It isn't. This process was found, in the 21st American, to be the undercut process. This was the lowest undercut process. And this is a killer, and it is very trying to an auditor. A very trying process, because it offers so many wonderful temptations. And that's what's wrong with this process.

Now, you run these two questions, one after the other, with no assessment, no E-Meter, nothing. You just put the E-Meter down after you've done the Dynamic Straight Wire thing, because on Dynamic Straight Wire, when you said, "Children," the needle was going on a gradual shift over here, and a little theta bop now and then. You said, "Children," and it fell a dial, or all of a sudden started doing a big theta bop in the middle. When you got off of children, it settled down to the other pattern. That told you that you had something to be run on the subject of children. That he will also, at the same time, give you a daffy reading, he will tell you some daffy terminal to represent—so you needed the E-Meter there. But you don't need the E-Meter on Past and Future Experience, not even vaguely. You can just put the E-Meter aside and turn it off, and just run these two commands. Just clear them with the pc very bluntly. Say, "We're going to run something about experience. Now, we're going to see how you get along with this little process, and here are the commands of it: What part of your life

would you be willing to re-experience? And the other command is: What part of the future would you be willing to experience? Now, here's the first command: What part of your life would you be willing to re-experience?"

The answer actually called for is a time, isn't it? And this is a time process. But there are very few preclears that will find this out for a very long period. They won't give you anything but super-significances and ball-up, and the pc who is real bad off will give you a type of experience. You accept all these things. You say, "What part of your life would you be willing to re-experience?" He says, "Well, eating cake." That's an answer? That's an answer. And that's followed with this: "What part of the future would you be willing to experience?" He says, "Well, more cake." That's an answer. So you just accept any answer that he gives you on the line. It gradually will boil down to a time answer. And it will gradually go back-track. The longer you run it, the more track you're going to cover, the more future you're going to cover. And there will be periods when the individual is absolutely sure that he is totally predicting the future. He gets into implants, let us say, that tell him what the future is all about. He's stuck 8000 years ago, but he's telling you about the future. All kinds of odd phenomena show up. But engrams come up and slap you in the teeth, one right after the other.

You run this for a while, and the individual says, "OOOh, well, you know I really wouldn't be willing—well, I would be willing—I don't know—I would—oohh, well—I really don't know—dental operation there, I was a young boy—I don't know if I'd like to re-experience that—I guess I could re-experience sitting in the—no, no, no. I could re-experience—I could re-experience the next day after it." You say, "That's fine," and just mark it down with the ball-point: "Dental experience as a child." That one he can't confront. Now, you're never going to run it as an engram, but you're going to have some tag of it as an engram. See, it may show you something.

As you go along and he runs into hot experiences, real, real hot experiences one right after the other, it is about time you put the E-Meter back in his paws. Get the idea? You don't have to start it with the E-Meter, but if he starts running into hot experiences, or if he gets into an engram and he can't seem to get out of the thing, the thing to do is not run the engram but give him an E-Meter and spot it in time for him. Get it spotted in time. If he's running into them hot and heavy, one right after the other, just leave him with the E-Meter. But if there is only one you have to spot in time, and then in a little while he doesn't seem to be running any more, take the cans away from him again and put the E-Meter aside. But if he starts running into one that obsessively sticks with him, don't let him flounder in the thing for an hour. Don't let him wallow in this one. Because he will just wallow in it, and this is no process—this is *not a good process* to run an engram with. So you let him out, OK? And the way you let him out is to locate it in time with an E-Meter. And you go on running the process. Now, as I say, it offers enormous temptations to the auditor—beautiful temptations to run the things contacted. As you sit this out, you actually are going to change the characteristic of the engram you will ultimately run on the case. But you keep listing engrams that he runs into. Keep listing engrams that he runs into, well knowing that he will favor motivators. For every one of those motivators there is an overt. Now an engram that he consistently and persistently keeps hitting and hitting and hitting, you are going to find in that engram probably the engram you will run, eventually. But not until he is in PT, out of the engram, it seems to have dropped out, and so forth, and he seems to be all smooth on this thing, are you going to reach for that one again. You are going to flatten the process and then go to the engram.

Here we go. ENGRAM RUNNING. Of course, that is run all the way through with an E-Meter. Give him the cans and start out on this engram that you more or less found with Past and Future Experience.

Now, this is going to undercut cases, and I don't care how long you run it. I don't care if you run it for two weeks, because this is a very productive process. But if you are going to run it over that period of time, it isn't noted here, but some THIRD RAIL had better be brought in here some place. And he'd better be shifted up finally until havingness. And you put in PAST

AND FUTURE EXPERIENCE, right after that line, “COMBINE WITH THIRD RAIL IF RUN MORE THAN 8 HOURS”. If you run it eight hours, this guy’s havingness is going to start dropping on him, and you are going to run into difficulties. You could get into difficulties. All right.

ENGRAM RUNNING. Well, Engram Running, when the case has been prepared this way, becomes very simple. A case will start running like a little typewriter, if you have got this Past and Future Experience pretty flat.

Once you have picked an engram, make sure you get its motivator not only its overt. If you have got an overt, get the motivator. If you have got the motivator, get the overt. And only when you have got that have you got an incident. Now, an engram that is having one side of the overt or motivator run will get sticky. You have got to find the other side, and you have got to get both of these things in date. Normally, this will start showing up on Past and Future Experience. Well, we are going to run this engram with an E-Meter, we are going to consider that we have an incident when we have got both a motivator and an overt that fit together. And if the thing is just awful sticky, and dubby, and shockingly poor, and a lot of other things, you just started running it too fast, that is all.

We have got several things you can do at this state of the case, and so forth. Probably the best of them is go back to running Past and Future Experience. You didn’t flatten it.

Now, here is this Engram Running. If you notice here, it says you run all the commands that run an engram twice. Run them all twice. That’s because “Find something unimportant in that incident” is going to stir up stuff that newly has to be confronted.

Once you have chosen an engram and you have begun to run it, you have had it. That’s it. That’s the engram you are going to run. So it has to be chosen with considerable care. Listen to me now: If you re-assess the case after you have started an engram, you will get almost any other incident that is hot to drop more than the engram you started, because most of the charge is already dissipated. So if you keep re-assessing a case, thinking another engram would be better to run for the case, you are of course always going to find another engram. You will never find the one you started to run again dropping with as much velocity. You see? That’s something you have to keep in mind. If you are going to run an engram, that’s the engram you are going to run. It’s got to have its overt or motivator; suppose you are running the overt side of it, you have got to have the motivator side of it. So you really haven’t got an incident until you have got both of these things located. And once you have started to run that, you have had it. Because it will discharge its charge and won’t register on a meter any more the way some other incident will.

You can get a case just stirred all up and run all backwards and upside down, and that’s the biggest mistake an auditor can make. I have given you the reason for the mistake-because now almost anything will drop better than the one you partially flattened.

If in doubt, run the engram you were running. If you are not getting rapid recovery, go back to the first engram you ran and considered flat and run it again. Sometimes, it will only take you fifteen minutes to run all five commands. You do it very fast. But very often something happened that it re-charged in some fashion. Very peculiar.

If you leave about a third of an engram missing and unflat, the whole engram has a tendency to charge up again. It is kind of funny. But you have got to flatten the engram you contacted.

Now the rule of the Last Largest Object is the only one I want you to pay any attention to in questioning the pc. Pc apparently is getting out of it. Change your auditing command. You are running, “What part of that incident can you confront?” He says, “Well, I don’t know, it’s pretty unreal to me, I don’t know whether this happened or not.” What was the last largest

object? If he said anything that was offbeat and showed an unwillingness to run any more of the engram, you want to find out at once what was the last largest object that you contacted in there. And he says, “A house.” You are going to shift your auditing command now to: “What part of that house can you confront?” And you are going to run that simply until he is back in the incident, and then you are going to go off on to “What part of that incident can you confront?” Doesn’t require any vast bridge. You just tell him you are going to shift.

In that way, using that rule, you can actually pick up an engram where he was running as Abraham Lincoln, and in the engram he was shot in Ford’s Theatre—you know—and the date is obviously correct. Dropped and everything. And then he runs John Wilkes Booth—no, he wasn’t Lincoln, he was John Wilkes Booth. And so help me God, you may find that he was the Secret Service Agent who had a couple of drinks that night and wasn’t watching. You don’t care whether he runs it dub or not. Don’t give up because he’s running it wrong, because it’ll come out right.

There was a joke on us in the 21st American. We had our paws on Bowie. He was Jim Bowie. And of course everybody doubted this, because it is a famous historical figure. And they tried to do everything under the sun to shake him out of this engram, and they finally went back to running it, and it was the one that flattened out. The trouble was, he had dub on it, which made Bowie die the wrong kind of a death under wrong circumstances. But as he ran it, the more he ran it, the more he ran it, the more right the circumstances got. And it finally all came out in the wash. He did run the death of Jim Bowie.

Historical figures, however, are usually the yo-yo point used. The guy went out of his own body at the death; there was some current historical figure; he said, “That is the identity necessary to resolve this incident. That identity could handle it. So I will just be Catherine the Great.” And he goes and runs Catherine the Great. The only mistake is to let him escape out of the time period. Maybe he did yo-yo right into the palace, maybe he did go right through her skull. But the right engram will shake out, because the Reality Scale is run by running an engram.

Theoretically, you could clear a person just by running one engram well enough. So never get off onto quantitative engrams. An engram is merely something for him to get used to confronting, and creating, and mocking up, and so forth. It’s just a playing field you are using. The significance, the amount of change he gets in his life, none of these things have anything to do with it at all. It is just how well he can handle a mental image picture, and you have chosen a honey for him to handle. That is about all it amounts to. And when he finds out he can handle this thing from A to Izzard and beginning to end, and he can do it well, then the next engram to resolve the case will run quite rapidly. And you will run on down and finally run his basic, earliest shift of identity, which is the rock. And formerly he said, “There is a beautiful, clear sphere—that’s the rock. And that’s all the rock.” Oh, heck. When you get several engrams run and get the rock as one of the engrams, you find out this beautiful, clear sphere was something he customarily clamped around thetans as a trap, and they sometimes clamped it around him, and there were raiding parties, and there was all kinds of personnel and there is drama and there is strain, and there is scenery and everything else. When you contacted the rock first and ran the rock first, he was insufficiently able to contact things. The date when he was mocking up this thing, he was so capable of mocking up that later on this poor, little, weak ole thetan, years and years and centuries and so forth afterwards going back to mock up this rock—uh-uh— it’s too beefy. That’s too much engram for him to confront first off.

So you choose the engrams—it doesn’t much matter what you choose. You will find that every sexual incident you contact is a bounce from a death. A little rule for you. So don’t let me catch anybody in the HGC running prenatals, birth, conception, because that is a bounce. Those are all tied in with the death, and the death is the engram which is necessary to resolve the case. So you keep running Past and Future Experience until you get them down to that—OK? Leave the second dynamic incidents severely alone.

Now it can be that he died, and he died is followed by a conception sequence, and he goes back to the old body to see if it is still decently buried—you know—and then he can't find the person that he thought he was going to be, get the next body from, and he gets all confused. And mess-ups of this character can occur. But keep him on the incident. Is this part of the text? When you finish a death and go through the exteriorization sequence, right at the end of it there is a conception or a prenatal or a birth. They quite ordinarily bounce into it, and you don't want it. You want nothing to do with it. So you stop him when you have got all of the exteriorization run.

There is a lot to know about engrams. You have been taught all this, but I am just showing you what you can do to win in the HGC with Engram Running. This would be a good, clean job then.

Every time you run an engram, now is the time to use some Not-Is Straight Wire, with its ordinary commands which you know. They are:

“Recall something that you implied was unimportant.” “Recall something somebody else thought was important.”

Don't ever let a pc run it in reverse, because it discharges havingness in about five commands. That is real rough the other way, too.

All right. Now there we have a rundown that will get engrams run, that will get ordinary, run-of-the-mill cases squared around, and that will get a lot done. But what about people who were not through the American 21st? And during that period of time up until they start in with a Theta Clearing Course, to run actual engrams on pcs, how about these people? Well, you have Selected Person Overts, with the “withhold” command added, and you will have a new bulletin out on these things, and so forth. We want that auditing to be relatively muzzled. It will win and everything will go along just dandy. But if you have got some case (and this is more for D.O.P.s than anything else)—if you have got some case that was awfully hard to start, very low random profile, you'd better turn it over to a graduate of the 21st American. And if you have got some case that, after he ran along for a while and was getting up to a point where he'd just run engrams beautifully, and the whole track's opening up, everything is going along just dandy, and it is certain that the engram necessary to resolve the case is just waiting, give him an auditor that can run it.

In other words, you can run an HGC this way: You can get some auditors that set pcs up to run engrams. You got the idea? And then you can have some auditors that run engrams. This is not any real violation of the Auditor's Code, because that will still give him the best processes and the best treatment for the pc that can be given.

Now there is no reason why, particularly after a staff Theta Clearing Course, that everybody can't run a regimen of this sort. But running it in the HGC, with all the profiles being submitted to me and all the Case Analysis Reports—the Case Analysis Reports now are more vital than profiles, because R changed on a case does not necessarily change the profile at all. You should know about that. You can change the R of the case without changing the profile. The person answered the same questions, only he answered them with Reality. This is quite remarkable. We need a brand new test. That test is in development right at this moment. It is a confront test, and that test will be coming up, but there is no reason to rush it, particularly. Let's just do it by Case Analysis.

I will get out a Bulletin that will take care of auditors who were not trained to run engrams, what they will run. But you already have data and material on this, and it is just as before, what you have been running.

Now, to start a case out with NOT-IS STRAIGHT WIRE is adventurous. That's an adventurous thing to do. That's a rough thing to do. We learned a great many things in the 21st American ACC. Learned a great many things, and that was one of them. Selected Persons

Overt-Withhold is very, very superior in undercutting cases to Selected Persons Overt. The only main change we have got is that we run Selected Person Overt-Withhold commands, just as it is given here in PT problem. That is a wonderful thing to do with a case, as long as the terminal is real to the pc. And there is no real reason that running a Scientologist, who knows what the command is, why ARC Break Straight Wire cannot be run on a person by an auditor who has not been through an Engram Running Course. That's a beautiful process.

I want to tell you something else. Can I tell you something here? A lot of research was done in the 21st American ACC, and students didn't see me as much as they thought they should, I suppose, but I was around. And I never saw so many flips and changes and vagaries in my life as I saw in that particular unit. The reports which I got were very—very helpful to me—very, very helpful to Scientology at large. There was a great deal done in that course. I spent about three weeks of the course—did very rapid research just in catching up with some of these undercuts. Because, let me assure you, the R factor in most of the cases you approach is so low that it poses a problem of running greater than we had ever imagined. Therefore, these are the processes that we are handing out.

Now, these are a Not-Is type of process. Dynamic Straight Wire runs a straight identification, but the rest of these things are Not-Is types of processes. To cure somebody from not-ising. When a person can confront something, he no longer has to not-is it.

But there was a funny command came up along the line, that I don't fully understand yet, but it takes care of a theta body. Now this is part of the research that was never given to the 21st American. And this is a peculiar darned thing. You can write it down on the back of this Bulletin, if you want to.

It is:

“Recall a time when you thought something bad was unimportant.”

And that is just about the wildest thing you ever saw. Now that runs all by itself but can be combined with:

“Recall a time somebody else thought something bad was important.”

And you will run all the newspapers off the case. The second command there is really not essential, but you just run this first command repetitively, and if it seems to run down or something bad happens, flip over to the other command. But you will as-is a theta body.

This is the doggondest thing you ever saw. It is a perfectly wild pitch. I was just adding up all possible combinations and working in all possible directions, and this one fell out of the hamper, and it doesn't integrate too well with the rest of your data. But this is the goofy one.

Now, something else came up in the 21st American that I should tell you in the HGC, and that is: After nine years, we have found out WHY. We had nine years of HOW, and now in the ninth year we find out why. Why people are aberrated. Why they are sick. Why they act the way they do. Why individuation takes place. And that is all wrapped up with WITHHOLD. I had withhold earlier, but didn't shake it all out of the hamper, because I didn't have the overts to go with it. We find out that an individual gets sick by having the overt impulse to make somebody else sick and then withholds it, because it is less social to give people illnesses. So he gets them himself. This is Freudian transference, it is a whole number of things. So when you run these overts, run the withhold with it and the case will start finding out why.

The theta body thing, and the masses and ridges, why, they run out when you ask a person to recall a time when he thought something bad was unimportant, or recall—well, that is the best command—recall a time when he thought something bad was unimportant. When you run this, you evidently run the center pin of the withhold. But you will get his tolerance. And

this is the first straight ethical process, evidently, we have. It raises a person's ethics. It as-is a theta body. It takes demon bodies and things like that off cases. I tested it two or three times here, just monkeying around with this thing, and it is one of the wilder ones. This is a wild pitch, that particular process.

So you could say that when a field doesn't immediately disintegrate, when you can't get an individual easily in the engram, when the field stays persistently black or something like that, you have got another string to your bow, and I don't care if you use it. But if you do use it, know this: It runs as an automaticity on such a demon case. He runs br-r-r-r-t—the last two thousand years he has been not-ising and saying it was unimportant that something was bad. And he will start coming up with, “Well, I should do something—no, I shouldn't do something—well, what is this? I should do something about it. I shouldn't do something about it. I have been very neglectful, but that really isn't bad. Not really. Somebody dying from the bullet wound I gave 'em—that really isn't bad. But—” And he is stuck right with the consideration on all of his overts—consequences of overts. They all must be unimportant. And it reduces his ethical level. But I have now seen two demon bodies disintegrate just with that one command just disintegrate—and this is the first time we ever had something that would disintegrate the astral body. So we find out at once that the astral body was an aberration. It isn't a necessary thing to make a thetan stick in the head at all.

All right. Now I wanted to give you this rundown, because today you were having a little bit of a rough time doing a transition from student to pro auditor, and I wanted to talk to you, even though it burned up some of your valuable time and mine. And ask you to sic semper transit, huh?

Now are there any questions? Yes, Jean.

Q. I have two questions. In running of the engram, do you ignore what they were running in the ACC, or do you just go back and run them? My preclear has had several engrams started.

A. Now, if we look over this carefully, we see in running an incident: Find the engram necessary to resolve the case. Once you have chosen it and have begun to run it, be sure you have the motivator and the overt and then do not, do not, do not, do not, depart from that incident to run another that “drops better” or comes up. Now look here. The engrams that were run on them in the course are no longer going to fall. And an engram is not going to show on an E-Meter. And if there were several engrams run on somebody in the course, and the first one wasn't flattened, then whoever audited them ought to be hit in the head with a sledgehammer. There's only one or two cases that got by with this, that I have checked up on so far, and it is about the most serious blunder that could be made. Now, what you do in a case that's had an engram already started is get a lie reaction check—that's all you want—of some sort or another, concerning this particular thing. You can put him on the E-Meter and ask him if it was run, and so forth, and ask him which one was the first one run. You could possibly get an occlusion, but usually the pc will tell you. There's no particular reason to doubt the pc. Get the first one, and get that one flat, and then you have no choice but to pick up the next one and flatten that one.

This applies without regard to how many auditors were on the case. This also, you will find out, will sometimes apply to somebody who had an engram audited in 1950. The only trouble with a 1950 engram is that it is probably an operation in the current lifetime, or a prenatal in the current lifetime, and it was the wrong engram necessary to resolve the case, and you won't get very far running the thing. And we have no data at this time, whether it's best to pick that one up and run it or not. But I would say for sure that an engram that should have been run to resolve the case, such as a past death, if that was ever entered in all of those years, including 1950—it may no longer drop on the E-Meter, because some of its charge is gone. That is the engram necessary to resolve the case.

Yes, got another one?

Q. Yes. The Dynamic Straight Wire—do you keep running this until you have picked up all the daffy terminals, then go through it several times and get the daffy ones each time?

A. If you get a daffy one, if you get several daffy ones, you take those you got on the first run and run them. Don't bother to go through again, because it will have straightened out. Enough will have straightened out to admit progress of the case. But if you don't get any daffy ones through once, then run it again. Any other questions? Dale.

Dale: I just had a comment on that. One 1950 engram, in which the auditor blew session because it was whole track, was the engram necessary to resolve the case and finally showed up. The guy had been black since 1950.

A. Good. Picked it up and flattened it. Well, that's a good job. That tells you that a black case, then, doesn't necessarily require five or six weeks of preparation before you run an engram. You pick up an engram as early as you can on a case and charge through. But it doesn't get you around starting a case. You have always got to start a case or start a session. Yes?

Q. On this re-experience process, do I run it until I get 3-D pictures, and track?

A. Yes. Oh, 3-D pictures and back in PT. Back in PT. I'll give you an example of one of these. Here's the pc. He is sitting in a terror charge, in a total black freeze, at 1500 AD. One second later, everything went to hell. One second before, everything had gone to hell. And he's sitting in this split second, at a rest point. Got it? Well, now, what do you think happens when you start asking him about future and past, alternately? He'll move right off that rest point, won't he? So this is an explosive, doggoned process. Now, I say you run it until he gets to PT. Some time or other you might find it impossible to get him to PT on the process. You just might. But the experience that has been had with it so far is that it does eventually move him to PT. Now is the time to take him back, at the auditor's discretion, and have him run that incident in which he was stuck.

By the way, "What part of PT are you willing to experience?" has on several cases exposed the engram necessary to resolve the case. It is the engram he's sitting in, and it is the one necessary to resolve the case. Yes?

Q. If you leave a process very unflat one afternoon, and come back in the morning and start questioning the guy, and you pick up first of all present time problems. Now supposing that process is the basic of his present time problem of the morning. Are he and you the terminals, the preclear and auditor the two terminals?

A. Yes.

Q. Do you run it that way?

A. Oh, well, if he got a lot of ARC breaks, it would be a good thing to run it this way. That would clean up all the ARC breaks, wouldn't it?

Now I am going to give you that again on ARC breaks. This is the hottest one to run ARC breaks on. Just pick up the auditor and pick up the pc, as the two people involved in the present time problem. I am glad you brought that up, Joe.

This idea of throwing him back into session after you have ended a session the day before is another point of judgment. Just how do you smoothly get him into it? Usually he has piled up something on top of the engram. There is a process here, which is not really a very good process, but which kicks them out, and it was not given in this ACC. That is Problems of Comparable Magnitude to that Engram, or that Incident. It will actually de-intensify an engram. You should have that as a little panacea.

That is an interesting one to wind up an intensive on. About noon of the last day you all of a sudden realize, "Boy, this man isn't going to make it." And you could run a problem of comparable magnitude to that engram and get it keyed out. However, you are better than that, and you will have had it flat by the last day of the last intensive he has, that's for sure. Any other questions? Don?

Q. Is "recall something" preferred over "recall a time"? I have heard "Recall a time you did something to somebody," and also "Recall something you did to somebody," which is slightly different.

A. "Recall a time" is always a superior process, unless the individual is consistently not recalling a time, at which time he is not obeying the auditing command. So you should say, "Recall something you have done to" to somebody who can't spot something on a time track.

Q. What's the difference there?

A. You are running really two processes with "Recall a time you did something," and you are running only one process, "Recall something you have done."

Q. Can he continue to do that without recalling a time?

A. Yeah. Definitely. Anything else?

"Recall a time," all by itself—you just sit down and say to a pc, "Recall a time. Thank you. Recall a time. Thank you." Some interesting things would happen to a case. Time, you see, is the single aberration. Joe?

Q. In running an engram, when you are tagging the engram for the first time, is it possible to peg, say, a 2-ton motivator and a one-pound overt, and that's the incident?

A. Yes. Because until they get some of the overt flat, the motivator will come off. The right one to run there, by the way, is the overt. You get that overt damn real, and all of a sudden you'll find the 20-tons have departed down to about 10-tons on the motivator. Now they'll run on comparable lines. Yes.

Q. Couldn't you have, say, a 20-ton motivator, as he was saying, and twenty one-ton overts tied to the same motivator, rather than one large overt?

A. You could. You could. Nevertheless, you'll find somebody getting all loused up on this, and best remedy is just to play what overt you find against what motivator you find as the incident. And just keep playing them one against the other, back and forth, back and forth, and eventually the thing will come out right.

There are many remedies, and one is Selected Persons Overt-Withhold Straight Wire on the personnel of the incident. You could take any incident as a PT and run any PT process on the incident. That's a little rule. I don't advise you doing it, however, but you can do it. It's very interesting: "Find something unimportant about that executioner," is just about the same as, "Find something unimportant about this room." If you want to get a reality soaring on a pc, just run "Find something unimportant about this room." And he'll start this not-is machinery going, you know, and he'll run it out to some degree, and all of a sudden the room will brighten up. Very interesting.

"Think of something you did to an executioner" would be it, rather than, "Think of something you did to that executioner." And he will come up with the overt, and he will find out he was the executioner in the same castle for about three lifetimes before he suddenly came back there and got executed. That usually is the way these things compare.

Any other questions? There is a burning question that you should ask, is: “Are we supposed to run these things muzzled?” Now, let me just say this, to do this for me: Let’s cut down the unnecessary yak. And if the pc seems to be ARC breaking at all, you voluntarily muzzle your auditing. You got it? Because what he’s got is an engram of being talked to or being interrogated in some fashion, and everything that he doesn’t consider exactly necessary to the auditing session he resents. So if you find a pc is ARC breaking, you muzzle your session. Any other questions before we break this up?

Thank you very much for your time, I appreciate very much your coming in. I know you had a hard day getting on to a new routine, and you have got auxiliary duties. Several people in the HGC have been split off of administration, and there are other things going on. Latch on to ‘em, get wheeling, but let’s start making theta clears in this HGC and just make nothing else but theta clears. I have given you a pattern here that was thoroughly tested out in the 21st American ACC, and you can make theta clears—there’s no great difficulty to it. Thank you very much.

TECHNICAL BULLETIN

SELECTED PERSONS OVERT WITHHOLD STRAIGHTWIRE

It is not only unreasonable but impossible to run engrams or higher processes than Selected Persons Overt Withhold on people who have low reality and low responsibility. Selected Persons Overt Withhold raises both reality and responsibility and some of the cases around will only start to respond after four to five weeks of Selected Persons Overt Withhold Straightwire. But the main point is that they do—repeat, *do* respond.

We have got it made in Selected Persons Overt Withhold Straightwire. Let's not lose it.

Selected Persons Overt Withhold Straightwire

Select a person (terminal) that is real to the preclear.

Run "Recall something you have done to ___ (that terminal)" and

"Recall something you have withheld from ___(that terminal)" alternately.

(one question after the other)

Wherever the person has a misidentification or a fixated terminal on any dynamic, that terminal should be selected out and flattened by Selected Persons Overt Withhold Straightwire. We will be rid of these unresponsible cases.

Do not graduate into General Overts until Selected Person Overt Withhold Straightwire is flat. When is Selected Persons Overt Withhold Straightwire flat? It is flat when the preclear has come up tone through shame, blame, regret, and a recognition of his own failures and preferably 4.0 on the tone scale as per "Science of Survival".

Minimize the two-way communication, clean up present time problems with the same process, using the terminals involved in the present time problem, and *if in doubt* MUZZLE the auditor.

**ENGRAM RUNNING ON OLD DIANETIC CASES
OR RESTARTED CASES**

It has been found that the abandonment of an unflattened engram to start another one can leave the case in an apparent jam. Starting a new engram without flattening the first one contacted *may* be, to the preclear, the same as a command not to confront the first engram.

Stable data: The incident entered by the auditor *must* be wholly flattened by Scientology commands before a second incident is approached.

The end goal of running incidents is the increasing of the ability to confront.

When incidents are started and not finished in favour of a new incident, the preclear may feel he is being forbidden to confront the first one.

An incident consists of an overt engram and a motivator engram on the same subject.

It is evidently necessary to scout the earlier *auditing* of any incident that was abandoned in order to get the incident run. Otherwise, a black detachment may result. The blackness and the detachment may exist in the earlier auditing of the same incident rather than in the incident.

The intention of a bad auditor is to prevent confronting. Therefore, bad auditing must be cleared away before a contacted engram can be completely entered again.

The process that most swiftly strips off bad auditing (to clean up engrams or otherwise) is:

“Recall something you have done to (auditor’s name).”

“Recall something you have withheld from (auditor’s name).”

These questions are run alternately (one after the other) and are best run muzzled. (TR 0, 1, 2 and 3 only—auditor only nods when preclear originates.)

This mechanism is probably behind most black or invisible cases now extant in Scientology.

How to Study Scientology

L. Ron Hubbard

The first thing that a student has to find out for himself and then recognize, is that he is dealing with precision tools here in the courses. It isn't up to someone else to force this piece of information on him. The whole subject of Scientology as far as the student is concerned is as good or bad in direct ratio to his knowledge of it. It is up to a student to find out how precise these tools are. He should, before he starts to discuss, criticize or attempt to improve on the data presented to him, find out for himself whether or not the mechanics of Scientology are as stated, and whether or not it does what has been proposed for it.

He should make up his mind about each thing that is taught in the school. The procedure, techniques, mechanics and theory. He should ask himself these questions: Does this piece of data exist? Is it true? Does it work? Will it produce the best possible results in the shortest time?

There are two ways to answer these questions to his own satisfaction: Find them in a preclear or find them in himself. These are fundamentals, and every auditor should undertake to discover them himself, thus raising Scientology above an authoritarian category. It is not sufficient that an instructor stand before him and declare the existence of these. Each and every student must determine for himself whether or not the instructor's statements are true.

As an example of a science in an Authoritarian Category, in the field of medicine some instructors declare that multiple sclerosis is the decay of nervous fibers, and that it is incurable, and that people who contract the "disease" die in a relatively short period of time. It must be answered in just this way on the examination paper or the student will find himself with less than a passing grade. This is not instruction—this is obstruction. In the first place, no one in a medical school knows anything about multiple sclerosis. A good instructor would expect his students to question such a statement and to find for themselves what can be done about multiple sclerosis.

There are two ways Man ordinarily accepts things, neither of them very good. One is to accept a statement because Authority says it is true and must be accepted, and the other is by preponderance of agreement amongst other people.

Preponderance of agreement is all too often the general public test for sanity or insanity. Suppose someone were to walk into a crowded room and suddenly point to a ceiling saying, "Oh, look! There's a huge, twelve-foot spider on the ceiling!" Everyone would look up, but no

one else would see the spider. Finally someone would tell him so. "Oh, yes, there is," he would declare, and become very angry when he found that no one would agree with him. If he continued to declare his belief in the existence of the spider he would very soon find himself institutionalized.

The basic definition of sanity in this somewhat nebulously learned society is whether or not a person agrees with everyone else. It is a very sloppy manner of accepting evidence, but all too often it is the primary measuring stick.

And then the Rule of Authority: "Does Dr. J. Doe agree with your proposition? No? Then, of course, it cannot be true. Dr. Doe is an eminent authority in the field."

A man by the name of Galen at one time dominated the field of medicine. Another man by the name of Harvey upset Galen's cozy position with a new theory of blood circulation. Galen had been agreeing with the people of his day concerning the "tides" of the blood. They knew nothing about heart action. They accepted everything they had been taught and did little observing of their own. Harvey worked at the Royal Medical Academy, and found by animal vivisection the actual function of the heart.

He had the good sense to keep his findings absolutely quiet for a while. Leonardo da Vinci had somehow discovered or postulated the same thing, but he was a "crazy artist" and no one would believe an artist. Harvey was a member of the audience of a play by Shakespeare in which the playwright made the same observation, but again the feeling that artists never contribute anything to society blocked anyone but Harvey from considering the statement as anything more than fiction.

Finally, Harvey made his announcement. Immediately dead cats, rotten fruit and pieces of wine jugs were hurled in his direction. He raised quite a commotion in medical and social circles until finally, in desperation, one doctor made the historical statement that, "I would rather err with Galen than be right with Harvey!"

Man would have made an advance of exactly zero if this had always been the only method of testing evidence. But every so often during Man's progress there have been rebels who were not satisfied with preponderance of opinion, and who tested a fact for themselves, observing and accepting the data of their observation, and then testing again.

Possibly the first man who made a flint axe looked over a piece of flint and decided that the irregular stone could be chipped a certain way. When he found that flint would chip easily he must have rushed to his tribe and enthusiastically tried to teach his fellow tribesmen how to make axes in the shape they desired instead of spending months searching for accidental pieces of stone of just the right shape. The chances are he was stoned out of camp.

Indulging in a further flight of fancy, it is not difficult to imagine that he finally managed to convince another fellow that his technique worked, and that the two of them tied down a third with a piece of vine and forced him to watch them chip a flint axe from a rough stone. Finally, after convincing fifteen or twenty tribesmen by forceful demonstration, the followers of the new technique declared war on the rest of the tribe and, winning, forced the tribe to agree by decree.

EVALUATION OF DATA

Man has never known very much about that with which his mind is chiefly filled: Data. What is data? What is the evaluation of data? For instance, if you have been in Scientology very long the chances are that someone has glibly told you that he knew from psychoanalysis that if one could remember childhood experiences one could be relieved of certain psychosomatic pains. His conclusion from this tiny scrap of information was that Scientology is not new. In 1884 when Breuer first presented this tiny fact to Freud, he was unable to convince the eminent Doctor, but he managed to convince Freud in the next ten years. Then Freud convinced his

friends. Medicine then fought Freud to a standstill, but eventually psychoanalysis emerged from the imbroglio.

All these years in which psychoanalysis has taught its tenets to each generation of doctors the authoritarian method was used, as can be verified by reading a few of the books on the subject. Within them is found, interminably, "Freud said" The truly important thing is not that "Freud said" a thing, but "Is the data valuable? If it is valuable, how valuable is it?" You might say that a datum is as valuable as it has been evaluated. A datum can be proved in ratio to whether it can be evaluated by other data and its magnitude is established by how many other data it clarifies. Thus, the biggest datum possible would be one which would clarify and identify all knowledge known to Man in the material universe.

Unfortunately, however, there is no such thing as a Prime Datum. There must be not one datum, but two data, since a datum is of no use unless it can be evaluated. Furthermore, there must be a datum of similar magnitude with which to evaluate any given datum.

Data is your data only so long as you have evaluated it. It is your data by authority or it is your data. If it is your data by authority, somebody has forced it upon you, and at best it is little more than a light aberration. Of course, if you asked a question of a man whom you thought knew his business and he gave you his answer, that datum was not forced upon you. But if you went away from him believing from then on that such a datum existed without taking the trouble to investigate the answer for yourself—without comparing it to the known universe—you were falling short of completing the cycle of learning.

Mechanically, the major thing wrong with the mind is, of course, the turbulence in it, but the overburden of information in this society is enforced education that the individual has never been permitted to test. Literally, when you are told not to take anyone's word as an absolute datum you are being asked to break a habit pattern forced upon you when you were a child.

Your instructor in Scientology could have told you what he found to be true and invited you to test it for yourself, but unless you *have tested it* you very likely do not have the fundamentals of Scientology in mind well enough to be comfortable in the use of any or all of the techniques available to you. This is why theory is so heavily stressed in Scientology. The instructor can tell you what he has found to be true and what others have found to be true, but at no time should he ask you to accept it—please allow a plea otherwise.

Test it for yourself and convince yourself whether or not it exists as truth. And if you find that it does exist, you will be comfortable thereafter; otherwise, unrecognized even by yourself you are likely to find, down at the bottom of your information and education an unresolved question which will itself undermine your ability to assimilate or practice anything in the line of a technique. Your mind will not be as facile on the subject as it should be. It is not through courtesy that you are being asked to check your data—you are being asked to become much better auditors by resolving your basic and fundamental concepts.

Any quarrel you may have with theory is something that only you can resolve. Is the theory correct, or isn't it correct? Only you can answer that; it cannot be answered for you. You can be told what other auditors have achieved in the way of results, and what other auditors have observed, but you cannot become truly educated until you have achieved the results for yourself. The moment a man opens his mouth and asks, "Where is validation?" you can be sure you are looking at a very stupid man. That man is saying, bluntly and abruptly, "I cannot think for myself. I have to have Authority." Where could he possibly look for validation except into the physical universe, and into his own subjective and objective reality?

A LOOK AT THE SCIENCES

Unfortunately, Scientology is surrounded by a world that calls itself a world of science, but it is a world that is in actuality a world of Authority. True, that which is science today is

far, far in advance of the Hindu concept of the world wherein a hemisphere rested on the backs of seven elephants which stood on seven pillars, that stood on the back of a mud turtle, below which was mud into infinity.

The reason engineering and physics have reached out so far in advance of other sciences is the fact that they pose problems which punish Man so violently if he doesn't look carefully into the physical universe.

An engineer is faced with the problem of drilling a tunnel through a mountain for a railroad. Tracks are laid up to the mountain on either side. If he judges space wrongly the two tunnel entrances would fail to meet on the same level in the center. It would be so evident to one and all concerned that the engineer made a mistake that he takes great care not to make such a mistake. He observes the physical universe, not only to the extent that the tunnel must meet to a fraction of an inch, but to the extent that if he were to misjudge wrongly the character of the rock through which he drills, the tunnel would cave in—an incident which would be considered a very unlucky and unfortunate occurrence to railroading.

Biology comes closer to being a science than some others because, in the field of biology, if someone makes too big a mistake about a bug the immediate result can be dramatic and terrifying. Suppose a biologist is charged with the responsibility of injecting plankton into a water reservoir. Plankton are microscopic "germs" that are very useful to Man. But if through some mistake the biologist injects typhoid germs into the water supply, there would be an immediate and dramatic result.

Suppose a biologist is presented with the task of producing a culture of yeast which would, when placed in white bread dough, stain the bread brown. This man is up against the necessity of creating a yeast which not only behaves as yeast but makes a dye as well. He has to deal with the practical aspect of the problem, because after he announces his success, there is the "yeast test": Is the bread edible? And the brown-bread test: Is the bread brown? Anyone could easily make the test, and everyone would know very quickly whether or not the biologist had succeeded or failed.

Politics is called a science. The punishment for a mistake in the "science" of politics is so tremendous that this whole culture is on the verge of being wiped out! There are natural laws about politics. They could be worked out if someone were to actually apply a scientific basis to political research.

For instance, it is a foregone conclusion that if all communications lines are cut between the United States and Russia, Russia and the United States are going to understand each other less and less. Then by demonstrating to everyone how the American way of life and the Russian way of life are different, and by demonstrating it day after day, year after year, there is no alternative but a break of affinity. By stating flatly that Russia and the United States are not in agreement on any slightest political theory or conduct of Man or nations the job is practically complete. Both nations will go into anger tone and suddenly there is war.

Russia is very, very low on the tone scale. She is a totalitarian slave state and about as safe to have in the family of nations as a mad dog at a cocktail party. We as a nation could be very, very clever—we could try to put Russia back together again.

We are a nation possessed of the greatest communications networks on the face of the Earth, with an undreamed of manufacturing potential. We have within our borders the best advertising men in the world. But instead of selling Europe an idea we give machine guns, planes and tanks for use in case Russia breaks out. The more threats imposed against a country in Russia's tone level, the more dangerous that country will become. When people are asked what they would do about this grave question, they shrug and say something to the effect that "the politicians know best." They hedge and rationalize by saying that after all, there is the American way of life, and it must be protected.

What is the American way of life? This is a question that will stop almost any American. What is the American way of life that is different from the human way of life? We have tried to gather together economic freedom for the individual, freedom of the press, and individual freedom, and define them as a strictly American way of life—why hasn't it been called the Human Way of Life?

In the field of humanities Science has been thoroughly adrift. Unquestioned authoritarian principles have been followed. Any person who accepts knowledge without questioning it and evaluating it for himself is demonstrating himself to be in apathy toward that sphere of knowledge. It demonstrates that the people in the United States today must be in a low state of apathy with regard to politics in order to accept without question everything that happens.

FUNDAMENTALS

When a man tries to erect the plans of a lifetime or a profession on data which he himself has never evaluated, he cannot possibly succeed.

Fundamentals are very, very important, but first of all one must learn how to think in order to be absolutely sure of a fundamental. Thinking is not particularly hard to learn. It consists merely of comparing a particular datum with the physical universe as it is known and observed. How, for instance, would you find out for your own satisfaction that there exists such a thing as a mock-up. Find a preclear who is also interested in verifying such existence of mock-ups or have someone run you on them.

Your instructor has done this a sufficient number of times, and has seen it done to others a sufficient number of times to satisfy himself that mock-ups exist and can be run and bettered on a preclear. But just because they exist for him and he informs you of his knowledge does not mean that it exists for you. Unless you have made up your mind through comparison of the information with the known universe, you will not be able to handle mock-ups properly. When there is an authoritarian basis for your education you are not truly educated.

Authoritarianism is little more than a form of hypnotism. Learning is forced under threat of some form of punishment. A student is stuffed with data which has not been individually evaluated just as a taxidermist would stuff a snake. Such a student will be well-informed and well-educated according to present-day standards, but unfortunately he will not be very successful in his chosen profession.

Indecision underlies an authoritarian statement. Do not allow your Scientology education to lie on the quicksand of indecision.

Unless you have looked into the matter of engrams and unless you have actually run a preclear into an engram—the realization that (1) there is a time track, and (2) that physical pain can be stored and can be recovered, and (3) that all the perceptics are registered during these moments of unconsciousness, will not be yours. Your knowledge concerning the engram depends exclusively upon what you have observed about that engram.

There have been volumes of articles written about techniques of running engrams. There are many techniques in existence which run them. Make up your mind whether or not they work for you.

First of all, find out to your own satisfaction whether or not there is an engram in existence. Then determine whether or not the technique in question will discover the engram for you, and whether or not the technique really runs the engram. Having made certain that there is an engram, ask yourself what kind of technique you would evolve if you decided to do something about this object, the engram. How would you go about it? Unless you have asked yourself this question and tried to come to a definite conclusion about it, you will never come into agreement on the technique of running engrams! You will be performing an authoritarian

rote. You can learn how to run an engram by rote, but unless you decide from your own observation that there is an engram to be run you will be simply performing some ritual in which a mistake is very easy to make.

An auditor who does not understand memory has no business attempting to improve a preclear's memory. He could hardly know what the anatomy of memory is. It cannot be done well by rote. About the worst thing that could happen to a preclear is to drop into something and then feel that the auditor is thinking, "Now, let's see—it was page 62 . . . or was it 63? . . . and the question was . . ." while the preclear sits there, suffering, and thinking, "Do something! Say something!" An auditor who is auditing by rote will make mistakes like that because he does not have the basic fundamentals as a part of his background of training.

A truly good auditor doesn't have to think twice. He knows "instinctively" how the auditing session itself should be run. When the basic fundamentals are securely the auditor's own there is no need for him to be told what must be done.

You are asked to examine the subject of Scientology on a critical basis—a very critical basis. It is not to be examined with the attitude that when you were in school you learned that such and such was true, and since you learned that first, the first learning takes precedence. A prime example of this is the literary critic who says, after reviewing a book, that the book is not a novel because it is not a cross section of life. His professor in literature gave him a passing grade because he answered the question "correctly" on his examination paper, and therefore a book is not a novel unless it is a cross section of life.

There is yet to appear a good definition for aesthetics and art, and yet they parrot a definition for a specific form of art!

Do not make the mistake of criticizing something on the basis of whether or not it concurs with the opinions of someone else. The point which is pertinent is whether or not it concurs with your opinion. Does it agree with what you think?

Nearly everyone has done some manner of observing of the material universe, and there is surely no one in Scientology who has not done some small amount of observation of organisms. No one has seen all there is to see about an organism, but there is certainly no dearth of organisms available for further study. There is no valid reason for accepting the opinion of Professor Blotz of the Blitz University who said in 1933 that schizophrenics were schizophrenics, and that made them schizophrenics for all the time.

If you are interested in the manifestation of insanity, there is any and every form of insanity that you could hope to see in a lifetime in almost any part of the world. Study the peculiarities of the people around you and wonder what they would be like if their little peculiarities were magnified a hundred fold. You may find that by listing all the observable peculiarities you would have a complete list of all the insanities in the world. This list might well be far more accurate than that which was advanced by Kraepelin and used in the United States today.

If sanity is rationality and insanity is irrationality, and you postulated how irrational people would be if certain of their obsessions were magnified a hundred fold, you might well have in your possession a far more accurate and complete list of insanities and their manifestations than is currently in existence.

If you will take the time and effort, then, of making a complete examination of your subject, introspectively and by observation, you will find that you have suddenly become an excellent auditor. The hard way is to sit down and memorize a third of a million words contained in *Science of Survival*—the method all too many educational systems employ in this age.

So then we ask you to look at Scientology, study it, question it, and use it as we present it and you will have discovered something for yourself. And in so doing you might well discover a lot more. What you will be doing in Scientology, the techniques and the theories are highly workable, but they are not highly workable just because we say so!

Since Scientology is a very precise science based on proven data, axioms, and precise procedures, it must be used exactly as stated in order to gain the results which have been obtained. By using it with understanding the student can observe for himself its workability. When you have applied it as it should be, and applied as it is taught at the school, and still find it unworkable, it is your privilege to question it and, if you like, reject it.

But it is a very funny thing, in the history of Scientology the only people who have shouted out against Scientology are those people who know little or nothing about it or they have been given some erroneous data about it and had used a very bad perversion of Scientology and said, "This is the way it is."

So, the only advice we can give to the student is study Scientology for itself and use it exactly as stated, then form his own opinions. Study it with the purpose in mind of arriving at his own conclusions as to whether or not the tenets he has assimilated are correct and workable. Compare what you have learned with the known universe. Seek for the reasons behind a manifestation, and postulate the manner and in which direction the manifestation will likely proceed. Do not allow the Authority of any one person or school of thought to create a foregone conclusion within your sphere of knowledge. Only with these principles of education in mind can you become a truly educated individual and a good Scientologist.

HOW TO SELECT SELECTED PERSONS

(Supplementing HCO Bulletin of February 16, 1959)

In Selected Persons Overt Straightwire, there is an element of diagnosis. How does one select the “selected person”?

Every time this process misses on a preclear, one of three things is at fault, either—

1. Pc has pt problem
2. Dynamic Straight Wire should have been run a week or two
3. The wrong person was selected for the process.

The whole thing is a matter of attention units (1950). If the preclear has his attention totally fixed on a terminal, little else is real to him. Look at one object only in a room. How real are the other objects? If a preclear’s attention is all bound up in some person, how can he find reality elsewhere.

Very well—how do we find, then, the “selected person”?

The most loaded two-way comm question is,

“Who in your life is to blame for the condition you’re in?”

Others of like ilk produce the “selected person” you then run on Selected Persons Overt Straight Wire.

“Who was the person who really had it in for you?”

“Who do you know or did you know that you’d really *hate* to be?”

If the pc to any of the above or all of them says, “myself”, that’s what you have to run.

Select a new person each time pc splits off the one you’re running. You’ll find some amazing valence shifts.

HCO BULLETIN OF 28 FEBRUARY 1959

ANALYSIS OF CASES

A primary skill required of an accomplished auditor would be analysis of a case. The basic error is overestimating the case's ability. All failures stem from a failure to undercut the reality of a case. If that reality level is reached, the case will improve. If not, the case remains stagnant.

RESULTS DEFINED: Case achieves a reality on change of case, somatic, behavior or appearance, for the better.

BETTER DEFINED: Negative gain. Things disappear that have been annoying or unwanted.

ABILITY GAIN DEFINED: Pc's recognition that pc can now do things he could not do before.

INTELLIGENCE GAIN DEFINED: Loss of restimulation of stupidity by reason of attempts to confront or experience the problems of life. (Intelligence appears when stupidity is keyed out or erased.) Intelligence is a confronting ability.

FAMILIARITY: or familiarization permits intelligence to manifest. Reaching and withdrawing are more possible when stupidity is keyed out or erased. Increasing ability to reach and withdraw increases intelligence.

It can be seen that when attention is fixed, the ability to reach and withdraw decreases, therefore intelligence decreases, therefore the ability to change decreases, therefore no "case gain".

Unfixing attention is done in various ways. As hypnotism is done by fixing attention, a parallel observation is that a person wakes up, receives less fixed effect, when attention becomes unfixed.

Unfixing attention must be done by increasing ability to reach and withdraw from the specific thing or person on which attention is fixed in the bank. The bank merely expresses a recording of past attention fixations.

Shocks of various kinds can unfix attention but always lead to a decrease in ability over a period. Unfixing attention by violence throws a case downscale. As the case goes upscale the attention refixes on things violence unfixed it from.

Clearing is a gradient process of finding places where attention is fixed and restoring the ability of the pc to place and remove attention under his own determinism.

Case Analysis consists then of the determination of where pc's attention (at current state of case) is fixed on the track and restoring pc's determinism over those places.

This is done by:

1. PT Problem running.
2. Dynamic survey and remedy of fixed points.

3. Selected items and persons survey and unfixing other-determined attention at those points.

The auditor's skill in locating where attention is now fixed is even greater now than the auditor's ability to remedy the fixation of the pc's attention since this latter problem is fairly well in hand.

There are many ways of doing a survey to determine what the pc's attention is fixed upon now. The E-Meter and interrogation of the pc are the main methods.

"What has your attention been fixed on lately (or 'in this Life')?" would elicit a reply that could then be used in the questions

"Recall a time when you did something to (item or person so located)."

"Recall a time when you withheld something from (item or person so selected)."

If you find the exact item or person on which attention is fixed, you achieve immediate case gain, which is to say reality, which is to say interest, in-sessionness, success.

If any pc you are running has not manifested case gain, reality, interest, in-sessionness, then one of two things is true:

1. You haven't found the item or person on which pc's attention is other-determinedly fixed and haven't run it yet, or
2. Pc is gone-man-gone.

I trust this may be of some small assistance in learning how to analyze a case.

CLEARING COMMANDS

Excerpt from HCO Bulletin of July 28, 1958

CLEARING COMMANDS: Clear each word with the full phrase once each with the following:

“What is the usual definition of the English (or other language) word__?”

Do not ask for definitions over and over as a repetitive command. If pc's definition is poor, clear command every few commands.

Clear only each different word in a bracket. Don't clear each line in a bracket.

MAGAZINE MATERIAL

TWO RULES FOR HAPPY LIVING

1. Be able to experience anything.
2. Cause only those things which others are able to experience easily.

Man has had many golden rules. The Buddhist rule of “Do unto others as you would have these others do unto you”, has been repeated often in other religions. But such golden rules, while they served to advance Man above the animal, resulted in no sure sanity, success or happiness. Such a golden rule gives only the cause point, or at best the reflexive effect point. This is a self-done-to-self thing and tends to put all on obsessive cause. It gives no thought to what one does about the things done to one by others not so indoctrinated.

How does one handle the evil things done to him? It is not told in the Buddhist rule. Many random answers resulted. Amongst them are the answers of Christian Science (effects on self don't exist), the answers of early Christians (become a martyr), the answers of Christian ministers (condemn all sin). Such answers to effects created on one bring about a somewhat less than sane state of mind—to say nothing of unhappiness.

After one's house has burned down and the family cremated, it is no great consolation to (1) pretend it didn't happen, (2) liken oneself to Job or (3) condemn all arsonists.

So long as one fears or suffers from the effect of violence, one will have violence against him. When one *can* experience exactly what is being done to one, ah magic, it does not happen!

The most basic proof of this is the earlier tests with problems of comparable magnitude and later tests of “selected overts”. When the problem or terminal is no longer restimulative, it ceases to have power to harm one.

How to be happy in this universe is a problem few prophets or sages have dared contemplate directly. We find them “handling” the problem of happiness by assuring us that man is doomed to suffering. They seek not to tell us how to be happy but how to endure being unhappy. Such casual assumption of the impossibility of happiness has led us to ignore any real examination of ways to be happy. Thus we have floundered forward toward a negative goal—get rid of all the unhappiness on Earth and one would have a liveable Earth. If one seeks to get rid of something continually, one admits continually he cannot confront it—and thus everyone went down hill. Life became a dwindling spiral of *more* things we could not confront. And thus we went towards blindness and unhappiness.

To be happy, one only must be *able* to confront, which is to say, experience, those things that are.

Unhappiness is only this: the inability to confront that which is.

Hence (1) Be able to experience anything.

The effect side of life deserves great consideration. The self-caused side also deserves examination.

To create only those effects which others could easily experience gives us a clean new rule of living. For if one does, then what might he do that he must withhold from others? There is no reason to withhold his own actions or regret them (same thing) if one's own actions are easily experienced by others.

This is a sweeping test (and definition) of good conduct—to do only those things which others can experience.

If you examine your track you will find you are hung up only in those actions a person did which others were not able to receive. Hence a person's track can become a hodge-podge of violence withheld which pulls in then the violence others caused.

The more actions a person emanated which could not be experienced by others, the worse a person's track became. Recognizing that he was bad cause, or that there were too many bad causes already, a person ceased causing things—an unhappy state of being.

Pain, misemotion, unconsciousness, insanity all result from causing things others could not experience easily. The reach-withhold phenomena is the basis of all these things. When one sought to reach in such a way as to make it impossible for another to experience, one did not reach, then, did he? To “reach” with a gun against a person who is unwilling to be shot is not to reach the person but a protest. All *bad* reaches never reached. So there was no communication and the end result was a withhold by the person reaching. This reach-withhold became at last an inability to reach—therefore low communication, low reality, low affinity.

All bad acts then are those acts which cannot be easily experienced at the target end.

On this definition let us review our own “bad acts” (or overts). Which ones *were* bad. Only those that could not be easily experienced by another were bad. Thus *which* of society's favorite bad acts are bad? Acts of real violence resulting in pain, unconsciousness, insanity and heavy loss could at this time be considered bad. Well what other acts of yours do you consider “bad”? The things which you have done which you could not easily yourself experience were bad. But the things which you have done which you yourself could have experienced had they been done to you were *not* bad. That certainly changes one's view of things!

Only processing can bring a person to a point where he or she could experience anything without enduring consequence. So it is no wonder that philosophy of yesteryear was stopped on “happiness” as a subject.

But all processes from the beginning of Dianetics and Scientology until now which improved the ability to confront (or experience) were gaining toward the goal. All processes that eradicated experience only were poor processes. The early drop in gains in processing (1950) came about because people dramatized an eradication of all badness. The auditors were unwilling to let the pcs experience anything, the pcs sought to get rid of things without experiencing things.

There is no need to lead a violent life just to prove one can experience. The idea is not to *prove* one can experience but to regain the *ability* to experience which is only done in processing.

Thus today we have two golden rules for happiness:

1. Be able to experience anything; and
2. Cause only those things which others are able to experience easily.

Your reaction to these tells you how far you have yet to go in processing. And that is the first time we knew that.

And if we achieve these two golden rules, we Scientologists would be the happiest and most successful people in this universe for who could rule any of us with evil?

Of course these are the characteristics of gods—But who said we were trying to make anything else?

PROCESSES USED IN 21ST ACC

Compiled from the Research Material and Taped Lectures of L. Ron Hubbard

I want to take up here with great rapidity the processes from bottom to top that we have so far found and that have been effective, and some additional data in running them.

And first is the process Dynamic Straightwire. The way to do a survey on Dynamic Straightwire is this: you ask the person to describe the dynamics from one to eight. We don't care about them being sequitur—change them round if you wish.

Now, you ask a person to describe each one of these dynamics. You are watching an E-Meter for a change in pattern. Therefore you must carefully isolate the pattern, before you can tell whether or not the pattern has changed on the E-Meter needle reading. But, more important than that, you are looking for a dynamic the preclear makes mistakes about while he is trying to describe it, a dynamic he cannot describe, or a dynamic he won't even approach and is very leary of, and his statement is confirmed by the E-Meter reading. In other words, you've got the statement of the preclear in this particular analysis being stacked up against the E-Meter reading all the way through in an analysis or diagnosis for Dynamic Straightwire.

All right. We go all the way through, asking for a terminal on these dynamics and we finally get a repeat. We will ask him for terminals on these dynamics, and we will get the same dynamic to read again. Now the basic rule which sorts this out is: Any dynamic which doesn't clear by two-way comm has to be run. Simple as that. Any dynamic which doesn't clear by two-way comm has to be run.

So, if you have two or three dynamics jammed up, you can hope that two of them will clear up, leaving you with the remaining dynamic.

But this is not the complete criteria of what you run. There is another stable datum. Don't run a terminal that is totally unreal to the preclear. Another stable datum, which comes on top of it, is: never run a terminal that is sensible. Never. If a terminal belongs on the dynamic, you can almost say you'll get nowhere running it. So you're looking for terminals that the preclear gives you for a dynamic which don't belong on the dynamic at all.

Now, if that terminal is real to the preclear, you will get a tremendous change in the case. If that terminal is totally unreal to the preclear and if it does belong on the dynamic, why, you're not going to get any change on the case, so why run it? Might as well run some other process.

So, we have several conditions by which the diagnosis on Dynamic Straightwire works. I've done enough of these now and run enough of them, isolated enough of them and gotten

conditions of change on enough of them, to realize that every time you changed a case you had (1) a person who couldn't describe the dynamic accurately, or who made mistakes while trying to describe it, (2) a person who gave you a non sequitur or erroneous terminal for that dynamic—the terminal was fairly real to the preclear, although it didn't belong there—and (3) you ran that, and it opened up track like mad.

What have you got here? You have a terrific identification. You are trying to undo identification that is lying right on the top. Well, this tells you, then, that it is neither a long process nor an invariable process. Given enough skill, you could undoubtedly find one of these on every case—given enough skill. But it is limited by auditor skill. Furthermore, it gives auditors a chance to “chop up” preclears and it gives auditors a chance to write some script, so this one has liability. And auditors have been writing script like mad. We had one particular case where the preclear couldn't say any terminal on the seventh dynamic, so promptly the auditor jumps in and takes the nearest related thing to the seventh dynamic, the thetan, he could get. This was A Head, and he ran A Head, and the preclear had nothing to do with it, and they wondered why the case didn't advance.

Now, you have auditors who are letting the preclear *choose*. In other words, there are auditors who actually believe that a preclear is permitted power of choice in an auditing session. And this is the biggest bug I have found existing at this instant on this ACC. That one's a blinker. They are probably not telling you this, that they think a preclear has power of choice. They don't know this: that it has to be nutty if you are going to run it—if it makes sense, why run it? They are looking for a wrongness in the preclear and they believe that the preclear knows all about his own case and could straighten it out all by himself. And that the auditor is an unnecessary adjunct. Now there are several people on this ACC who believe this and this is a great compliment to their faith in human nature, but it's certainly of no value in an auditor. The preclear has no power of choice at all. The one the preclear would never choose is the one you run.

An example: We had a preclear here who gave three terminals on the fifth dynamic. One of these was a mountain. So the preclear was given the power of choice as to which one to run and, of course, came up with a cat. So they sat there running cats. Well, a cat happens to be right for the fifth dynamic, so why straighten it out? The process is aimed at straightening out something. Obviously, the mountain was wrong. The preclear was totally stuck on the idea that there was a mountain in on this.

We found a mountain on the eighth dynamic in another case that hasn't been running. This case had been running metal on the sixth dynamic. So what? Metal belongs on the sixth dynamic—why run it? Get the idea? But this auditor had found a mountain on the eighth dynamic and ignored it. Of course, everybody knows God is a mountain—that's obvious

Now, this was the one to hit. And where you find these people out of session it is because nobody has trailed down a nutty dynamic. When they're out of session on Dynamic Straightwire, they're not interested in it at all, they are just not running an identification. They're running something reasonable, and at once the biggest liability of auditors is that they are reasonable and that they write script and write in reasonable reasons for it all. And they're trying to audit unreasonability out of people—and these two things just don't go together at all.

The next process up the line is Selected Person Overts. Select a terminal who is real to the preclear and, as you undercut the process, it comes closer and closer to present time. The person chosen has to be closer and closer to present time the more you try to go downscale on the process. But the person must be real, that's a criteria in there. And the next thing about it is, you must flatten off several of these people. And the basic reason for this is to prepare an individual to own up to some responsibility for his own actions. Unless he can assume some responsibility for his own actions, he won't do anything in an auditing session, so this is the one that cures.

The auditing command for Selected Person Overts is **“Recall a time you did something to (the selected person’s name).”** But that is undercut by the auditing command **“Think of something you did to ___”** or **“Think of something you have done to ___.”** Now, the reason you say “Think” is because these people are very chary of owning up to anything or accepting any responsibility out in broad daylight in front of God and everybody, so you run “Think” and you’ve got a lot of people who are having a rougher time who won’t own up to their own lives and who can’t take responsibility for them on the third dynamic, but can take responsibility for them on the first dynamic. And this is the dynamic selection. So “Think” undercuts “Recall.”

The next one—General Overts—is much less effective when it has not already been undercut by Selected Person Overts. The individual just goes on and on with sweetness and light. The auditing command for General Overts is **“Recall a time when you did something to somebody.”** Now there are other phrases and so forth which could be used for this sort of process, but here we are interested mainly in people. We are not very interested in MEST and the remaining four dynamics. They’d splatter all over the place. That’s why it’s “to *somebody*.” If you said “something,” you would get the remaining four, so there is an alternate command in here if you wanted to run the other four dynamics. You would say, **“Recall a time when you did something to something.”**

Now, the next one up the line from this is Not-Is Straightwire: **“Recall a time when you implied something was unimportant.”** And this, we find, is best run on an alternate basis with the next auditing command, **“Recall a time when somebody else thought something was important.”** These two commands are alternated, one after the other, and you get these cases that are in a jam.

This is the direct cure of notisness; and where you have a case that is running a bad not-is, a process can evidently be invalidated or not-ised when the individual is out of session, or overnight. This is what Not-Is Straightwire cures. These are the people on whom a process works once, and never works again. These people are not-ising so badly that they can’t duplicate—and not-is, of course, is a mechanism to prevent duplication. So you cure, not duplicate. And the cure for it is Not-Is Straightwire.

HCO BULLETIN OF 4 MARCH 1959

HGC ALLOWED PROCESSES

(Also for Instruction in HPA/HCA and ACC)

(Supersedes all earlier HGC allowed Processes
except where these give data on the following)

Processes on gradient scale from unconscious pc to theta clear.

CCH 1, 2, 3, 4
Rudiments (Not CCH 0)
PTP by Selected Person Overt-Withhold Straight Wire
Know to Mystery Straight Wire (See later bulletins)
Dynamic Straight Wire
ARC Straight Wire
Selected Person Overt-Withhold Straight Wire
General Overt-Withhold Straight Wire
Factual Havingness (and Third Rail)
ARC Break Straight Wire
Not-Is Straight Wire
Past and Future Experience
What Can You Confront
You make a mock-up for which you can be totally responsible
Track Scout
Engram Running
Route One

The target of these processes is theta clear as different from MEST clear. Therefore, the higher MEST clear processes, Help and Step 6, are omitted.

We are not trying to make MEST clears in the HGC; therefore, Help and Step 6 are disallowed.

On old Dianetic cases or where engrams have been run by other auditors, run Selected Person Overt-Withhold on "an auditor" and "a preclear" until track is free. This is a necessary early step to get some cases moving.

Engram running should not be used by those not trained in it.

Muzzled auditing should be used when:

1. Pc ARC Breaks easily;
and
2. Auditor shows signs of over-communication.

Be prepared to run Selected Person Overt-Withhold Straight Wire for as long as 3 to 5 weeks if pc begins to have emotional changes on it.

HCO BULLETIN OF 6 MARCH 1959

TRAINING DRILLS

NAME: ARC Break

POSITION: Student and coach sit facing each other a comfortable distance apart.

COMMANDS: The coach makes up his mind there has been an actual specific ARC break. He doesn't tell the student. He then says, "Start". Then the student says:
"HAVE I DONE SOMETHING WRONG?"

The coach answers this appropriately and the student says:
"WHAT WAS IT?"

The coach answers, and then the student says:
"WHEN WAS IT?"

The student gets it described and then says:
"HOW IS IT NOW?"

Then when he's got it more or less stamped out here then he takes it on the other side of the picture and says:
"HAVE YOU DONE SOMETHING WRONG IN THIS SESSION?"

The coach answers that appropriately and the student auditor asks:
"WHAT WAS IT?" "WHEN WAS IT?" and "HOW IS IT NOW?"

When all have been handled satisfactorily the coach ends that cycle of action and then starts a new one.

PURPOSE: Is to train the student to handle ARC breaks in a session and to get them handled quickly and effectively on both the overt and motivator side, since there's always an overt connected with an auditing ARC break of one kind or another.

TRAINING STRESS: The training stress is on the reality and actuality of ARC breaks and the necessity of handling them. It should be pointed out that on an E-Meter it is the ARC break that causes the rising needle and also it must be pointed out that in actual auditing he will be using an E-Meter since he's not running this with a meter in his hand. In real auditing he flattens it until his meter shows no change on the subject. In running this TR he is simply going to flatten it by the seat of his pants and the satisfaction of the coach.

This is a 2-way comm formal auditing non-duplicative process and is only used to patch up ARC breaks when one occurs. It is not a repetitive command process which is supposed to do something terrific for the pc. It doesn't. It is just supposed to keep the session on the road and is not in itself therapeutic.

The student never answers or explains to the coach about the ARC break. In other words, we must keep the Auditor's Code while running an ARC break out. Probably more strongly than we would ordinarily keep an Auditor's Code. No evaluating questions. No invalidating questions. No explanations.

It should be understood that an ARC break is the only thing that will depress a profile. Nothing else will depress a profile except an ARC break. Handling ARC breaks is the only thing which keeps the profile from being depressed so this is a pretty important TR and it's really got to be smooth and free. It is the one thing that can submerge an engram or foul the session. It should be understood that in actual auditing if the pc gives the auditor the Break as soon as the auditor asks for it, the question "What is it?" is dropped.

**HOW TO DO A
DIAGNOSIS ON DYNAMIC STRAIGHTWIRE**

You ask the person to describe the dynamics from one to eight. We don't care about them being sequitur; any way you want to break it up, we don't care.

Now you ask a person to describe each one of these dynamics. You are watching an E-Meter for a change in pattern. Therefore, you have to carefully isolate the change of pattern before you can tell whether or not the pattern's changed on the E-Meter needle reading. But more important than that, you are looking for a dynamic that he makes mistakes on while he is trying to describe it, a dynamic he cannot describe, a dynamic that he won't even approach, that he is very leary of, and his statement is confirmed by the E-Meter reading. In other words, you have got the statement of the pc in this particular analysis or diagnosis for Dynamic Straightwire.

All right, then, we go all the way through asking for a terminal on these dynamics and we finally get a repeat. We will ask him for terminals on these dynamics; we'll get the same dynamic to read again. Now the basic rule which sorts this out is—any dynamic which doesn't clear by two-way comm has to be run. Simple as that. Any dynamic which doesn't clear by two-way comm has to be run.

Don't run a terminal that is totally unreal to the preclear. Another stable datum which comes on top of it is: Never run a terminal that's sensible. *Never*. If a terminal belongs on the dynamic you can almost say you'll get nowhere running it. So, you are looking for terminals that they give you for a dynamic which don't belong on the dynamic at all.

Now, if that terminal is real to the pc you will get a tremendous change in the case. If that terminal is totally unreal to the pc and if it does belong on the dynamic, why you're not going to get any change on the case, why run it? Might as well run some other process. It is neither a long process nor an invariable process. Given enough skill you could undoubtedly find one of these on every case. Given enough skill. But it is limited by auditor skill. Furthermore, it gives auditors a chance to chop up pcs and it gives auditors a chance to write some script.

You do not let the pc choose. You have auditors who actually believe that a pc is permitted power of choice in an auditing session. That one's a blinker.

Where you find pcs out of session, it's because nobody has trailed down a nutty dynamic.

HCO BULLETIN OF 10 MARCH 1959

Dist:

All Staff
All Offices

**SUPPLEMENTAL DATA SHEET TO HCO BULLETIN OF FEB 16, 1959
AND STAFF AUDITORS' CONFERENCE OF FEB 16, 1959**

The Feb 16 Bulletins, done rapidly to inform staff auditors, omitted the full gradient processes.

Some of the omitted (and very important) processes are Overt-Withhold Straight Wire, General Overt-Withhold Straight Wire, ARC Break Straight Wire, Third Rail, What Can You Confront and Mock Up Responsibility.

The complete list in order of use on any case is:

ROUTE THETA CLEAR

1. Rudiments and TR 5N
2. Present Time Problem
3. Dynamic Straight Wire
4. Overt-Withhold Straight Wire
5. General Overt-Withhold Straight Wire
6. ARC Break Straight Wire
7. Third Rail
8. What Can You Confront
9. Mock up a picture for which you could be totally responsible
10. Not-Is Straight Wire
11. Past and Future Experience
12. Engram Running
13. Route One (When theta clear is obtained)

This is a complete route to theta clear on all cases so far examined and audited (which contained some real "what walls").

Steps 1 to 5 above inclusive, if flattened, constitute a RELEASE.

The HAS Co-Audit Processes are:

3. Dynamic Straight Wire
4. Overt-Withhold Straight Wire
5. General Overt-Withhold Straight Wire

with the Instructor starting and stopping all sessions and doing all assessments. The auditing itself is severely muzzled.

HCA/HPA Professional Processes include 1 to 8 above inclusive.

HCS/BScn Processes include 1 to 11 inclusive.

HGS/DScn Processes include entire list.

PROCESSES USED IN 21ST ACC

(Continued from P.A.B. No. 155)

*Compiled from the Research Material and Taped Lectures
of L. Ron Hubbard*

All of these straightwire processes run best with an E-Meter, using the question "When?" About the only reason we came off *time* was because auditors were using time to harass. It is not that it isn't best to run it with time—it is best to run it with time. The muzzled fashion of running here is "Recall a time ... when"

The guy says he did.

"When?"

All right, the next response on the preclear's part is, "I don't know." Then the auditor goes into action.

Now, when you hound them and mix them up and twist them up and mess them up with time questions, all that's happening is that the auditor is dramatizing his own confusion about time, and he probably wouldn't accept the preclear's answer if it was three o'clock, September 2nd, 1959.

Muzzled Auditing is very severely this: The auditor utters the auditing command, the preclear answers it, and the auditor says, "All right." The preclear originates, the auditor nods. Let's make this a very severe definition of what we call muzzled auditing. Now, when you let the auditor go a little bit and give him an E-Meter and "When?" my experience and observation here in the 21st ACC is, he just goes for broke. It's rather as if you cut two strands of a three-strand rope and he quickly busts the other strand. In other words, it's muzzled or nothing. And where you have somebody who is doing any chop-up or is stacking up ARC breaks in any way, you have as your best answer "muzzled," and muzzled is *muzzled*. And they can't say "When?" either, because evidently if you give them "When?" they can go for broke and they can use "When?" and the answers thereof to chop the preclear up.

We did try to install a muzzled "When?" For my money, it hasn't been successful. We've had at least one of our people exceed this at once. Just letting him open his mouth starts the machine. "It's all right for you to say 'When?'" *you* can say to this auditor—"It's all right for you to say 'When?'" "Right away, he says, "Well, I've got to do something else." And so forth. We have even found that muzzled auditing wouldn't go on this one: "I'll repeat the auditing command." You can't even let them do that. You can't let them say this, because it has been used to invalidate the preclear. We have an auditor (he's not an auditor, he's a case) who, every time the preclear answers the question, says, "I'll repeat the auditing command." The

preclear tries to answer the question again, and the auditor just uses this as a non-acceptance. So this can't go as part of muzzled auditing. That so far has been my observation.

This may be a very harsh look, but I feel from what I have observed that I am justified.

As I have already mentioned, we've got another condition here—reasonability. People have been writing script on the preclear's engrams to some degree. That is a great evil. And those people we have turned loose and those people who are running engrams and are saying this sort of thing are doing pretty well, and some of them are writing a bit of script. And the main thing they are *not* doing is picking up the overts. There are a couple of them stalled around here on overts.

There is a rule about this: When they cannot easily find or run the overts, take them right straight on down to Dynamic Straightwire. These people are not owning up to their own responsibilities and that means—perhaps because the case has changed over to an area of irresponsibility—that you have a situation here in which the individual has dropped out responsibility factors to such a degree that he cannot be trusted. When a person won't own up to his overts, you have an irresponsibility of great magnitude. This goes hand-in-glove with failing to answer the exact auditing command, failing to execute an auditing command, and so forth. And that can happen while running engrams.

Magazine Article

AN INSANITY QUESTIONNAIRE

The World Health Organization has issued the following questionnaire to determine whether or not a person is insane, and infers that if one answers "yes" to any of the following, he is insane and needs help:

Are you *always* worrying?

Are you *unable* to concentrate because of unrecognized reasons?

Are you *continually* unhappy without justified cause?

Do you lose your temper *easily* and *often*?

Are you *troubled* by regular insomnia?

Do you have wide fluctuations in your moods, from depression to elation, back to depression, which *incapacitate* you?

Do you *continually* dislike to be with people?

Are you *upset* if the routine of your life is disturbed?

Do your children *consistently* get on your nerves?

Are you "browed off" and *constantly* bitter?

Are you afraid *without real cause*?

Are you *always* right and the other person *always* wrong?

Do you have *numerous* aches and pains for which no doctor can find a physical cause?

Scientology organizations as the leaders in the field of mental ability are doing the only successful work in correcting such disabilities.

The first sweeping, low cost attack on mental disability is now under way in Scientology organizations with HAS Co-Auditing courses, now beginning on all continents.

DO IT YOURSELF THERAPY

At last we have a successful way for the untrained person or the financially embarrassed Scientologist to make it all the way to *release* and prepare himself for theta clear at *low cost*.

Heavily supervised co-auditing at HAS level has become possible with my development of two things,

1. Processes that undercut most reality levels, and
2. Muzzled auditing.

For as little as 2 gns (or \$10) a week, one can have the major benefits of Scientology by giving a little and getting a lot.

HAS Co-auditing courses are run by all major Central Organizations and are being started in HCO enfranchised centres.

The applicant enrolls in the PE Course and receives a week of theory. He graduates to a Comm Course lasting two weeks of three nights each and costing 2 gns (or \$10) per week. He receives his HAS certificate and graduates to co-auditing for three nights a week for 2 gns (or \$10) per week and continues on until he reaches the state of *release*. This may take many months but he gains all the way in health, on his job, in his environment.

The co-auditing is done "muzzled" and under the heavy supervision of a trained professional who knows how to do it.

It is only successful if so done.

These new processes and muzzled auditing can be the beginning of a new civilization. For, cases are cracking on these units with such frequency and speed that even old timers instructing them are getting an eager new look.

A *release* is a person whose case "won't get any worse". He begins to gain by living rather than lose.

Release is a way point toward theta clear. A good release can be theta cleared by a professional running engrams in from 50 to 125 hours.

This is the new look. If you want to know more about it, write Hubbard Communications Office Worldwide in London or your nearest central organization.

We can put hundreds of thousands upstairs rapidly if we follow this well-blazed trail.

We are *still* winning.

HCO BULLETIN OF 24 MARCH 1959

Dist: WW

HAS CO-AUDIT

All offices should recognize that we have something new and startlingly successful in HAS Co-auditing done by and in the organization as an adjunct of the PE Foundation.

The complete gen on how to do this will be released in the very near future on these lines. This bulletin is to point out its importance.

It is expected that the following cities will begin in the central organization HAS Co-auditing courses immediately on receipt of the technical information:

London (already in progress), Los Angeles, New York, Melbourne, Johannesburg (where the information already exists), Paris, Washington (optional), Auckland (where the information already exists), Perth.

At once all names and addresses of all PE attendees should be gotten in order as mailing lists by the above organizations for their areas and they should stand by to make an immediate mailing.

Persons for night work should be appointed by the above organizations as follows:

PE Foundation Director
PE Foundation Instructor
HAS Comm Course Instructor
HAS Co-audit Supervisor.

The PE Foundation basic course is one week long—5 nights. HAS Comm Course is three nights a week, Co-audit supervised is the same three nights. In case of crowded quarters the HAS Comm Course should be on a different three nights than the HAS Co-audit, i.e. Monday, Wednesday, Friday Comm Course; Tuesday, Thursday, Saturday Co-audit.

The charge to any applicant should be two or three guineas per week or \$10.

THIS IS THE MOST IMPORTANT SINGLE PROMOTION EVENT OF THIS YEAR AND SHOULD BE TREATED AS SUCH.

MAGAZINE—MAJORS AND MINORS

It has been found in at least one organization that the purpose of major and minor issues of the continental magazine has not been understood. A major issue goes out once every month to the membership only; a minor issue goes out once every month to the entire mailing list, particularly book buyers. *Certainty* Issues Vol. 5 No. 23, Vol. 6 No. 3, Vol. 6 No. 2 are typical minor issues and with their ads adjusted and made more timely are now being sent to the entire mailing list.

Neglect in sending minor issues to the entire mailing list can result in the eclipse of an operation, otherwise there is no adequate method of contacting new book buyers. Minor issues are mainly slanted at new book buyers but go to the entire list.

If your mailing lists are not so arranged as to make this possible or if your address systems make it difficult you had better do something about it in a hurry as these are the most uneconomical omissions that can be made by an operation.

SCIENTOLOGY SERVICE ADMINISTRATOR

HCO offices requiring books, tapes, bulletins and other services should request them from HCO Administrator WW, 37 Fitzroy Street, London, which post is now occupied by Roddy Stock. The function of this post is to give service to other Scientology organizations and HCO offices.

PROCESSES USED IN 21ST ACC (Concluded)

(Continued from P.A.B. No. 156)

*Compiled from the Research Material and Taped Lectures
of L. Ron Hubbard*

The engram commands we are using are as follows: **“What part of that incident can you confront?”**, **“What part of that incident can you be responsible for?”** and **“What part of that incident can you confront—for how long?”** And when we have sorted these out, we run **“Find an unimportant part of that incident.”**

By incident, we mean both the overt and the motivator. An engram is some portion of an incident containing pain, unconsciousness and exteriorization. But the whole incident would consist of the overt-motivator which belong together; therefore we may find them running thousands of years apart, but, nevertheless, bundled up and identified with great thoroughness. We are running this simply with a kind of understood acknowledgment in most cases, and we are trying not to make this a sharp Tone 40 process, because that tends to drive the pictures away. (Some people are still doing this to a slight degree. Their acknowledgments are a bit too good and tend to make the engram vanish. This is a common thing.)

One thing we are faced with in this ACC is the inability of the student to accept the fact that a case changes. This must be stressed. Why are you auditing a case if you don't expect it to change? These students go on auditing somebody day after day and

actually downgrade the case again by giving it the same careful treatment throughout. They are *careful*, as if the preclear is still crazy. They haven't noticed that the preclear is now doing pretty well. This leads to ARC breaks.

One more process which I haven't mentioned so far is ARC Break Straightwire. We are not using it on the ACC, not because it isn't good, but merely because it is lengthy. Dynamic Straightwire, cleverly done, takes a case apart. It starts almost any case. Selected Person Straightwire on Overts will bring up the responsibility of a case to a point where he can be trusted to run engrams; and ARC Break Straightwire is the one which lays open the track. The only trouble is, I have seen it run for fifty hours. It's a long process, but it is a valuable process.

We have one final process here. It is a central process which processes anybody, and it is the thinking process of SCS. Now, to have the thinking process of SCS would be very valuable, because the assertion of control is your biggest point out. The reason auditors can't audit and the reason cases can't run and the reason valences happen, and so forth, has to do with handling people. Taking an old, old process here and remodeling it, we find that we have a very fast, wound-up-doll, muzzled auditing process that can kick the living daylight out of a case; and we are including the process in the 21st ACC.

The process is simply this: **“Think of an identity you could handle. Think of an identity you couldn’t handle.”** Or: **“Think of an identity that could be handled. Think of an identity that could not be handled.”** This is the SCS Control process, Thinking version.

It is not yet decided which of the auditing commands is the best. You can run the preclear either at cause or generally. The general process is “Think of an identity that could not be handled. Think of an identity that could be handled.” Run alternately, one command after the other, it probably undercuts the other process, which is “Think of an identity you could handle. Think of an identity you couldn’t handle.”

It sounds very bad to say “you couldn’t handle”—it is a negative process. That is why it has to be sandwiched in with a positive process. Strangely enough, it doesn’t totally run on the positive process, because the preclear has a private ambition—not to be handled. He doesn’t want to be controlled in any way. So you must run the negative process in on the other side of the positive process.

I can’t tell you at this stage how many cases this process can be run on. But I do know that it is the anatomy of cases in group one, for all my study of them so far shows that their greatest unreality is the unreality of control. They demonstrate a hectic attitude toward the preclear because of an anxiety about controlling him, or an apathetic attitude towards the preclear because they know they can’t control him.

The whole subject of valences finally shook out here on the 21 Ts ACC. I hasten to tell you about it. The preclears have been through arduous control on the whole track. Arslycus, where everybody got worked to death (produce, produce, produce, work, work, work . . .)—Space Opera, where control was nothing if not deadly—in fact, at every place on the track where everybody went haywire, they had to make a total effect on people. So the preclear who is having a bad time has as his central goal an individuality that cannot be controlled; and this is why most of these lower scale people want to be clear. They do not want to be not-controlled; they just want to be absent.

This is also the reason why some people, although they say they are willing to clear people, are really unwilling to do so; because a clear is someone you cannot handle the way they think of handling people. So they become unwilling to make somebody clear, and they will chop it up somewhere along the line. So there is a reasonable reason underlying this obsessive chop-up that some students do to a preclear, and a reasonable reason behind an auditor’s coming up to you with great unhappiness the moment his preclear starts to make a gain. He himself wants to be clear so that he cannot be handled, but, if he knows he can’t be clear, he adopts an identity that cannot be handled.

Various societies in various times have various things that cannot be handled, and they get stuck with these solutions, and it is almost a rational solution. They adopt an identity that cannot be handled—and that is what is sitting in the preclear’s chair. And sitting in the auditor’s chair is somebody who knows only too well that the preclear can never be handled and so it doesn’t matter what he does; or somebody who is determined to handle the preclear even if it means knocking his block off. This results in misemotional responses to handling the preclear.

This is one of those horrible simplicities.

We had processes long ago on identity and inventing identities and various types of identities, and we also had processes on handling people (“What could you handle? What couldn’t you handle?” “What could you change? What couldn’t you change?” that sort of thing). Well, that all adds up to this process; and this process works much faster than SCS.

However, we shall know more about the Thinking version of SCS later on. I just wanted to give you a summary of the techniques and processes being used in the 21st ACC, for your information.

HUBBARD COMMUNICATIONS OFFICE

HCO BULLETIN OF 15 APRIL 1959

EMOTIONAL TONE SCALE EXPANDED

(Cancels Bull. of April 8)

There are several misemotions hitherto not placed on the ARC Emotional Tone Scale.

These are:

- 0.0 — Failure (Death)
- 0.2 — Regret (Being other bodies)
- 1.0 — Blame (Punishing other bodies)
- 1.3 — Shame (Responsibility as blame)

In running Overt Withhold Straight Wire stubborn cases run these emotions for some weeks of auditing and go upwards more or less in that order. Only when they come to failure as an *emotion* do they then get into apathy.

No case run on Overt Withhold Straight Wire can be said to be making progress unless misemotions turn on below 2.0. If the right button is reached by correct assessment, emotional reaction occurs in the running of that button.

HCO BULLETIN OF 3 MAY 1959

SOLUTION TO SOLUTIONS

It is interesting when some old well-worn Scientology phenomena such as problems and solutions resolves.

I noted in 1956 that problems tended to collapse upon one as he solved them, if you will recall. When you asked someone to invent a problem of comparable magnitude, his problem went further away in distance. When you asked someone for a solution to his problem the problem approached closer.

Well, I have now found the reason for this—the “penalty of solving”. It is, I might comment, not an unimportant discovery for we all become victims of problem-collapse when we solve things. This is why people won’t solve their problems, why they “have to have problems”.

Failure to make solutions (or postulates) stick elsewhere makes the thetan “believe” that solutions collapse problems on him.

A process to demonstrate the first observation is well known—problems of comparable magnitude—and getting the pc to then “solve the problem” (this last of course is not “therapeutic”).

A process to overcome this collapsing of problems upon one is “What solution could you make stick?”

HCO BULLETIN OF 4 MAY 1959

AN AFFINITY PROCESS

We have a fundamental Reality process in Overt-Withhold Straight Wire and, at a higher level, “What can you confront?”

Variations suggest themselves but what with Administration, Congresses, HPA Courses, ACCs and heavy promotion, I have not had time to test them.

The above form, startlingly enough, does work. It *apparently* cracks lower cases than “What can you confront?” There is some evidence it raises havingness.

A basic communication process is “Recall a time you communicated.”

There have been few successful Affinity processes. However, as unlikely as it first appears, the following is nearly a pure Affinity process.

“What would you like to confront?”

HCO BULLETIN OF 7 MAY 1959

NEW PROCESS

THEORY

It never snows but it avalanches!

Possessing now tremendous processes at lowest levels, we need a new understanding of processing and assessment.

The broad tone scale is divided into three general parts. Highest is Pan Determinism. Mid-range is Self-Determinism. Low range is Other-Determinism.

The fundamental difficulty is that something has so thoroughly overwhelmed the pc that he is it. This is Other-Determinism become the person. Mild locks use this route to further overwhelm him. A person doesn't really find anything in this lifetime that would have overwhelmed him enough to aberrate him. It took great doing. Things like prenatals and operations and shocks just use the existing overwhelm channel.

The picture of aberration is this. The person causes an effect, time and time again. Usually this is not aberrative. But one day he causes an unintended effect. He didn't mean to. It was wrong. This is the true overt act—an unintended bad effect. It is not *deserved* by the recipient. It is a wrong, unintended, undeserved effect. The person now tends to limit his effects or withhold his effects. Having been wrong once, he now becomes cautious. Next thing he knows he has assisted himself to be overwhelmed. He now has an inflow channel over which other things, all locks, can now overwhelm him.

Eventually he becomes an "other-determinism". This, of course, can get nothing done, doesn't outflow, etc., etc., which adds up to all the faults we find in an aberrated person. For example, if the pc has been overwhelmed by money, he, in money matters, is now money. If you took some money and threw it on the bed it wouldn't do a thing. It wouldn't stack itself up or add up accounts. Money doesn't *do* anything. Therefore, the pc, as an other-determinism, does nothing really about money—and this we find annoying in him. It is his aberration.

Clearly all one need do as an auditor is to reverse this flow and put the pc at cause over the button, money, to have the other-determinism (and the overwhelmingness) fade away. Using Problems of Comparable Magnitude or Overt-Withhold Straight Wire or simple reaching, the effect is turned to cause and the pc comes out of it.

Assessment is only discovering *what* has overwhelmed the pc.

Auditing is the reversing of other-determined flows by gradient scales, putting the pc at cause again.

THE BASIC ERROR

The question was asked me, and a fine question it was, "Why does a thetan make his postulate fail to stick in the first place? Why would he say, 'I can get my postulates all messed up and so cause an overt act'?"

Obviously all aberration is third dynamic. The entrance into self-determinism requires that a thetan conceive the idea of other beings. Also he must then conceive that there are zones of privacy from which he must not communicate.

This error leads to obsessive or fixed channels on which one can be overwhelmed, since he “may not” take the position of cause on this channel.

Avoidance of the places he must not communicate from leads into all manner of difficulties, since this is inhibited communication. A person, therefore, becomes as aberrated as he cannot communicate, as aberrated as he is overwhelmed by Other-Determinisms, as aberrated as he himself dare not assume cause points.

A NEW PROCESS

This leads to a new process, for use “in individual sessions”. The final phrasing is not established at this time.

“From where could you communicate?” or

“Find a place from which you could communicate,” or

“Recall a place from which you have communicated.”

My first tests show this to be very strong but workable. I have not established the depth this reaches nor the complete effectiveness up scale. But it does reverse Other-Determinism heavily.

(This, of course, does not supplant Selected Person Overt-Withhold Straight Wire as fundamental and is not for use in HAS Co-auditing, where Selected Persons Overt-Withhold Straight Wire is the tested allowed process.)

This new process may open a faster route to theta clear, even though that route is already very fast.

Note: Apparently this process, **LOCATIONAL COMMUNICATION**, relieves the face pressures and terror stomachs (after turning them on) which have proved reluctant. Terror stomachs we have a specific for. Face pressures, we do not have totally taped.

AN UN-DOABLE COMMAND

There are a very few commands that cannot be done. One of these is “Find an unknown” (1954).

I have just found another one:

“Invent an other-determinism”.

Perhaps if it could be run, as Jan Halpern commented, it would be a one-shot clear.

HCO Offices

CANCELS ALL EARLIER DIRECTIVES ON HGC ALLOWED PROCESSES

**HGC ALLOWED PROCESSES AND ACC PROCESSES AS OF
MAY 21, 1959**

The following processes are the only allowed processes for use in HGCs anywhere.

THETA CLEAR SCHEDULE

For use on unconscious and fixedly psychotic persons unwilling to be audited:

“You make that body sit on that chair” (or “lie on that bed”), and CCH 1, 2, 3, 4.

For use on persons unwilling to be audited at any time:

Two way help bracket
“How could you help me?”
“How could I help you?”

Get each question answered. Use lots of two way comm. Don't Q and A with reasons.

For use on persons unwilling to be audited by reason of session errors:

TR 5N, which is:

“What have I done wrong?”
“What have you done wrong?”
with two way comm.

For persons who are acutely ill:

Run old TR 5 if needed.
Diagnose exact button and run Overt Withhold Straight Wire or
Run Factual Havingness
Or do an assist.

For use on persons who complain that auditing has no effect on them or who make very slow gains:

Have pc put the following thought in six sides of room, going around in different order each time (example, front wall, back wall, ceiling, floor, right wall, left wall).
“Put the thought into that (designated room side), ‘Nothing can have any effect on (pc's name)’.
“There are variations of this phrasing: “Nothing must be done to (pc's name),”
“Nothing can be done about (pc's name).” Depends on what makes the meter fall.

This process probably requires about 15 to 25 hours to flatten. Use the same wording throughout.

For use on persons in general. If this has been handled in an HAS Co-audit well, don't handle it again:

Overt-Withhold Straight Wire after careful assessment and used on various buttons. Dynamic Straight Wire, Know to Mystery Straight Wire, are all more or less same process but are different ways of assessment. Always run terminals, never conditions.

For use on persons in general, always to some extent when they enter HGC:

S-C-S.

For use on auditors in for auditing. Run until fully flat:

Op Pro by Dup old (original) style.

For use on people going to theta clear. Use liberally and long:

“Find a spot from which you could communicate.”

For use on people going to theta clear:

Find engram necessary to resolve the case each time. Check out all terminals present in it. Make a list. Run Overt-Withhold Straight Wire on a (each terminal in incident by general name). Don't run off from incident that is being run. Pc will go up and down the track but when one terminal is flat, choose next from same incident we started with. The commands for this are “Guess at something you have done to” “Guess at something you have withheld from”.

For finishing off cases to level of theta clear:

Run Overt-Withhold Straight Wire on minds, brains, bodies, mest.

For easing off any case into comfort or completion of an intensive:

“From where could you communicate?”

HAS CO-AUDIT

The only allowed process in HAS Co-audit is Overt-Withhold Straight Wire on present life terminals selected by instructor.

HCO BULLETIN OF 26 MAY 1959

The following article appeared recently in the London City Press. It may be used by City Offices and Area Offices for information to papers.

“MAN WHO INVENTED SCIENTOLOGY”

One best-seller is often the real beginning in the story of a publishing house. But to come into existence because of another publisher's best-seller is unusual. This is what happened in the case of the Hubbard Association of Scientologists International.

The HASI and all its concerns is founded on the work of one man, L. Ron Hubbard, engineer, explorer, nuclear physicist and writer. Holding in his mind a knowledge of Eastern thought gained in his travels, his instruction in psychology from a medical doctor who had studied personally under Sigmund Freud, and his training in mathematics and nuclear physics, L. Ron Hubbard found himself convalescing in hospital towards the end of the second world war, after a distinguished career in the United States Navy.

During the year he spent in hospital he reviewed earlier work he had done on the fundamentals of knowledge. He was also confronted with the deplorable nervous reactions of his friends who had been through the war. He concluded, after many experiments, that his ideas could help people towards greater ability and greater happiness.

He coined the word Scientology, to mean the science of knowing how to know.

EXPERIMENT

Then followed several years of experiment, which he supported by writing fiction. His ideas, like most new things, met with complete disbelief in official quarters in spite of the fact that they had by this time been practised, proved, tested and documented.

A thesis he wrote in 1948 was ignored. However, people began to hear of his work and to get hold of carbon copies of his thesis and make more copies of it and hand them to friends. Hubbard's correspondence grew to embarrassing proportions as more and more people found out that Dianetics (the branch of Scientology he wrote about at that time, the branch which deals with mental anatomy) really worked in practice. They asked him for lengthy explanations.

In 1950 L. Ron Hubbard thought of writing a popular text book on Dianetics to relieve him of the task of writing dozens of long letters every day. A publisher offered to print the book, but demanded the manuscript within three weeks. The book was duly written and delivered—180,000 words of it—within three weeks.

This book, DIANETICS: THE MODERN SCIENCE OF MENTAL HEALTH, was expected to sell 6,000 copies and sold 100,000 almost immediately. It went to the top of the best-selling lists and stayed there during the summer of 1950.

The book tells the layman how to use Dianetics. Thousands of people began to use it. Hundreds of people wrote, spoke, and ranted for and against it. Interest in Dianetics reached hysteria level in the United States and various organizations were set up, with and without L. Ron Hubbard's approval, to deal with the demand for treatment and training.

To combat this confusion of commercial exploitation, Hubbard went back to the broader subject of Scientology and founded the Hubbard Association of Scientologists International as the official organization which would treat people, train people and supervise research.

Books and more books were demanded. Hubbard duly wrote them and the HASI duly published them under its own name or under the name of one of its offices. Since 1950, more than thirty books by L. Ron Hubbard and many other Scientologists have been published by the HASI.

Perhaps the best-known titles are DIANETICS: THE MODERN SCIENCE OF MENTAL HEALTH, SCIENCE OF SURVIVAL, SELF ANALYSIS IN SCIENTOLOGY, PROBLEMS OF WORK and THE CREATION OF HUMAN ABILITY.

It is fitting that the main part of HASI's publishing output should be written by the man who founded it, and that all the books it publishes should be about Scientology in its various aspects, whether applied to helping the individual and training professional practitioners, or to more topical subjects such as those dealt with in ALL ABOUT RADIATION and HOW TO LIVE THOUGH AN EXECUTIVE.

The 'international' at the end of the HASI's title is well earned. Few publishers have offices in, and books printed in, Washington, London, Los Angeles, Melbourne, Auckland, Johannesburg, Paris and Berlin. And this within nine years.

TRANSLATIONS

Scientology books have been translated into many languages and the London office (which is now the central office of the organization) receives enquiries from all parts of the world and has on its staff people from Australia, Greece, New Zealand, Mauritius, Rhodesia, South Africa, Spain and the United States. Students come from far and near, east and west, for training to become professional practitioners in Scientology or 'auditors' as they are called (an auditor: one who listens and computes). When trained, they qualify to help other people improve their lives and their abilities by doing simple mental exercises under their skilled supervision; and many of them go back to their own countries and set up offices, groups, training centres and clinics of their own. A large part of their training consists of the study of texts published by the HASI.

The publication of DIANETICS: THE MODERN SCIENCE OF MENTAL HEALTH in 1950 started, not just a publishing house, but a world movement. The long-ignored work of one man now suddenly affects the lives of people from Malaya to Manchester. And the HASI becomes a very busy organization indeed.

HCO BULLETIN OF 5 JUNE 1959

FORMULA 10

This is the first practical approach I have developed toward reaching the state of OT.

Up to and including step 7 gives us a theta clear. Steps 8, 9, 10 and 11 give us the finishing touches for OT.

This formula gives two states, then, depending on where it is used.

The full data background of all this is given in the HPA/BScn Course tapes of Spring 1959 and the 6th London ACC tapes (which also give the way to do this very broadly).

FORMULA 10—AN APPROACH TO OT

1. Do case assessment. Selected Person Overt-Withhold Straight Wire (this life). (Flatten)
2. "Recall (or think of) something you have been responsible for." (Flatten)
3. "Recall (or think of) something you have confronted." (Flatten)
4. "Recall (or think of) something you have been responsible for." (Flatten)
5. Do case assessment. Run "From where could you communicate to a (*general terminal*)".
Note: Run any terminals that react.
6. "From where could you communicate to a body."
7. Locate and run engrams by "From where could you communicate to (A) (generalized form of terminal found in engram)"; run all terminals found. (B) Run until Rock incident is run (run as general terminal).
8. Reassess case for ANY terminal that has ANY reaction and run "From where could you continue to communicate to a (generalized form of terminal)". Run No. 8 until there are none that react.
9. "From where could you continue to communicate to a body." (Flatten)
10. "From where could you communicate to a mind."
11. "From where could you continue to communicate to a mind."

L. RON HUBBARD

NOTE: This may be used in HGCs when tapes have been studied by auditors.

HCO BULLETIN OF 10 JUNE 1959

CO-AUDIT FORMULA

To be used by any Co-Audit Instructor

Find what the person thinks is wrong with him.

Find a terminal he believes represents it. Audit that terminal with Overt-Withhold Straight Wire.

HOW TO “SELL SCIENTOLOGY”

See “What is Scientology?” article in MA Bulletin of near date to this.

Base your line of talk to strangers on the premise that the 19th Century brutalities and foolishness of psychology, psycho-analysis and psychiatry have made your listener doubtful of mental healing. Agree they are right about this. Enlarge on the faults of old 19th Century practices.

Then say they are not *all* bad since they gave us a basis on which to start Scientology.

Then show how Scientology learned that men weren't animals, learned that shock and surgery on the brain was harmful, learned that sex was only a minor basis for neurosis and insanity. All this without saying *what* Scientology is or describing it.

Then, without really ever explaining what Scientology is, say it has hope for man in a kinder, better world and that we must outgrow our fear of mental healing and look ahead, not backward.

If you get real insistent, even oddly accusative of listener, even slightly angry on this point and stress it over and over, you should have some people willing to come to a PE Course. And if you also stress this in PE Courses, in the HAS Course, in the Co-audit, you will start a new concept of thought around the world.

You have started a new reason to get annoyed at people. They'll use it!

HCO BULLETIN OF 23 JUNE 1959

MA—BPI

WHAT IS SCIENTOLOGY

Scientology is the science of human ability and intelligence. It was developed over a third of a century by Doctor Hubbard, American nuclear physicist and leading world authority on the subject of life sources and mental energies and structures. The Hubbard Association of Scientologists International assists and forwards his work and is a charitable non-profit organization with thousands of professionals who help people to help others. The HASI conducts free basic classes in Scientology and is authorized to train to higher levels for which, however, charges are made amounting to about five shillings an hour for personal coaching.

Professional processing in Scientology is available from the Association and many professional Scientologists in private practice.

Scientology is the only full study in the field of the mind developed in the Twentieth Century. Older Nineteenth Century studies such as psychology, developed by Wundt in 1879 in Leipzig, Germany, psycho-analysis, developed by Freud in 1894 in Vienna, Austria, and psychiatry, developed through the Nineteenth Century in Russia, did not necessarily fail, since they provided data which permitted Scientology to begin.

Modern, kinder methods largely have taken the place of old brutalities such as shock, brain surgery and years of pitiless self revelation. Man no longer is thought of as a brute animal, charged with unconscious and cunning force.

A brighter more modern day has shed greater understanding on the problems of the mind and the nature of life and one need no longer shun mental healing practised by modern, civilized people.

Scientology, in less than a decade, has become the world's primary study of Man and the mind and has today more offices and practitioners than all other Nineteenth Century practices combined. Thus we must learn to bury the past of mental healing and look forward to our better day, the day of Scientology and new hope, the day of help without threat or harm, the day of a new and better civilization, born with the birth of a better understanding of Man.

HCO POLICY LETTER OF 2 JULY 1959
Issue IV

ADD FORMULA 10

These two processes are added to Formula 10 and just after running engrams:

Process S2—
“From where could you communicate to a victim?”

Process S22—
“Think of a place from which you could communicate to a victim.”

Optimum use on low cases is obtained running S22 fully muzzled.

(Note: This is the 1st one-shot OT process.)

HCO BULLETIN OF 3 JULY 1959

GENERAL INFORMATION

PURPOSE OF THIS WORK:

To modify the data and material taught and demonstrated in the HCA/HPA Theory and Practice course and to bring uniformity of stable data to students and instructors.

There are six basic process types. One or more processes of each type is included in the Theory and Practice course. Listed here are the six basic types, the characteristic, purpose and stable datum of each. These are the general data for each basic type. Specific data are given with the processes themselves.

TYPE 1. STARTING AND ENDING SESSIONS.

Characteristic: Two-way communication. Two-way communication is how it is done.

Purpose: To compose preclear into and release him from the auditing session.

Stable Datum: Agreement. Each thing done in starting and ending sessions is the establishment of an agreement.

TYPE 2. CONTROL PROCESSES.

Characteristic: Control by action. Preclear's physical actions are controlled in order to do the processes.

Purpose: To place preclear's body and actions under the auditor's control to invite control of them by the preclear.

Stable Datum: Never let the preclear get out of doing what he is told.

TYPE 3. DUPLICATION.

Characteristic: Mimicry by action. Physical actions are duplicated.

Purpose: To establish communication.

Stable Datum: Each command in its own unit of time separate from every other command.

TYPE 4. SUBJECTIVE.

Characteristic: Thinkingness. The preclear must think something to do the process.

Purpose: To recover automaticities of thought and as-is unwanted thinkingness.

Stable Datum: Body control comes before control of thinkingness.

TYPE 5. OBJECTIVE.

Characteristic: Spotting and finding. Preclear must spot or find something exterior to himself to carry out the auditing command.

Purpose: To orient preclear in present time, drop out past and improve havingness.

Stable Datum: Attention of preclear must be under auditor's control.

TYPE 6. STRAIGHT WIRE.

Characteristic: Remembering and forgetting. Preclear must do these things to carry out auditing command or question.

Purpose: To re-control remembering and forgetting and relate past to present.

Stable Datum: Specific things, not generalities.

DEFINITIONS OF THETAN, MIND AND BODY—the three parts of Man

THETAN: The awareness of awareness unit which has all potentialities but no mass, no wavelength and no location.

MIND: The accumulation of recorded knowns and unknowns and their interaction.

BODY: An identifying form or non-identifiable form to facilitate the control of, the communication of and with and the havingness for the thetan in his existence in the MEST universe.

A thetan himself without the body is capable of performing all the functions he assigns to the body.

* * *

THE CCH PROCESSES—TONE 40 AUDITING

Definition of Tone 40 auditing: Positive, knowing, predictable control toward the preclear's willingness to be at cause concerning his body and his attention.

CCH 1—A TYPE 2—CONTROL PROCESS

NAME: Give me that hand, Tone 40.

COMMANDS: "Give me that hand." Physical action of taking hand when not given and then replacing it in preclear's lap. And "Thank you" ending cycle. All Tone 40 with clear intention, one command in one unit of time, no originations of preclear acknowledged in any way verbally or physically. May be run on right hand, left hand, both hands ("Give me those hands") or "Don't give me that hand", each one flattened in turn, never switching to a different hand or command before flattening the one already started.

- POSITION:** Auditor and preclear seated in chairs without arms, close together. Outside of auditor's right thigh against outside of preclear's right thigh. This position reversed for left hand. In both hands preclear's knees are between auditor's knees.
- PURPOSE:** To demonstrate to preclear that control of preclear's body is possible, despite revolt of circuits, and inviting preclear to directly control it. Absolute control by auditor then passes over toward absolute control of his own body by preclear.
- TRAINING STRESS:** Never stop process until a flat place is reached. To process with good Tone 40. Auditor taught to pick up preclear's hand by wrist with auditor's thumb nearest auditor's body, to have an exact and invariable place to carry preclear's hand to before clasping, clasping hand with exactly correct pressure (enough to be real to preclear, not enough to bruise his hand over a long run), replacing hand (with auditor's left hand still holding preclear's wrist) in preclear's lap. Making every command and cycle separate. Maintaining Tone 40. Stress on intention from auditor to preclear with each command. To leave an instant for preclear to do it by his own will before auditor does it. Stress Tone 40 precision—this process puts order into preclear's case, thus precision must be stressed.
- HISTORY:** Developed by L. Ron Hubbard in the 17th ACC, Washington, D.C.; 1957.

CCH 2—A TYPE 2—CONTROL PROCESS

- NAME:** Tone 40 8-C.
- COMMANDS:** "With that body's eyes look at that wall." "Thank you." "Walk that body over to that wall." "Thank you." "With that right hand touch that wall." "Thank you." "Turn that body around." "Thank you." Run without acknowledging in any way any origin by preclear, acknowledging only preclear's execution of the command. Commands smoothly enforced physically. Tone 40, full intention.
- POSITION:** Auditor and preclear ambulant, auditor in physical contact with preclear as needed.
- PURPOSE:** To demonstrate to preclear that his body can be directly controlled and thus inviting him to control it. Finding present time. Havingness. Other effects not fully explained.
- TRAINING STRESS:** Absolute auditor precision. No drops from Tone 40. No flubs. Total present time auditing. Auditor turns preclear counter-clockwise then steps always on preclear's right side. Auditor's body acts as block to forward motion when preclear turns. Auditor gives command, gives preclear a moment to obey, then enforces command with physical contact of exactly correct force to get command executed. Auditor does not check preclear from executing commands.
- HISTORY:** Developed by L. Ron Hubbard in Washington, D.C., 1957, for the 17th ACC.

CCH 3—A TYPE 3—DUPLICATION PROCESS

- NAME:** Hand Space Mimicry.

- COMMANDS:** Auditor raises two hands, palms facing preclear and says, "Put your hands against mine, follow them and contribute to the motion." He then makes a simple motion with right hand, then left. "Did you contribute to the motion?" "Thank you." "Put your hands in your lap." When this is flat the auditor does this same thing with a half inch of space between his and preclear's palms. "Put your hands facing mine, about a half inch away, follow them and contribute to the motion." "Did you contribute to the motion?" "Thank you." "Put your hands in your lap." When this is flat auditor does it with a wider space and so on until preclear is able to follow motions a yard away.
- POSITION:** Auditor and preclear seated, close together facing each other, preclear's knees between auditor's knees.
- PURPOSE:** To develop reality on the auditor using the reality scale (solid comm line). To get preclear into communication by control + duplication.
- TRAINING STRESS:** That auditor be gentle and accurate in his motions, giving preclear Wins. To be free in two-way comm. That the essential part of the auditing command is the motion, not the verbal patter. When it is necessary to physically assist preclear to do commands, use one-hand commands, putting preclear's hand through the command with auditor's free hand holding preclear's hand by the wrist. Accept preclear's answer to the question, "Did you contribute to the motion?"—his answers are accepted, whatever they may be. Auditor always places his hands up before telling preclear to do so. Auditor tells preclear to put his hands in his lap and keeps his own up until preclear does so, allowing preclear to break the solid comm line.
- HISTORY:** Developed by L. Ron Hubbard in Washington, 1956, as a therapeutic version of Dummy Hand Mimicry. Something was needed to supplant "Look at me. Who am I?" and "Find the Auditor" part of Rudiments.

CCH 4—A TYPE 3—DUPLICATION PROCESS

- NAME:** Book Mimicry.
- COMMANDS:** Auditor makes a simple or complex motion with a book. Hands book to preclear. Preclear makes motion, duplicating auditor's mirror image-wise. Auditor asks preclear, "Are you satisfied that you duplicated my motion?" If preclear is and auditor is also fairly satisfied, auditor takes book back, acknowledges, "Thank you", and goes to next command. If preclear says he is and auditor fairly sure he isn't, auditor takes book back and repeats command and gives book to preclear again for another try. If preclear is not sure he duplicated any command, auditor repeats it for him and gives him back the book. Tone 40 only in motions. Verbal two-way comm quite free.
- POSITION:** Auditor and preclear seated facing each other a comfortable distance apart.
- PURPOSE:** To bring up preclear's communication with control and duplication. (Control + duplication = communication.)
- TRAINING STRESS:** Stress giving preclear wins. Stress auditor's necessity to duplicate his own motions. Circular motions are more complex than straight lines. The basic rule on complexity in duplication processes is: Make the motions as complex as is necessary to get the preclear's interest and attention and no more.
- HISTORY:** Developed by L. Ron Hubbard for the 16th ACC in Washington, D.C., 1957. Based on duplication developed by LRH in London, 1952.

METHOD OF RUNNING CCH 1, 2, 3, 4.

CCH 1 is run first and run to a flat spot. Then CCH 2 is run. If CCH 2 produces change, it is flattened and followed by CCH 1. Then CCH 2 and if it again produces change it is followed by CCH 1. This rule is followed throughout—when either CCH 2, CCH 3, CCH 4 produces change the process is flattened and followed by CCH 1. This series of four processes is left when they can be run, one after the other (1, 2, 3, 4) in the same session without producing change.

The four CCH processes are to be run on the following cases:

INSANE: That is, a person who is extremely and obsessively unwilling to control his body, his attention and his thoughts.

UNCONSCIOUS: Any person who is unaware, to a great degree.

HOSTILE: Person who has appeared for processing but who demonstrates a complete unwillingness to accept order and to carry out an auditing command.

CCH 1 “DON’T GIVE ME THAT HAND” version, is a specific process for a case who is dramatizing a heavy compulsive withhold condition.

* * *

ARC STRAIGHT WIRE—A TYPE 6—STRAIGHT WIRE PROCESS

COMMANDS: “Recall something that was really real to you.” “Thank you.” “Recall a time when you were in good communication with someone.” “Thank you.” “Recall a time when you really liked someone.” “Thank you.” The three commands are given in that order and repeated in that order consistently.

POSITION: Auditor and preclear seated facing each other at a comfortable distance.

PURPOSE: To give the student reality on the existence of a bank. (When used as a training drill.) This is audited on another and is audited until the preclear is in present time. It will be found that the process discloses the cycling action of the preclear going deeper and deeper into the past and then more and more shallowly into the past until he is recalling something again close to present time. This cyclic action should be studied and understood and the reality on the pictures the preclear gets should be thoroughly understood by the student. The fact that another has pictures should be totally real to the student under training.

NOTE: It should be thoroughly understood that this is a valuable process and an excellent step in preparation for running the heavier recall processes.

HISTORY: Developed by L. Ron Hubbard in 1951 in Wichita, Kansas. This was once a very important process. It has been known to bring people from a neurotic to a sane level after only a short period of application. It has been run on a group basis with success but it should be noted that the thinkingness of the individuals in the group would have to be well under the control of the auditor in order to have this process broadly beneficial. When it was discovered that this process occasionally reduces people’s havingness, the process itself was not generally run thereafter. It is still, however, an excellent process with that proviso, a reduction of havingness in some cases.

If this process is “policed” the auditor asks the preclear “when” before giving the acknowledgement, as often as is necessary to maintain control of the

preclear—or as often as is necessary for the auditor to maintain his own confidence that the preclear is under control and doing the process. This process can be run “muzzled” and should be, where muzzling is indicated.

ASSESSMENT An inventory and evaluation of a preclear, his body and his case to
DEFINITION: establish processing level and procedure.

1. Determine processing level.
2. Determine process to be used.
3. Always undercut reality level of the case when assessing processing level.
4. Establish reality level of case by two-way communication using understanding and affinity as guides. Understanding: What can the preclear say and talk about that is easily understandable to the auditor? What can the auditor say and talk about that is easily understandable by the preclear? Affinity: What does the preclear like or dislike? What does he detest or ignore? What is he anxious or otherwise mis-emotional about?
5. Never overlook an obvious physical defect or communication difficulty when making an assessment of any kind.
6. Be alert to preclear’s comm lags and what produces them.
7. Observe the preclear’s response to control.
8. Find out what the preclear assigns cause to—what he blames what he feels he can do nothing about.

TERMINAL ASSESSMENT—for OVERT-WITHHOLD PROCESS

In the HCA/HPA course this is done by two-way communication. The student should learn it by observance of the instructor. Terminal Assessment is made to locate the terminals in the case which, when run, will produce an increase in the responsibility and reality level of the preclear.

A VERY BRIEF COVERAGE OF DYNAMIC AND KNOW TO MYSTERY SCOUTING

1. Discover the terminals the preclear states to represent each part of the expanded Know to Mystery Scale. Any terminal which is obviously aberrated and won’t clear by two-way comm should be run.
2. Discover what terminals the preclear has identified with the wrong Dynamic. Any terminal wrongly placed that won’t blow by two-way comm should be run.

NOTE: Two-way comm here does not mean invalidative or evaluative questions or comments by auditor.

SELECTED PERSONS SCOUT

This is the assessment most used. It is applied to the persons in the preclear’s present life. There are several loaded questions which can be used and there are several observations to be made by the auditor.

QUESTIONS: “Who is to blame for the condition you are in?”

“Who do you know or have known that you’d really hate to be?”
“Who really had it in for you?”
“Who do you know or have known that you dislike thinking about?”

To be observed by auditor:

Comm lag: Willingness or unwillingness to communicate about a specific person. Physical and emotional effect produced by discussion of specific person: agitation, voice change, blushing, dopiness, etc.

NOTE: Auditor must realize that preclear has no power of choice in the selection of terminals. The terminal is chosen by the auditor.

In a case where the preclear does not answer up to questions or shows no useful (to the assessment) effects from questions, simply select the person who is realest to the preclear and proceed with the process. Continue running the persons in preclear’s present life on basis of who is realest until preclear is able to answer up to assessment questions. Realest person at start may turn out to be the auditor. If so, run it.

OVERT-WITHHOLD SELECTED PERSONS STRAIGHT WIRE

- A TYPE 6—STRAIGHT WIRE PROCESS

COMMANDS: “Think of something you have done to ____.” “Thank you.”
“Think of something you have withheld from ____.” “Thank you.” Or
“Recall something you have done to ____.” “Thank you.”
“Recall something you have withheld from ____.” “Thank you.”

The use of the “think of” command rather than the “recall” allows the preclear to plow through where his track is jammed and incidents are not easily separated, to the point where he can recall. In either case commands are run alternately, one for one.

POSITION: Auditor and preclear seated facing each other at a comfortable distance.

PURPOSE: To put the preclear at knowing cause toward the people in his current life so that those people can no longer restimulate the preclear in livingness.

TRAINING Any terminal run with this process is flat when that terminal can no longer restimulate the preclear’s reactive bank. When the preclear can find no new incidents to recall and must repeat old incidents to continue process, a given terminal can be considered flat. Make sure he is repeating *incidents* and not recalling *similar* incidents before ending the run on that terminal. Also, the first few repeats may be just the preclear’s way of filling in a comm lag. Student should observe and understand phenomena occurring with this process. Where assessment has been properly made, the preclear will manifest various mis-emotions ranging from below 0.0 on the tone scale up to 2.0 and emotions up to 4.0. The NOT-ISNESS on the case will show up as attempts to not-is the auditor, process or anything preclear’s attention touches. The preclear, at first, will not correctly assign the reasons for his mis-emotions and discomforts and will blame them on the auditor, etc. This is an example of COROLLARY No. 3 of AXIOM 58 in action. This process is run “muzzled” by the student in training. Muzzled auditing is done as follows: At the beginning of session, instructor makes an assessment of the preclear’s case and chooses the terminal to be run. He gets the preclear’s agreement to run the process and does a very brief clearing of the command with the preclear. Then, the student auditor says, “Start of session,” and gives the first

command. When preclear has answered the auditor acknowledges and goes on to the next command. If the preclear originates anything, either as a statement, comment or question the auditor nods his head as an acknowledgement. If the preclear asks to have the command repeated, the auditor nods his head and repeats it. This is continued until end of session or until process is flat on that terminal. If student has any question or thinks terminal is flat, he puts his hand behind his chair and wig-wags to get instructor's attention. He does not leave his chair. Near end of session instructor gives the team notice that the session will end in two minutes. At the end of that time, when preclear has answered the last command and has been acknowledged, the student auditor says, "End of session." This is all there is to muzzled auditing done by students. The student auditor uses only TR 0, TR2, TR3 (duplicative command) and handles originations with a nod of his head, *only*. No rudiments or two-way comm beyond "Start of session" and "End of session". Student should understand that when he runs this process (and some others) on preclears in the field, he should use muzzled auditing whenever he finds himself with any tendency to over-communicate or with any preclear who ARC breaks easily. Student should also understand that Overt-Withhold Selected Persons, Third Rail, ARC Break Straight Wire and Not-is Straight Wire can all restimulate so much automatic NOT-ISNESS that the preclear will at times apparently lose his bank, his memory, and even the auditing command and its meaning. The only action indicated when this occurs is to persist with the process.

HISTORY: Developed by L. Ron Hubbard in the 21st ACC, in Washington, D.C., in 1959, as a means of ensuring wider and more predictable case gains by more auditors, even unskilled ones.

FACTUAL HAVINGNESS—A TYPE 5—OBJECTIVE PROCESS

COMMANDS: "Look around here and find something you have." "Thank you." "Look around here and find something you would continue." "Thank you." "Look around here and find something you would permit to vanish." "Thank you." Commands are each flattened in turn before going on to next command. Process can be begun on any of the three commands, but the above order should be followed. If process is begun on "vanish" the next command to be run is "have".

POSITION: Auditor and preclear seated facing each other at a comfortable distance and with preclear facing majority of auditing room.

PURPOSE: To remedy havingness objectively. To bring about the preclear's ability to have, or not have, his present time environment and to permit him to alter his considerations of what he has, what he would continue and what he would permit to vanish.

TRAINING STRESS: To be run smoothly without invalidative questions. One of the most effective processes known when thinkingness can be controlled somewhat. The student should thoroughly understand that when a preclear is set on wasting, the vanish command will at first occupy the majority of auditing time spent on this process. Student should understand that the three commands can be each flattened in order any number of times and that running one of the commands is quite apt to unflatten the other two. Process should be continued until this no longer occurs.

THIRD RAIL is a special form of **FACTUAL HAVINGNESS**

COMMANDS POSITION: are the same as in Factual Havingness. However the commands are & run in a special ratio of:
8 commands of “vanish”
2 commands of “continue” and 1 command of “have”.

PURPOSE: To remedy extreme conditions of NOT-ISNESS. To remedy obsessive waste. To permit use of the process without bogging preclear in any one of the commands.

TRAINING STRESS: Student should realize that there is very seldom any reason for altering this ratio and should never Q and A with the preclear’s complaints about doing the “continue” or “vanish” commands. Student should understand that Third Rail should be run where auditor is uncertain where to begin with Factual Havingness.

HISTORY: Developed by L. Ron Hubbard in Washington, D.C., in 1958, as the best form of objective havingness. Originally developed by L. Ron Hubbard in London in 1955 as “Terrible Trio”. Third Rail developed by L. Ron Hubbard in London for the 5th London ACC.

RUDIMENTS—A TYPE 1 PROCESS—OPENING AND CLOSING SESSIONS

COMMANDS: None as such. Rudiments is the establishment of the agreements basic to an auditing session, and the termination of them, at end of session. Students must understand what the rudiments are and be able to use them with any preclear who is capable of agreeing to them, by two-way communication. They are:

1. Auditor
2. Preclear
3. Auditing room
4. Start of session
5. Preclear’s goal for session.

Auditor, by two-way comm, gets preclear’s agreement to each of these, allowing preclear to state his own goals. The above order is not necessarily the order in which they are established. There should be enough two-way comm to get the preclear’s agreement and no more. The auditor should determine for himself, but not tell the preclear, what he (the auditor) intends to do with the session. At the end of session auditor makes sure the preclear is released from agreements. Auditor does not argue with the preclear about the preclear’s goals.

NOTE: If a preclear cannot communicate about the rudiments or be brought to agree with them fairly easily, CCH 1, 2, 3, 4 should be run with only “Start of session” spoken by the auditor as total rudiments. Rudiments are not used otherwise with any preclear who needs to be run on CCH 1, 2, 3, 4. Alternatively, for more accessible cases, do “muzzled” auditing as described above.

MOCK UP A PICTURE FOR WHICH YOU CAN BE TOTALLY RESPONSIBLE

—A TYPE 4—SUBJECTIVE PROCESS

- COMMAND: “Mock up a picture for which you can be totally responsible.” “Thank you.”
- POSITION: Auditor and preclear seated facing each other a comfortable distance apart.
- PURPOSE: To put preclear at cause with regard to mental image pictures to the degree that engrams are under his control.
- TRAINING STRESS: That preclear not be run on this process before he is willing to carry out a subjective process command exactly as given. Earlier processes should be well flattened before this is attempted. Otherwise the preclear will be given loses. The command means exactly what it says and the preclear’s thinkingness must be well enough under control for him to view the command that way. This process should not be run for ever without an occasional flattening of NOT-IS Straight Wire.
- HISTORY: Developed by L. Ron Hubbard in Washington, D.C., in 1958.

RE-EXPERIENCE AND EXPERIENCE PROCESS

—A TYPE 4—SUBJECTIVE PROCESS

- COMMANDS: “What part of your life would you be willing to re-experience?” “Thank you.” “What part of the future would you be willing to experience?” “Thank you.” Commands run alternately, one for one.
- POSITION: Auditor and preclear seated facing each other a comfortable distance apart.
- PURPOSE: To bring about the preclear’s ability to re-experience his past without enduring consequence and to confront the future without restimulation.
- TRAINING STRESS: That student understand that the process is run until flat and that student be aware of what “flat” is. When the preclear can easily get out of any incident he gets into and when he can re-experience those things without enduring consequence. Where engrams are encountered with the process the auditor should attempt to find out the year of its occurrence by two-way comm and flash answers and should record the dates found. The auditor must not go into general two-way comm with the preclear about the incidents preclear contacts. Never end the process while preclear is sticking in an incident.
- HISTORY: Developed by L. Ron Hubbard in Washington, D.C., in 1959.

PRESENT TIME PROBLEMS—PART OF RUDIMENTS—TYPE 1 PROCESSES

- COMMANDS: Auditor, by two-way comm, discovers the preclear’s present time problem and discusses it with him. If it blows on this basis, fine. If not, we move out of Type 1 Processes. To handle the present time problem other than by two-way comm, discuss it with the preclear and get the names of the terminals involved. Ask the preclear which of these is realest. Run the one he names with Selected Persons Overt-Withhold Straight Wire. Discuss the problem. Find which of the remaining terminals is most real to the preclear. Run it with S.P.O.W.S.W. Discuss the problem and so on until the problem is run out, which is when the preclear does not need to do anything about it.
- POSITION: Auditor and preclear seated facing each other a comfortable distance apart.

PURPOSE: To remove the surface difficulty that is the present time problem so that the auditing session can progress.

TRAINING STRESS: Student should know definition of a problem and should know very well what happens to auditing sessions where present time problem is unflat. A problem is “The conflict arising from two opposing intentions”. A present time problem is one that exists in present time, in a real universe. It is any set of circumstances that so engages the attention of the preclear that he feels he should be doing something about it instead of being audited. Auditor uses questions based on definition of present time problem to find present time problems. Never leave a present time problem half run. Preclears with whom the rudiments cannot be readily established should not be run on present time problems but should be run on CCH 1, 2, 3, 4.

HISTORY: Developed by L. Ron Hubbard in London in 1952.

ARC BREAK STRAIGHT WIRE—A TYPE 6 PROCESS

COMMAND: “Recall an ARC break.” “When?” “Thank you.”

POSITION: Auditor and preclear seated facing each other a comfortable distance apart.

PURPOSE: To as-is ARC breaks. To bring about the preclear’s ability to confront and as-is ARC breaks. To straighten out the preclear’s time track which has become collapsed by ARC breaks in restimulation. To key out and take out of restimulation the “Rock” chain.

TRAINING STRESS: To not acknowledge the preclear’s execution of the command until the time of the ARC break has been established and to acknowledge with good TR 2 when the time is established. To accept preclear’s reality as to “when”. If he says, “It occurred the year I graduated from high school,” accept it and go on to next command. Assist him with two-way comm when he has difficulty locating time. Flash answers may also be used for this. Do not leave process until preclear can easily get out of incidents he gets into on the process. Process is flat when recalling ARC breaks no longer produces undue amounts of mis-emotion. Student should understand that the process has the limitation of being somewhat hard to clear command with person unfamiliar with the term “ARC”.

HISTORY: Developed by L. Ron Hubbard in Washington, D.C., in 1958.

NOTE: In handling ARC breaks with the auditor, the auditor should use Selected Persons Overt-Withhold with the auditor as the terminal when the break is severe. Otherwise, use TR 5N.

NOT-IS STRAIGHT WIRE—A TYPE 6—STRAIGHT WIRE PROCESS

COMMANDS: “Recall a time you implied something was unimportant.” “Thank you.” “Recall a time somebody else thought something was important.” “Thank you.” Commands run alternately, one for one.

POSITION: Auditor and preclear seated facing each other a comfortable distance apart.

PURPOSE: To bring NOT-ISNESS (Axiom 11) under preclear’s knowing control and to reduce the NOT-ISNESS in the preclear’s bank. To improve recall and increase reality. To generally increase preclear’s willingness to confront his

past. To as-is the times when preclear not-ised others. To bring about the ability to evaluate importances.

TRAINING STRESS: To be certain preclear can recall overt acts to some fair degree before attempting this process. To make certain the preclear is not running the process on the effect side (i.e. recalling times he thought things were important and times others implied things were unimportant). To persist when preclear's restimulated NOT-ISNESS threatens to destroy the session. To run the process to a flat spot where the preclear easily gets out of the incidents he gets into and can recall incidents without immediately restimulating NOT-ISNESS, which is manifested by a sudden worsening of his recalls.

HISTORY: Developed by L. Ron Hubbard in Washington, D.C., in 1959.

SCALE OF PROCESSES TAUGHT IN HCA/HPA

This is a scale of processes as they fit with the CONFRONTINGNESS SCALE, from the bottom up.

1. CCH 1, 2, 3, 4.
2. Rudiments.
3. PT Problems by Overt-Withhold Straight Wire.
4. ARC Straight Wire.
5. Selected Persons Overt-Withhold Straight Wire.
6. Factual Havingness)
These two processes can be interchanged.
7. Third Rail)
8. ARC Break Straight Wire.
9. NOT-IS Straight Wire.
10. Past and Future Experience.
11. Mock up a picture for which you can be totally responsible.

TECHNICALLY SPEAKING

We have a whole world full of “victims”.

That’s enough.

We don’t have to be victims ourselves. It’s a scarcity we don’t have to remedy.

New Definition: A Scientologist—one who is not a victim.

We can make victims into people without Q and Aing.

Historical note: The whole Christian movement is based on the victim. Compulsion of the overt act-motivator sequence. They won by appealing to victims. We can win by converting victims. Christianity succeeded by making people into victims. We can succeed by making victims into people. It’s time the inversion turned anyway.

HGC ALLOWED PROCESSES

The following rundown is to be used in all HGCs.

For use on unconscious and fixedly psychotic persons unwilling to be audited:

“You make that body sit on that chair (or lie on that bed)”, and CCH 1, 2, 3, 4.

For use on persons unwilling to be audited at any time:

Two way help bracket
“How could you help me?”
“How could I help you?”

Get each question answered. Use lots of two way comm. Don't Q and A with reasons.

For use on persons unwilling to be audited by reason of session errors:

TR 5N, which is:
“What have I done wrong?”
“What have you done wrong?”
with two way comm.

For persons who are acutely ill:

Ask them what part of their body they think is ill.
Use that as the terminal. Run:

“From where could you communicate to a _____?”
(body part named).

For use on persons who complain that auditing has no effect on them or who make very slow gains, or who are going for OT. Run:

Process S2: “From where could you communicate to a victim?”

This is flat when pc can confront calmly a victim.

For use on persons in general. If this has been handled in an HAS Co-audit well, don't handle it again:

Overt-Withhold Straight Wire after careful assessment and used on various buttons, Dynamic Straight Wire, Know to Mystery Straight Wire, are all more or less same processes but are different ways of assessment. Always run terminals, never conditions.

For use on persons who have a p.t. problem. Get them to name the terminals associated with the problem. Run:

“From where could you communicate to a _____?”
(general form of terminal).

For use on persons in general, always to some extent when they enter HGC:

S-C-S.

For use on auditors in for auditing. Run until fully flat:

Process S 2:

“From where could you communicate to a victim?”

For use on people going to theta clear. Use liberally and long:

Assess case with E-Meter. Spot terminals needing clearing. Use:

“From where could you communicate to a _____?”
on each terminal.

For use on people going to theta clear:

Find engram necessary to resolve the case each time. Check out all terminals present in it. Make a list. Run: “From where could you communicate to a _____?” (each terminal in incident by general name). Don’t run off from incident that is being run. Pc will go up and down the track but when one terminal is flat, choose the next from the same incident we started with. Remember to resurvey incident for new terminals when several are flat.

For finishing off cases to level of theta clear:

“From where could you communicate to a _____?”
(male, female bodies, bodies, mest).

For easing off any case into comfort or completion of an intensive:

Get person to say what is wrong. Get them to name the terminal they think is the trouble, run:

“From where could you communicate to a _____?”
(terminal name).

HAS CO-AUDIT

Comm processes may be used in HAS Co-audit. Assess by asking person: “Are you sick or well?” If he says “ill”, ask, “What part of your body do you think is ill?” Run:

“From where could you communicate to a _____?”
(body part person said).

If person says “well”, then say, “What person or thing have you been most sorry for?” (meaning pity). Whatever person says, run it as a terminal, “From where could you communicate to a _____?” (generalized form of whatever he or she said).

This gets people up to talking and you get the “word of mouth advertising” you should have, plus a lot of better people.

ACTUAL WORKING DEFINITION OF PSYCHOLOGY

That body of practice devoted to the creation of any effect on living forms.

This is the totality of study. The ethics of the effect do not enter in this subject.

It is not a science since it is not an organized body of knowledge.

In actual use it is a dramatization of Axiom 10, wholly reactive.

In this wise the word can be used by Scientologists, and this definition can be used legally to prove Scientology isn't Psychology.

HCO BULLETIN OF 5 AUGUST 1959

HGC PROCESSES

The lack of results in HGC is probably due to the restimulative nature of Communication Processes, a phenomenon we have noted on ACCs.

Therefore, I am giving you this regimen which I want you to very thoroughly enforce so that we can regain the results and therefore income and dissemination on the HGC.

These processes were first evolved by me in 1956 to process the personnel of a large London company so that they would get uniform results and would not be telling one another different processes during work. It is therefore amongst the first packages to be "used on anybody". You have all the data on this, I am sure. It is in the paperback on Control. Switch all pcs to this and we'll have a happier set of auditors and better results.

Run Psychos on CCH 1, 2, 3, 4.

Switch all other cases except the acutely ill (on which you should run Communication Process to the ill body part) to S-C-S and Connectedness.

When these are flat run the pc for a while on the following Comm Process:

"From where could you communicate to a person with difficulties?"

When pc seems to be flattish on this, return to S-C-S and Connectedness.

Let's increase those results.

THE HANDLING OF COMMUNICATION PROCESSES

SOME RAPID DATA

The most important research development of recent times is the "Communication Process". It has gradually been evolved for nine years, beginning in July of 1950 when I isolated Communication as one of the three important pivots on which all mental association turned, the other two being Affinity and Reality.

Much could be said about this evolution and the search, but the important gain remains, that to-day, I have evolved finally a single command type process that answers all requirements of all levels of clearing and violates no rules of auditing.

An auditor to-day could audit with just three packages:

1. The CCHs
2. S-C-S and Connectedness, and
3. The Communication Processes.

Using these he would certainly achieve releases and clears on all cases he could keep on the auditing roster. I must call your attention to the facts of this: we have achieved our finite goals in auditing and clearing can be done easily and broadly without kick-backs. Therefore all programs should be geared with these steps:

1. Make a clear or two.
2. Use Communication Processes, in Co-audit toward clearing.
3. Groove in administratively to clear your area.

I will shortly write a small book on Communication Processes which will give all. Meantime, the essentials of use are as follows:

1. By Communication Process is meant any process which places the preclear at Cause and uses communication as the principal command phrase.
A typical wording now standardised is, "From where could you communicate to a ___?"
2. The terminals to which Communication Processes are addressed must be real terminals never significances only.

Right "From etc, to a 'husband' "
Wrong "From etc, to a 'thought' "

Right "From etc, to a 'dog' "
Wrong "From etc, to a 'mistake' "

3. All terminals employed in the command should be generalised. Don't peg pc to one lifetime with a proper name. Always use a generalised name since Communication Processes span lives too fast to be limited too much.

Right "From etc, to a 'husband' "

Wrong “From etc, to ‘Bill’ “
Wrong “From etc, to ‘your husband’ “

If you isolate Bill as the terminal that needs running, find out what Bill is to the pc. Use what the pc describes Bill to be or what rises on the meter. Bill will turn out to be ‘a husband’ or ‘a friend’ or ‘a mechanic’ or some generalised terminal. He is *never* run as ‘Bill’, as that pegs pc to one life and rarely clears Bill whereas the generalised terminal *does* clear Bill.

4. Run a Communication Process more or less muzzled. The smoother, the more confident, the more experienced the auditor, the less muzzle is needed. The process wins totally muzzled so err in the direction of more muzzle, not less.
5. A Communication Process is flat when none of that class of terminal produces change or a comm lag or a cyclic aspect on the time track. If the pc no longer goes into past on a continuous long run, the process is flat.
6. Use a meter. This alone tells you when a terminal is really flat. This alone diagnoses a terminal properly. A good electrometer can save you three hours in every five. Lack of meters means lack of clears. Only a meter keeps the auditor from clearing the auditor’s buttons out of the preclear. Only a meter keeps processes from being left unflat. Only a meter can show when a terminal is clear or a preclear is clear. Use a meter if you want to clear people. Insist on your auditor using a meter if you want to get clear.
7. Know meter behaviour. There’s a lot of data on this. But I’ve recently found a new one.

A terminal needs to be run if it drops and then when ignored any further questioning causes a needle to rise only.
The right terminal found again sticks the needle and stops the rise.

If a terminal is left unflat (if it is run and then dropped before it is flat), the needle in future sessions will only rise.

A steadily rising needle is by definition then the symptom of an abandoned terminal. That terminal must be found again. If found it will stop the rise of the needle. It must then be run and flattened. This is why some cases bog down and this is how it is remedied.

A further discovery is that a terminal clears on the meter just like a pc clears on a meter. Example—an unclear person doesn’t read steadily at Male or Female Clear reading, but goes above or below that reading and the reading changes. Similarly, a terminal found on a pc reads above or below Male or Female Clear reading. If the terminal is run by a communication process it makes the tone arm read higher or lower than Male or Female Clear. The running of the terminal changes the tone arm position, making it rise and fall, rise and fall. The rises of the tone arm get easier, the falls more rapid until at last the tone arm does not rise or fall but sits on Male or Female Clear, depending on the sex of the pc (not the terminal). The more flexible the tone arm, the looser the needle.

If that’s Greek to you, better grab plane or train to a Central Org and study the E-Meter because you won’t make any clears until you do.

8. A preclear is mest clear when no terminal selected is, when run by a Communication Process, productive of variation of the tone arm from Male or Female Clear reading. A preclear is theta clear when he can handle engrams without producing a change from clear reading.
9. Cases do not improve if they are in a victim valence as they self invalidate between sessions. Communication Process S2 or S22 must be run to remedy this.

10. If an assist is done by a Communication Process, the terminal chosen (usually a body part) must be flattened fully (see 7 above) before the case can be expected to move again on a new terminal.
11. When an auditor finds a steadily climbing needle on a pc new to him but not auditing, he must suspect that a terminal has been run but isn't flat. He should query past auditing or living until he finds a terminal which stops the rise. He then runs this flat before he goes on.
12. Old pcs benefit from a Communication Process using "an auditor" as a terminal to clear off the case. This is done when the auditor fails with 11 above.
13. Old auditors can be smoothed out as cases by running a Communication Process on "an auditor" and "a preclear". Run each flat.
14. In general run any terminal selected back down until the tone arm reads Male or Female Clear stably for many commands and pc is no longer cycling on track with that terminal.
15. Process illnesses with Communication Processes if the illness is in the way of the session. Assess by finding out what part of body pc considers ill. Run what he says. Run it in one or several sessions until that part reads Clear on the tone arm.

These are some of the rules above of Communication Processes.

A few cautions however should be emphasised.

Don't Self Audit with a Communication Process. Use a touch assist on body or room instead.

Don't clip a terminal into action on a case and leave it unflat. Flatten it in one or many sessions instead or make sure you tell the next auditor that it is unflat.

Communication Processes are so simple. They are apparently innocent and charming. They are in actuality strong enough to move a whole bank. So they should be handled with accuracy and the same respect you'd give 90% dynamite.

Note to HCO Secs, D of Ps and Assoc Secs and heads of Organizations: It would be well worth your while to study this bulletin thoroughly, then have your people study it and take an examination on it.

Those who can't pass it eventually shouldn't be handling paying preclears until well audited and retrained for we have no passing fancy here in Communication Processes and we use in them the cream of everything in techniques and procedure we have learned in nine years.

HAS CO-AUDIT—FINDING TERMINALS

If the instructor switches around terminals endlessly on a HAS Co-audit course, then you have nothing but rising needles left on these cases. It is necessary to get the very first terminal that dropped on the pc and convert it to a general form and run that terminal with a Communication Process until the terminal is again reading on the tone arm at male or female clear (depending on the sex of the pc, not the terminal) and stays there.

This is why you don't fill up the Co-audit.

Regimen on this is find the first thing that dropped on the pc then state it in a general term—make sure it drops. Example: pc's first assessment was on his wife. Find it again and see if it stops the needle rising; if it does, run: "From where could you communicate to *a* wife?" Note that it is *a* wife, not *his* wife. If the needle dropped the first time he was ever assessed on Bill, we have to find out what Bill is and run it.

On new enrollees in the Co-audit, take a body part only. A body part is then run on the Communication Process, "From where could you communicate to a (name of body part)".

This is only considered flat when no matter what or how many questions are asked about that body part, it registers on the tone arm of the meter at male or female clear, whichever the pc is. Only then can you go on to a new process.

Communication Processes look so simple. They are in reality terribly tricky and terribly effective.

Pick the right body part on the pc and he'll stay in the Co-audit until he's clear on that part, that's for sure.

When you see a pc getting fouled up by lousy Co-audit handling you are losing a student and, I am willing to confirm, gaining a victim computation.

TO A ROMAN CATHOLIC

In Ireland, where we had an office for some years, the problem of processing persons of the Catholic faith was thoroughly worked out and the Church did not consider itself interested in the matter of auditing Roman Catholics and did not restrain any from being audited when Roman Catholics asked permission to be. Indeed Scientology is closer to the "Faculty Psychology" of the Church in the sixteenth century than modern psychology is. Modern psychology is not accepted by the Church because it considers man to be an animal with no soul. Scientology not only accepts but can prove than man does have a soul. Saint Thomas Aquinas is an early forerunner of Scientology. Scientology is not an heretic religion and demands no belief or faith and thus is not in conflict with faith. Several monsignors of the Church have been interested in Scientology and have approved of our activities. The late Pope Pius was an enemy of psychoanalysis but was heard to express a neutral attitude toward Scientology. He once assisted us in handling a government matter in the United States.

All that processing requires is that you obtain a better reality on your environment and all its drills are aimed at this. Thus it has no conflict.

Just as your religion would not forbid you to obtain a better command over a typewriter, so it could not be expected to forbid you to obtain a better command over your office, staff, or home. There is no conflict here.

It is interesting that in nearly ten years of public presence, the materialistic sciences have often rapped at Scientology (Communism is a violent foe of ours) but never once in any country including Ireland has the Roman Catholic Church raised its voice against us.

GROWTH WITH COMPETENCE

There is a great deal of history to the development and dissemination of Dianetics and Scientology. And it has not been without its severe lessons.

One of the first vows I made, in L.A. in the fall of 1950, was based on the assumption that "it will go as far as it works", and I vowed to make it work not just for the few but for the many and not just in expert hands but for the tyro as well. Well, that vow has been achieved.

The HAS Co-Audit course taught in Washington, D.C., by Nibs, Dick, Jan and Nina West has made Mest Clears using only muzzled co-auditing.

So it is working for the many in the hands of the relatively unskilled group co-auditor.

But there were other things learned in this history. And amongst them was the lesson that a Central Org can succeed as far as it can service. When a Central Org can no longer service it cannot succeed. And that goes for any individual or group in the whole of Dianetics and Scientology, and on these the sun never sets.

Our problem then, now, is to be able to service as far as we go. We are in the possession of powerful tools. We have relatively good literature and will soon have better. We can promise a great deal and point proudly to records of things we have done. We can say with truth that we have done more than fifty thousand years of thinking man could do in understanding and assisting the human being. We can command a very wide sphere of credit for first discoveries. We can promise a great many things on the basis of having delivered them. BUT CAN WE SERVICE THIS WELL AS A GROUP?

I get some very fine reports from HAS Co-Audits throughout the world. But amongst these reports there are a few failures, a few resistive cases. I could audit them, a great many Scientologists could audit them and push them through. BUT the fact remains that there are auditors here and there who cannot.

"Why?" I asked the HCO Area Secretary London the other night on telex—"Low ARC," she replied. And this apparently explained two case failures by field auditors.

And not very long ago when we had a bad code break with a pc in the field, the Ethics Committee suspended the auditor for a few days and then told him he could be reinstated but would have to sign a paper pledging to obey the Auditor's Code and HE REFUSED TO SIGN IT. Why? Because he had "gotten results with invalidating pcs too often", but the truth is he hadn't gotten good results and the tests showed it so he was wrong. But why wouldn't he sign the Auditor's Code?

These of course are isolated things BUT AT THIS PRESENT INSTANT THEY EXIST.

Low ARC, the HCO Area Sec London said.

Well, what's this low ARC doing at this stage of the game? How come this late in the business does an auditor get discovered who doesn't believe in the Auditor's Code? Why do individuals and groups still flub on occasion?

I know that all these people basically mean well. I would stake my life on their humanity and decency. And have. But we're in something that's got to go all the way and the basic lessons contain this one, an Organisation will succeed as far as it can service.

And if groups are still flubbing service let alone Administration, then they aren't going to go very far.

Now does this mean there must be more training?

No.

There will always have to be training but this won't entirely solve this one.

"Low ARC," the HCO Area Secretary London said. What did she mean by that? She meant basically that these auditors somehow or other weren't going to make a pc well. They didn't care enough about that pc to do the job.

The button which causes such things is VICTIM. This is the central button of the Overt Act-Motivator Sequence. Some auditor, perhaps one that is ordinarily quite good, gets a restim. He keys in something not from what the pc said for this couldn't aberrate anyone. He gets a restim between sessions on the Overt Act-Motivator Sequence, and he comes back into session with the VICTIM button in full flare. And what does he do? Almost beyond his control he flubs. He makes a victim out of his pc. Why? Because that's the exact action which occurs when an Overt Act-Motivator Sequence is triggered.

Low ARC. The whole answer to it is contained in VICTIM. The auditor feels that the pc deserves what he gets for a moment. He rationalises it all out—but he treated the pc as a victim. A dropped ashtray, a stupid auditor remark, an invalidation of a cognition. . . however the auditor flubs, he is treating the pc as a victim, and the pc victimised responds with bared engrams.

Well, true enough a lot of pcs ARC break easily because they are really being fully fledged victims, and all the auditor has to do is slightly hint toward victimising in the pc's estimation and bang, out goes the session. But an auditor who ISN'T really treating the pc as his victim can pull the pc through. The auditor who is keyed in by this victim thing drops all the cans in the rack and flubs but grandly.

All this has been a big mystery previously. It's understood now and thoroughly. And further, we've the processes that can do something about it.

The right way to audit this victim item out from scratch is with a Comm Process. Handling the whole case it is necessary in most instances to find a specific dropping terminal on the pc, perhaps even more than one, convert it into a generalised form and flatten it until it reads as a button right at the clear reading of the pc's sex. When this has been worked over and done, it is usually safe to do a plunge into this victim thing. Given the pc in session—given the pc really answering the auditing question, then we can handle the Overt Act-Motivator Sequence with the Comm Process, "From where could you communicate to a victim?" The process is actually a one-shot OT Process.

Don't make the mistake of running a pc who figure-figures his answers or gives philosophic type answers on a Comm Process without actually making him do it, do it, do it.

There are cases around that have been "audited" for years who have never really done a process. This can be whipped by a Comm Process done with paper and pencil. You locate the terminal with an E-Meter and then you lay the instrument aside, give the pc a sheaf of paper and a pencil, and every time he answers your auditing question, you have him or her draw the answer on the paper. As the Comm Process exceeds language, it can be easily checked. Even if the pc seems to be having some success but could succeed faster you can boost it along with

the “paper trick” as this is called. So even the people who couldn’t be trusted with a thinkingness process can be run on a Comm Process using the paper trick.

All right. That’s what makes an auditor not flub, and it keeps him from being a burden to himself and others as a person too. It’s a cyclone of a process as the experienced person can tell you. And it prevents the flubbing of service in an Organisation.

Scientologists who can’t stand the sight of money or who can’t seem to get pcs are just having a fine old time being in some way or another, a victim. So let’s face this reality and understand clearly that we can guarantee our successes as individuals and Organisations by getting bell clear on victim. Then we can give service. And then an Organisation can give service. Then it’s safe to make promises. And we don’t get Administration chopped up. And it’s safe and successful to have an Organisation set up and financed and running on the mission of clearing Earth.

Of course we have to go right on with our jobs whether victim is flat or leaping about like a Texas thermometer. Of course we have to go right on organising and planning and making the future real. We can’t just quit and say well, when we all get to be clear then we’ll go-man-go. We can’t afford that. But this time be warned. We know that with our Organisations and Comm lines and plans we’re going to go successfully or not straight up the line. Let’s see this one coming though and not fly into the thunderhead blind. Let’s understand that staffs and individual Scientologists are going to goof just as long as the victim button is not flat and that it’s going to take quite a while to get it all flat.

People are always preparing for rainy days and failures. Well, let’s prepare for success. If we get much bigger nobody will be able to handle anything unless we get smooth operation, smooth procurement, efficient good looking HAS Co-Audit units, successful case handling everywhere. We won’t be able to live in a climate of 75% success and 25% failure. We won’t be able to administer with people here and there on our lines who are bound and determined to be victims and to appoint us their executioners.

We’re moving right up to the Big Win and we should be able to handle it without going half round the bend patching up the flubs made by the victim impulse that comes on when we’re restimmed or exhausted. Let’s win all the way this time and keep it won..

You see, you can’t ever get a victim valence to win. It’s a plain lesson to him, and he believes it, fallacious though it is, that when somebody wins there is always a loser and that winning “is always an overt act to somebody”. To prevent losers, our victim doesn’t win. He quits instead.

Thus there can be no constant and safe win until we have amongst us whipped our first big hurdle. No amount of planning, writing and care, no amount of education can overcome this impulse. We already know it can only be done by auditing. So let’s clear up this thing, let’s get the auditing, let’s make sure that when we set up something to go none of us will say, “Oh-oh, that’s a win! Mustn’t! Mustn’t!” and start tearing the whole thing down.

Before we get too far along this road let’s make sure we stay winners after we’ve won by making sure that none among us will go victim on us and cut our throats with the best intentions in the world.

Let’s define Scientologists as “People who aren’t Victims”, and really get the show on the road.

WHY “VICTIM” WORKS AS A PROCESS

We all should have heard of the Overt Act-Motivator Sequence. If we have not we should review “The History of Man”.

The highest level of third dynamic activity and the earliest instant of it is and was communication. Before communication (in one form or another) there was only native state. Obviously you are not going to run out native state—leave that to the Psychiatrists and Politicians. Therefore the earliest button susceptible of aberration was apparently communication.

However, communication itself is not aberrative. Only the misuse and withhold of communication is aberrative. One received his first communication foul-up when he postulated “somebody can mess up my postulates”, when he granted that, right, then he or she had it thereafter.

The idea that communication could be harmful apparently came in about this point. And the obvious conclusion that one could injure with communication must have followed shortly after. That one could be injured and that one could injure was established by “example”. Here began the game of “victim”.

Death is just one of the varied forms of the game of victim. That one could be killed by the communication words or missiles of another is just an extreme form of the game.

That this was a game and that it was played out by Thetan “B” pretending that he had been injured so Thetan “A” would further withhold his postulates, has all been lost in the depths of the Reactive Mind. Death isn’t a game anymore. Not even injury is a game. We know how seriously these things are now regarded and how utterly caved-in and lost Thetans have been for a very, very long time.

Only with Scientology have we come back to the straight of it. And the straight of it is that one cannot be injured until he has postulated that Thetans can be injured and, by example of Thetans pretending to be injured, has come to the point of himself not only consenting to be injured but actually getting torn to shreds.

The basic postulate of injury or death (or harmful communication) is best summed up by “victim”.

To restrain others one sets an example as a victim. It might be said that this is a last ditch way of being cause. On that thin idea rests all the disease and death, all the agony and travail of man. It is almost the bottom point of the Reactive Mind.

In any Overt Act-Motivator Sequence there is a villain and a victim. If the auditor were to choose and run the “villain” then he would be violating the basic definition of operating thetan which is “To be willing and knowing cause over life, matter, energy, space and time”, and would be processing the pc at effect point. The basic definition of victim must then be, as our

HCO Staff Auditor pointed out, unwilling and unknowing effect of life, matter, energy, space and time. Therefore, to keep the pc at cause we have no choice but to process him in such a way as to face him up to “victim”.

Naturally this process is not going to run on the following cases until they are up to it:

1. A person who cannot conceive of ever having done anything bad to anybody or anything (“old sweetness and light”).
2. A person who has a heavy present time problem (PTP).
3. A person who has had a bad ARC break with the auditor (who conceives the auditor has made him into a victim of bad processing or code breaks).
4. A person who needs to have several buttons cleared away which are pressing and making his present time very bad; and
5. A person who simply fogs out hour after hour on general comm processes and needs to have lighter buttons run until he can handle comm processes.

With these above five things cared for, then a pc should be able to run easily if lengthily on “From where could you communicate to a victim?”

During the run on the process all manner of chains come into view. Monitoring the type of chain or chasing down some sideline should be avoided thoroughly especially while running “victim”. The pc is all too willing to duck and dodge and an auditor who Qs and As (changes the process just because the pc changed or wandered) had better go back to the Academy for a spell or get his own case gone over at the HGC.

Pcs have gone into convulsions, screaming fits and many other manifestations while running “victim”. Of course they would, since they are dramatizing what they have done to others and are wearing the engram in full. But it is easier to run victim on the pc than to run engrams on him as such for he can pull out of “victim” engrams easily with a comm process.

A large percentage of pcs will not recover and stay recovered until “victim” has been run and flattened. This is due to their using auditing to be “victims” of. This is the heart of the old “service facsimile”. This is why they have service facsimiles. So they can be victims.

The pc, while running victim, goes rapidly back and forth from one valence to another. He goes through all the various phenomena of engrams, locks and secondaries and in spite of the violence of the process, very often would rather run victim than anything else.

But, as above, beware of trying to run this on somebody who will not ever admit having done something or anything to anybody. This is the figure-figure case. The difficulty here is that the person cannot face any terminal subjectively for fear of having ruined it or for fear of ruining it. Therefore—and watch this carefully—he does not do the comm process. Such a person needs a comm process run on very particularized terminals done in a general form: “From where could you communicate to a dog” or anything else that drops. But if this is very necessary then run the person on the paper trick even with the lighter terminals. Make him draw each answer. Cases that have never, never moved before in hundreds of hours of auditing, get shot down in flames with the paper trick.

While running victim, the auditor should not use “how could you communicate” as an interjected command. It’s a different process. If the auditor is having trouble he should have run a lighter terminal. One of the most effective light terminals and one of the best comm processes particularly for the HAS Co-Audit is a body part. One asks the pc if he has ever had trouble with any part of his or her body and when the answer is given, run body part named in a generalized form such as “From where could you communicate to a leg?”

From all the results I've been looking over lately, it would seem that the most broadly workable form of the comm process is a body part as above or "a body". After all, the pc IS in a body. Doing the comm process on mest before a body part and the body are run, seems to be a little rough on the pc (this is part of a system called universe processes), as the pc himself as a Thetan is generally mest shy.

Auditing body parts, however, has its lighter moments. At the last congress I gave, the body part given by the pc as a part of the body with which he had had trouble, when run, didn't do a thing for the pc. Surprised auditors and instructors were not long in finding out why—the pc's body part had been run and flattened years ago by older processes and didn't have a twitch left in it. This stuff's been working for a long time you know.

Well, that's the way it is. A person doesn't get sick or injured unless he's cast himself in the role of victim by reason of the game and his Overt Acts. And if you want somebody to cease to be a disease prone (new term there) and get up and do things and be bright and not flub and to win win win, get him up to a point where he can run victim with a comm process and from there on flatten the living daylight out of it.

When is victim flat? When the tone arm of the Hubbard Electrometer reads consistently at the clear reading for the pc no matter how many more auditing questions are asked about victims. *Every* terminal you run should be run until the tone arm reads male clear (12,500 ohms) for a man, and female clear (5,000 ohms) for a woman. And this is particularly true of a victim.

Don't start this going in an HAS Co-Audit until the pc being audited has had flattened on him easier terminals. And these may take an awful lot of hours to flatten. Victim itself is a very long run. The run is shortened by preparing the case well first so preparation time is never lost time on this process.

There is another button, in fact there are many more special buttons. It goes on up toward OT. And it isn't run at first on a comm process, but that's another and later story. I'll still be around when you get ready for it.

Meanwhile, de-victimize and win!

HCO BULLETIN OF 25 SEPTEMBER 1959

HAS CO-AUDIT

Here are some hints on how to run Comm Processes on assessment:

The instructor asks the preclear if he is sick or well. If the pc says he is ill then the instructor says, "What part of the body would you say is ill?" Whatever the pc answers, this is then run on "From where could you communicate to a (generalized terminal) body part." If the pc answers that he is well, the instructor says, "Have you ever been ill?" The pc will in general say yes. The instructor then says, "What part of your body was ill?" and runs the Comm Process on whatever the pc says.

Giving you advance scoop on a new research win it seems that the most effective and rapid clearing could take place with what we will call Universal Processes. This means running a Comm Process on Universe as follows:

"From where could you communicate to the physical Universe."

"From where could you communicate to a body."

"From where could you communicate to a mind."

"From where could you communicate to a Thetan."

This is all experimental at this stage but it would be a separation process from all universes the thetan is anxious about and should be quite successful in general use.

However I give you this not to use but to show you that we would probably win further and better if we began to steam people up on the subject of being clear and then slammed right in on whatever universe they could handle on Co-audit. I would then run Co-audit as follows:

Do the actions described above on body part and when the pc has come through that go at once on to the physical universe and then graduate him on to any body part that bangs on the meter and finally when various parts are flat get him into running the body as a general terminal.

HCO BULLETIN OF 26 SEPTEMBER 1959

**DATA ON CLEARING A STAFF MEMBER
AFTER SPECIFIC TERMINALS ARE FLAT WITH
OVERT-WITHHOLD STRAIGHT WIRE**

“What would you like to confront?” until nominally flat.

Then:

“You make a mock-up for which you could be totally responsible,” run until Mest Clear.

Then:

“From where could you communicate to a body?” until Theta Clear.

Scout out and run Present Time Problems as they come up with:

“Invent a problem of comparable magnitude to that problem,” E-Meter check for these each session and then don't spend the whole of every session on it. Just run it until she/he doesn't have to do anything about it right now.

On ARC breaks run TR 5N: “What have you done to me?” “What have I done to you?” then “What have you done to me?”

Run this regimen and no other and send special weekly reports labeled “THACKER CLEAR PROJECT”.

This will get them clearer faster than any other project I know just now.

TECHNICAL NOTES ON CHILD PROCESSING

The best process in *Self Analysis*, for a child if he can do it, is ARC Straight Wire, in the back of the book.

The best process for children in general is some version of TR 10 (Notice that[Room Object]). The variation which is best is "Feel my arm," "Feel your arm," "Feel my face," "Feel your face," etc, all done with the hand. Another version for very young children is "Where is the table?" "Where is the floor?" etc on room objects.

Injured children respond best to touch assists and to locational "Where did you fall?" "Where are you now?" etc repetitive until child is well.

For an unwilling child use short sessions (as short as two minutes) but always begin and end the session complete with goals and PT Problem query.

For a bad-off child use CCH 1 and 2; these are heroic but effective. They require a very skilled auditor and *no* interference.

Give the child the dignity of real sessions. And when a child flips to trying to audit you as a turnabout, let him.

Remember that if you spoil Scientology for a child with bad auditing you may close the door on the only way out he'll have in this life.

HCO BULLETIN OF 29 SEPTEMBER 1959

UNIVERSE PROCESSES

I have just been checking out a process series we will call Universe O/W. It is a killer in sheep's clothing.

Assessment is done with an E-Meter to discover which of four things has the greatest difference of needle pattern. One does not look for a drop, he looks for the one of the four that is different than the others.

The four are:

Thetan or spirit
Mind or brain
Body or male body or female body
Physical Universe or earth or continent or town or house or dwelling.

One uses different ways of putting these things if he doesn't get instant difference on calling off Spirit, Mind, Body, Physical Universe. If he does get a different pattern from the rest he proceeds to audit that discovered thing as follows:

"Think of something you might have done to a ____." (The " ____ " being the terminal you discovered.)

Alternated with:

"Think of something you might have withheld from a ____" (same terminal).

Because these dive backtrack so fast the question may not be a direct "Recall what you have done to" since that implies certainty.

This problem could be a specific for illnesses of chronic type.

This is an allowable process in HGCs.

UNIVERSE PROCESSES

Now that HCO WW at Saint Hill Manor is settling down for the long run, thanks to the co-operation of all Central Organizations and Franchise Holders with very few exceptions, I have been able to do some co-ordination work on processes I have been developing and would like to give you a rapid rundown on some of this work.

The first modern development of any importance since Comm Processes is called "Universe Processes".

This is based on some work which started with the 1959 HPA/BScn Course. The most gross breakdown of parts of life is: 1. The Thetan 2. The Mind 3. The Body and 4. The Physical Universe. This division is a sort of shorthand of the eight dynamics and gives us the stuck points of the majority. As this division is refined it becomes the eight dynamics as used in the old Dynamic Straight Wire.

Almost anything which applied to or was used in Dynamic Straight Wire can also be used in Universe Processes.

The most elementary form of Universe Processes is called "Universe O/W". This consists of doing an E-Meter assessment of the person on the four points above, taking the most different needle reaction from the rest (Thetan, Mind, Body and Physical Universe) and running what was found with Overt-Withhold Straight Wire.

Example: Let us say that we found Physical Universe to be the thing which fell the hardest or looked the most different on the E-Meter. One would then run as an alternate question: "Recall something you have done to the Physical Universe" alternated with "Recall something you have withheld from the Physical Universe". When the E-Meter was reading Clear on the tone arm for the sex of the pc, one would then reassess and use the one of the three remaining terminals (Thetan, Mind or Body) which now fell differently or more than the other two. Thus all four would eventually be run.

Universe O/W is based upon the observable fact that a thetan is trapped in a thetan, a mind, a body and the physical universe. If he weren't, he or she wouldn't be sitting in a chair. Thus we process the extremely obvious, scouting out with an E-Meter only what obviousness is more troublesome to the pc than the other obviousnesses. Of course it seems strange that a thetan could think of himself being trapped in another thetan but you see this all the time in valences. Ghosts become ghosts by being overwhelmed by thetans they think are ghosts and so on. That a thetan is trapped in a mind and that it is not his own mind that he is trapped in is also obvious. If it were his own mind he would soon as-is it and you see what a hard time he has trying to erase it: that hard time comes about because he is misowning the mind in which he is trapped. And this is true of all traps. A thetan is usually quite sure that there is something wrong with the ownership of his own body and sure enough there is. And of course he's in the universe without much understanding of it.

It is far more obscure that a thetan gets trapped in the remaining dynamics even though this is equally true. He isn't really trapped in an animal if he is sitting there in a human body and so forth. So Universe O/W processes the obvious that is the most obvious.

All four of these terminals are run.

Now there is another way of attacking this problem and it is very successful. This is the “Universe Comm Process”. One assesses the pc in exactly the same way but runs the terminal on “From where could you communicate to a ... (one of the four universes as above)”.

It is very notable that Comm Processes work best on obvious and visible terminals and work much less well on things that are not present and worst on things that are merely ideas or significances. You can make great headway with a pc with “From where could you communicate to a body” when with the same pc you might get very, very slow results with “From where could you communicate to a brother”. Therefore the easiest to run and make progress with a Comm Process is using an obvious terminal and this of course would be one of the four universes, thetan, mind, body and physical universe.

However, when one runs a very obvious terminal with a Comm Process, one must carefully avoid pinning the process in present time. One cannot successfully run a Comm Process with “From where could you communicate to this room”. This is too specific. The pc is balked by the fact that the Comm Process strongly calls up every room like “this room” and if he answers anything about these other rooms he is not doing the exact auditing command and so goes rapidly out of session. Specific terminals that permit no large breadth of time span won’t run on a Comm Process because the process escapes the time limit imposed all too easily. One would have to run “From where could you communicate to a room” in order to wipe out the bad effects of “this room” on the case.

Universe Comm Processes are evidently the best version of all Comm Processes.

The assessment of the proper terminal can be a little tricky. The semantics of the terminal get in an auditor’s way. And yet the auditor may be led astray into using a version of the terminal that is not really an obvious terminal. Example: The pc does not understand what a thetan is and the meter does react to it so the auditor sorts out “soul” and “spirit”, etc, but gets a large drop on “astral body” and decides to run it only to discover that he is running an engram of recent origin in which the words appear. “Spirit” dropped less but would have run because it was more general.

You are probably wondering how we can get away with running “conceive a static”, forbidden in the book *The Creation of Human Ability*. We can just barely get away with it because of the nature and power of the Comm Process. By damping out excessive individuation the Comm Process increases havingness. A total individual can’t have much of anything—you can’t even have a car really unless you can be, besides self, a “car driver” or a “car passenger”. A totally individuated person cannot be anybody but himself, cares for nobody but himself and can share in no activity of any other person. Hence as we flatten out this obsessive individuation we gain in the pc usually enough havingness to run a massless identity such as a thetan. However this terminal usually runs less well than the other three employed in Universe Processes.

There are other developments which will be discussed in later bulletins, such as “Think of a creation you could make unknown” but these in general are not as important to us as the above.

If you are having trouble keeping your people on a Co-audit it’s because the things you are running on them are not real to them. I think you will find that by using a Universe Assessment on a Co-audit as above, you will have much more constant attendance. Try it anyway.

A USEFUL PROCESS

On your HGC process you have many who cannot seem to plumb an overt/motivator sequence. On any such and many more, you will find the following process works admirably:

“Recall being critical.”
“Recall withholding criticism.”

If the pc tends to become ill push on through. This is the lowest level of force and influences body form. Try it and tell me how it goes.

D.E.I. EXPANDED SCALE

(With a Note on Salesmen)

The original scale

4.0 Desire
1.5 Enforce
.5 Inhibit

was expanded in 1952 to

Curiosity
Desire
Enforce
Inhibit.

In 1959 I have found another vital point on this scale which gives us a new case entrance point.

Curiosity
Desire
Enforce
Inhibit
Unknown

I suspect also that "Wait" fits between Unknown and Inhibit.

To make these agree in intention, they would become

Interest
Desire
Enforce
Inhibit
Unknow.

This scale also inverts, I find, similar to the Dynamics and below sanity on any subject.

Unknow
Inhibit
Enforce
Desire
Interest

These points, particularly on the inverted scale, going down, are lowered by failure. Each lower step is an explanation to justify having failed with the upper level.

One seeks to not know something and fails. One then seeks to inhibit it and fails. Therefore one seeks to enforce it and fails. Thus one explains by desiring it and fails. And not really being able to have it, shows thereafter an obsessive interest in it.

The above inversion is of course all reactive.

Reactive selling (of interest to us in a salesman campaign) would be accomplished thusly (and this *is* the basic scale of selling):

The salesman refuses to let the customer forget the product;

The salesman then inhibits all efforts by the customer to refuse the product;

The salesman enforces the product on the customer;

The salesman now finds the customer desires the product;

And the customer will remain interested.

There is an interplay here whereby the salesman reverses the scale:

| Source of Sales Failure | |
|-------------------------|-----------------|
| <i>Salesman</i> | <i>Customer</i> |
| Interest | Unknow |
| Desire | Inhibit |
| Enforce | Enforce |
| Inhibit | Desire |
| Unknow | Interest |

Salesmen, bringing about an inverted scale, can go downscale themselves as they do it. They seek to interest and meet *forgetfulness*. They *want* to sell and meet *opposition*. They *high pressure* the customer and get pressured back. And about the time the customer *wants* the product the salesman is reactively inhibiting the sale. And as the customer's interest is at its highest the salesman forgets all about him.

SALESMAN SUCCESS

All a salesman has to do is continue to try to interest the customer and the reactive inversion will take place.

It is interesting that this scale, more importantly, gives us new case entrances. A series of Comm Processes on any terminal, say "bodies", could be run.

From where could you communicate to an unknown body an unwanted body a necessary body a desirable body an interesting body

This would pick the case off the bottom and run it to the top on any terminal that has gone totally reactive.

By the way, don't take my remarks on salesmen as being "all for the best". The basic overt act is making people want useless objects and spaces, and unfortunately for him that's often part of the business of the salesman. He, unlike us, sometimes isn't fishing people out of the mud. He's often more likely pushing them in. Therefore *he* needs our help to get square with the world. As his income depends on making people want things and buy things (even though sometimes they need them), we haven't much choice but to show him the mechanics of selling, to the end of getting him to help pull others out of the mud. Making somebody want something they really need is no crime, but the salesman is on very shaky ground. What do

people really need? We had best not try to get involved in the ethics of all this, or to persuade them to sell only needed items.

The whole economic structure needs the salesman; he is the key of the whole structure. But we can leaven the flow of even useless goods by letting an invitation to freedom trickle in the same channel.

AN EXPERIMENTAL PROCESS

Recall Processes have always worked well. But it has been hard to get the most fundamental processes that would reach the lowest cases. Here are some Recall Processes that work way down South of the Auks:

COMM RECALL PROCESS:

“Recall a Communication”

KNOW MYSTERY RECALL PROCESSES:

“Recall an Unconsciousness”
“Recall Waiting”
“Recall a Mystery”
“Recall Sex”
“Recall Eating” (or a variation
“Recall Food”)
“Recall a Symbol”
“Recall Thinking”
“Recall an Effort”
“Recall an Emotion”
“Recall Looking”
“Recall Knowing”
“Recall Not-Knowing”

These are very good, especially on bad off cases. They all work. When the lowest seems flat one can go to one above. Probably there is an E-Meter tellingness that denotes flatness. I'm working on this and will have the gen soon.

The earliest experiments of this were on “Recall a Mystery” as a method of raising IQ and the pc was spouting poetry he'd “forgotten”.

There are many possible versions of these simplicities as one can run them on terminals and significances. Also, remember that these things (Recall Processes) take the pc out of PT and put him back in. You stop one with the PC back in PT. The Comm bridge to be used on this process is: “When you next get an answer close to present time we will end this process if it is all right with you.” Then don't go on for an hour or two, catch it with 8 or 10 commands by seeing the pc is doing a short cycle at the time and has started back up.

“Recall Exhaustion” is a simple, very effective version of a work process.

“Recall Creating” is a good way, apparently, to mop up Step 6 flubs.

Therefore you can use these processes in the HGC or you can, when it is okayed, use them in training. These are individual processes and not co-audit. As a note on co-audit, the process, the only basic affinity process, “What would you like to confront,” could cut your co-audit attendance losses. It is now allowed, having been carefully tested. Man, do they get interested in cases and hence into session. This is a fine individual process for pcs that “have no reality on pictures”.

CREATE PROCESSES—DANGERS & ADVANTAGES

Just before I leave on extended trips I always take the safety measure of writing down the newest and latest and exactly where we are in proven research.

The newest and best as now authorized only for staff member use on Staff Theta Clearing and the Co-audit, and processing of staff members only, and not at this time for use in the HGC or on the general public, is the Create series of processes.

These are the first effective OT processes and as such, when used on persons not yet Theta Clear, they have certain dangers. Additionally, they are the most valuable series of processes which we have. They can be used in one form or another on any level of case and will reach pretty much all the way to the top.

As to dangers, I refer you to our experiences with Step 6 processes. Here was a series with great promise which in many cases became rather deadly. The datum here is that when you improve the ability of a pc to make and see a picture you also inadvertently improve every picture in the bank including engrams, and anybody who has seen a totally solid motivator engram will agree that it is not pleasant.

Create processes stem from a new study I have made of the Cycle of Action as given in *FUNDAMENTALS OF THOUGHT*. Axiom 10 becomes confused by the Thetan with the Cycle of Action. Draw the two and look at them as each other and you will see what I mean—identifying them is chaos. We get a “slip” automaticity which, whenever a person starts to create, forces him over into destruction. There is enough philosophy in this demonstrable fact to make it the subject of my next large book.

Cancelling any bad effect from this slip automaticity from Create to Destroy has been solved by using the middle point of the Cycle of Action—Survive. In Scientology the dynamic principle of existence is “Create” as in Dianetics it was “Survive” (see *FUNDAMENTALS OF THOUGHT*).

A case run toward Create is best run on this and the inverted ARC triangle—“What Would You Like To Create”. This becomes the key process of OT from any level. However, obsessive creation is in effect the whole engram bank and the reactive mind and a lot of other things. Therefore it is best to beware of beefing up the engrams for too long a period of time. The most *tested* way of easing a case off from the deadly Step 6 phenomena is to change from “What Would You Like To Create” back to “What Would You Like To Confront” at routine intervals. “What Would You Like To Confront” cancels out Step 6 phenomena by easing down the Survive part of the Cycle of Action. Confront and Survive are of the same order of thing. Survival could be represented best by “continuous confronting” at a process level. Too much “What Would You Like To Create” gets us into too persistent and solid a bank on occasion. The bank is surviving. Therefore the pc is made very uncomfortable and should then be run a bit on “What Would You Like To Confront”.

“What Would You Like To Confront” should be interspersed with “What Would You Like To Create” at a ratio perhaps of a session of each or, in a severe case, an hour of one then an hour of the other.

“What Would You Like To Destroy” is under test and apparently should run. This would be a psycho curer for sure. But “What Would You Like To Confront” would have to be interspersed with “What Would You Like To Destroy” in order to keep the bank from overwhelming the pc.

Here then we have three processes:

“What Would You Like To Confront?”

“What Would You Like To Create?”

“What Would You Like To Destroy?”

These are on the Cycle of Action as Create Survive Destroy. They are given above in the order of best tested. We know “What Would You Like To Confront” will make pcs feel wonderful and will straighten out Step 6’s habit of making the bank more formidable. It is a good, sound, well tested process.

“What Would You Like To Create” is the key to all cases, but to run it you will have to salt it down with periods of running “What Would You Like To Confront”. “What Would You Like To Destroy”, though not much tested at this writing, might also have to be interspersed with “What Would You Like To Confront”.

We will probably discover that all three of these have to be run and that the last one will be the best case entrance at my guess.

A new child process, very successful, has already emerged from this rationale. This is: “You Do Something You Think I’ll Like”. Various simplifications of the Confront and Destroy commands would be something like: “What Would You Like To Look At” and “What Would You Like To Tear Up”. The last one is not tested.

A sure kill on a pc would be to run “What Would You Like To Confront” until it has eased off and then to run “What Would You Like To Create” until it gets grim, and then “What Would You Like To Confront” again, and back and forth. This is somewhat tested as a combo at this writing and it works well.

Under test right now is the way of running all three parts of the Cycle of Action to obtain the smoothest possible recovery by the pc.

Right now this data is only for staffs of Central Orgs as it is very dynamite and very experimental, but it also gives the best and clearest promise of rapid case gains and we want Central Org staffs up before we release this stuff more widely. This is about as revolutionary in rapid effect as engram running was in its time and place. We’re really into something here with a high rapid gain which when it is all smoothed out and sweeping the field will take us right over the top unless we find stops on the part of auditors that we can’t easily overcome. And I think we can whip all the bugs and get it wheeling.

I came down to Sthil last Spring to find the route to OT that almost anybody could follow. Well, I’m betting even at this early look that we’ve got our teeth into it with Create series.

ACKNOWLEDGEMENTS IN AUDITING

Avoidance of Double Acknowledgement is vital if you ever hope to keep the preclear in session.

Double Acknowledgement occurs when the pc answers up, the auditor then acknowledges, and the pc then finishes his answer, leaving the auditor with another acknowledgement to do (and also leaving the auditor with no session).

Wrong:

Command: "What could you say to your father?"
Pc: "I could say, 'Hello'."
Auditor: "Fine."
Pc: "... Father, how are you?" I could say that."
Auditor: (weakly) "Good. What could you say to your father?"
Pc: "I could say, 'Are you feeling well?' "
Auditor: (desperate by now) "Good!"
Pc: "... enough to go fishing?" "
Auditor: "Well okay all right. Now "

A pc is not always sure he has answered the question so he often changes his mind. If the auditor gives him Tone 40 or any acknowledgement at all in between a pc's reply the *auditor is wrong*.

You just don't "encourage" a pc with a lot of agreement OK's and Yes's in the middle of answers. The pc answers, the pc is *sure he has answered* and the auditor then acknowledges. After all, it is the pc that must be satisfied.

There are many ways to mis-acknowledge a pc. But any mis-acknowledgement is only and always a failure to end the cycle of a command—auditor asks, pc replies and knows he has answered, auditor acknowledges. Pc knows auditor has acknowledged. That is a full auditing command cycle. Don't forget it and expect a process to work, it won't. The roughest spot in most auditors is TR 2, not so much *how* to acknowledge but *when*.

An auditor running into this with a pc should handle it this way.

Auditor: "What could you say to your father?"
Pc: "I could say, 'Are you feeling well?' "
Auditor: "Did that answer the question?"
Pc: "Well, no. I could say, 'Are you feeling well enough to go fishing?' "
Auditor: "Did that answer the question?"
Pc: "Yes, I guess it did. He always liked fishing and sympathy."
Auditor: (sure pc is through) "Good! What could you say to your father?"

And there's the way of it. If the pc is not sure he has answered and that the auditor has accepted the answer, the *pc will get no benefit from the auditing*. And that's how important that is.

Mood can be expressed by an acknowledgement. Evaluation can also be accomplished by acknowledgement, depending on the tone of voice with which it is uttered.

There is nothing bad about expressing mood by acknowledgement, except when the acknowledgement expresses criticalness, ridicule, or humour.

You can always spot a bad auditor. He does two things: he talks too much to the pc and he stops the pc from properly answering.

1ST MELBOURNE ACC MATERIAL

The following Technology is being taught on the 1st Melbourne ACC which began November 9, 1959, at HASI Melbourne:

Bring tone arm of meter to clear reading for sex of pc at the beginning of session by getting withholds off the case, use two-way comm and "What question shouldn't I ask you?" and overts in PT restim on various dynamics. Auditing of processes on average pc not to begin until tone arm so registers. On lower than clear reading arms if all else fails to run S-C-S.

In extremely difficult cases to do an assessment by dynamics for current overts to get pc's tone arm to read clear before session. Then, seeing needle changes on any one dynamic, to ferret out the overt.

75 hours spent getting pc in session not too long. Tone Arm trick to be done each session.

Create series of processes "What would you like to confront?" and "What would you like to create?" "What part of a ___ (assessed terminal) would you be willing to create?" alternated with "What part of a (same terminal) would you be willing to confront?"

Cases in 1st Melbourne were started on clearing tone arm then running "Think of entering a mind." "Think of not entering a mind." Alternated. Goal of course is to get whizzing up toward OT.

Some of the scheduled processes to be run include: "What force would it be all right to use?" "What force would it be all right not to use?" The same pattern of process to be applied to postulates, spaces, masses, forms on various dynamics. Experimental version: "What _____ (as in this paragraph) would it be all right to make?" "What _____ would it be all right not to make?"

The main valence splitter is given above in entering minds. But another easier valence splitter (similar in action to Overt Withhold Straight Wire) is "Tell me a difference between (any specific or general terminal) and yourself." "Tell me a similarity between (same terminal) and yourself." The extreme version is "Tell me of a difference between yourself and a body." "Tell me a similarity between yourself and a body." Not necessarily recommended as not tested. This last is called Valence Differentiation.

My goal at Saint Hill, in which all Orgs are assisting, is to consolidate research and produce rapid OTs. The above processes are some of the fruits already garnered.

The 1st Melbourne Congress and ACC tapes are available from Melbourne or from HCO WW, same prices. Not too high. The full rationale of these processes and others are on these lectures and demonstration tapes of the 1st Melbourne.

HAS CO-AUDIT

It has been found that the Overt-Withhold Straight-Wire Process runs better on HAS Co-Audit than the Communication Process, as the Communication Process does not get off overts, it causes people to “blow” the course.

To revert to previous instructions, then, run the following Process on HAS Co-Audits:

“Recall something you have done to” (terminal)
“Recall something you have withheld from” (terminal)
(one question after the other)

The Co-Audit Instructor should select a terminal by communicating freely with the pc, asking questions relating to pc’s present life terminals and the eight dynamics. Pc will be fixated on any terminals against which he has committed overt acts—even though these overts may have been not-ised. The terminal chosen by the Instructor must be real to the pc and must show charge on the E-Meter.

Keep up the Co-Audit pc’s interest in Case. This is a most important factor if large groups are to be maintained. If there is little change in needle reaction and no obvious signs of mis-emotion on terminal, then run terminal to a comm lag flat point and then locate another terminal. After this terminal has been handled it may be preferable to return to previous terminal, but this is a matter for the Instructor’s discretion.

If pc runs out of answers (for Co-Audit only) abandon terminal and find another.

“What have you done?” “What have you withheld?” “ is the general form of this process and may be used.

URGENT CHANGE IN ALL CO-AUDIT COURSES

Here we go. I told you in the last Franchise Bulletin that we had hit a jackpot. Of course, you to some degree put this down to the usual Hubbard enthusiasm. But my enthusiasm and encouragement was what kept us at it until we knew what we had to know to go for broke on OT and quite incidentally on all lower level cases. And this isn't even related to enthusiasm. No more cold-blooded statement was ever made than my telling you that the situation was definitely corralled. It is. I am sorry that the gen is sort of complicated and requires know-how, and would much rather have arranged it so all we had to do was push the button and we got a clear, but as soon as you see and experience this data I think you will be very happy with it.

It all begins back in Wichita when I wrote that extremely unpopular article which is still appearing in *Advanced Procedure and Axioms*—FULL RESPONSIBILITY. It turns out that this is the hottest thought the old man ever thought but it didn't come into view in its full importance for more than eight years.

The one thing the public doesn't want to have anything to do with is FULL RESPONSIBILITY. They shudder and they run whenever they think of it. So thee and me will have to shoulder the load and shove them at the sausage machine and all that. For the whole story develops around this center pin of responsibility. There was so much to the story and so many possible variations of the tale that getting it all in line and trailmarking a way through the darkly woods has been a very painful job—both to you and to me. But we did it. And we've got it. And if we can just hold still long enough we'll have the full benefit of it.

Overt acts and withholds are important technology. If you can get somebody to take the overts out of any incident the incident will tend to vanish. And it would vanish completely except for one thing. Telling another person about one's overts is not enough. It is also necessary to take full responsibility for them. Thus the old wheeze about confession as advocated by one of the pagan churches (pagan to Scientology), that all one had to do was whisper one's misdeeds and they would go away, turns out to be so halfhearted that it becomes a very vicious operation. I've just been all over this ground and can tell you as a technical fact that the simple imparting of one's sins, or, more comprehensibly, one's overts and withholds, is as inadequate as using paste to build a skyscraper—and about as dangerous. If the Church or somebody then pretended to take responsibility for the confided overts, then we've spun our fellow in just like that and we've degraded the person and the society. The person who confides must then take responsibility for the action he considered a sin by means of honest processing or it's just no-go, no-show, spin-down-spin-in. And there went the co-audits running overt-withhold. And there went up the tone arms when the pc told us his crimes. The rule is a thorough, harsh, unavoidable rule: When we get a person to confide a crime, we must then run on that crime what part of it he could be responsible for until it goes. ALERT YE HGCs. If you don't do just that you'll have some very unhappy people on your hands.

THEREFORE: BE IT RESOLVED THAT—whenever a person has discovered to the auditor a sin, crime or discreditable act or discreditable creation, that auditor is honor bound on all dynamics to run at once a process that will bring about the person's taking responsibility for his action. If the auditor does not he will have a spinning pc.

THIS GIVES US THE ONLY PROCESS WE COULD GET AWAY WITH IN A PE CO-AUDIT: That would be a process which recovered responsibility. The currently indicated process, done without assessment, would be “WHAT PART OF YOUR LIFE (PAST) COULD YOU BE RESPONSIBLE FOR?” *DO NOT RUN ANYTHING ELSE IN CO-AUDIT!*

Of course doing an overt or a withhold is a refusal to take responsibility in some sphere, but overts and withholds are the offshoot of responsibility or lack of it not vice versa.

Now go back and read this again and start clearing some people. More gen later.

Best,

L. RON HUBBARD

IMPORTANT

RESPONSIBILITY FOR O/Ws

To the degree that a pc does not take responsibility for his Overts and Withholds his bank becomes solid.

On all cases on which Overt-Withhold is being run it is absolutely necessary that they be levelled off with responsibility on the incident, or the session involved, or both.

A tone arm brought down by reducing the Overts and Withholds can be made high again because Overt-Withhold has a Step 6 reaction of toughening up the bank and making masses and facsimiles solid, unless the terminal and the session is handled with:

“What part of acould you be responsible for? “

Techniques of Child Processing

L. Ron Hubbard

Tomorrow's cases are child cases today. Whole civilizations have changed because somebody changed the children. In the past, the children were usually changed for the worse. Today let's be different and change them for the better.

But whatever the benefits and reasons of child processing, however much it may do to smooth out a home and improve the future, the fact remains that it is a highly technical subject. The processing of children requires more technically perfect auditing and more properly applied sessions and processes than the average adult.

To achieve the greatest benefit for children, one should first achieve the greatest possible command of auditing skill and Scientology theory and practice. Because a child is helplessly unable to express his ARC breaks violently enough to be listened to is no reason he should be given them.

Child processing demands more perfect auditing than adult processing and therefore requires a better trained auditor than the average. If you would process children, be a Professional auditor first even if the children are your own. You will find that it will pay.

With that reservation in mind, here are a few very modern developments in the processing of children. These are the best processes I know and the only processes that have worked out over a long period of time on a great many children.

TYPE OF SESSION

A child must be given a very formal session. A child's case will go downhill generally if the child is processed hit or miss, any old time, with careless sessioning. A child's session must be given the full dignity of an adult session. It must be opened and closed. All the formalities of a session must be observed—and of course the auditing must be done in a place where the session cannot be broken in upon by outside persons or influences.

The old technique of "short sessioning" works very well with a child. All one does is formally open and close a session and run within it only a minute or two of some simple process as below. The attention span of a child is short and if the child is even faintly unwilling to be audited, you can coax the child into short sessions and then, as time goes on, lengthen them gradually.

ASSISTS ON CHILDREN

Of course one does not open and close a session with any formality while doing an assist. The preclear is always too tied up with the emergency and the agony to do anything but the process.

The best assist for a child is “Where did it happen?” and, after asking this, “Where are you now?” getting the child to point each time he answers the questions.

“Look at my fingers” while touching around the injured area lightly, is also a good assist for an injured child.

ROUTINE CHILD PROCESSES

Probably the most worthwhile child process which works as early as first speech is: “Where is the ____?” using “table,” “chair” and other room objects, but avoiding bodies. The child takes this at first as a language examination and is very proud of it. It occasionally blows grief charges on losses.

Very effective on a child that is normal or has a physical defect is an alternate touching of the child’s arm, the auditor’s arm, and using various duplicative body parts first on the auditor then on the child, accomplishing in effect: “From where could you communicate to a body?” with the actual command: “Feel my arm,” “Thank you,” “Feel your arm,” “Thank you,” and so on, using common body parts. But a warning with this—if it turns on a somatic, do the same process session after session until the child is very bright and alert all the time. This is a very fine child psychosomatic process.

CHILDREN WITH ROUGH CASES

Very young children and children who are older but have rough cases, respond well to CCH I and CCH 2—but if you have to look those up to find out what they are, or if you are not a Professional, don’t try them.

A version of TR 5 “You make that body sit in that chair” can be run even on babies by substituting bed for chair.

INSTILLING CONFIDENCE

The worst crime most Scientology parents commit is demanding the child be far better and brighter than he or she can manage at once. This has the effect of making the child feel that he can’t really do anything to please his parents and that he is thus failing them. The right thing to do is to acknowledge what the CHILD thinks he can do or is all right. Otherwise you are evaluating for the preclear and that’s a Code break. A child seeking the approval of his parents is always inventing new tricks to attract attention. This means the child is already feeling neglected without reason, but is not in itself any bad sign. Acknowledge the tricks and spend more time with the child.

RECALL PROCESSES

Self Analysis Recall Processes contained on the next but last page of the book *Self Analysis* can be run on a child with some success. For the very young children, these require rewording.

The aforementioned may seem brief to you, but it is a complete catalogue of workable and invariably helpful processes for children. If they can run any more than this, they’re adults.

Saint Hill Manor, East Grinstead, Sussex

HCO BULLETIN OF 23 DECEMBER AD9

BPI

RESPONSIBILITY

If the definition of operating thetan is knowing and willing cause over all dynamics then we can see at once that responsibility must go hand in hand with making an operating thetan.

One cannot as-is act for which one is taking no responsibility, but for which one is really responsible.

The reason one gets amnesia on his past lives or even denies their existence lies with responsibility. He or she is unwilling to take responsibility for having been this or that other identity. This keys in in present time and closes one down every time one stops taking responsibility for one's fellows. Fighting 'other identities' in present time one ceases to be responsible for other identities. Therefore those he has had in the past become 'other people' and one dramatizes his own past identities because he cannot take responsibility for them.

When one falls away from responsibility on the various dynamics he can then become less and less able to influence those dynamics and therefore becomes a victim of them. One must have done to other dynamics those things which other dynamics now seem to have the power to do to him. Therefore one can be injured. One can lose control. One can become in fact a zero of influence and a vacuum for trouble.

The way one becomes separate from others is by his own overt acts against them. These overt acts become withholds and the person then individuates very strongly. You have seen this happening in auditing. The more overt acts the Auditor pulls on the pc the less willing the Auditor is to audit that pc. Further, the more overt acts the pc pulls on the Auditor the less willing he is to stay in session. It only looks as though cause and effect is at work. Actually all life consists of opposed causes where it is aberrated.

The way a person blows out of session or blows out of an organization or blows out of Scientology is a simple one. He withholds information and hides his overts. After a while he blows himself off. Show me a pc blowing session and I will show you a pc who has not levelled with his Auditor and who is guilty of undeclared overts against the dynamics and the Auditor. Show me a staff member who is blowing the Organization and I will show you a staff member who is guilty of undeclared overts against the Organization.

It is fatal to audit anyone unless full two-way comm is established between the Auditor and the pc. A person who goes on being audited without asserting his responsibility for what he has done is a person who will make no auditing gains or whose auditing gains will slump. As most of the human race has undeclared overts this fact alone assumes gigantic proportions in forwarding Scientology and for that reason alone we will have to give it a lion's share of attention from here on out.

Of course you will see that many people at first will not come near us for fear of what we will find out. But as this is better understood you will find that the people who come to us will come with a willingness to bare their guilt to us and get it sorted out.

As this is so much the case we must then therefore have amongst us none with undeclared overts against the dynamics which would prevent their getting gains in processing or who would render a person's confidences liable to use for less pure purposes.

Along with this technical discovery then goes the administrative must that our noses must be clean and our hearts cleared. Our strength will be the strength of a billion if we have nothing to hide.

This may or may not be popular. I don't care about that. It is effective. I do care about that.

And remember that whenever a person discloses to view discreditable overts and withholds we must run what part of that act or incident could you be responsible for.

You're going to see more case gains than you've ever seen before—providing you have the stamina to get over this first hump.

So here we change from irresponsible to responsible, from guilt to strength and all in the twinkling of an eye.

BLOW-OFFS

Scientology Technology recently has been extended to include the factual explanation of departures, sudden and relatively unexplained, from sessions, posts, jobs, locations and areas.

This is one of the things man thought he knew all about and therefore never bothered to investigate, yet, this amongst all other things gave him the most trouble. Man had it all explained to his own satisfaction and yet his explanation did not cut down the amount of trouble which came from the feeling of “having to leave”.

For instance man has been frantic about the high divorce rate, about the high job turnover in plants, about labour unrest and many other items all stemming from the same source—sudden departures or gradual departures.

We have the view of a person who has a good job, who probably won't get a better one, suddenly deciding to leave and going. We have the view of a wife with a perfectly good husband and family up and leaving it all. We see a husband with a pretty and attractive wife breaking up the affinity and departing.

In Scientology we have the phenomenon of preclears in session or students on courses deciding to leave and never coming back. And that gives us more trouble than most other things all combined.

Man explained this to himself by saying that things were done to him which he would not tolerate and therefore he had to leave. But if this were the explanation all man would have to do would be to make working conditions, marital relationships, jobs, courses and sessions all very excellent and the problem would be solved. But on the contrary, a close examination of working conditions and marital relationships demonstrates that improvement of conditions often worsens the amount of blow-off, as one could call this phenomenon. Probably the finest working conditions in the world were achieved by Mr. Hershey of Chocolate Bar fame for his plant workers. Yet they revolted and even shot at him. This in its turn led to an industrial philosophy that the worse workers were treated the more willing they were to stay which in itself is as untrue as the better they are treated the faster they blow off.

One can treat people so well that they grow ashamed of themselves, knowing they don't deserve it, that a blow-off is precipitated, and certainly one can treat people so badly that they have no choice but to leave, but these are extreme conditions and in between these we have the majority of departures: the auditor is doing his best for the preclear and yet the preclear gets meaner and meaner and blows the session. The wife is doing her best to make a marriage and the husband wanders off on the trail of a tart. The manager is trying to keep things going and the worker leaves. These, the unexplained, disrupt organizations and lives and it's time we understood them.

People leave because of their own overts and withholds. That is the factual fact and the hardbound rule. A man with a clean heart can't be hurt. The man or woman who must must become a victim and depart is departing because of his or her own overts and withholds.

It doesn't matter whether the person is departing from a town or a job or a session. The cause is the same.

Almost anyone, no matter his position, can remedy a situation no matter what's wrong if he or she really wants to. When the person no longer wants to remedy it his own overt acts and withholds against the others involved in the situation have lowered his own ability to be responsible for it. Therefore he or she does not remedy the situation. Departure is the only answer. To justify the departure the person blowing off dreams up things done to him, in an effort to minimize the overt by degrading those it was done to. The mechanics involved are quite simple.

It is amazing what trivial overts will cause a person to blow. I caught a staff member one time just before he blew and traced down the original overt act against the Organization to his failure to defend the Organization when a criminal was speaking viciously about it. This failure to defend accumulated to itself more and more overts and withholds such as failing to relay messages, failure to complete an assignment, until it finally utterly degraded the person into stealing something of no value. This theft caused the person to believe he had better leave.

It is a rather noble commentary on man that *when a person finds himself*, as he believes, *incapable of restraining himself from injuring a benefactor he will defend the benefactor by leaving*. This is the real source of the blow-off. If we were to better a person's working conditions in this light we would see that we have simply magnified his overt acts and made it a certain fact that he would leave. If we punish we can bring the value of the benefactor down a bit and thus lessen the value of the overt. But improvement and punishment are neither one answers. The answer lies in Scientology and processing the person up to a high enough responsibility to take a job or a position and carry it out without all this weird hocus-pocus of "I've got to say you are doing things to me so I can leave and protect you from all the bad things I am doing to you." That's the way it is and it doesn't make sense not to do something about it now that we know.

A recent Secretarial Executive Director to all Central Organizations states that before a person may draw his last pay cheque from an Organization he is leaving of his own volition he must write down all his overts and withholds against the Organization and its related personnel and have these checked out by the HCO Secretary on an E-Meter.

To do less than this is cruelty itself. The person is blowing himself off with his own overts and withholds. If these are not removed then anything the Organization or its people does to him goes in like a javelin and leaves him with a dark area in his life and a rotten taste in his mouth. Further he goes around spouting lies about the Organization and its related personnel and every lie he utters makes him just that much sicker. By permitting a blow-off without clearing it we are degrading people, for I assure you, and with some sorrow, people have not often recovered from overts against Scientology, its Organizations and related persons. They don't recover because they know in their hearts even while they lie that they are wronging people who have done and are doing enormous amounts of good in the world and who definitely do not deserve libel and slander. Literally, it kills them and if you don't believe it I can show you the long death list.

The only evil thing we are doing is to be good, if that makes sense to you. For by being good, things done to us out of carelessness or viciousness are all out of proportion to the evil done to others. This often applies to people who are not Scientologists. Just this year I had an electrician who robbed HCO of money with false bills and bad workmanship. One day he woke up to the fact that the Organization he was robbing was helping people everywhere far beyond his ability to ever help anyone. Within a few weeks he contracted TB and is now dying in a London hospital. Nobody took off the overts and withholds when he left. And it's actually killing him-a fact which is no fancy on my part. There is something a little terrifying in this sometimes. I once told a bill collector what and who we were and that he had wronged a good person and a half hour later he threw a hundred grains of Veronal down his throat and was lugged off to hospital, a suicide.

This campaign is aimed straightly at cases and getting people cleared. It is aimed at preserving staffs and the lives of persons who believe they have failed us.

Uneasy lies the head that has a bad conscience. Clean it up and run responsibility on it and you have another better person, and if anybody feels like leaving just examine the record and sit down and list everything done to and withheld from me ;and the Organization and send it along. We'll save a lot of people that way.

And on our parts we'll go along being as good a manager, as good an Organization and as good a field as we can be and we'll get rid of all our overts and withholds too.

Think it will make an interesting new view?

Well, Scientology specializes in those.

A THIRD DYNAMIC FOR SCIENTOLOGY

To bring about a Scientology third dynamic greater than any group has ever before had, your co-operation, whether pro or layman, is requested.

Any Scientologist, whether certified or not, may participate. There are two ways you can participate:

1. To get off your own overts and withholds, and
2. Urge other people to get off theirs.

To accomplish this and provide an orderly check on this and to prevent any overt being used by anyone, the following procedure is recommended:

- (a) That a full list of present lifetime overts and withholds be made, with or without the assistance of sessions, particularly as they apply to Scientology or related groups and personnel, and signed and sent to HCO WW, Saint Hill Manor, East Grinstead, Sussex, England.
- (b) That a second list then be made giving what responsibility one could take for these. Instead of the second list an auditor's report saying it has been done, the auditor attesting it, may be forwarded.

That these files exist in my personal possession should make it effectively impossible for anyone to try to use the information.

In this way we can cover all existing certificates and people and by following this with new people keep an expanding group clean and clear.

I appreciate any co-operation you can give me in forwarding this programme and will doubly appreciate any auditing you do toward this direct goal.

All persons so cleared on overts would be listed from time to time in HCO publications as "people you can trust".

THE UNMOVING CASE

And here we are ten years after the date I wrote the first book with the solution to both types of cases that give us trouble. And that's a good anniversary release.

Of course you saw the first book after January of 1950 but in the cold bitter winter of Bay Head, New Jersey, I was busy writing down the research of years which would become first a best seller and then a long term steady seller across the world, beating most book records.

You know "Dianetics: The Modern Science of Mental Health" and you know its data, and you know also that any case could be cleared if you could run all the engrams off the case. And you know as well that you have run into cases that resisted all efforts to run engrams or penetrate the bank. It was only these cases that kept Dianetics and all its goals from being realised by all auditors.

We have concocted many dodges and much training skill has been perfected, all to run just two types of cases—for most of the cases around in the public could still be cleared by straight Dianetic processing right out of Book One.

In this and the next bulletin I am going to take up these two types of cases and their solution. Valuable data? You stated it correctly.

The first of these two types was the case which didn't experience any improvement even after you had run the exact engram necessary to resolve the case.

The hallmark of this case was unreality. It either went through it all with no emotional change or it jumped all over the track and de-railed at unlikely moments. This case also ARC broke very easily and was plain hell to keep in session, or it was so apathetic it continually slumped. When the case did make a gain it promptly relapsed and was telling everyone how bad the auditor was.

Well, we've actually been talking about this case for several bulletins. It is the case which mustn't let anyone find out. Its earmarks are one or more of the following:

1. Runs with no reality
2. Skids around on the track
3. Goes out of Communication easily
4. Experiences little if any gain in processing
5. Criticises the Auditor
6. Propitiates
7. Tries to blow

Any one of the above and probably several more characteristics may be present in such a case. But it just can't run engrams whatever else can be said about it and it just doesn't make progress.

One of the things this case is doing is using auditing to make people guilty of overt acts. As an auditor this case won't really get down to auditing and as a preclear the case just doesn't ever get up and fly.

There are various degrees of this case. Almost anyone has sooner or later run into one or another of these. But the whole summary is contained in one fact: The person gets little benefit from Dianetics or Scientology.

If all the cases in Scientology were really wheeling we'd get no hold-ups either as auditor or as pc. Further we wouldn't be tiptoeing around holding on to so many pc secrets that we ourselves get giddy making sure nobody tries to capitalise on them. We would be in fact a free people, the only free people on earth.

Further we can only be harmed by those things we have harmed and if all of us—for you have an influence in this too, remember—had our worst overts and withholds off no person or agency on earth would be able to touch a Scientologist harmfully. And that's worth working for isn't it?

The failed case doesn't move (as listed above) and doesn't audit very well, since it just can't confront overts from another and turns them away.

Well, that's the Dianetic failed case. And it's the Scientology failed case. And knowing this we begin the road to freedom as a group as well as individuals.

The case that does not advance under auditing is the case that has undisclosed overts and withholds. The main ones that are harmful to an advance of the case are in the present lifetime and are known to the preclear (but sometimes are a trifle out of sight and bounce into view quite suddenly and painfully).

Get the overts and withholds off the case and run responsibility on them and you have a case that is wheeling at last. It can run anything and it can be cleared.

Well that's the main Dianetic failed case and why.

Remember that when a pc tells you his current lifetime overts and withholds you are code bound to run responsibility on them.

Now, let's face up to it and do it, do it, do it.

Ds of P
Staff Auditors

OT PROCEDURES FOR HCS/BScn COURSES
AS RECORDED IN WASHINGTON, D.C. ACADEMY
JAN 1960 LRH TAPES, 9 HOURS, 7¹/₂ ips.

SESSION DATA

Rudiments:

- (a) Auditor checked out—o/w's off on auditor or auditors or pcs until OK to be audited.
- (b) Environment checked out—o/w's on auditing room, associated personnel and people.
- (c) PTP checked out—o/w's on people connected with PTP unless it can be done by Problems of Comparable Magnitude or two-way comm.
- (d) ARC breaks—check earlier sessions. TR5N.
- (e) Goals for session.

Omit any or all of above except goals if pc already in session. Use any or all of above at any time if session bogs down or pc gets upset or choppy.

AUDITING ATTITUDE

You do the auditing. This is all HGC type auditing, not PE Co-Audit. The auditor handles pc and improves pc on his own responsibility. Instructions which violate this (making auditor a via, not cause) may be disregarded both by student and staff auditors.

Audit the pc on the whole track as a general rule only when pc's tone arm is sitting at Clear as a consequence of setting up the session, getting off present life overts, rehabilitating ability to withhold, getting responsibility run on incidents pc has revealed, getting off discreditable creations and getting responsibility run on them.

Don't wound-up doll on pc. Keep finding out what he is doing and how he is doing it and if he is doing anything else. Be interested.

Use heavy control, as extreme as you feel necessary, as mild as works.

If pc is ARC breaky work rudiments over *or* look hard for present life overts and withholds discreditable to pc.

Enfin DO WHAT YOU DO THOROUGHLY. If you only do a small portion of this, do it *well* and finish it before looking for greener pastures.

First Stage

1. Clean up *and continue to keep cleaned up pc's overts and withholds* in life which would interrupt two-way comm with auditor. This includes *anything* pc has done in his life which disturbs the tone arm.

Rehabilitate pc's ability to withhold on any terminal he has done lots of overts against.

(Overts include making another person guilty of anything. Don't overlook these.) Always run responsibility on any major overts discovered.

2. Only when a pc has a needle reading at clear reading for his sex should you go for chronic somatics, etc.

Note: The following steps are not necessarily to be run in the order they are listed here. It is at the auditor's discretion which is tackled when.

3. Hunt up pc's "discreditable creations" (use wording that best communicates to pc in asking for these), starting with his present lifetime. Run responsibility on these. Use some such commands as: "What part of that incident could you admit causing?"—"What could you withhold from that person (those people)?"
4. Check well into his goals. What goals does he particularly want rehabilitated? Clean up his earliest present life "discreditable creation" on this goal line by running responsibility on it. You may do well to run several of these. This, of course, may be done much later in session after whole track. This is artistic rehabilitation.
5. Find out how he feels about generally improving himself. Burning question: Does he deserve to get well? Investigate his chronic somatics and find out who he is making guilty by having them. Do this by clever two-way comm, *not* by repetitive auditing command. This is the make-break point of a case. Get real real about it. This step applies ordinarily to the very boggy case that isn't running well. Any case can benefit from it but it is a must on a boggy case.
6. Clean up "social atmosphere" of present life by getting off 2nd and 3rd dynamic overt-withholds. Family, job, etc. This step would be more germane to an HGC pc and may be omitted by students. However, a bad tone arm that won't adjust to clear by the above will possibly adjust with this step if you rehabilitate the pc's ability to withhold from such areas.

General Note on Above. Always run some responsibility when a pc communicates an overt or withhold of magnitude. The tone arm will *not* come down or go up when pc communicates overt or withhold unless he assumes responsibility for the act.

Always rehabilitate pc's ability to withhold, especially when auditor is getting him to spill a great deal. "Mindless Object" reading (1.5) indicates pc's ability to withhold has been badly shaken. Good command: "Think of something you could withhold." Runs well, alternated with various forms of "What could you admit causing?"

Second Stage

1. If pc has a field, somatics, malformity or aberration, clean it up as follows:
 - (a) Find out what he is looking at.
 - (b) Date it with the meter.
 - (c) Run "What part of the scene could you admit causing?" (Keep on with the same command no matter how much the scene changes, until pc is in PT when he will most likely come up with the scene of present auditor and auditing environment within the last day or two. It is then flat for your purposes.
2. Disassociation from identities. *Stable Datum:* Any "identity" is a misidentification, therefore get it off case.
 - (a) Identity most in restimulation. (Whole track.)

- (b) Identities of the last two or three lives, with special attention to the *shifts* of identity involved.
 - (c) Any identities you can get hold of. Be sure to get his most creative life. (Whole track.)
3. Immediate past lives. Most cases crack when the last life before this one and perhaps the last few lives are well explored. Tackle these with the E-Meter. Find out all about them.

The rule is that in stage one you set the pc up to be audited and clean up present life. In stage two you clean up immediate past life or lives and then the whole track.

SUMMARY

The keynote is INCREASE CONFIDENCE by increasing ability. The gradient scale is:

- (a) Confidence in being audited.
- (b) Confidence in present existence (immediate time track).
- (c) Confidence in present life.
- (d) Confidence in regaining health by running off chronic somatics.
- (e) Confidence in regaining memory of and recovering from past few lives, particularly the last one.
- (f) Confidence on the whole track by removing overts and re-establishing withhold ability on the whole track.

If a step is done well and thoroughly, the *next* step is done more easily by pc. If no thoroughness is present and if pc never wins on any step, recovery is only partial.

THE BLACK CASE

In the last bulletin I mentioned that two case types held us up in Dianetics and that I had now solved these ten years after the first book's writing.

The first type was the case that had so many overts and withholds in this lifetime that it could not be gotten into two way communication. The remedy for this is to get the overts and withholds confessed and run responsibility on these acts.

The second type is the "Black Field" case. The case with a field could not run engrams because he could not see them. Before I started to teach people to audit I never found this case. I didn't find it because I merely assumed that the case was stuck on the track and I persuaded the case to get unstuck. In May 1950 in teaching a class in Washington, D.C., I found that at the exact moment of stuck there was sonic, visio and the rest.

After I started teaching people how to audit this case eluded them and after a while I found some that eluded me too. Naturally anyone knowing that this was an unauditible case (for the fact was quite well advertised) used the mechanism to cover up overts and withholds.

The mechanism I am about to give you relieves however any such case and changes it around considerably. This remedy applies not only to Black Field cases but any kind of constant view including invisible fields and stuck pictures.

This formula has proven sufficiently good that the only way to get around it is for the pc to run like the dickens—and you can keep him from doing that by getting off his overts and withholds.

Whether or not you have relieved his overts and withholds, you can use this formula with great profit—and just because it's simple, let's keep it as simple as it is. It will work.

In taking hold of a new case, the first thing to do is start the session letter-perfect with rudiments and goals, whether the case has ever been audited before or not. Then ask the person to close his or her eyes and find out what the person is looking at. If it is PT, okay to proceed along any process line. If not PT but a stuck picture, a field or "nothing" at once put the pc on the meter (where he should have been all along) and do a time scout. Pin whatever the person sees in time as exactly as you can, right down to the minute of the day.

This may blow the pc up to PT in some cases. But usually it will only change the view slightly.

Now understand this: If a pc is stuck on the track all the auditing you are doing is around an out of PT area and is not valid for present life. So it is very valuable to handle just what it is that's sitting there and not scramble it up with any other process than this one.

It does not matter, for this formula, where the pc's tone arm is located for its reading will be more or less for the stuck incident and not as a result of present life material. So disregard

the tone arm and the injunction never to audit a pc with a high tone arm when you are doing this. Attend to the tone arm after you've got the pc in PT.

All right, we've got the time of the incident. The pc is still sitting there with his eyes closed. His data is very vague, perhaps he may be totally unco-operative. Who cares. Do this anyway.

Run now "What part of that scene you're looking at could you be responsible for?"

He may give you the most strained or vague answers. That's all right. This will still work. Keep running it no matter how many times he repeats the same answer.

The picture will start to shift. It may shift with slowness or enormous rapidity or both, but it will shift. Well, just go on and run the process as above right up to PT and then skip it except for noting where he was stuck.

When you have the pc in PT get off his overts and withholds and let the tone arm down. "What would you let me know?" "What would you withhold from me?" alternated will do very well to clean it all up providing you run responsibility on any incident of importance the pc comes up with.

Well, that's the case that couldn't see pictures. That's the psychologist who says they don't exist. That's the rough case that wouldn't move on the track.

Despite all the randomness I'm getting some things done lately, eh?

CASUALTIES
(not confidential)

There are a few casualties along the line of getting off overts, and by my telling you about them, you may be able to prevent others and to better understand what is going on.

Only about eight people have “run for the brush” to date because of an unwillingness to reveal their overts against Scientology. There may be a few more but the data is not to hand. The overwhelming majority of Scientologists have embraced these new techniques and measures with enthusiasm. Factually, those that blew were not in possession of much data on overts. I feel that if they had been they would have stood up to it.

In early November I ordered all organizations to give an E-Meter check on all staffs preliminary to auditing these on the new overt/withhold—responsibility combination. I also forbade Central Orgs to employ persons with hidden social crimes that might be used to hurt Scientology (blackmail) until expiation could be accomplished and auditing completed.

This began by suspending one Doug Moon in HASI Melbourne until he had been cleared since he was such a social liability.

Almost instantly on receipt of the E-Meter check order Iain Thompson in HASI London, long-time friend of Moon, unexpectedly resigned and caused Kaye Thompson to resign from HCO WW.

All that had happened at Saint Hill up to that moment was my release of casual non-Scientology personnel and a liquor stealing butler before I left for Australia so Mary Sue could carry on more easily. The day I returned to Saint Hill Norma Webb, a Peter Stumbke and another non-Scientologist named Dinah Day resigned and ran away.

On November 23rd at the urgings of Nina West, close friend of Webb, Nibs Hubbard deserted his post in Washington and left no forwarding address. It transpires that he had been caught up in the Moon—Webb—West connections. He tried to find nerve to face an E-Meter the Saturday he left but did not report for his scheduled session with his Washington auditor on that day. He has since been heard of here and there borrowing money and staying out of sight.

The registrar in Melbourne subsequently left before she could be put on a meter.

The only action taken concerning these people is suspension or cancellation of certificates pending E-Meter checks and clearing of overts against Scientology. None except Moon were dismissed, but they have been heard to say that they were. They resigned without notice to me.

Any Scientologist encountering any of these personnel would do all of us a favour by getting them on a Meter and getting their overts against us off and reporting having done so to HCO WW.

If any further blows occur as a result of present know-how, the same procedure will be followed.

As Nibs Hubbard was probably being blackmailed it is creditable that he removed himself from post before he could be made to harm the Washington Organization.

JUSTIFICATION

When a person has committed an overt act and then withholds it, he or she usually employs the social mechanism of justification.

We have all heard people attempt to justify their actions and all of us have known instinctively that justification was tantamount to a confession of guilt. But not until now have we understood the exact mechanism behind justification.

Short of Scientology Auditing there was no means by which a person could relieve himself of consciousness of having done an overt act except to try to *lessen the overt*.

Some churches used a mechanism of confession. This was a limited effort to relieve a person of the pressure of his overt acts. Later the mechanism of confession was employed as a kind of blackmail by which increased contribution could be obtained from the person confessing. Factually this is a limited mechanism to such an extent that it can be extremely dangerous. Religious confession does not carry with it any real stress of responsibility for the individual but on the contrary seeks to lay responsibility at the door of the Divinity—a sort of blasphemy in itself. I have no axe to grind here with religion. Religion as religion is fairly natural. But psychotherapy must be in itself a completed fact or, as we all know, it can become a dangerous fact. That's why we flatten engrams and processes. Confession to be non-dangerous and effective must be accompanied by a full acceptance of responsibility. All overt acts are the product of irresponsibility on one or more of the dynamics.

Withholds are a sort of overt act in themselves but have a different source. Oddly enough we have just proven conclusively that man is basically good—a fact which flies in the teeth of old religious beliefs that man is basically evil. Man is good to such an extent that when he realizes he is being very dangerous and in error he seeks to minimize his power and if that doesn't work and he still finds himself committing overt acts he then seeks to dispose of himself either by leaving or by getting caught and executed. Without this computation Police would be powerless to detect crime—the criminal always assists himself to be caught. Why Police punish the caught criminal is the mystery. The caught criminal wants to be rendered less harmful to the society and wants rehabilitation. Well, if this is true then why does he not unburden himself? The fact is this: unburdening is considered by him to be an overt act. People withhold overt acts because they conceive that telling them would be another overt act. It is as though Thetans are trying to absorb and hold out of sight all the evil of the world. This is wrong-headed, by withholding overt acts these are kept afloat in the universe and are themselves as withholds entirely the cause of continued evil. Man is basically good but he could not attain expression of this until now. Nobody but the individual could die for his own sins—to arrange things otherwise was to keep man in chains.

In view of these mechanisms, when the burden became too great man was driven to another mechanism—the effort to lessen the size and pressure of the overt. He or she could only do this by attempting to reduce the size and repute of the terminal. Hence, not-issness. Hence when a man or a woman has done an overt act there usually follows an effort to reduce the goodness or importance of the target of the overt. Hence the husband who betrays his wife must then state that the wife was no good in some way. Thus the wife who betrayed her husband had to reduce the husband to reduce the overt. This works on all dynamics. In this light most criticism is justification of having done an overt.

This does not say that all things are right and that no criticism anywhere is ever merited. Man is not happy. He is faced with total destruction unless we toughen up our postulates. And the overt act mechanism is simply a sordid game condition man has slipped into without knowing where he was going. So there are rightnesses and wrongnesses in conduct and society and life at large, but random, carping criticism when not borne out in fact is only an effort to reduce the size of the target of the overt so that one can live (he hopes) with the overt. Of course to criticise unjustly and lower repute is itself an overt act and so this mechanism is not in fact workable.

Here we have the source of the dwindling spiral. One commits overt acts unwittingly. He seeks to justify them by finding fault or displacing blame. This leads him into further overts against the same terminals which leads to a degradation of himself and sometimes those terminals.

Scientologists have been completely right in objecting to the idea of punishment. Punishment is just another worsening of the overt sequence and degrades the punisher. But people who are guilty of overts demand punishment. They use it to help restrain themselves from (they hope) further violation of the dynamics. It is the victim who demands punishment and it is a wrong-headed society that awards it. People get right down and beg to be executed. And when you don't oblige, the woman scorned is sweet-tempered by comparison. I ought to know—I have more people try to elect me an executioner than you would care to imagine. And many a preclear who sits down in your pc chair for a session is there just to be executed and when you insist on making such a pc better, why you've had it, for they start on this desire for execution as a new overt chain and seek to justify it by telling people you're a bad auditor.

When you hear scathing and brutal criticism of someone which sounds just a bit strained, know that you have your eye on overts against that criticised person and next chance you get pull the overts and remove just that much evil from the world.

And remember, by and by, that if you make your pc write these overts and withholds down and sign them and send them off to me he'll be less reluctant to hold on to the shreds of them—it makes for a further blow of overts and less blow of pc. And always run responsibility on a pc when he unloads a lot of overts or just one.

We have our hands here on the mechanism that makes this a crazy universe so let's go for broke on it and play it all the way out.

RESPONSIBILITY

Responsibility is often misdefined by the pc.

The definition for auditing of responsibility is “Admit causing,” “able to withhold.” Usable commands would be “What about a (terminal) could you admit causing?” “What could you withhold from a (terminal)?” “What could you admit causing?”

Responsibility as a word can still be used as itself in an auditing command.

HCO BULLETIN OF 24 JANUARY 1960

All Staff Members

OT PROCEDURE

I have tested and released a new OT procedure for your use on Staff Clearing Course, in the HGC and in your own co-auditing which I know will give you theta clears in a relatively short time.

I am well embarked on a program now for the UK to release this new material.

We can get one theta clear a month off the HGC.

We can work successfully toward the goal of having nothing but theta clears on staff.

The Washington Congress blew the lid off in the US. People finishing the HCS Course there are fanning out all over the country giving non-certificate courses to old auditors by sweeping demands from the field.

The new PE program is also working wonders. It omits the Comm Course and puts people straight from the PE into the Co-audit, and there runs—"What could you admit causing a person?" "What could you withhold from a person?" This is advocated now for HASI London.

We are getting together a UK Congress that gives the Washington Congress over again and which is rigged to succeed as a Tape Congress.

To begin this decade of 1960's we are well away from the mark and have the majority of the countries with us. We now have to make a hard push on the UK to get things wheeling like we mean it.

I thank you for your forbearance and hard work, and can assure you that it is all in the direction of the biggest win man has ever had.

This one we are going to make.

HCO BULLETIN OF 25 JANUARY 1960

Cent Orgs

**OT-3 PROCEDURE
HGC ALLOWED PROCESSES**

This bulletin supersedes all previous bulletins.

Any case that cannot adequately define simple words like “change”, “problem”, “responsibility”: run CCHs 1, 2, 3, 4, as per their earliest bulletins.

STEP ONE:

Rudiments:

Check for present time problem. Run by any good method. Check for ARC breaks with auditor and environment. Erase by any effective method. Set goals for session when PT problem and ARC breaks handled.

Establish rudiments at the beginning of each session. Re-establish rudiments if pc goes out of session. Check over what pc got towards his goals at session end.

STEP TWO:

Scout for present life overts and withholds. If found, run “What about that incident could you be responsible for?” (see note on “responsible”). Flatten off all present life overt/withholds and zones of irresponsibility (high or low needle).

This should bring the needle into quietness and the tone arm down to clear reading for the pc’s sex.

On a low tone arm case, particularly below two, find any terminal that dips the needle, however slightly, and run withhold on that terminal: “What could you withhold from a ___?”

“What could you make (terminal) contribute?” run alternately with “What would you rather not contribute to (terminal)?” has also made a low tone arm rise. S-C-S and CCHs have also done so. The low tone arm is supposed to be the tougher one. Actually it’s the valence of a mindless object and the last resort of the pc to withhold, so rehabilitating withhold cleverly should get it easily.

STEP THREE:

Clear the pc’s field with responsibility as per recent HCO Bulletin on black, invisible or dub-in cases. When pc sees pictures of PT then go at case in general.

STEP FOUR:

Run “What about a victim could you be responsible for?” until the tone arm tends to read at clear reading for sex in this lifetime.

Whenever the pc encounters an incident that seems very sticky, which is to say when the picture sticks many commands by the E-Meter, spot the time in terms of years ago and down to the month and day. When the incident is spotted, if it continues to hang up run it as an incident with this command: “What about that incident could you be responsible for?” and, as needful,

on a two way comm basis, and by any process as needed get off its overts and withholds and “Who would it make feel guilty?”

When any incident is reasonably flat continue with “What about a victim could you be responsible for?”

This does not mean that you spot and run every incident encountered. Spot and run only those that stick.

STEP FIVE:

Explore the immediate past lifetime or lifetimes of the pc. Get the pc’s identity and form (sometimes they were animals), and if lifetime alters position of tone arm, run “What about (name) would you be willing to be?” “What about (name) would you rather not be?”

Do this until incident is flat. If heavy engrams in such a lifetime stick, run “What about that incident could you be responsible for?”

STEP SIX:

Run down any famous or enduring identities of the pc on the whole track, and handle as above.

Ease off this with responsibility as a victim.

STEP SEVEN:

Do a dynamic assessment on the pc and locate any terminal that drops, and run on this “What could you withhold from a ___?” until pc can withhold.

If any severe incident turns up flatten with responsibility.

STEP EIGHT:

Any chronic somatic or disability of the pc, if still not located, should be tackled with “What about that (name it) could you be responsible for?” and untangle the resulting pictures by placing them in time and running responsibility on any that stick hard.

STEP NINE:

Flatten once more responsibility on a victim.

STEP TEN:

Rehabilitate the pc’s ability to withhold by running cause-withhold version of responsibility (see note below) on all dynamics with various terminals.

Cautions: Until some responsibility is run on some cases no present life overts show up. Responsibility is the key to high and low tone arms, not overts. Handle any severe overts that turn up on a case with responsibility process.

Do not run a mass-less terminal such as “sex” or “help”. Find instead some actual terminal, not a significance.

Beware running adjectival commands such as “frigid woman” or “a little boy with a mole under his left grind”. Run instead the plainest terminal that drops.

Do not run things that are not real to the pc as he has made them unreal to lessen the overt. Instead run lots of overt finding processes such as “What could you admit causing a (terminal real to pc)?” alternated with “What could you withhold from a (same terminal)?”

Much of the material here is on the Washington 1960 HCS tapes. But this rundown here is to be followed in the event of any conflict of procedure.

IMPORTANT NOTE: WHERE RESPONSIBILITY IS USED ABOVE IT CAN ALSO READ “WHAT COULD YOU ADMIT CAUSING (TERMINAL)?” “WHAT COULD YOU WITHHOLD FROM (TERMINAL)?” THIS ALTERNATE COMMAND IS A BETTER PROCESS THAN “WHAT ABOUT (TERMINAL) COULD YOU BE RESPONSIBLE FOR?”

Note: Usage of this rundown should be taught on staff theta clearing courses.

THE KEY TO ALL CASES—RESPONSIBILITY

During the past three months I have made several important discoveries in the field of the human mind which iron out the bits and pieces that were getting in our road in making broad clearing programmes possible.

First of these was the discovery that the *tone arm* of the E-Meter rather than the needle was foremost in analysing the case. When the tone arm reads at three for males and two for females on the modern meter a process can be considered flat. Aside from various special states such as valence shifts, this will hold true. When the tone arm reads at clear for the person's sex no matter what one attempts to restimulate on the case you have a *clear*. Additionally the hot areas of the time track are located because they throw the tone arm to higher or lower readings. Good auditing today cannot be done without an E-Meter of good reliable quality as distributed by HCO WW in the UK and by Wingate Enterprises in the United States. It could be said that the E-Meter has just now become an absolute necessity in auditing and general analysis—using the E-Meter RIGHT we can achieve clears.

Next, but not next in importance was the discovery of the anatomy of RESPONSIBILITY. Although Responsibility has been known as a case factor since 1951 (just as the overt-motivator sequence has been) it has not been until now that I have been able to get it to run well on cases.

Responsibility is a significance. Pcs define it in various ways. And all rather tend to run from it. Pcs in general pretend they would much rather be victims than causative sources—which is what is wrong with their cases. In order to get responsibility to run I had to find out a lot more about it and not until the very end of 1959 was I able to define it in any way that made it run and come into being on a case.

Now I mentioned the E-Meter first in this because it is RESPONSIBILITY— LEVEL OF which causes the tone arm of the E-Meter to fluctuate. Place the pc in an area which has a very high tone arm reading or a very low one and you find the pc in an area in time when he was being very irresponsible.

It is not always true that a pc picked up as reading at the clear reading of his sex is high on responsibility. There is an inversion of the matter where the pc is so very low on responsibility that he just gets a body reading for his sex and that is that. The test of this is the running of responsibility, as given in this bulletin. If the pc, run on responsibility, changes the position of the tone arm from the clear reading then that pc has a very long way to go perhaps before he can achieve any responsibility. If a pc is run on responsibility as given herein, if his track is explored, and if the tone arm reads and continues to read at clear then he is very responsible and very clear. But you would have to run the pc a bit not just read him on the meter in order to get an accurate view of the matter. In other words, don't look for overts to check out on a case. Look for tone arm fluctuations when responsibility is run. *It takes at least a certain level of responsibility to show up overt acts on E-Meter.*

What exactly does the E-Meter read? It reads the degree of mental mass surrounding the thetan in a body.

A thetan accumulates mental mass, pictures, ridges, circuits, etc, to the degree that he misassigns responsibility. If he does something and then says that it was done by something or someone else then he has failed to assign cause rightly and, doing so, he is of course left with an apparently uncaused mental mass. This to us is the "bank". To Freud it was the "unconscious". To the psychiatrist it is lunacy. He therefore has as much bank as he has denied cause. As he is the only cause that could hang himself with a mass, the only misassigned cause therefore is self cause. Other people's causation is not aberrative and does not hang up except to the degree that the pc is provoked to misassigning cause. Other people's cause is therefore never audited.

Here then we have the anatomy of the reactive mind. The common denominator of all these unwanted ridges, masses, pictures, engrams, etc, is RESPONSIBILITY.

The discovery of the direct anatomy of RESPONSIBILITY is as follows:

Able to admit causation.

Able to withhold from.

This you will recognize as old reach and withdraw and as the fundamental of every successful process. But now we can refine this into the exact process that accomplishes a removal of the reactive mind and re-establishment of causation and responsibility.

A thetan will not restore his own ability until he is certain he can withhold from things. When he finds he cannot then he reduces his own power. He will not let himself be more powerful than he believes he can use power. When he gets mad he of course can control nothing, neither can he really direct anything. When he causes something that he thinks is bad, he next seeks to withhold. If he cannot withhold then he begins to compulsively cause things that are bad and you have overt acts happening.

What we call responsibility is restored on any subject or in any case by selecting a terminal (not a significance) and running on it:

WHAT COULD YOU ADMIT CAUSING A (TERMINAL)? THINK OF SOMETHING YOU COULD WITHHOLD FROM A (TERMINAL).

Overt acts proceed from *irresponsibility*. Therefore when responsibility declines, overt acts can occur. When responsibility declines to zero then a person doing overt acts no longer conceives them to be overt acts and YOU DO NOT EVEN GET A WIGGLE ON THE E-METER NEEDLE when looking for overts and withholds on such a case. Thus some criminals would not register on overts at all even though they had the loot in their pockets! And it is often necessary on any case to run cause/withhold on present life terminals as given above before the person can conceive of having committed any overts against those terminals.

THIS IS VERY IMPORTANT: No case will run well and many cases will not run at all with present life overts and withholds undisclosed and unflattened. These overts and withholds may not even come into view UNTIL THE VERSION OF RESPONSIBILITY GIVEN HEREIN IS LIBERALLY RUN ON THE CASE. Choose any area where the pc conceives himself to be a victim. Select a terminal to represent that area that falls on an E-Meter. Run cause/withhold as given herein on that terminal and watch the overts pop into view. It is not necessary to handle these overts when they come up with any other process than cause/withhold since cause/ withhold given here is responsibility.

There are other factors on cases that need handling but these are all handled with responsibility processes. If all the factors involved in a case are well handled as given herein you will have a theta clear who will be able to do a lot of things humans can't do. And if you handled a case totally with this material and its specialized skills then you would have an

Operating Thetan. Fortunately for this universe no thetan will let himself go free unless he can operate without danger to others and the responsibility factor is way up on all dynamics.

This material is covered in tape lectures from the Washington January Congress 1960 (nine hours) and in the HCS Course lectures, Washington, January 1960 (nine hours). The Congress, which was very warmly received in Washington, is being replayed in many areas by public demand and the HCS Course is being given as the HCS/BScn Course in all Central Organizations.

This is the major breakthrough we are starting the 1960s with. We are counting on HGCs turning out theta clears at regular intervals and we are working to get all staffs of Central Organizations through to theta clear on Staff Clearing Courses.

This material is also being used on PE Courses which now should run as follows: One week PE Course with TR demonstrations, this free. People pass from this course directly into Co-Audit (no Comm Course) at a fee, on the following process: "What could you admit causing a person?" "What could you withhold from a person?" Terminals other than "person" may be selected by the Co-Audit Instructor. A full intensive given by HGCs on the basis of OT-3 Procedure is sufficiently in advance of this to make individual auditing necessary in most cases. OT-3 has been released to all Central Orgs who have the Washington HCS tapes. The CCHs are used on cases incapable of defining terms.

In view of this material and what is now known of responsibility and overts and what they do to case level, a new kind of justice comes into being, making it completely unnecessary to punish. You can know a person by his case level. Does it advance or doesn't it? Does he elect others ogres when he himself has been doing things or does he show Scientology in himself?

This is a brand new look and it can be made a brand new earth. We started the 1960s the right way as I think you will discover.

THE CO-AUDIT TEAM

The running of a co-audit team as done on a staff theta clearing course, as done on staff and at home by Scientologists, can be either a very trying and unsuccessful activity or it can be a wonderful success, depending on whether it is done wrong or right. A fine example of this is the old time inability of a large percentage of husband-wife teams to succeed. But even a husband-wife co-audit team can succeed these days and come out clear if they follow the rules laid down in this bulletin.

Co-audit teams fail not because either partner is unwilling but because they dive into the deep without preparing the weather in advance.

The first requisite of any co-audit team is to thoroughly prepare the auditing climate and keep it repaired. This is true of any new team, no matter what either member of it did on any old team.

Therefore co-audit procedure must do the following before any cases are tackled:

Audit alternate sessions (not alternate intensives).
Run as the first process to be flattened:

“What have you done to me?”
“What have you withheld from me?”

and they run this every time the ARC breaks stack up.

Assess the case with an E-Meter as to whether Dianetics and Scientology on one hand or the sex of the auditor on the other hand get the biggest fall on the meter or change on the tone arm.

This action determines whether Dianetics and Scientology or the sex of the auditor get run first. They are both to be run. All we want to determine is which to run ahead of the other.

Find one or more terminals that represent Dianetics and Scientology. Run each (the one with the biggest meter reaction ahead of the rest) on “What have you done to (terminal)?” “What have you withheld from (terminal)?” Run them all. Run only until each one is relatively flat and only as long as the pc has ready answers. Check them all over again.

Running the sex of the auditor must also be done. If the auditor is a woman then run “What have you done to a woman?” “What have you withheld from a woman?” If the sex of the auditor is male then run “What have you done to a man?” “What have you withheld from a man?”

All the above must be clean as a whistle before one tackles a case. So making sure of the above, no matter how many hours it’s devouring, will give wins all the way.

Every session one handles all the rudiments.

“Is it alright to be audited by me?”
If not let’s get into O/W again and clean up Dianetics and Scientology again.

“Is it alright to be audited in this new environment?”

If not, get off the overts and withholds on the environment—finding some terminal that represents it as a general terminal.

“Do you have a present time problem?”

If so get it out of the road by two-way comm if possible, picking up the overts and withholds and guilt on the terminals involved. But don't handle PTPs endlessly and skip other auditing.

“What goal would you like to set for this session?”

Buy the goal the pc sets so long as it's real to him. Don't force pc into the auditor's goals or goals unreal to pc.

When one gets down to the pc's case the auditor does a dynamic assessment and finds where the tone arm is moved by one or another of the dynamics. If the tone arm (not the needle) is moved by a dynamic, then using the needle motion, find the hottest terminal that represents that dynamic and run overt/withhold on that terminal. When this is flat, do another whole dynamic assessment. Find a terminal that represents that dynamic and run it. And so on. Always use general rather than particular terminals. Avoid adjectival commands. Never run a significance. A terminal is flat when overt/withhold no longer moves the tone arm around and the needle is not stuck. The tone arm does not have to be reading at clear for the pc's sex if the terminal is flat—it must only be that the terminal no longer influences the tone arm and doesn't drop the needle when mentioned.

When the pc reads more or less constantly at clear reading for his sex after doing all the above, then finish the case off with “What have you done to yourself?” “What have you withheld from yourself?”

And now get this: In co-auditing there are greater strains than professional auditing. Therefore havingness problems arise. So make it a rule that for every two hours of auditing on rudiments or O/W or anything else (which I hope not), run *one half hour of objective havingness* with the following single command “Look around here and find something you could have.”

I am at the present moment working on more co-auditing manual material, but it won't be ready for quite a while and it contains more or less what you find shorthanded above. If one of the co-auditors has no HPA or HCA it's worthwhile to get training before co-auditing.

I am giving you this in the interest of making clears. I have piloted this out as probably the only safe procedure for everyone available in present technology. These are both the fastest processes and least liability. The above regimen is not just pretty good. It's a winner. But if you go running engrams or assuming the pc likes womankind or etc, etc, etc, or if you plunge into the case without clearing up the idea of auditing and sessions you are in for trouble, co-audit or professional.

Now let's see some more clears around here.

SECURITY CHECK

In keeping with policy carried out by all Central Organizations, an E-Meter check will be made on all new and existing staff at Saint Hill.

An E-Meter is better known as a "lie-detector" and is used to ascertain truth of background and conduct.

The following points will be covered by the examiner:

- Any criminal background
- Any Communist or subversive connection
- Spreading of slander concerning Saint Hill or its people
- Discouraging new employees by malicious lies
- Receipt of commissions on purchases for Saint Hill
- Overts against Doctor or Mrs. Hubbard.

No staff at Saint Hill are exempt.

No suspicion is necessarily attached to any person at Saint Hill. This is a security check. It is an effort to clear the air.

The test will be administered by Robin Harper, Technical Secretary, and any undesirable results will be rechecked by Mrs. Hubbard.

THEORY OF RESPONSIBILITY PROCESSING

In order to make up one's mind to be responsible for things it is necessary to get over the idea that one is being forced into responsibility.

The power of choice is still senior to responsibility. What one does against his will operates as an overt act against oneself. But where one's will to do has deteriorated to unwillingness to do anything, lack of will is itself an aberration.

Variations in the reactions of pcs to responsibility processes stem from the pc's belief that his power of choice is being or has been overthrown. Where an auditor has a pc balking against a responsibility process, the pc has conceived that the auditor is forcing responsibility on the pc and very little good comes of the session.

There is nothing wrong, basically, with doingness. But where one is doing something he is unwilling to do, aberration results. One does, in such a case, while unwilling to do. The result is doingness without responsibility.

In the decline of any state into slavery as in Greece, or into economic strangulation of the individual as in our modern western society, doingness is more and more enforced and willingness to do is less and less in evidence. At length people are doing without being responsible. From this results bad workmanship, crime, indigence and its necessities for welfarism. At length there are so many people who are unwilling to do that the few left have to take full burden of the society upon their backs. Where high unwillingness to do exists, democracy is then impossible, for it but votes for the biggest handout.

Where high unwillingness to do exists then we have a constant restimulation of all the things one is really unwilling to do such as overt acts. Forcing people who do not want to work to yet work restimulates the mechanism of overt acts with, thereby, higher and higher crime ratio, more and more strikes and less and less understanding of what it is all about.

The individual who has done something *bad* that he was not willing to do then identifies anything he does with any unwillingness to do—when of course he has done this many times. Therefore all doingness becomes bad. Dancing becomes bad. Playing games becomes bad. Even eating and procreation become bad. And all because unwillingness to do something bad has evolved and identified into unwillingness to do.

The person who has done something bad restrains himself by withholding doingness in that direction. When at length he conceives he has done many many bad things, he becomes a total withhold. As you process him you encounter the recurring phenomenon of his realization that he has not been as bad as he thought he was. And that's the wonderful part of it. People are never as bad as they think they are—and certainly other people are never as bad as one thinks they have been.

The basic wonder is that people police themselves. Out of a concept of good they conceive themselves to be bad, and after that seek every way they can to protect others from self. A person does this by reducing his own ability. He does it by reducing his own activity. He does this by reducing his own knowingness.

Where you see a thetan who sleeps too much and does too little, where you see a person who conceives bad doingness on every hand, you see a person who is safeguarding others from the badness of himself or herself.

Now there is another extreme. A person who must do because of economic or other whips, and yet because of his own concept of his own badness dares not do, is liable to become criminal. Such a person's only answer to doingness is to do without taking any responsibility and this, when you examine the dynamics, falls easily into a pattern of dramatized overt acts. Here you have a body that is not being controlled, where most knowledge is obscured and where responsibility for others or even self is lacking. It is an easy step from criminality to insanity, if indeed there is any step at all. Such people cannot be policed since being policed admits of some obedience. Lacking control there is no ability to obey, and so they wind up simply hating police and that is that.

Only when economic grips are so tight or political pressure is so great as it is in Russia do we get high criminality and neurotic or psychotic indexes. Whenever doing is accompanied by no will to do, irresponsibility for one's own acts can result.

Basically, then, when one is processing a pc, one is seeking to rehabilitate a willingness to do. In order to accomplish this one must rehabilitate the ability to withhold on the pc's own determinism (not by punishment) further bad actions. Only then will the pc be willing to recover from anything wrong with the pc—since anything wrong with the pc is self-imposed in order to prevent wrongdoing at some past time.

All types of responsibility processes have this as their goal: to rehabilitate the willingness to do and the ability to withhold on one's own determinism.

Restraint in doing something one knows he should do is a secondary deterrent but comes with other offshoots of responsibility into the cognition area.

Thus we have a formula of attack on any given area where the pc cannot do, is having trouble or cannot take responsibility: (a) Locate the area. (b) Find a terminal to represent it. (c) Find what the pc has done to that terminal that he thinks he should have withheld. (d) Reduce all such incidents.

In short all we have to do to rehabilitate any case is find an area where the terminal is still real to the preclear and then get rid of what he has done and withheld, and we come up with an improved responsibility.

Of all the responsibility processes, the oldest one I developed is still the best one by test and that is:

“What have you done to a (terminal)?”
“What have you withheld from a (terminal)?”

The processing results depend in large part on the accuracy of assessment, on the willingness of the auditor to process the pc and upon running the process as flat as it will go before finding another terminal.

Assessment accuracy depends upon skilled use of the E-Meter. Dynamic Straight Wire is best, and a weather eye upon the tone arm to see what terminal varies it, once one has the dynamic and from that has selected a terminal.

The willingness of the auditor to process the pc depends upon the confidence of the auditor to obtain results—and this is established by deletion of things the auditor has done to pcs and withheld from pcs in general and this pc in particular. Thus co-audit teams would be right always if they took each other as the terminals to be run first, get these pretty flat (and keep them flat during processing with “What have you done to me?” “What have you withheld

from me?”), then as the next thing to do run the sex of the auditor off the pc, then clean up Dianetics or Scientology (or use this as step two). And only then go into “case”. That would be a pretty fine co-audit team after they have survived the first explosions and gotten them gone.

Then in searching out areas to run as a case, care should be taken not to over-run a terminal or under-run one. A pc running out of answers can get very restless.

Responsibility *can* be rehabilitated on any case and when it has been you have a clear and that’s all there is to it.

HCO BULLETIN OF 4 FEBRUARY 1960

CenO

OVERT MANIFESTATIONS ON A LOW TONED CASE

Every high scale manifestation or activity has a low scale mockery:

There can be an apparent clear reading on a case that has never been successfully audited. This case is too low toned to register at all as a thetan. The resulting read is therefore that of the body minus a bank. No overts will show up on the needle of this case.

Only when responsibility has been run does this case shift off the low reading and get different tone arm and needle responses.

Such a case is fairly easy to recognize. The case has obvious areas of great irresponsibility and yet reads like a clear. But once you scout out the case this state of affairs becomes upset and the case reads otherwise, and then eventually comes back after an awful lot of sessions and intensives into the clear range and stays there. But now the case is able where it was before very apathetic and really useless.

Any clear check out must include the following exercise and indeed this is the process which gets these low level cases really cracking. This is both a clear examination and a good entrance to cases. It is also the best way to check out overts when in doubt.

You run on the E-Meter a dynamic assessment and pick up any dynamic that gives a change of needle pattern, or take any dynamic which makes needle drop no matter how slightly.

Having located the dynamic we now ask the pc for any terminal he or she thinks would represent that dynamic. We take any terminal that has any drop on it as given or suggested by the pc.

On this terminal we now run overt/withhold as follows:

“What have you done to a (terminal)?”
“What have you withheld from a (terminal)?”

This was the terminal realest to the pc, therefore when responsibility is increased on it you have generally increased responsibility.

When we have flattened this off mildly we go through the whole operation above again.

Before we have done this many times overts will begin to show up on the case and will be recognized by the pc.

Doing this well just once unsettles the false clear reading and that reading will not return until the case is actually cleared.

HONEST PEOPLE HAVE RIGHTS, TOO

After you have achieved a high level of ability you will be the first to insist upon your rights to live with honest people.

When you know the technology of the mind you know that it is a mistake to use “individual rights” and “freedom” as arguments to protect those who would only destroy.

Individual rights were not originated to protect criminals but to bring freedom to honest men. Into this area of protection then dived those who needed “freedom” and “individual liberty” to cover their own questionable activities.

Freedom is for honest people. No man who is not himself honest can be free—he is in his own trap. When his own deeds cannot be disclosed then he is a prisoner; he must withhold himself from his fellows and he is a slave to his own conscience. Freedom must be deserved before there is any freedom possible.

To protect dishonest people is to condemn them to their own hells. By making “individual rights” a synonym for “protect the criminal” one helps to bring about a slave state for all; for where “individual liberty” is abused, an impatience with it arises which at length sweeps us all away. The targets of all disciplinary laws are the few who err. Such laws unfortunately also injure and restrict those who do not err. If all were honest there would be no disciplinary threats.

There is only one way out for a dishonest person—facing up to his responsibilities in the society and putting himself back into communication with his fellow man, his family, the world at large. By seeking to invoke his “individual rights” to protect himself from an examination of his deeds, he reduces just that much the future of individual liberty, for he himself is not free. Yet he infects others who are honest by using *their* rights to freedom to protect himself.

Uneasy lies the head that wears a guilty conscience.

And it will lie no more easily by seeking to protect misdeeds by pleas of “freedom means that you must never look at me”. The right of a person to survive is directly related to his honesty.

Freedom for man does not mean freedom to injure man. Freedom of speech does not mean freedom to harm by lies.

Man cannot be free while there are those amongst him who are slaves to their own terrors.

The mission of a techno-space society is to subordinate the individual and control him, by economic and political duress. The only casualty in a machine age is the individual and his freedom.

To preserve that freedom one must not permit men to hide their evil intentions under the protection of that freedom. To be free a man must be honest with himself and with his fellows.

If a man uses his own honesty to protect the unmasking of dishonesty, then that man is an enemy of his own freedom.

We can stand in the sun only so long as we don't let the deeds of others bring the darkness.

Freedom is for honest men. Individual liberty exists only for those who have the ability to be free.

Today in Scientology we know the gaoler—the person himself. And we can restore the right to stand in the sun by eradicating the evil men do to themselves.

So do not say that the investigation of a person or the past is a step forward to slavery. For in Scientology such a step is the first step toward freeing a man from the guilt of self.

Were it the intention of the Scientologist to punish the guilty, then and only then would a look into the past of another be wrong.

But we are not the police. Our look is the first step toward unlocking the doors—for they are all barred from *within*.

Who would punish when he could salvage?

Only a madman would break a wanted object he could repair—and we are not mad.

The individual must not die in this machine age—rights or no rights. The criminal and the madman must not triumph with their new-found tools of destruction.

The least free person is the person who cannot reveal his own acts and who protests the revelation of the improper acts of others. On such people will be built a future political slavery where we all have numbers—and our guilt—unless we act.

It is fascinating that blackmail and punishment are the keynotes of all dark operations. What would happen if these two commodities no longer existed? What would happen if all men were free enough to speak? Then and only then would you have freedom.

On the day when we can fully trust each other, there will be peace on Earth.

Don't stand in the road of that freedom. Be free, yourself.

Place 1 in each
British E-Meter

BRITISH E-METER OPERATION

To operate the British version of the Electrometer designed under my guidance by Fowler and Allen, a British instrument firm, the following steps must be done at the beginning of each session.

The instrument has a 5,000 ohm calibration knob (a) and switch (b) not present on the U.S. Meter.

Before (or after) plugging in the electrodes at (e), with the tone arm at "off", throw the 5,000 ohm switch (b) downwards from "off". Then turn the instrument on with the tone arm (c) and place the tone arm at 2.

Now move the otherwise unmarked calibration knob (a) left or right until the needle is exactly on "set" on the dial.

Then move the tone arm to the white dot (g) between 2 and 3. The needle should move over to "test". If it does the batteries are properly up (they last a year or more unless you carelessly leave the meter "on" for days when not in use).

Now click the 5,000 ohm switch (b) up to "off".

Hand the pc the electrodes.

Have the pc squeeze the electrodes. The needle should fall 1/3 of the dial or more. Shift the 1—16 sensitivity arm (d) up or down until the pc, squeezing the cans, *does*, on one squeeze, get a 3rd of a dial drop.

You are now ready to audit.

Keep the needle around the "set" mark. Keep the sensitivity low so that you only get significant readings (not breath or heart beat). Most pcs run around 1 on sensitivity on this meter which is very live. Sticky pcs have to have a higher sensitivity setting.

When finished with the session and the meter, turn the tone arm to "off" or your battery will wear out much faster.

Stow the cord to the electrodes inside the electrodes which are hollow. A little examination will show you how. Then stow the electrodes in the case and close it. Use the U.S. E-Meter book for all other meter particulars.

If your meter ceases to function ship to Fowler and Allen, 39 Mackenzie Rd, Beckenham, Kent, at your postage expense. Enclose return postage. Unless due to carelessness or breakage, they will service and re-battery your meter. Opening the panel or changing the meter about inside voids the guarantee.

CREATE AND CONFRONT

The cycle of action (create, survive, destroy) and the communication formula (cause, distance, effect) with Axiom 10 (the highest purpose etc, creation of an effect) become identified in the mind with one another.

The preclear who is having a difficult time is on an inversion of the cycle of action (counter-create, counter-survive, counter-destroy).

Any preclear is somewhere on this cycle. The preclear who only gets death pictures or bad pictures is somewhere late on the cycle of action or late on an inversion cycle.

This preclear believes that every cause brings about a destruction.

Thus he falls out of communication, since any and all received communication will destroy him, he thinks.

All this is covered in the First Melbourne ACC Tapes and will probably not be covered to such a degree again. The Melbourne ACC Tapes are consecutive with the Philadelphia lecture series (fall 1952), and are a little out of the way of our present theory, but have a special place in know-how.

Out of this we now have an understanding of what a limited process is. Any process which makes the preclear create is a limited process and should be avoided. Such processes as "Tell a Lie" are creative processes.

The preclear has creation tangled up with cause and cause tangled up with the overt-motivator sequence. The thing that straightens all this out is any version of responsibility run with the pc at cause. Earlier the best we had to straighten this out was confront. Responsibility is confront and is very senior to confront as a process.

When a pc over-creates he accumulates the unconfrosted debris. All you have to do to restimulate debris (stiffen up the bank) is to run the pc on some version of create process.

Havingness is a confront process and straightens out the create factor.

Havingness is the lowest version of responsibility; Confront is the next lowest; Overt-Withhold is the next; and at our present top for practical purposes is just plain responsibility. Actually all these are responsibility processes.

Create is bad only when one does not take responsibility for the creation.

The key process of all processes at this writing is being responsible for having been irresponsible.

There is a great deal of anatomy to responsibility. A great many answers lie waiting on its track. When one maligns another, he has not taken responsibility for the acts of that other person and so is separate from that other person.

One of the highest points of knowingness which is not at this time known is whether we are all one or if we are actually separate beings. Enough responsibility run achieves a subjective answer to this. While several offshoots of this present technology are under test at this time it can be said with certainty now that the best version of responsibility for most cases is:

“What have you done to a (terminal)?”
“What have you withheld from a (terminal)?”

It will be seen at once that what could you do to and what could you withhold from a terminal is a create process, and is therefore slightly limited and leaves debris. Thus it can be said with finality overt/withhold rather than cause/withhold is the best process.

In the presence of ARC breaks, havingness is a must on any responsibility process and is always a good preventive for flops. Don't forget havingness. We know now that it is the lowest rung of responsibility. This becomes evident when we examine the withhold aspects of havingness.

Plain ordinary “What could you be responsible for” is of course a very fine process and oddly enough often goes lower (for a short run) than overt/withhold. Responsibility isn't just a high level process. It works where it works.

It is interesting that while running pure raw responsibility in its non-create form (what have you been responsible for) we see anew the old know-to-mystery scale revealed.

Factual Havingness can be run in its trio form with good results:

“Look around here and find something you could have”
“Look around here and find something you would permit to continue”
“Look around here and find something you would let vanish”

The old restrictions and know-how of running this still apply.

“Look around here and find something you could have” is of course a wonderful process. And whenever you run an hour and a half of any other version of responsibility you had better run half an hour of “Look around here and find something you could have” and be on the safe side.

SUMMARY:

The data in this bulletin is far from merely theoretical. To some auditors it will come as an emergency super frantic hysterical rush item for they should shift over any version of responsibility they are running to the above versions.

Don't run any other version of overt/withhold than that given above. You can run responsibility as itself on any incident or terminal if the pc can take it. Run a half hour of havingness for every hour and a half of any responsibility subjective process.

NOTE:

Instead of the CCHs for that low low level case, why not get it going with havingness as above and then find any terminal that ticks on a meter and run O/W on that terminal. Then run more havingness. Then find another terminal that ticks and run O/W on that. Then run more havingness. And so on and on with the same pattern until you get the case shifted on the cycle of action and functional.

HOW TO RUN O/W AND RESPONSIBILITY

I have just yesterday finally sorted out the exact relation of overt/withhold and responsibility as they apply to life and to auditing and have pretty well wrapped up the optimum auditing commands: therefore I want to get this data off to you as fast as possible and get it in use as soon as possible because here again is an increase in auditing effectiveness over and above our existing successes. In the next bulletin up I want to give you a revised form of a model auditing session and after that procedure OT 3A. However you can use this following material right now and without those, and I recommend that you recognize what you have here as a modification which changes all earlier statements even if they seem to you slightly in conflict.

To begin: A person who does an overt act to another life form has already abandoned responsibility for that other life form. An overt act and a withhold are evidently expressions of abandoning responsibility already extant and are therefore a manifestation of irresponsibility.

Therefore, for the sake of auditing skill as well as theory, overts and withholds are the same as irresponsibility.

When running overts and withholds, according to the evidence now to hand, you are actually running irresponsibility off the case. You are taking away the lower inversion of responsibility.

The way to run an overt/withhold process is to choose a terminal with an E-Meter. Early in the case choose terminals that are specific and close to PT. When you have chosen the terminal by reason of its drop on the needle and its reality in the pc's life, you run on it the following:

“What have you done to a ___?”
“What have you withheld from a ___?”

When addressed to a specific terminal it is worded:

“What have you done to ___?”
“What have you withheld from ___?”

Now this may require up to thirty hours to flatten on some cases. But whatever you choose to do on a case then do that thing well. The tone arm may or may not go down on this process. But it will become very different. Try to end up the process with the tone arm lower than it was at the start. If the pc runs out of answers well that's it. Don't force him hard. Just go on to the second stage on the same terminal in a very generalized form.

By this time you have no more than discharged an irresponsibility and you have the responsibility all to handle. Indeed, according to the many cases I have now looked over, the tone arm may not even begin to come down properly or come up properly until the second stage is run and flattened.

The second stage process is responsibility. You take the same terminal you ran the O/W on and (if it was a specific form you now use a general form, i.e. O/W on your mother becomes responsibility on a mother) run as follows:

“What responsibility have you taken for a ___?”

This is the process which will bring the tone arm down or up, but only when the O/W is fully flattened first.

This above combination of processes is the fastest and surest main line of auditing procedure now known. The above commands are far and above the best proven commands.

As you can see the slightly older process “What could you admit doing to a ___?” and “What could you withhold from a ___?” are indeed manifestations of responsibility and factually are an index of responsibility. But when it comes right down to cases the above versions cover all cases and do it right.

What a lot there is to know about auditing today. Getting a combination of processes such as the above for the general handling of cases relieves us of the constant tension of what should I run and gives us time to concentrate on a perfection of running it extremely well.

An auditor ought to be adept at CCHs and running the above. He ought to be very sharp with an E-Meter and he ought to be able to run a model session with no blunders. This done equals clearing people.

There is no substitute for training at the level of HCS/BScn. Running a session right and handling an E-Meter and pc successfully are auditors' skills. It must be admitted that very few auditors are possessed at this time of complete and near perfect auditing ability. I take my own responsibility for this and that responsibility lies in not having established an inflexible regimen of auditing. I did not do so because there was ample room for the improvement of techniques and auditing routines. But these last five months of work have brought us closer and closer to the exact right ways to handle cases and the exact processes to run on them. This has arrived with a much fuller understanding of what complexity man is accomplishing toward aberration with the fifty-five axioms. Man got pretty complicated in digging himself in. It has been my job to get pretty simple about digging him out.

The new key data which has emerged as clear-cut fact includes as an invariable that the person himself dug himself in, lost sight of why, and is holding himself in a state of stupidity, aberration and even insanity. We suspected this for years, but a way to prove it and then give a person personal reality on it was not mapped through. Now it is as tough as this. If you run “What have you done?” “What have I done?” you can hold a tone arm inactive. Every gain is balanced with a counter accusation, which is to say a new overt, and so the process gets nowhere after a few questions. No, the pc did it all himself and must gradually come to realize that with total subjective reality through processing, not because the auditor told him.

The pc made the facsimile to restrain himself from ever doing it again. Basically good, he goes wrong by failing to keep his own high standards and so loses control of himself.

Another datum: A high tone arm shows loss of the ability to start or reach—a low tone arm (below the clear reading) shows the loss of ability to stop or withhold.

In locating a terminal on an E-Meter (and why try to audit without one of these key tools), remember that the needle drops only on those terminals that the pc still feels some responsibility for. There is some responsibility to be found on these. The drop does not mean that this is what is wrong with the case so much as this is that thing wrong with the case that can be remedied at this time. Overts don't even show up on a terribly irresponsible case until some responsibility is restored. But a rather irresponsible case run on the above procedures on any terminal that does drop will get changes away from the clear reading on the tone arm.

To clear a case it is not so much necessary to run everything off the case as it is to run whatever you run so well that the confidence of the case is restored. Restoration of confidence in being able to handle the bank and therefore life is a better goal than trying to flatten the whole case indifferently. What you contact, do it well no matter how long it takes. A good proceeding is to find anything close to PT and in the environment of a pc (PTPs give a real good clue) and then handle it with great thoroughness with the above procedure. Any constant restimulator of PTPs aches to be audited with the above and will do more for the case as a whole if the auditing is well done and thorough than running any amount of back track. Confidence is the keynote of clearing. That is what the pc lost on his way down.

Don't worry if the needle stays high or low and don't believe the pc is still hiding something from you. You can take the above rundown and do it all. The overts of the pc will eventually out. He doesn't tell you about overts at first because he doesn't see them as overts. They were all justified and the target has been lessened, etc, etc. Then when he has O/W and responsibility run on any terminal that drops, his general responsibility comes up to a point where he knows an overt was an overt.

I trust the above will correct any small disturbances that have been occurring or any stalls you have been running into.

SCIENTOLOGY CAN HAVE A GROUP WIN

If every one of us relieved his conscience of all his transgressions against others, what would happen to society?

The social ills of Man are chiefly a composite of his personal difficulties. The combined dishonesties of individuals add into the formidable total of aberrated Third and Fourth Dynamics.

Criminality and war (and is there a difference?) came about because of a staggering social aberration. This is only a composite of individual aberrations. People who believe otherwise are just being irresponsible for their share.

Each man and woman on Earth has contributed to this massive tangle of transgression. The overts and withholds of each are added to the total mass of social ills. Further, one man or one woman failing to take his or her share in the general responsibility which makes society sane works as a further subtractive from group or world effectiveness.

There are many, many instances on record now of a whole social situation clearing up *with others* when one person was processed on the problem. A wife, estranged for years, processed on her husband and his family, quite commonly hears from them. The enmity, vanquished in her, vanished from them.

There is, therefore, more to this than an arithmetical one for one throughout the world. It would not be necessary to process, apparently, every person on Earth to bring sanity to Earth.

First there is the easily seen advantage of returning communication and honesty to just one person by removing his overts and withholds from the total sum. On this proposition alone we could win. And we should try to win on this, whatever else we do. Each person should restore himself to communication with Mankind and the world by removing from himself his own transgressions and failures.

To this we add the fact that each person so processed becomes a strong point of effectiveness which then influences his associates and eventually, even if only by this influence, discharges their confusions.

And then to this we add the fact that when one's own transgressions are dismissed the persons involved in them, even when not processed, tend to become unburdened.

And if we strongly influence others to become honest by getting their overts and withholds processed, we have approached with thorough and hard-headed practicality a resolution of the social ills of Man.

This is an impulse which can become a wave, and from a wave can grow into an avalanche that would sweep away the snarled tangles from human life on Earth.

All great cathedrals began their building by the placement of a single stone.

The building unit of a great society is the individual.

We can speak of clearing in a broader sense and we can discuss its potentials for Earth. But while we work at that there is today another meaning to the word—a smaller meaning to the individual perhaps but a greater meaning to all men. Since it can happen *now*, in a few hours of good processing: the clearing of one's transgressions in this lifetime and the taking of responsibility therefore.

We are a group inured to high-flown tasks. This is an easy task to confront.

HGCs can do this for people. Field Auditors can do this for people. We can demonstrably and easily clear in under a hundred hours all the key overts and withholds from a case in all directions and restoring responsibility thereon. We have the skills. I know we have the will.

Every Scientologist can get this done. And every Auditor can do it using an E-Meter, and the processes of HCO Bulletin of February 18th, 1960 and the session model of HCO Bulletin of February 25th, 1960. The task is well within the scope of the skills of even the newly trained.

I think you will agree with me that this one we can do. And I assure you that doing it on a case gives that case its fastest available relief. Later we can carry the case forward to higher levels with all the gain that would bring—but just now can we not assume a goal that falls within the reality of all of us?

For it is no accusation for any person living in our times to say that he can be relieved of transgressions against his fellows. And even that small amount picked up from the great web of lies leaves the tangle surely less.

This programme is a simplicity. Its technology is to hand, proven and rechecked. And it points ahead to a big win.

Shall we take this step to a clearer Earth as our first great group accomplishment?

HAVE YOU LIVED BEFORE THIS LIFE

by
L. Ron Hubbard

Published March 1960

Have You Lived Before This Life?, subtitled “A Scientific Survey,” is a study of past life incidents discovered during the 5th London Advanced Clinical Course of 21 October—29 November 1958. It contains an introduction to the subject, a statement of how the survey was conducted and by whom, and reports of forty-two incidents recalled by Scientologists attending the course. These incidents are dated between the twentieth century and many billions of years ago, and their locations range from England, Norway and Tibet to planets many galaxies distant.

Not only are these incidents fascinating, but their narration reflects how Scientology engram running was done.

The 21st American ACC (January—February 1959) also covered Scientology engram running; however, case histories in this book come only from the 5th London ACC.

176 pages, hardcover with dust jacket, glossary. Available from your nearest Scientology Organization or Mission, or direct from the publishers: Scientology Publications Organization, Jernbanegade 6, 1608 Copenhagen V, Denmark; or Church of Scientology Publications Organization U.S., 2723 West Temple Street, Los Angeles, California, 90026, U.S.A.

**OT-3A PROCEDURE
HGC ALLOWED PROCESSES**

This bulletin supersedes all earlier bulletins.

Any case that cannot adequately define simple words like help, change, problem, control, responsibility: Run CCHs 1, 2, 3, 4 as per their earliest bulletins.

STEP ONE:

Rudiments—(See Model Session HCO Bulletin of February 25th, 1960.)

Goals
Surroundings
Auditor and ARC Breaks
Present Time Problem

Establish Rudiments every session. Establish them more often with touchy pcs.

STEP TWO:

Run Cause ARC Straight Wire to give pc a win on getting audited. Once each over and over. End process only with pc in present time on cycle.

“Recall communicating to someone”
“Recall a time you felt affinity for someone”
“Recall something that is really real to you”

STEP THREE:

S-C-S
High Needle Case: Run with emphasis on START
Low Needle Case: Run with emphasis on STOP

STEP FOUR:

Scout for present life overts and withholds. If found run “What about that incident could you be responsible for?” (See note on Responsible.) Flatten off all present life overt/withholds and zones of irresponsibility (high or low needle).

This should bring the needle into quietness and the tone arm down to clear reading for the pc's sex.

On a low tone arm case, particularly below two, find a terminal that is in a stuck picture and run withhold on that terminal: “What could you withhold from a _____?”

If an overt is a very bad one that the pc can take little responsibility for, run O/W on the specific terminal involved, then generalize the terminal form in the command and run responsibility. Commands here are “What have you done to _____?” “What have you withheld from _____?” Then “What responsibility have you taken for a _____?”

When a pc has done a very bad overt to a person or thinks he has, his level of responsibility is already below zero on that type of person. Therefore responsibility run on the specific terminal (such as "Agnes") won't work as pc's responsibility on "a woman" was very low before he did an overt to "Agnes". Therefore it would be O/W on "Agnes" and responsibility on "a woman".

The whole essence of clearing in this lifetime is done by the steps up to and including this one. The procedure would be to locate the present life overts (or personnel in PT Problems), run O/W on them and then responsibility on the general form.

STEP FIVE:

Clear the pc's field with responsibility as per recent HCO Bulletin on black, invisible or dub-in cases. When pc sees pictures of PT then go at case in general. O/W on persons in a stuck picture will move it. Running withhold only on such persons will raise a low needle case.

STEP SIX:

Run "What about a victim could you be responsible for?" until tone arm tends to read at clear reading for sex in this lifetime.

Whenever the pc encounters an incident that seems very sticky, which is to say when the picture sticks many commands by the E-Meter, spot the time in terms of years ago and down to the month and day. When the incident is spotted, if it continues to hang up run it as an incident with this command: "What about that incident could you be responsible for?" and as needful on a two way comm basis, and by any process as needed get off its overts and withholds and 'who would it make feel guilty?'

When any incident is reasonably flat continue with "What about a victim could you be responsible for?"

This does not mean that you spot and run every incident encountered. Spot and run only those that stick.

STEP SEVEN:

Explore the immediate past lifetime or lifetimes of the pc. Get the pc's identity and form (sometimes they were animals), and if lifetime alters position of tone arm run "What about (name) would you be willing to be?" "What about (name) would you rather not be?"

Do this until incident is flat. If heavy engram in such lifetime sticks, run "What about that incident could you be responsible for?"

STEP EIGHT:

Run down any famous or enduring identities of the pc on the whole track, and handle as above.

Ease off this with responsibility on a victim.

STEP NINE:

Do a dynamic assessment on the pc and locate any terminal that drops, and run on this "What responsibility could you take for a _____?"

If a severe incident turns up flatten with responsibility on the incident.

This step can be done many times. Most of the pc's case will be found connected with some general terminal.

STEP TEN:

Do a survey of case, finding anything that the pc has trouble confronting and run responsibility on it.

Clues: Sick Person—Insane Person—Robot—Prize Fighter—Worker.

STEP ELEVEN:

Find anything pc has created arduously for a long time and run responsibility on it.

STEP TWELVE:

Run Responsibility on Matter, Energy, Space, Time, Motion and Thought. Confront can be run first on these as a kinder step.

Caution: Until some confront and responsibility are run on some cases no present life overts show up. Control, Confront and Responsibility are the key to high and low tone arms. Always handle any severe overts that turn up on case with responsibility process.

Do not run a massless terminal such as "sex" or "help". Find instead some actual terminal, not a significance.

Beware running adjectival commands such as "Frigid woman" or "a little boy with a mole under his left grin". Run instead the plainest terminal that drops.

Do not run things that are not real to the pc as he has made them unreal to lessen the overt. Instead run lots of overt finding processes such as "What could you admit causing a (terminal real to pc)?" alternated with "What could you withhold from a (same terminal)?"

NOTE: *Confront* can be run as a prelude to any and all responsibility, with the following command "What about (...) could you confront?" Do not use the dichotomy version (rather not). Confront is sometimes easier, sometimes harder than responsibility.

Much of the material here is on the Washington 1960 HCS tapes.

Usage of the rundown should be taught on staff theta clearing courses.

Central Orgs

**EXPANSION OF OT-3A PROCEDURE, STEP TWO
HGC ALLOWED PROCESSES**

Step Two of OT-3A Procedure is as follows:

Run Cause ARC Straight Wire to give pc a win on getting audited. Once each over and over. End process only with pc in present time on cycle.

- “Recall communicating to someone”
- “Recall a time you felt affinity for someone”
- “Recall something that is really real to you”

Now people do have time tracks, the time span of the individual from beingness to present time on which lies the sequence of events of his total existence. And when the preclear *is* in session and is being run on a recall type process, he, with his attention, goes up and down this time track. He may recall things only from this life or he may recall things from his whole past track; but however that may be, his attention cycles from early on the track to present time or from present time to early on the track to present time. This is known as the cycle aspect of recall type processes. In ending such a process, it is of utmost importance that the auditor end it with the preclear in present time on the cycle. The auditor wants to watch ending the process when the preclear has not made a smooth cycle into present time, but has made a big jump from way back in the past to present time. In such a case, the preclear has really bounced out of the past incident into present time, and it is only an apperency that the preclear is in present time.

So when ending such a process, the auditor must exert caution to be certain the preclear is in present time. Being left with one's attention back on the track is not a comfortable sensation and sometimes can be quite painful, despite any justification offered by an auditor who himself has no reality on the time track, and I hope there are no such auditors.

With Cause ARC Straight Wire, the auditor must forget his fastidiousness about ending the process precisely so on the last command, “Recall something that is really real to you.” He ends the process, no matter on what command of Cause ARC Straight Wire, when the preclear's attention has come into or close to present time, close to present time being the last day or two.

In ending such a process the communication bridge used is as follows: “The next time you come close to present time I am going to end this process.” He continues to give the commands using the question, “When was that?”, after each answer the preclear gives and before the acknowledgement. When the preclear gives an answer close to present time, he says, “That was the last command of that process; end of process.” Bang. With processes that cycle, there can be no communication bridges like, “If it's alright with you in a few more commands I am going to end this process.” It could take fifty more commands until the preclear is close to present time; and by that time, the preclear has entirely forgotten that there ever was any intention on the auditor's part to end the process as it seems to him that the auditor must have changed his mind and decided to run the process longer than *a few* commands.

An auditor should not get upset with a preclear when the auditor, in an effort to get the preclear to give an answer right in present time, starts the preclear back down the time track

again. Remember it is the auditor who calls the shot, and if he misses, then he had better learn to gage it a bit better. A good auditor allows himself time in which to properly end a process.

Now two further cyclic processes which can be seen under Step Two of OT-3A are:

1. “What would it be all right for you to make forgotten?”
2. “What would you permit to have happen again?”

These are called Cause Elementary Straight Wire and are two separate processes which are not to be run alternately.

The first process puts the preclear at cause over forgetting, and the second process rehabilitates the preclear’s ability to duplicate. These are both terrific processes in turning on recall in the preclear. All processes under Step Two are unlimited, with the “make forgotten” one only slightly less unlimited as it has a bit of a tendency to run down havingness. Havingness, however, should be checked upon in each session and run as needed.

The auditor should not consider Step Two of OT-3A lightly. These processes are, in reality, very potent and will certainly do more for CCH-step cases than anything we have had before. An example of this is how preclears broke through from psychosis to neurosis to sanity with the simplified version of ARC Straight Wire as given in the original *Self Analysis*. So use these processes and win faster.

Note: On second thoughts for purposes of differentiation, the first process, “What would it be all right for you to make forgotten?”, should be termed Cause Elementary Straight Wire; and the second process, “What would you permit to have happen again?”, shall be called Duplication Straight Wire. These two processes were first used in early Advanced Clinical Courses in Phoenix and were called at that time “Elementary Straightwire”. The commands of “Elementary Straightwire” as given in *Dianetics 1955* were: “Give me something you wouldn’t mind remembering” and “Give me something you wouldn’t mind forgetting”. As the ability to recall depends upon the mechanisms of forgetting and remembering (the ability to duplicate) you can easily understand the importance of these in Step Two of OT-3A.

STANDARDIZED SESSIONS

There are many reasons why sessions should be standardized and held in pattern. First of these is confidence. The auditor, going over practised ground, feels more confident and, startled by some sudden action or new development, does not lose session control by seeming incapable to the pc. The preclear, accustomed to repetitive session pattern, feels a security when all his sessions are predictable as to pattern of address. And if he changes auditors he is still able to feel confident that he is getting real auditing.

A second reason is duplication: Just as old repeater technique *done by* the auditor to the pc will run out a phrase or charged word, so do session patterns, well followed, tend to run out earlier sessions. Duplication does not make all things seem alike. Duplication of a session adds communication to the session and speeds up the willingness of the pc to communicate to the auditor.

The basic freeing action of auditing depends upon the separation of thought from form, matter, energy, space and time and other life.

We see in “science” as currently practised a nearly total identification by the “scientist” of mass with thought. “Man from mud” is a natural conclusion by anyone who has all his thought bound up in mass.

The reason a clear’s needle is so free (and you’ve seen, certainly, how an E-Meter needle gets sticky, then freer and freer) is that his thought is separated from a matter, energy, space, time consequence.

The “dead-in-’is-’ead” case is totally associating all thought with mass. Thus he reads peculiarly on the meter. As he is audited he frees his thinkingness so that he can think without mass connotations.

What auditing is doing is making the preclear think key thoughts until they can be thought without creating or disturbing matter, energy, space and time.

As most pcs associate themselves with *thought*, only when they can think a thought without ploughing anew into mass can they exteriorize. Difficult exteriorization or exteriorization with bad consequences is all caused by a person’s considerations of thought being matter, self being matter, etc, etc.

The basic overt act is making somebody else want mest. This recoils so that self wants mest. Thus we have the “necessity for havingness”. Running havingness restores the pc at cause over matter, permits him to be separate from matter to some degree.

Thinking, then, is separated from mest by repetitive thinking on the exact points that pin a particular person to mest.

If a person is aberrated, say, on the subject of women, the shortest cut to de-aberration (barring havingness difficulties—see below) would be the repeated command “Think of a woman.” At last he would no longer have pictures or masses just because he thought *that*

thought and you would then find he could *think* about women as opposed to reacting about women.

This naturally leads to an obvious basic process, “Think about matter” “Think about energy” “Think about space” “Think about time” “Think about a thetan.” In theory each one could be run flat in turn and then all run again.

In actual practice this is pretty steep for most cases and would not be real to many. A more complex approach containing more significance is more real to the pc.

The pc’s mind is trapped into *forms* of mest and life, rather than merely mest and life. Thus, what falls on the E-Meter needle shows what form of mest and life his attention is fixed upon.

Havingness is a complicated subject when viewed in a pc’s mind. Familiarity, which is to say, predictability, is strongly connected with his ability to have or own. When he receives shocks or surprises, his ability to predict is invalidated and he *can’t have*.

The reason a thetan “dies” is his loss of the familiar by the introduction of the unpredictable. Rapidity of change of state, unpredicted, would be a definition of surprise, also of death and forgetfulness.

The more change he is subjected to, that he did not predict, the less he can have.

Thus when he is given a “rough session”, the pc’s havingness goes down. Not predicting the shifts and changes of the auditor, the pc ceases to be able to have the session or its appurtenances—the auditor, the room, etc. The smoother the auditing the better the pc’s havingness stays up.

The model session is designed to avoid unpredictable changes. Thus it is designed to retain havingness by retaining pattern, which is to say, retaining predictability by the pc.

Auditing, done smoothly, duplicatively session by session as to session pattern, runs itself out, even if the pc has a constantly changing bank.

A pc began to use pictures when he changed lives and sometimes, therefore, language, but only after he had already adopted language for thought. So an ultimate step in processing could concern itself with separating the pc from the significance of words. Some such process as “Think of a word,” followed by “Think of a meaning,” would in theory, if it could be run (but has not been tested and would violate havingness), discharge the pc of his dependence on language for thought and would find him less fixated on having pictures (which of course bridge the language barrier).

Appearing in a form composed of matter, running on energy, existing in space and keeping pace with others in time is a favour pcs do one another (or an overt act depending on how cynical you may feel when you consider it).

The games condition of havingness is have for self, can’t have for others. Appearing in a form violates this games condition. Also, giving another words violates it. Thus actors and writers tend to go downhill by violating their own games condition *if they are in one*. A games condition evolves from separateness. Running some form of separateness can then result in exteriorization not from willingness to lose the mass of the body but by curing the games condition. Separateness is of course handled on lower cases by running out obsessive connectedness. But separateness itself can be run.

Any auditing is a solution: Solutions are ordinarily an alter-is of problems. Thus getting people to confront problems or even solutions can resolve not only case but auditing where

auditing itself has now and then, in absence of smooth analysis and session handling, become a problem to the preclear.

A fine process for this is “Tell me a problem that auditing would be a solution to,” and for that matter, this also applies to any psychosomatic illness. A person with a bad leg would experience relief if audited on “Tell me a problem a bad leg would be a solution to,” as a repetitive process. Similarly, it might work if one asked “Tell me a solution to a bad leg you could confront,” or “What problem about a leg could you confront?” which last is very good as a process.

The separation of thinkingness from a problem, from particular forms, and from Life and Mest are the primary targets of auditing. And just as the repetitive auditing command runs out not only the connection with a mass but itself, so does a repetitive session design eventually free the pc from not only his aberrations but auditing itself.

A person gets as able as he regains confidence—and he gets as free as his auditing is a constant not itself a wild variable.

GOALS IN THE RUDIMENTS

A session is a cycle of action.

Unless it is started, continued and ended properly the preclear is put in continuous session. If it is not given a proper cycle of action it does not result in any control of the preclear.

Rudiments are not something it is nice to do. Rudiments are something that must be done.

A great deal of the value of auditing lies in the mechanics of the session itself. If you wish to demonstrate this for yourself all you have to do is try short sessioning. This consists of starting, continuing for a few minutes, a session, and ending the session. It has good gain qualities for a pc who has poor concentration. It does not matter what is run. What matters is that direct control of thought results in setting an example that thought can be controlled.

A session without proper rudiments is a session without control. A session without control gets no gains of any note.

After working with this for years I believe a nearly foolproof method of handling the rudiments has been developed.

The parts of modern rudiments are as follows:

Goals
Surroundings
Auditor and ARC breaks

Present Time Problem

End rudiments:
Present Time Problem

Auditor and ARC breaks
Surroundings
Goals

(Note the end rudiments are changed in order from HCO Bulletin of February 25, 1960.)

GOALS

Goals are set at the beginning of the session in order to make the preclear postulate session occurrence. If the pc says nothing about goals or even says nothing will happen, probably nothing will happen of any note in the session. Goals are taken up first in a session before environment, auditor or problems because these may entail auditing if they are not right,

and the moment you start to audit the last three then you are running a session without setting goals and may run the entire session of the auditor or the present time problem and miff it because no goal was ever set. The auditor who does not set up goals immediately following the start of a session may wind up without getting a chance to set goals.

There is a lot to know about goals. There have been processes entirely devoted to goals. A great many more processes could be developed about goals. However the value of these tools or processes does not compare to just getting a goal or three set for the session itself. If you run into difficulties about goals there are two processes which can be used, and perhaps other old processes might also be worked on the subject.

The basic reason we give stress to goals is to keep the auditor from making one of the greatest fundamental errors he can make: The auditor is processing in one direction and the pc wants to go in another. This creates a basic disagreement between auditor and pc which prevents auditing from getting anywhere and results squarely in ARC breaks and upsets. Where these are frequent this mistake must be supposed to exist and must be cleared up.

There are only three things a pc can do in a session so far as results are concerned: he can get better, he can stay the same, he can get worse. Therefore there are only three basic types of goals: improvement goal, no-change goal, deterioration goal. All this derives from survive and succumb as the two opposite poles.

The auditor may be seeking improvement while all the pc wants to do is succumb. The auditor may be trying to keep the pc from getting worse and the pc wants only to get better. The auditor (but let's hope not) may be working unconsciously or otherwise on a particular pc to make him or her worse and the pc is trying to get better. Of course in the last case O/W is indicated for the auditor on this type of pc. Fortunately the last type is rare.

The commonest disagreement on goals comes about on the first mentioned. The auditor wants improvement and the pc wants deterioration. Some auditor trying wildly to make a pc better gets a failure only because he has never closely observed the pc's goals and hasn't got this straight with the pc.

If goals go wrong the simplest process to clear the pc on direction is a problem process. This might sound odd, but it is quite true. The fastest goals process is a general problems process. This occurs because the pc in looking over problems falls into realizing what his actual desires are. The quickie version of this process handles solutions in this fashion:

The auditor looks over the preclear and sees that the pc has some obvious disability. He asks the pc if the pc has any disability and steers it into getting the pc to bring this one to light. This would be something like a bad foot or cough. One selects a mass terminal for this disability, such as chest for the cough (whatever the pc says it is), and runs the following command, "What problem would a bad foot be a solution to?" Using this on one or more disabilities and running it a while (until pc is in pt on it) shows the pc at once that at least as far as a foot is concerned he has been trying to succumb.

This is a very ordinary occurrence since factually any chronic psychosomatic is an effort to succumb. Remember that the doors are all locked from within by the pc himself.

If pc is still reluctant and upset about goals or isn't getting better faster because of the solutions process above, run some consequences in this fashion: "What would you be likely to do if you didn't have a bad foot?" This makes the pc look at it some more, and some responsibility run on what he has said he might do will clear the thing away.

The general process that uncovers most of this is "Tell me a problem"; when pc has, "What part of that problem could you be responsible for?" When pc has, the auditor says again, "Tell me a problem," etc, etc, etc, on a repetitive basis.

Now remember that we weren't trying to make his foot well. That may or may not happen with any rapidity. What we are trying to get the pc to look at is that his goal alignment is not an improvement but a deterioration.

The old process of worse than, minus the invent part, also accomplishes the same end: "Think of something worse than a bad foot." This on a repetitive basis will turn up all sorts of horrible consequences to not having a bad foot. Of course having a victim with his face kicked in before one and the police sirens sounding is worse than having a bad foot by the pc's rationale.

Because people hold in and cripple themselves mentally and physically to keep from doing things they know are wrong, goals, more frequently than you would like to find, are in the direction of getting worse. Until you untangle this one as an auditor you may not be able to make any lasting progress with a pc.

Factually a pc in bad condition is more likely to have succumb goals than survive goals.

When handling rudiments, get the pc to set a goal, any goal or even two or three goals he really thinks he can make in the session. But if after two or three sessions it is apparent that he is not achieving his goals as set by him in the session, despite care to handle them by the auditor with processing, it should be suspected that the pc is technically an "opposite vector" case and has private goals quite the reverse to getting better. When one has uncovered this fact as the auditor, without evaluation, he had better get it uncovered to the pc.

There are no auditing failures. There are only errors in auditing. Chief amongst these errors is failure to take up and straighten out the pc's goals. That is the first amongst the rudiments and last in the end rudiments so it must be pretty important. Don't discount its value, and handle it with the attention it deserves.

Once upon a time or two I have asked some auditor auditing me what *his* goals for the session were. It produced some interesting randomness. But a pc is under no orders but the auditor's and it isn't something that is needed in the session. Also I have just up and told the pc what I would like to get done in the session and sometimes it worked and sometimes it didn't, and I found that what the pc wanted to get done and what the pc said he or she wanted to get done were more important.

Unless the pc postulates his recovery, it won't last even if you make him recover in spite of himself or herself. The way to make the pc postulate it is by handling goals as above. The pc is often very startled by what he finds out about his actual intentions.

I have stopped being startled by what pcs do. I find that when they don't recover very fast they don't want to and I start working over their goals no matter what else seems to be the matter.

The CCHs work better if rudiments are used, but sometimes that's impossible due to state of the pc. Take up goals with such a pc at the first available chance however and make your work easier.

Life is a series of attained goals. Auditing requires at least the setting of goals and their attainment.

South Africa
CenOCon

INTERROGATION

(How to read an E-Meter on a silent subject)

When the subject placed on a meter will not talk but can be made to hold the cans (or can be held while the cans are strapped to the soles or placed under the armpit, I am sorry if that sounds brutal, it isn't), it is still possible to obtain full information from the subject.

Asking questions, one expects no reply, asks for no pictures. The auditor just watches the needle for dips when questions are asked.

It is best to start with several nul questions: "Will it rain?" "Do you like bread?" etc. And then shift off to heavier leads. At any time the subject gets too agitated to read, return to asking nul questions or use the agitation as a dip.

Meter response for "No" or negative or don't know = no fall.
Meter response for "Maybe" "You're getting close" = slight fall.
Meter response for "Yes" or "Correct" = steep fall.

Sample interrogation: Subject is given cans. Nul questions are asked. Then:

"Were you persuaded to make trouble?" (fall)
"Was the person who persuaded you a native?" (fall)
"What was the person's name?" (no verbal answer, heavy fall)
"Do you know where the person who persuaded you lives?" (heavy fall)
(Name various nearby towns.)
"Does the person live in?"
Take town with heaviest fall.

Divide town named into streets, sections, sort out the exact part of the town named. Give leads on location until you know the house.

If person were educated you would use: "Considering the alphabet to divide at 0, does the person's last name start with a letter in the first half of the alphabet (pause, look at meter) or the last half of the alphabet" (pause, look at meter, compare the two readings—you may have to ask this two or three times). "All right, it was the first half. Now was it A, B, C, was it D, E, F, etc." "Now the second letter of the person's last name ... ", (repeat the same performance).

It's a good idea to mark down your findings on a blackboard where the subject can see them if he's very reluctant and can read.

A phonetic system can be worked out for subjects who are not educated. Maps of town areas are useful. With one eye on the meter you just point to areas of the map and let the meter guide you in.

When you have worked out an area or name, repeat it several times and shift it around until you get maximum drop.

A whole mine of information can be picked up from a silent person.

On reporters, looking for possible accidents is a good convincer. Tell the reporter not to speak and use over and under times “Have you ever had an accident?” “Was it more than five years ago?” “Was it less than five years ago?” Watch the needle, pin it down to maximum fall. That’s the year. Now get the month (first or last half of year, then, for first half, ask about Jan, Feb, Mar). Month found get the day. Then the hour of the day. Then the type of vehicle or accident. Then who was hurt, etc. Reporters always start talking somewhere along about this time. Don’t pay any attention. Just go on and nail it down.

In a security check, you want the person who persuaded the person you have on the cans to engage in a riot. When you locate and have brought this new person, you do the same thing. But now you have a whole committee of names to get and your subject is better educated.

Taking ten people from a strike or riot, you can find the instigator of their group. Finding the instigator and getting him on the cans you can run it back to a higher command level.

The end product is the discovery of a terrorist, usually paid, usually a criminal, often trained abroad.

Given a dozen people from any riot or strike, you can find the instigator of that group or more than one. Finding that one, you can get his boss.

Twenty or thirty paid agents provocateurs can keep a whole country in revolt. Clean them up and the riots collapse.

Thousands are trained every year in Moscow in the ungentle art of making slave states. Don’t be surprised if you wind up with a white.

Revolts kill an awful lot of natives. Only when security has been established can a reform be applied.

Use E-Meter “clean hands” to convince people that a population is loyal and that reforms are in order.

In the riots in London, anybody arrested has his fine paid for him by some mysterious group. Demonstrators are recruited. So this isn’t limited to South Africa.

Crack the agents provocateurs’ identities and you’ve cracked the new slavery of Earth—the worker’s production demanded by the state for nothing.

We have a lot of reforms ourselves but we don’t need criminal agents or dead people killed in riots to put them in effect. Don’t use guns, use E-Meters to make a country secure.

By the way, the answer to passive resistance is for the government to passive strike against any district from which it occurs. No water, lights, pay, government or service. Simply use the same tactic back. Don’t use guns, cordon the area off and shut off power and water.

THE PRESENT TIME PROBLEM

Everybody has present time problems at times. They come up unexpectedly. They happen, between intensives. They pop up between sessions. They, indeed, occur within sessions. And the auditor who neglects to handle them when they arise will get little auditing done.

It's the present time problem that sticks the graph, makes it register no change. (It's ARC breaks that drop one.)

What is a "PTP", as the auditors write it in their reports?

It is basically the inability to confront the dual terminal nature of this universe.

It is an inability to span attention and denotes that the pc who is having lots of PTPs has his attention very fixed on something.

The definition of a problem is intention v. intention or "two or more opposing and conflicting views on the same subject".

If the pc has problems with wife or husband, we can be sure that they have divergent views on some basic thing in life. Thus the auditor who has a pc who always has PTPs with one, the same, person, had better run O/W (overt-withhold) on that terminal in a specific form (George) and then responsibility on the general form (a husband). Thus a PTP is as good as an assessment. Find what terminals the pc has PTPs about and handle that terminal as above. Indeed this is more than a trick—it's a great time-saver. One can waste hours on a pc who repeatedly comes up with a PTP on the same person. But that person in the PTP is often the current clue to the case. "Grace the wife" leads to "a wife" leads to "a woman".

Present time problems are not always concerned with the world outside auditing. Auditors can be a PTP to the pc, especially when the pc has big withholds!

PROCESSES ON PTPs

Present time problem processes are many. The earliest was two-way comm. A later one was "Invent a problem of comparable magnitude to" But this one of course is a create type process and is therefore very limited.

Still another process was "Tell me your problem." "How does it seem to you now?" This almost runs the whole case.

A recent one that has workability is "What problem could you confront?" This finds out for the pc that he can't *confront* a problem at first without doing something about it. *That* isn't confronting the problem. This is an amusing, effective and educative process.

Problems tend to snap in on the pc. The mechanism here is that he cannot confront them so, of course, they snap in upon him. When he invents a few the first problem he had visibly

moves away from him. This last is now a demonstration, not a process, because of the create factor.

The fastest current process is “Tell me your problem.” “What part of that problem have you been responsible for?” This is an alternate question process. You will find the problem changes and changes. It runs the whole case.

A general process on problems, which is a very healthy process, is “What problem have you been (or might you have been) responsible for?”

The easiest process on problems to run, if slower, is “Tell me your problem.” “What part of that problem could you confront?”

CONFUSION AND THE STABLE DATUM

Problems are nasty case stickers because in a problem one has an old solution causing new problems. This is the principle of confusion and the stable datum. The confusion (two or more opposed views or actions) stays in position because it is hung on a single fixed point. If you want to see a pc go into confusion ask him what solution he could confront. (This is not a good process, it's a demonstration.)

A preclear is sometimes chary of motion in the bank. He seizes upon fixed particles to avoid moving particles. A very top scale process that does some fabulous things to a pc also illustrates this: “What motion have you been responsible for?” This truly sets a bank whizzing, particularly black cases or stuck picture cases. Running this, it is possible to discharge pc liability to problems.

THE DUAL UNIVERSE

The basic unit of this universe is *two* not one.

The less a pc can confront *two* things, the more he fixes on *one*. This is the highly individual person, also the self-auditing case.

This is probably the basic trap of a thetan. He is a single unit that has not cared to confront dual units and is therefore subject to the persistence of all dual things. As he does not seem to care as much for *two* as he does for *one* that which is not admired tends to persist and we have a persisting dual universe.

Also, when he is with somebody else, he tends to confront the other person but not to confront himself. “What about you could you confront?” is a murderous process. It is all right to run. It picks up the times when his attention was off self and yet self was creating. This is the genus of a reactive bank. It is probably what pain is.

However, a better and more spectacular process that demonstrates this and gets to the heart of problems is “What two things can you confront?” This increases ability and reduces one's liability to problems. I suppose one could go gradiently up in number and have at last a pc that could tolerate any motion or number.

It is quantity not quality which makes a bank. Thus running significances is of little worth. A thetan gets ideas of too many and too few. He cannot have, at length, anything that becomes too scarce—one of the old important rules of havingness given in *Scientology 8-8008*.

OUT OF SESSION

A pc is in session when (a) he is willing to talk to the auditor and (b) he is interested in his own case.

The primary violation of part (a) is overts and withholds—the pc is afraid to talk or talks to cover up.

The second violation (b) occurs when the pc's attention is "over there" in present time, fixed on some concern that is "right now" somewhere in the physical universe. Technically a *present time problem* is a special problem that exists in the physical universe now on which the pc has his attention fixed. This violates the "in session" rule part (b). The pc's attention is "over there" not on his case. If the auditor overlooks or doesn't run the PTP then the pc is never in session, grows agitated, ARC breaks, etc. And no gains are made because the pc is not in session. Hence the unchanged graph when the pc has a PTP that is overlooked or not properly handled.

PTPs are easy to handle. If you, the auditor, become impatient at having to "waste time" handling a PTP or if the pc considers it a waste of time to handle it, a mistake is being made. So long as a PTP falls on a meter even slightly, it had better be handled until it no longer falls when checked.

If the same type of PTP keeps coming up, use it as a case assessment and run it out-out-out as given above, using O/W and responsibility.

And if the pc *always* has problems, better note he *also* has motionless pictures, is only-one and self-audits heavily and get him used to motion and two particles as given in processes above and he'll be a better case very soon indeed.

HCO BULLETIN OF 7 APRIL 1960

Franchise Hldrs
All Staff Auditors
Note HCO Secs
send to every certified
auditor in your area.

A NEW SUMMARY OF AUDITING

(This bulletin is the first major break-through in processing in 1960. It is a new statement of processing you will appreciate.)

In ten years, the chief thing which needed improvement in the dissemination of Dianetics and Scientology was more and faster processing results.

A good result in processing depends on two things:

- (a) The workability of the technical process; and
- (b) The ability of the Auditor to apply processing to a preclear.

The bulk of my own work for ten years, then, has been on these two things.

However, you should not make a mistake in thinking that the first released processes did not work as processes. Book One Engram Running, as any old time Dianeticist can tell you, works.

Engram running from "away back" works so well that I probably would not have advanced auditing technically to any degree, if people at large had been able to apply Book One engram running as given in 1950.

Personally I have rarely failed to resolve a case and bring it to a happy conclusion solely with engram running. I would have gone on researching to resolve the mystery of life but not to improve auditing if a majority of auditors had been able to get excellent results.

Alas (or happily) there were too many cases that didn't change when audited by some auditors. And so I tied further researches on life with the development of processes most auditors could handle and with which they could obtain spectacular results rather easily. I do not say that to condemn auditors, only to show the why of further processes, the basic impulse behind the release of new processes. They make it easier to do it faster and they reach the few cases we now and then failed to reach before.

For a long, long, long time I've felt we have been there. I have wanted it to be positive enough so that all auditors could experience being there at a process level.

Training is better and easier. Theory today goes light years beyond what I would have considered as necessary years ago. Processes reach even unconscious people.

But in all this wealth of technology, we still have the problem of auditor application. Here is an example: In spring 1959, I gave the exact way to handle a co-audit group (London HPA and 6th London ACC tapes). To obtain maximum results, I had learned, the instructor was the auditor to each pc in the room. Each case was assessed by him. Each person run by him on a via of the co-audit auditor. Here and there I hear of a co-audit losing people. I hear of an instructor saying, "I only have to look in on them (the co-audit people) once in a while during an evening." And I hear of a spectacularly spectacular co-audit group, fully successful, several

clears in fact, where the only thing that was done was the *exact* duplication of the London HPA and ACC instructions!

Now do you see what I mean by processing results depending upon the auditor?

Co-auditing in groups was wrapped up, complete, in the spring of 1959. The task now is to get it adhered to so there will be more clears. A whole year later we are just starting to win on this.

The programme of research may present a myriad of new data. It has not changed certain fundamentals about auditing. It has not changed the exact way to make a clear. Let's not lose sight of these facts.

The first and foremost rule of auditing is **FIND SOMETHING THE PRECLEAR CAN DO AND PROCESS HIM TO IMPROVE THAT ABILITY.**

A lot of auditors audit quite oppositely and fail here and there and say they don't know why. The auditor finds "what is wrong" with the pc and tries to remedy it. That has *nothing* to do with the goal of auditing. That's a Q and A with the pc's bank. The pc thinks something is wrong with him and restrains himself. All you have to do to make a pc clear is to help him build his confidence back in the things about him that are right!

To clear a pc all you have to do is give him or her a series of wins he or she realizes are wins.

The 1947 scale of wins was this: Get a pc to have pictures by any device. Get the pc to erase light locks. Get the pc to be more and more able to handle gradiently heavier bits of bank. When pc was fully confident, pc was clear.

(That wasn't all, by the way, that's been overlooked in clearing. Read the Book One clear definition again.)

Of course as time has gone on we have been more and more articulate. I have found ways to say things, found ways to describe things that I thought *everybody* knew. I have erred consistently in overestimating understanding. I seek to remedy that by stating things more clearly. I feel I am winning on this.

But there are certain things I myself find very hard to understand. Among these is how I can run any engram flat in a few hours unless its overt has to be run first; and that some auditors take 50 to 75 hours to flatten an engram. How is that? Well, I'm sure I don't know unless it is as follows:

All you have to do to run an engram is first get the pc accustomed to his bank and track by various mild processes, get him under good control, contact the least incident necessary to resolve the case and flatten it. Well, that's it. To flatten an incident Dianetically, you only erase it. To flatten it Scientologically you run it until pc has it back again fully and is total cause over it (you run it after it has erased). To accomplish all this apply the rule in capitals above. *No auditing tricks are necessary* unless you have thrown the pc in over his head without a gradient approach to the bank.

Recently I had some auditors complain that they were being forced, using OT-3A to start at step one on new pcs when "auditor discretion should be used as to what step should be first taken". And what was auditor discretion? Throw the pc in over his head, I guess; new pcs deserve at least some recall process to start out.

The rule I audit by is the one in caps above. By gradients I recover for the pc confidence in handling himself. At length analytical handling replaces reactive handling.

Here are the first winning sessions on two pcs and the point of first win on each:

PC "A" 1952: No pictures. All unreal. Suicidal. Now most people would have tackled the suicidal trait or some such. This pc had had at least 200 hours on engrams. No results. I found pc had an allergy to milk.

By using "think processes" I managed to get Expanded Gita run without creating mock-ups. "Think how you could waste milk," etc.

The pc was able to drink milk after that. Big win! Pc made steady gains of like nature afterwards. The pc could drink water. That was an ability. I made the pc able to drink milk too!

PC "B" 1959: Pc never before audited and had a mysterious field. No relief or release on scouting the present life. No change. Got the pc to describe field. Found it was a window. Ran "What part of that picture could you be responsible for?" for a half an hour with pc's *only* response, "I could be responsible for looking out of this window." Then suddenly all shifted, pc got a big kinesthetic of jumping into his car and tearing off in it.

We stopped right there. Pc had a big win, felt there was a change. Felt he could be helped by auditing.

The indicated procedure after was to run responsibility on anything pc saw in the bank until he was in present time with his pictures and then, little by little accustom him to locks, secondaries and engrams, a win every time, until he was clear.

Clearing is a *qualitative* return of confidence in self *not* quantitative handling of bank. By returning confidence, one achieves clearing in a short while.

By the quantity approach one drags the hours out endlessly since there's an endless supply of engrams. The regained ability to handle *one* fully is better than ploughing through a thousand briefly.

Well some day *somebody* will hear me. And we'll have *lots* of clears.

There's also this matter of having a session going before we tackle a bank, for the pc is always tackling his bank out of session and doesn't recover, so there must be a session if he tackles his bank and *does* recover.

A session depends mostly on these conditions:

1. Pc willing to be helped by auditor (or as in an unconscious pc, unable to prevent being helped);
2. Pc under auditor's control to the extent of doing the process;
3. Pc willing to talk freely to the auditor;
4. Pc interested in own case; and
5. Auditor well-trained enough to handle a session form properly.

Then and only then can we begin the gradient approach of recovering pc's confidence in analytically handling himself and abandoning his reactive withholds and restraints and self-imposed barriers.

To accomplish 1 above, run two way help. Even an alcoholic bum, antagonistic and vicious, will come around eventually on two way help more or less two-way commed until it is running like a process.

"How could you help me?"
"How could I help you?"

Those are the magic words on the reluctant or unwilling pc. Eventually the pc becomes willing to be under the auditor's control.

To accomplish 2 above, it is sometimes necessary to run "You make that body sit in that chair" or "You make that body stand still" or both for a long time, pc doing command each time, before control exists sufficient to run S-C-S. These can be big wins for a pc.

To do 3 above, the auditor can run "Think of something you could tell me," "Think of something you might withhold from me," until the E-Meter arm dives. Pc will eventually talk if the pc was under control enough to do the process.

To accomplish 4 we have only to be lengthy in discussing the aspirations and upsets of the pc's life.

To accomplish 5 we should have started a long time ago.

To give pc Big Wins we tackle small targets. Open up the recalls with Cause ARC Straight Wire and "What would you be willing to forget?" Erase and put back a lock.

Erase and put back a moment of pain (stubbed toe, cut finger). Erase and put back a secondary. Erase and put back a minor engram. Erase and put back a rougher overt engram. Do every little job well. Handle every session well. finish what you start. If pc goes greasy on the track and skids, return to control processes via 1 to 4 above. Then win up some more wins.

Straighten up women and men and other terminals with O/Ws.

Do what you like, but keep it no heavier than pc can win with. Give him wins, not a caved-in bank.

Sometimes you have to patch up a whole case that was long ago flubbed. Go at it just as above and *then* run out the first engram that pc was ever thrown into and *then* run out that auditor.

This is the basic philosophy of auditing. The main reason any auditor has lost on a case is his misunderstanding of his approach. He knows "What's wrong" with the pc and attacks it. And the pc loses before he wins.

The only thing *wrong* with a pc is his lack of confidence in handling himself without hurting others. So he creates disabilities which automatically restrain him from making the same mistakes again. Try to relieve those disabilities without returning confidence to the pc and you are liable to lose every time.

It would help you if you made up a chart for each pc and checked it off each session.

1. Pc still willing to be helped _____
2. Pc under control and executing every command _____
3. Pc willing to talk to me _____
4. Pc interested in own case _____
5. I am following model session exactly _____
6. Pc havingness is up _____
7. Pc is having wins _____

If you check these off every time before a session, you won't miss. And you'll know what to tackle if the intensive is not going too well. The answers are *there* in those seven points, not in a startling new departure in processes!

Look, I want you to have even more wins than you are having.

I'm not really growling about it. I'll even concede I've never said it so succinctly before or lined it up so smoothly. But study it well, won't you? It contains the whole "secret" of auditing. We want more clears.

Whip me up some more won't you?

PRESESSION PROCESSES

Have you ever wondered how to persuade a stranger to get audited? Have you ever had to “sell” a hostile family member Scientology before you could audit someone? Have you ever had trouble auditing anyone?

Well, you’ll be pleased to know that these problems have been vanquished by some material I’ve developed. You see—I *do* think of you!

Pre-session processes are a new idea. They were hinted at in HCO Bulletin April 7, 1960. But there’s more to it.

A pre-session process is a process that is used to get into session:

- (a) A stranger who isn’t receiving well;
- (b) A person antagonistic to Scientology;
- (c) A person who ARC breaks easily in session;
- (d) A person who makes few gains in session;
- (e) A person who relapses after being helped;
- (f) A person who makes no gains in auditing;
- (g) A person who, having been audited, refuses further auditing;
- (h) Any person being audited as a check-off before session, aloud to pc or silently by auditor.

Pre-session processes parallel in importance the auditing of unconscious people. But I feel they have wider use and will assist dissemination enormously as well as improve graph gains.

These processes are four in number. They are designed as classes of processes to handle these four points:

- 1. Help factor
- 2. Control factor
- 3. Pc Communication factor
- 4. Interest factor.

Unless these four points are present in a session, it is improbable, in a great number of cases, that any real, lasting gain will be made. This is old data.

It is new data to consider these as *pre-session* points.

Before one has a pc in session he cannot really run a Model Session or any session at all.

The usual struggle is to start a session and then try to start a session by having the pc go into session.

This is a confusion of long standing and leads auditors to run processes like the CCHs when they could be running higher processes. The CCHs are often necessary, but not necessary on a pc who *could* be put into session easily and could then run higher level processes for faster gains.

The only thing this changes about a Model Session (HCO Bulletin February 25, 1960) is the START. If a pc is in the auditing room and auditing is to be attempted, then one starts, not Tone 40, but formal. "We are going to begin auditing now." The auditor then goes over his check list and ticks off the pre-session points 1, 2, 3, 4, and satisfied, goes into the rudiments and carries forward a Model Session. Naturally, if he wants to put the pc into session with pre-session processes, when the pc is finally in session we would startle him out with a Tone 40 "START".

A pc who is running extraordinarily well and making fast gains should be checked over silently at beginning and then given "START" Tone 40 as in the Model Session and the auditor proceeds at once to rudiments. But this would be used only after the pc was really getting along. A new pc or new to the auditor should be pre-sessioned as above for many sessions.

A pre-session type of session might find the auditor not satisfied with more than the first two of the four points by session end. If so, end the session easily with a location of pc's attention on the room and simply end it by saying so.

While many processes may be developed out of the four classes of help, control, communication and interest, it is certain that these classes will remain stable, since these four are vital to auditing itself and imply no wrongness in the pc. All other known factors of life and the mind can be handled by a session and improved. But these four—help, control, communication and interest—are vital to auditing itself and without them auditing doesn't happen.

One or more of these four items was awry in every pc who, one, did not take auditing, two, on whom gains were poor or slow, and three, who failed to complete auditing. So you see that is a number of pcs and the pre-session processes are the important remedy. Why make the same error again.

One of my jobs is to improve auditing results. This may be, as you may find, the biggest single step in that direction since Book One, since it includes them all. The auditor can *cause* help, control, communication and interest rather than hope they will come to pass. As such these four factors are practically clubs.

I would almost rather not give you some processes to fit these four conditions. I certainly desire you to be free in inspecting, understanding and employing them. What great art could arise from this innocent scientific quartet. I would rather you used them as a maestro rather than play sheet music.

How adroit, how clever, how subtle we could become with them!

Example of what I mean:

Grouchy car salesman. Knows that anything Scientologist friend Bill takes up is "rot". Hates people.

Scientologist approaches. Gets a scoff at Bill's enthusiasms.

Scientologist handles help. "Don't you think people can be helped?" Lazy argument, all very casual. Car salesman finally wins by losing utterly. He concedes something or someone could help him.

Another day. Scientologist approaches. Asks car salesman to move here and there, do this and that, all by pretending interest in cars. Really it's 8-C. All casual. Salesman wins again by losing.

Another day. Scientologist gets on subject of communication with car salesman. Finally salesman concedes he doesn't mind telling Scientologist about his shady deals. Does. Salesman wins and so does Scientologist.

Another day. Scientologist gets car salesman to see pictures or blackness by any smooth conversation. Salesman becomes interested in getting his flat feet fixed up.

Negative result: One scoffer less Positive result: One new pc.

Any way you handle them the Deadly Quartet *must* be present before auditing, or even interest in Scientology, can exist.

Talk about John Wellington Wells. The Scientologist can weave even greater magical spells with help, control, communication and interest.

Talk to a new club. What about? Help, of course. Get them to agree they could be helped or could help.

And when they ask you to come back talk about good and bad control. And when they want you again, it's communication you stress.

And interest of course, when you give *that* talk, will find you ready people.

In Scientology everybody wins. It's the only game in which everyone does. With these four factors you can't lose and neither can they.

As a Scientologist you know several processes under each heading. It's establishing each point in turn that's important.

Ah, what a shock you'll get on some pc when you find he wasn't ever interested in his own case. He was getting audited for his wife! You'll only find that out if you get the three forerunners flat first.

PROCESSES

On processes, under help you have two-way comm about help, two-way help, help in brackets, dichotomies of can-help can't-help, rising scale on help; lots of forms.

On control you have two-way comm, TR 5 (You make that body sit in that chair), CCH 2, old-time 8-C, object S-C-S, S-C-S, etc, etc.

On communication you have two-way comm, "Recall a time you communicated," etc, but much more basically, two-way comm to get off overts, O/W on the auditor, "Think of something you have done to somebody" "Think of something you have withheld from somebody" with occasional, "Anything you would like to tell me?" when meter acts up. Nothing helps communication like getting off fundamental overts that would keep pc out of session or ARC with auditor. That's the point of this step, whether done casually in a drawing room or in an auditing room. "Surely, Mrs. Screamstack, you can't sit there and tell me that, unlike the rest of the human race, you have never done a single wrong thing in your whole life!" Well, that's one way to knock apart a case at a formal dinner party.

Interest is the place where your knowledge of the mind comes into heavy play. But note that this is Number Four. How often have we used it for Number One and flopped ! That was because the correct One was missing, to say nothing of Two and Three! I can see you now trying to interest a family member with Four without teaching on the first three. Why, I've done it myself! Just like you.

I audited an official of a government after a dinner party for two hopeless hours one night. He knew he'd been run over. But he surely was no sparkling result. I shamefully and vividly recall now that, not touched by me, his idea of help was to kill off the whole human race!

The first steps of OT-3A will gain interest from almost anyone. Even the Black Fives will get confounded when they find what state their recalls are in.

AND THEN?

And then follow a gradient scale of gain. Find something the pc can do and improve it.

When the four points, the Deadly Quartet, are covered, we have the rudiments and they must cover facts, not glibity.

After the four points you improve the case by gradient scales.

And you keep the four points established.

SUMMARY

If it takes you a hundred hours to establish the four points of sessioning, you'll still win faster because you will win.

If it takes only two hours the first time you do them on a pc, feel lucky.

Be thorough.

Establish the four points. Use a Model Session. Follow a course in processing of finding something the pc knows he can do and improve that ability.

And you'll have clears.

And if your use of the Deadly Quartet becomes as adroit and smooth as I think it will, we will have this planet licked and be scouting the stars before we're too much older.

At last, we've created the basic weapon in Scientology dissemination and processing that makes us a lot more effective on Earth than a lot of drooling politicians scrubbing their hands around an atomic warhead. By golly, they better watch out now.

But don't tell them. Just run (1) Help, (2) Control, (3) Communication and (4) Interest.

Now go tackle somebody who wouldn't buy Scientology—use the Deadly Quartet. And win!

HCO BULLETIN OF 24 APRIL 1960

U.S. Fran Hldrs

CONCERNING THE CAMPAIGN FOR PRESIDENCY

A person named Richard M. Nixon will enter his name this Fall at a convention as a citizen aspiring to the Presidency of the United States. Many Scientologists think he is all right because I once quoted him. This is very far from the facts and I hasten to give you the real story why Richard M. Nixon must be prevented at all costs from becoming president.

Two years ago in Washington this man's name appeared in a newspaper article as uttering an opinion about psychology. I called attention to this opinion as a matter of banal interest in an article.

Shortly two members of the United States Secret Service, stating they had been sent directly by Nixon, entered the establishment of the Founding Church of Washington, D.C., armed with pistols, but without warrant or formal complaint, and with foul and abusive language threatened the girls on duty there.

Hulking over desks, shouting violently, they stated that they daily had to make such calls on "lots of people" to prevent Nixon's name from being used in ways Nixon disliked.

These two men stated they were part of Nixon's office and were acting on his express orders. They said that Nixon believed in nothing the Founding Church or Scientology stood for.

Their conduct before the ladies present was so intolerable that Mary Sue, having heard the shouting and curses from her office, had to come and force these men to leave, which they finally did, but only after she threatened to call the police.

As Scientologists were present, much information was obtained, of course, from these agents as to their routine activities. These were not creditable. Nixon constantly used the service against the voteless and helpless people of Washington to suppress the use of his name.

I am informing you of an exact event. It convinced me that in my opinion Nixon is not fitted to be a president. I do not believe any public figure has a right to suppress the use of his name in articles. I do not believe a public figure should enforce his will on writers or organizations by use of the Secret Service. I believe a democracy ceases to exist when deprived of freedom of speech. I do not believe any man closely connected with psychiatry should hold a high public office since psychiatry has lent its violence to political purposes.

Would you please write your papers and tell your friends that Nixon did this and that his actions against private people in Washington cause us to defy his cravings to be president.

It's my hope you'll vote and make your friends vote. But please don't vote for Nixon. Even his own Secret Service agents assure us he stands for nothing we do.

I do not tell you this because Mary Sue came close to serious injury at Nixon's hands. I tell you this because I think psychiatry and all Fascist-Commie forces have had their day.

We want clean hands in public office in the United States. Let's begin by doggedly denying Nixon the presidency no matter what his Secret Service tries to do to us *now* in

Washington. It is better, far better, for us to run the risk of saying this now, while there's still a chance, than to fail to tell you of it for fear of reprisals and then be wiped out without defence by the Secret Service or other agency if Nixon became president. He hates us and has used what police force was available to him to say so. So please get busy on it. I am only telling a few friends.

BOOKS ARE DISSEMINATION

One of the oldest Organizational Health Charts states "...given books in distribution, the remainder of these facts are true. . .".

No matter what you do with an organization, no matter how much writing of letters you do, the dissemination success of a group will not accomplish any security unless books are distributed.

Seeing to it that the newly interested person is provided with the proper reading materials is a far more important step than most HCO Secs and PE directors have realized, but these are not the worst offenders. The field auditor, attempting to run a group and keep afloat, fails most often, when he does fail, in the Book Department.

Making sure that interested people get books is making sure that they will continue their interest.

Assuring then they will read and understand the books, it is necessary to get them into an extension course.

If you think you can interest a person in Scientology and yet avoid your responsibility in getting him or her to read books on the subject, you are wasting a tremendous amount of effort.

Do you know why the first book DIANETICS: THE MODERN SCIENCE OF MENTAL HEALTH was written? Word of mouth on Dianetics was going forward so rapidly that my letter volume, even before the first book, was startling. Each one of these people expected me, either to write them a long letter and tell them what it was all about, or to be given a chance to come and see me so that I could tell them personally what it was all about. In other words, my time was going to be consumed, not in further research, but in writing letters and talking to people. My answer to this was to write DIANETICS: THE MODERN SCIENCE OF MENTAL HEALTH which rapidly informed the newly interested person what this new science was all about.

I will make you a wager. I think you are wasting most of your time answering questions which are answered in books. I think you are talking yourself hoarse to friends, and other people, and groups, explaining over and over and over things that are already taken up in books. I think your time is being devoured by attempts to reach through the natural conversational barriers of people.

You are not giving, I am sure, the newly interested person an opportunity to go and sit down quietly by himself, without any social strain, and study a book on the subject. Only in this way will he come to a decision about the subject which is his own independent decision having inspected the materials. This has to be done quietly and it is best done through the pages of a book.

Without any reservations, I can tell you that DIANETICS: THE MODERN SCIENCE OF MENTAL HEALTH, based as it is upon mental image pictures and energy masses, those things which are most real to people, is the best forward vanguard in our possession. It was

written at a time when I was very interested in bridging the gap between an uninformed public and an informed public, and contains in it most of the arguments necessary to quiet the suspicions of the newly interested person and contains as well most of the answers to that person's questions.

DIANETICS: THE MODERN SCIENCE OF MENTAL HEALTH contains today a perfectly workable therapy. But more importantly it contains a bridge between the uninformed and the informed public on the subject of Scientology.

If you are not furiously pushing DIANETICS: THE MODERN SCIENCE OF MENTAL HEALTH and if you are not insisting that each newly interested person read it as something new, startling and strange in the world, you will be wasting most of your dissemination efforts.

Oddly enough, this book, to this day, sells more copies around the world than the average best seller in any given year. Where it has been pushed, Scientology is booming. Where it has not been pushed, Scientology is limp.

Just inspect the number of simple, startling items in DIANETICS: THE MODERN SCIENCE OF MENTAL HEALTH. Here you find the Dynamics, here you find several of the earliest Axioms, here you even find the rudimentary ARC tone scale. You find as well a thoroughly accurate description of clears and the reactive mind.

Do you realize that the world does not yet know anything about the reactive mind? Here is the total answer to Freud's subconscious. Here is the resolution of most of the problems of psychotherapy.

You know so many things that are new and wonderful and strange that you forget that Bill and Joe and Mary have never heard of any part of them. They are not interested in past lives. They are interested in what makes them do strange and peculiar things. They have heard vaguely about the tenets of psychology. They do not know that these have all been answered in DIANETICS: THE MODERN SCIENCE OF MENTAL HEALTH.

When people are asking you questions about Dianetics and Scientology, no matter how obtuse or abstruse the questions are, your best answer to these questions was my earliest answer and that was, "Read DIANETICS: THE MODERN SCIENCE OF MENTAL HEALTH and that will answer your question".

In the last HCO Bulletin I gave you pre-session processes. This makes a complete cycle. With pre-session processes we can take a new person and by running the course of help, control, communication and interest, put him in a frame of mind to want to know more about the subject.

In this Bulletin I am trying to tell you what to do about the person once you have brought him up to this point. It is all right for you to go on and audit him but I assure you he will never get anywhere until he has read DIANETICS: THE MODERN SCIENCE OF MENTAL HEALTH. All the questions and counter arguments and upsets which are boiling through his mind now are answered in that book, bringing him up to a point where he wants auditing, where he successfully goes through PE. Give him auditing, let him co-audit, do anything you want with him, but insist, insist, insist that he reads DIANETICS: THE MODERN SCIENCE OF MENTAL HEALTH.

You would be completely amazed at the ideas some people have of Scientology even after they have gone through a PE Course and have read *Problems of Work* or some other manual pushed off on them simply because it is cheap. *Problems of Work* is all right and should be distributed but it is not informative on the subject of the human mind.

Let's get down to basics here and see what we have really done. We have made a breakthrough. The moment of the breakthrough is recorded at public level with DIANETICS: THE MODERN SCIENCE OF MENTAL HEALTH. If people do not read this book, they just will not have broken through.

Any "sales tricks" you employ after you have succeeded by use of help, control, communication and interest in arousing that interest, to get them now to inform themselves of the moment of breakthrough, will be well expended by you, otherwise these people will be talking through a fog and will experience a sensation of having been brought up to some high plateau without having climbed a cliff. It is factual that you can bring a person all the way to clear and have on your hands a mentally illiterate person. I know, because I have done just that. All the clears I made twelve to thirteen years ago evaporated into the society. I did them a great deal of good. Some of them are now occupying high positions, but none of them have ever associated me and my work in Dianetics and Scientology with what happened to them. They are, for the most part, convinced that what I did was some fabulously magical thing which was done for them only, and for them especially, something like a spiritual revival, but nothing to be understood. These people never did gain that understanding because I never explained to them what was happening. It was only after DIANETICS: THE MODERN SCIENCE OF MENTAL HEALTH was written and distributed that we began to get somewhere in the world. People we processed might have been led to worry more about their own cases than those I processed, but at the same time their worrying was at least intelligent. I can still clear people with the technologies of twelve and thirteen years ago and, indeed, have been carefully reintroducing you to these technologies. Now the time has come for us to realize that there are very close to two and a half billion people on this planet who are mentally illiterate. They do not know what makes them tick. They have no concept whatsoever of the basis of human reaction. They are intolerant. They are at war with one another. They follow strange leaders and wind up in strange places. They have no hope that anything will ever dig them out. Only a minute percentage of these people have ever been introduced to DIANETICS: THE MODERN SCIENCE OF MENTAL HEALTH.

Do not believe for a moment that just because I wrote a book on the subject cases became harder. As a matter of fact they became more co-operative. We are making a great many clears today. Hardly a week passes on my correspondence lines without clears being reported. But look at the mental illiteracy even of some auditors. Do you know that people report me clears and call them releases. These people have never studied the definition and capabilities of clear in DIANETICS: THE MODERN SCIENCE OF MENTAL HEALTH. They bring preclears up to this standard, find there is a considerable distance to go and start striking for theta-clear before they say anybody is clear. You yourself may have made a clear and classified the clear as a release just because you were not totally familiar with the conditions of clear. I still think the best statement of a clear occurred in DIANETICS: THE MODERN SCIENCE OF MENTAL HEALTH. I have had no reason to revise that statement. Pushed at, however, by many Scientologists, I have tried to find way stops between clear, as defined in DIANETICS: THE MODERN SCIENCE OF MENTAL HEALTH, and OT. There are quite a few. I almost laughed in somebody's face the other day when he said to me that a notable person on one central organization's staff was being audited by him and that he had gotten her up to a state of release "with a free needle on anything you asked her", and added that he would soon have her clear if he kept working at it. Concerning the same person, visitors at that central organization for some time have been saying, "She has a sort of feeling about her as though she might be clear". The truth of the matter is she has been clear for several months but her auditor is straining so hard, seeing as he does how far human capability can be made to reach, that it has never occurred to him that he has passed clear some time back. Any PC that has a relatively free needle has probably been cleared by the standards laid down in DIANETICS: THE MODERN SCIENCE OF MENTAL HEALTH.

Now that we can interest people, let's take the next inevitable step. Let's push this book. Let's crowd it into people's hands and demand that they buy it. Let's develop the trick, when they ask us complicated questions, of stating that they should read DIANETICS: THE MODERN SCIENCE OF MENTAL HEALTH.

After all, we have a brand new science in the world. DIANETICS: THE MODERN SCIENCE OF MENTAL HEALTH is a brand new book that describes it at public level and it is a good thing if you want to get people into a house to get them to come in the front door. The front door we have is DIANETICS: THE MODERN SCIENCE OF MENTAL HEALTH. I, personally, do not believe the book could ever be written again, since it was written at a time when I was well aware of the public arguments concerning the mind. For the indifferently literate person it forms the necessary bridge from knowing nothing to knowing something. It is an exciting book. Push it. Get your people to read it. Now let's get going.

If you cause cards to be printed concerning the whereabouts of PE Courses, always add to them:

“To know more about this subject read DIANETICS: THE MODERN SCIENCE OF MENTAL HEALTH, available at (give the place). The greatest scientific development in this century has happened.”

To all Central Orgs. Push this book with every possible display and mention. Where you find people have not bought it in your Central Files, you'll find interest has been lagging. Play down all other PE books, display DIANETICS: THE MODERN SCIENCE OF MENTAL HEALTH as *the* book they must now buy. Tell them so during the breaks. “DIANETICS: THE MODERN SCIENCE OF MENTAL HEALTH answers your questions.”

Unlimited stocks are available at HCO WW and even more are already printed and being bound now in New Zealand for N.Z., Australian and South African shipment. Order all Southern Hemisphere stock of DIANETICS: THE MODERN SCIENCE OF MENTAL HEALTH through HCO WW.

We've lost the people in a maze of many titles. Take down all your many book displays. Concentrate on *one*, DIANETICS: THE MODERN SCIENCE OF MENTAL HEALTH.

I am asking Australia for instance to have a huge wooden book, DIANETICS: THE MODERN SCIENCE OF MENTAL HEALTH, erected on their marquee and spotlighted.

We can absorb the world's confusion on *one* stable datum. Let's do it.

HCO BULLETIN OF 29 APRIL AD10

Auditors of South Africa

THE SCIENTIFIC TREATMENT OF THE INSANE

The insanity rate per capita in South Africa is appalling. Through the papers and reports of Peggy Conway and other sources, it is easily seen that a primary requisite in any programme of the rehabilitation of the Bantu in South Africa would be mental health.

Any race which lives in poverty is already overwhelmed by bad food and disease without adding insanity amongst its familial units.

For instance, a white family in the United States which has amongst its number one insane person is crippled economically through concern and confusion. In a family already burdened by the environment, one insane or even neurotic person could become the back-breaking straw.

However, my records show (and will have to do until I can make a closer survey myself) that the number of insane and neurotic persons runs much higher than amongst comparable populations. The subject has not been studied well probably because “native customs” or “tribal characteristics” are too often advanced as an explanation of irrational conduct. True, there are native customs and tribal characteristics but it would take a Scientologist to separate out the ethnic factors and understand the remainder as neurosis and psychosis.

Malnutrition and anxiety in any person, as we well know, can produce all the symptoms of insanity.

Having studied twelve separate primitive peoples in far flung parts of Earth in this life, it has become obvious that when a state of primitiveness is veneered by white customs the incidence of insanity rises amongst the primitives. For example, the American Indian, when he lost his tribal lands and hunting diet, turned to alcoholism and other degraded forms of insanity. The whites then adjudicated these as characteristics of the Indian rather than insanity.

Any race which is seeking survival under adjusted conditions experiences a high incidence of mental illness.

The keynote of insanity is destructive efforts on various dynamics.

It is doubtful if anyone has realized the part insanity has played in various disturbances, nor how it has prevented the bettering of various conditions in the world.

Mental Health, a *real* programme of mental health, is vital to the public peace and public safety.

Here we have a hardworking man, trying to adjust, trying to hold his head up. At home he has a wife too neurotic to help, a teenage son that has gone the route of criminal insanity, a father who has taken to drink, all of them hanging upon his work and pay. It's rough trying to remain steady, hardworking and sane under such conditions. The temptation to quit is strong. Before a populace can be a credit it must have some hope it can live through it—and insanity is the biggest threat to that hope.

Yet insanity in any population is not limited to the poor. Indeed, the incidence of insanity in the United States is as high in the very rich as it is amongst the very poor.

Real mental health, which the Scientologist can accomplish as the practitioner of the only validated psychotherapy in the world today, would reduce the statistics.

South Africa lately suffered from insane have-nots and even worse at the hands of an insane “have”.

Insanity is a problem that is both legal and scientific. A criminal is in fact insane. A terrorist is insane. People can be policed only so far. The insane, as we know so well on a scientific level, are so far from being policed that they cannot follow the simplest order.

Insanity is neither hard to understand or treat. But only Scientology could say this.

Insanity divides into eight general types. These are easily plotted, they are irrationally destructive or succumb impulses on each dynamic. Assign the tone scale to each type and you have all the insanities there are.

The cure of insanity is accomplished in its deeper stages by very light and careful handling. A person has to be brought up to the level of being processed. The first step is rest. The second step is mild exercise. The third step is group processing. Above this level processing is possible. The cost of treatment is not high if undertaken sensibly. But 19th Century practitioners who knew little about it got on a compulsive “do” and, failing with milder methods, resorted to brutality. Fortunately, such practices are now fading out under our influence. Rest camps and hospitals would do more for insanity than all the violence in the world. But only a Scientologist would be wise enough to refuse to Q and A with the violence of insanity by using violence to “cure” it.

Scientology could handle the problem of insanity in South Africa. Only when insanity has been handled could there be broad guarantees of a calm future. What is a riot but a third dynamic insanity?

The tremendous work done by Peggy Conway, bless her, in her surveys and contacts now comes to great use.

Without in any way transgressing, we have already formed a programme on this.

We must legally establish ourselves, support the government in its desire to handle this problem, and coordinate our efforts.

The government and the population need our help. And if we help we will bring order in our sphere of activity. We will be wearing our own hats.

I am in deadly earnest about our role in public peace. It is not political but technical and as such we have no peers.

All we need to work on at the moment is getting people convinced of the truth that we *can* help the situation and that only we can help in this sphere.

So here we go. Are you with me?

HELP

We have known for some time the importance of the button *Help*. It is first and foremost amongst the key buttons of Scientology. Thoroughly clearing Help alone, and on back track terminals, has made clears.

In an essay published on the otherwise unpublished Students' Manual, I stressed the fact that unless the preclear and the auditor had Help straightened out they were not not likely to make very much progress. Help is the key button which admits auditing. The remaining buttons of Control, Communication and Interest, give us a session. But ill we cannot even start pre-sessioning with any other button than Help.

Since the winter of 1957/58 when this was used in an American ACC I have been working with this trying to get a better understanding of it for you.

It now appears that Help is the make-break point between sanity and insanity. That a person cannot accept help along some minor line does not mean that he is insane, but it certainly means he has some neurotic traits.

The inference level of this condition of aberration on the subject of Help would be a fear of dependency. This means that Help has already gone wrong with the person. We see in children occasionally an enormous striving to be self-reliant. We ordinarily applaud this but if we inspect the child carefully we will find that resistance to being helped goes along with an obsession to help. Parents themselves, disbelieving that the child can help them, usually inhibit the child's help and thus worsen the condition. I have seen one child go downhill to "normal" by reason of a thwarting of help by the parents. But no matter how fondly the psychologist used to believe in the nineteenth century that childhood was a good pattern to use for estimating future social conduct, we in Scientology know that the child has already become aberrated on the subject before it is manifested in this light.

My examinations have now led me to the conclusion that a person has a make-break point of sanity on any given subject. This point is help. On the tone scale it would compare at 2.0 for any dynamic. The whole index of a personality could be adjudicated by an examination of the person's reactions to various types of help. Above this point a person can help, and can be helped, providing, of course, the help is sincere, and really is help. Below this point help becomes betrayal.

Help is always betrayal to a thoroughly aberrated person. This explains a great deal to us when we understand it. The first example that comes readily to notice is the reaction of a very low scale pc undergoing auditing. He invariably thinks, and may even sometimes tell the auditor, that the auditor has not helped him but betrayed him.

All auditing protests except those against flagrant breaches of code denote a breakdown of the help button in the auditing session. While it does no good to run Help on a preclear and continue while running it to repeat flagrant code breaks, it does do a great deal of good to clarify the whole subject of help if a session seems to be full of ARC breaks, no matter what the auditor tries to do to patch them up.

It is unfortunately true that help can be as wrong with the auditor as it can be with the preclear where we have uncleared people doing auditing. However, it has been my experience that even while some of their efforts were completely knuckleheaded, practically no auditors exist who are not sincerely trying to help the preclear. The trouble comes about when the preclear clips the effort of the auditor into the category of betrayal. This makes the auditor react against the preclear, and the situation deteriorates.

We have, in the immediate past of this civilization, the deterioration of several of the practices which began as a sincere effort to help and which are not now classifiable as anything better than betrayal. Psychiatry and medicine are both good examples of this. The person who goes to a psychiatrist usually finds himself betrayed. He does not receive help, he receives brutality in the form of electric shocks, brain surgery and other degrading experiences. Even in the highest form of psychiatry it was common advice for the psychiatrist to tell the wife that the best cure for her troubles was to betray her husband, and vice versa.

The psychiatrist was caught in this help-betrayal deterioration. Psychiatry had so long attempted to help the insane without success that at last they began to Q and A with their patients. Of course, to an insane patient help is always betrayal. Medicine is now going a similar course unwittingly, and has lost most of its public repute through not having stayed on a research line that would bring medicine upscale, but continued with a line of application which considered man a body and would not consider him anything else. Considering a person to be a "hunk of meat" is a sort of a betrayal in itself. Naturally one betrays a thetan when he regards the thetan as a piece of meat.

World War Two pretty well saw the end of the last dregs of sincere help in psychiatry, most governments involved in the war employed psychiatry, it now turns out, for political purposes. They were set a very good example by one, Hitler. Thus the last embers of sincere help in psychiatry were more or less extinguished. Nothing like this would happen in Scientology because we are dealing with basic truths rather than basic ambitions. Where ambition becomes greater than truth any sphere of activity goes to pieces. Indeed, in the final analysis that is the fundamental deterioration of the track.

Another excellent example is found in the Mau-Mau uprising in Kenya. The terrorists killed only twenty whites as compared to thousands of natives, but the whites they chose to kill were only those who had sought to help them. The Kikuyu was evidently completely certain that anyone seeking to help him was only betraying him. Their reaction, then, in killing their best friends becomes more understandable. The action remains insane, but in their frame of reference it was entirely comprehensible. Any time we go about the task of handling large bodies of insane people or illiterate and fearful native populaces, we would do well to keep in mind the importance of this help button, realizing that to these help is totally betrayal. The thing to betray is this help-betrayal identification, not the people.

If you sort this out and find your own examples and see whether or not it holds true for you, I think you have a small gasp of relief coming to you. No Scientologist has been without a preclear who has not become absolutely certain somewhere in the course of auditing that the entire goal of the auditor was to betray. This left one hanging with an unsolved riddle. Our own sincerity was beyond question. How to be misinterpreted this wildly was so incomprehensible that we often assigned the reasons to ourselves. Perhaps some of these reasons did lie with ourselves. Nevertheless, in the final analysis the only thing we did wrong was not to clear the Help button with the preclear.

CLEARING HELP

There are many ways to clear the Help button. As this is the first step on pre-sessioning, it may be that the button has to be cleared several times in the course of auditing.

The first thing to do is to put the preclear on a meter. If you don't have a good meter, and you don't know what a meter does, order one fast and get instruction. Discuss help with the

preclear, and note the needle reactions. If the needle tended to stiffen and stick on any discussion of help, then you have your work set out for you. If the needle remains free and continues to be free on the subject of help, no matter what you run or how you discuss it, of course the button remains free.

It is important that any attack you make upon this button be continued as a pre-session activity for auditing period after auditing period, if necessary, until the meter needle is free on this subject. There is no need to go on, in fact there is no point in going on, if the preclear thinks that you are going to betray. Somewhere this will manifest itself as ARC breaks, the whole auditing programme will go to pieces, and you will wind up without a preclear, as well as an unfinished cycle of action. So pay attention to what I tell you here, where auditing is concerned: work with help and nothing but help until the needle is free on the subject.

What processes should you run? The first process, of course, is ordinary two-way comm. One discusses the preclear helping others and others helping the preclear. One gets the preclear's views on the subject of help, and without evaluating for the preclear, lets the preclear express these views.

The next process is Help on a two-way bracket. This is, "How could you help me?", alternated with "How could I help you?" Do not expect this to do very much to the tone arm, because it won't. A two-way flow of this character is not a reliable way to bring a tone arm down. But it does do something, and does tend to free up the needle on this particular subject.

The old five-way bracket on help can then be employed: "How could you help another person?" "How could another person help another person?" "How could another person help you?" "How could you help me?" "How could I help you?"

This is a rough bracket but it is useful and should not be dropped out of the repertoire.

Is there any process which would clear up the help button thoroughly and totally?

Naturally, since it moved forward again into such importance, I have been doing work on it and have developed up to a stage of conditional application (which means, I leave myself free to change my mind when broad experience has been gained) a new way of loosening up any solution. I have been applying this to the central buttons in Scientology and have found it working. The general formula is to take the button one wants to clear and ask the pc what problem a certain solution could be to him.

Applying this to help, one would repetitively ask the pc, "What problem could help be to you?"

I first used this on the button responsibility with very good results, since I found that responsibility is very aberrated in its reactive definitions and, because one is often being a valence, is run irresponsibly. This version of running responsibility to a flat point seems to be quite workable.

If the preclear is inventing answers rather than picking them up off the track, you might do better to ask him the following version, "What problem has help been to you?" If invention was present one always has the remedy, in spite of the fact that no terminal is apparently present, of running, "What help could you confront?" "What help would you rather not confront?" I don't know how far this would go as I have not tested it over a long period, but at least in its first stages it works. Responsibility, oddly enough, can be run on a no-mass terminal or significance. I have not had much chance to test out confront, but on the theory that anything you could run responsibility on you could also run confront on, I would say at first glance this is probably a workable process. I will know more about it soon and I would appreciate your telling me anything you have on it.

You have, therefore, several processes by which help can be flattened. Unfortunately, none of these processes reach an unconscious or insane person. Of course, when I say unconscious, I mean somebody with his eyes shut, and when I say insane, I mean somebody who is institutionalized, and should be. In the matter of the unconscious person, you have the CCHs and you also have them with the insane person to some extent. However, the best thing for an insane person is not processing, but rest, and when the person has had considerable rest, still processing is not yet the answer, exercise is. And when the person has had some exercise over a long period of time, you will find that group processing with other insane persons is still better than individual auditing. Only at this time is it possible to do very much for the insane. The first reason, of course, that one takes this approach is the auditor. Why attack large numbers of insane cases with individual auditing when other methods are far more economical and efficacious, so long as those other methods are only rest, exercise, group processing, hobby work, and such. Efforts to reach the insane with help, of course, simply restimulate the insane idea that help is betrayal. This is why psychiatry resorted to such savage and bestial "treatments" as shock and surgery. They were up against people who apparently would not be helped. Thus psychiatry went into total effect. This is why psychiatry failed, and is in a failed state today and has lost all of its public repute.

People have been betrayed so often on the whole track that it is no wonder they get help mixed up with betrayal, but help became betrayal only at those periods of the track where the dwindling spiral had been reached for any civilization. Even the upstanding Roman by the third century A.D. was happily using the political mechanism of inviting all the Germanic chiefs, that would accept, to feasts and then poisoning them, after vast assurances that Rome was about to help the chief's country. A deterioration of help can occur on any dynamic and in any area, but, as I said above, it occurs at the make-break point of sanity-insanity.

One word on all this. The preclear may be sane analytically and still react violently at times in session. Remember that he is reacting in session because he has been thrown into the area of his reactive mind. In reactive zones and areas help is almost always betrayal. Thus when running a rough engram do not be amazed to find the pc (whom you have carefully cleared on the subject of help) getting rabid about betrayal. He is in the middle of an engram and, of course, the hard core of any engram is betrayal. Don't break off and start running help on him, just run him on through the engram. He will come out of it all right, if you do your job. Help should be handled as a pre-session process and should be handled well and thoroughly and if in any series of sessions the preclear's idea of help apparently deteriorates, you have gotten him into a series of incidents where help is betrayal and he should be cleared once more as a pre-session activity in some later session on the subject of help.

There are many possible processes, there are many possible approaches. As a Scientologist, understanding this, you should not permit yourself too far into the frame of mind of believing a pc is evil or cannot be helped, simply because he apparently will not be helped. All pcs can be helped. Most pcs have aberrated ideas on the subject. It's up to you to take hold of these as a first order of business and clean them up, at least until the meter needle is free on the subject, no matter how many hours that takes.

All HGC Auditors

OUR TECHNICAL PROGRAMME

(This applies to all HCO and Central Org Staffs everywhere)

As the data has come in and I have had a chance to view what has been happening, I would say that many riddles are answered and that we are now embarked upon broad HGC pc and Central Org staff clearing programmes. I will be talking more about this and you will see the pattern shaping so here is a forecast of it.

From October to March I stressed security on Central Org staffs and heavy withholds on HGC pcs as the important point. Now we have broad experience with this. We will continue to use it and not forget what we know about O/Ws and we will continue to teach it.

Don't let a bad security risk *near* a staff position ever whether you know the overt or not. It's enough if the needle falls badly on key questions. That's it. The person is not put on any post until audited. (Don't retain on post while auditing for you'll get Dev-T and other evils.) On an HGC pc a bad O/W picture must be cleaned up before you can get too far as the first thing to do. Not even Help bites on a non-confessed criminal. Such persons *know* their own overt. We're kidding ourselves if we think they don't. So shake the pc down when you see a wild tone arm. Getting the O/Ws confessed is all you do; the tone arm may not change much. But the pc will stop dodging it all and you can begin "Help", for responsibility is too steep at this stage and the pc too far down for real high auditing.

In other words there's a pre-session stage for all staff members and a wild tone arm HGC pc. It's not auditing, really. It's a confessional. Cure the analytical "I'm afraid he'll find out" the pc is holding to. Don't run anything on it as though it were a real session. Just shake the info out by any means or process. That's enough.

Now we begin on Help. Two way help is probably the hottest PE process there is. You can shift to that in PE. But remember to get the PE Co-audit team to a more general form of help within a couple of weeks. The five way bracket would be good enough for PE (complicated enough).

For the staff member we go from getting off a few of the hotter O/Ws to help. And we run help flat-flat-flat. Any version, type or kind. We run help until the pc can be asked "How could you help your worst enemy?" without registering the tiniest change on a needle. All we run is help, any version for hours and hours. We take up terminals. We take up dynamic assessment. But we only run help on anything we find. We flatten help until you couldn't get its width with a micro electronic caliper. *Nothing* else. And you'll hear me on this for months to come.

The same applies to the HGC pc. Once the worst O/Ws are confessed we run help in suitable versions. And we run it for weeks if need be until we get a needle flat, free, utterly calm on *any* help question. (Of course if the pc can't talk sensibly at all, we use the CCHs.)

Remember, Help was the primary reason for the clears in 1957-58.

Remember, at 2.0 there is the make-break point. Help is betrayal. How to help? Betray! What is help? A way to do you in! So we audit pcs up to 2.0 with other processes, they blow,

they don't come back. "The auditoryak yak yak." So why run any other process? If you do you'll evidently lose the pc in lots and lots of cases.

Flatten help until the pc *can* be helped and *can help* without *any* qualms.

You've learned a lot about help. Apply it.

Now when we have help flat we'll go to other things. We'll follow up the scales of processes like this:

For a staff member in an HCO or Central Org:

- O/Ws confessed only
- (don't employ a wild tone arm)
- Help flattened
- Control flattened
- Communication flattened
- Communication re-established thoroughly
- (by O/W and responsibility)
- Havingness completely rehabilitated.

For an HGC pc:

- O/Ws confessed
- Help flattened
- Control flattened
- Communication re-established thoroughly (O/Ws and resp)
- Locks, secondaries, etc as per the "light touch" bulletin.

If you have to use CCHs you probably are auditing somebody who shouldn't be in an HGC.

On an HGC pc havingness can be run on any pre-session type session. End it up each day with an hour of "Look around here and find something you can have" and have a comfortable pc. But in using havingness while pre-sessioning before control is flat to a free needle remember to make sure pc has done each command before you give the next.

On the field auditors and anybody who has been trained we ought to carry on a programme like:

- Get O/Ws confessed
- Get help flat-flat-flat
- Make sure they get the highest cert they trained for
- Get them in for modern training
- Get them validated for 1960
- Get them audited the rest of the way.

If we attack the field in that order, flattening ourselves, each step we take with them, and taking this step by step with each new Academy trainee, we'll be clearing the field.

Ah, so you penetrate what I'm trying to do! Yes you're right. I've stayed on post and not gone off hunting lions and have re-researched ten years of work and successes and have plotted out the broadest clearing programme I could practically apply. I am clearing every staff member in Central Orgs and HCOs on a timed programme of a few months for each step as given above. You've had the first step, confessed O/Ws. It worked well. By the way, income came way up and flubs went way down. From an October of strewn wreckage we have moved to a May that sees us in pretty wonderful shape organizationally. Income is moving up everywhere.

Comm lines are better. Staffs are happier. What did it? The first step for staff members—O/Ws confessed and their use in establishing security.

In my programme, just to make sure we thoroughly win, I've calculated how long it takes to move a new concept in. It's about 5 months. O/Ws info is now grass common. Almost everybody on staffs is aware of meter action and potential. We won't forget or lose it. All right. We conclude this stage for staffs as of now and move into help. You're going to get help for months! Run it, PE it. Co-Audit it. HGC it. Staff clear on it.

Any one of you can grasp all this in minutes. But as a group we have to experience it, learn about it, know it, use it. So it's months now coming on Help. After that we'll move on up.

This is a long-range clearing effort. I want to see nothing but clear staff members the world around. And we'll do it. In just twenty months from now it will be done. That's the timetable. We're five months on our way. Like it?

Now when I'm stressing this on staff members and HGCs are hitting it hard (HGC will continue to run the scale for HGC as given here on each pc), you are going to hit the field auditors and the public with the subject in vogue. Thus you'll be stressing help now until five months are up to all the people you reach. Of course even after that you'll stress it, but for five months we're monomaniac on it. Dig up the help essays in lectures and Abilities. Use them in mags and letters. Get familiar with handling help, talking to people about help, handling help in all its phases. You get clever on the subject. That's all part of it, you'll see another resurgence in Central Orgs and the field just by flattening this one for five months. O/W doubled our success. See what help does now.

What formidable people we'd be if we had all five steps flat! We're already the most effective group on Earth. Let's upgrade our own group ability.

So that's the programme. A staff member is lucky to be aboard just now. Has been lucky especially since Autumn 1959. That was when the bell went. And do not send to find for whom the bell tolls. It tolls for an aberrated Earth.

I audit you. You audit the field and Scientologists, they audit Earth. Is it a bargain?

So get hot on the staff co-audit programme. Get hot on the PE with help. Grind help to pieces on the HGC. Picasso had his blue period. This is the help period.

So let's get clear!

HELP PROCESSING

At last we've found the button almost any case and all the world can run.

Help may not be everything that is wrong with the world but it is the only common denominator the world can understand.

I have known about *help* for some years and in 1957, autumn, used it, with fateful Step 6, in clearing people. The first clears made easily by others were done with meter assessments and five-way help brackets on terminals.

It was found that Step 6, being a creative process, was bad on some cases. The clearing formula was help and Step 6. We tended to abandon both when Step 6 became an overt. It blew us off.

The next big technical development was O/W. Overt-withhold, of course, is as old as 1954 (Phoenix) when reach-withdraw was introduced. But the full knowledge of what overt-withhold meant to cases was not released until November, 1959. Here came much new technical data, all of it vital to clearing. A person with large withholds from the auditor will not go into session. This is true, valid and useful. We could not clear many people even now without it. Further, we find all losses in Scientology personnel in Central Orgs and the field stem from O/W.

In researching O/W, as early as December, 1958 (Washington, D.C.), it was found and proven conclusively that it was what the person himself did to others that was aberrative, *not* what was done *to* him. The test of this can be made easily. *Given*: an ARC break between auditor and pc who have known each other some time. Note the position of the meter tone arm. Run "What have you done to me?" "What have I done to you?" Observe that after some small variation the limited value of this two-way flow (which assumes the auditor's bad action was half what was wrong with the pc) shows up in a stuck tone arm. This two-way process is too limited to alter the tone arm after a few minutes. A lie has been introduced. This lie sticks the tone arm. Now shift to "What have you done to me?" "What have you withheld from me?" And watch the tone arm free up and eventually go toward clear reading. In other words, the situation freed wholly only when we assumed that only what the pc had done had any aberrative value.

This and other vital material learned between 1957 autumn and now was the technology necessary to do full clearing on everyone except the wholly psychotic and unconscious people (where we have the CCHs).

Everything learned about O/W is still necessary to clearing. *But* everything that applied in O/W *also* applies to *running help*.

It's marvellous that a five-way bracket on help cleared people. It did clear some. But where it failed it ran into the rule that it's only what the pc does that is aberrative, what is done to him is not. Thus, what *help* the pc has given and what *help* he has denied or failed to give are aberrative. What help the pc received, in the long run is not (no matter how the psychologists cut it).

There are probably thousands of ways *help* could be run. You can think of dozens. All of them would be effective in greater or lesser degree. Just add help into any process form we know. But the one general process on help that would rank high would be “What have you helped?” “What have you not helped?” alternated.

This is not a dichotomy. This is the best way I know of to run the sense of what help one has given plus what help one has withheld. This is the O/W version and we will call it “Help O/W” to keep ourselves oriented and not introduce too many new terms. I find “failure to help” instantly upsets “What help have you given?” “What help have you withheld?” This version does *not* run. The correct sense wording is “What help have you given?” “What help have you not given?” This lets the pc as-is his failures to help as well as his denials of help.

This is only the general form. Think how much more we know about O/W. Apply it to help.

Two-way help would have use. But would be limited. Use it. Know it’s limited.

Five-way bracket help would have use. But would be limited. Use it. Know it’s limited.

This pair has enough power to gain more constant attendance in a PE Co-audit than we have had. So use them in PE Co-audit. Two-way help has just moved a PE Co-audit case that has been in co-audit for one year without moving on any other process.

Two-way comm on help has value. It’s the pre-session version. No matter who is helping who, a discussion of it can get the pc closer to session.

Now here is data you’ve been wondering about. Does help in pre-session become an end all in the HGC. No. Hit the pre-session points lightly, then in Model Session form use *help* as the process to be run. And run it until it’s flat-flat-flat.

When the Model Session has begun, run a meter assessment. Find any terminal that drops. On that terminal, in specific or general form, “How have you helped?” “How have you not helped?”

Any experience you’ve had with O/W and meters and assessments, apply it to help.

And that’s how you’re going to clear people. It’s amazingly fast, even on a psychosomatic illness.

Now get your own reality on this.

HOW HELP BECAME BETRAYAL

Help is the button the world spun in on a few million years ago. It's where we find our pc. "Help is betrayal", so there is no way out. Scientology "must be bad" because "help is betrayal". *Everybody* knows that. So if Scientologists help people then we "must be betrayers"!

We've heard it, seen it. But now we know what it is and can laugh quietly when people try to chew us up.

When they really wanted to make a trap of it all, it was propaganda given out that "help is betrayal". None must have any help lest they be betrayed. So the thetans stay in their cages.

It is interesting how this mechanism developed. The game of victim is very old. It intended to arouse mercy and safeguard possessions. It became a trap. Once one *believed* in victims thoroughly he started to help *only* victims.

So this sequence began—one hurt another (who played victim), one felt sorry for the other, one sought to help the other. (Ever see a professional help sponge?) When this was very old, the action of injury became identified with the action of helping. As the cycle was injure—victim—help, as soon as the time gets vague in it, the parts of the cycle become injure-is-help or help-is-injury.

It has long been true that help could be injury as a common denominator. Out of this rose self-reliance as a virtue. You've known people who refused help because they were "proud" or "self reliant". Well, that's only the first stage of "help-is-injury".

The second phase is not so old. I think it's only been reversed for the last two million years or so in this quarter of the universe. The "complete flip" is not an identification of help with injury but a disassociation, a complete dispersal on the subject. How-to-injure becomes *help*. *This is* betrayal. With the intention to injure, one offers help to create a dependence on something disguised, which on use becomes injurious. It is this psychotic action which finalized the trap as a trap. "Don't dare accept any help because it is only an effort to betray", is the fixed idea which has become prevalent. One can have neither games nor life with that idea. It's this idea which poisoned Christianity.

Now that may be hard for you to see because, by the very virtue of being a Scientologist, you don't think all help is offered just to injure. But others have that idea and so you find *them* hard to understand. We are few because we few didn't believe all help was injury. But as soon as we sought to help others, who didn't accept Scientology, we ran into a wall. What was the wall? The above idee fixe. The majority in the world evidently believe that help is only an intention to injure. This is more than help-can-injure. This is "all-help-is-dangerous-because-anyone-offering-to-help-intends-only-to-injure".

There are too many examples around for you to need many more. You can find your numerous own. But the Mau-Mau people killed only those whites that had sought to help the blacks. And just as I was wrapping up the research on this technology (which is now beyond being only a theory) I received a letter from a white attorney who had been asked to help. In a panic he was demanding to be let off quick! It was very funny. With my research papers on my desk before me, I was presented with a perfect example of the technology! Poor man—little did

he know what his letter was arriving into. I wrote him back and his next letter was *so* confused! He may even recover.

These ideas, as fixed convictions, are all about us and across the world. This *is* the idea which blocked our way in our sincere intention to make men free. This is how we have caught it in the press and, some of us, from our dearest friends and relatives.

We have been confused. But so is Man. Man is still confused. We are not. By studying and knowing our data on this, the “wall” will go “poof”.

Any psychosis, neurosis or illness is fragile, no matter how fierce it seems. These can only thrive in lies.

Now what will happen to the barriers we have had when they are hit by truth?

I give us twenty months to having all cleared staffs on Central Orgs, three years to all cleared Scientologists, two decades to a large proportion of Earth cleared. That’s my idea of it now.

So learn to handle *help*. Get cleared on it in co-auditing or in the HGC. Learn a dozen ways to discuss it so as to break down the barricade of “disinterest” (which is really fear) and get the show on the road.

Help is *not* injurious. Help is *not* the best way to hurt.

Help is just help. Let’s flatten it until we’ll always know it and never forget it again, and learn adroitly to collapse the help psychosis in others by talk alone.

We have bought our own Freedom to Help.

Use it.

L. RON HUBBARD

(In the next bulletin I will give you the exact way to use help in Model Sessions.)

HCO BULLETIN OF 22 MAY 1960

MA

DE-CERTIFICATION, HOW YOU SHOULD SUPPORT IT

The Cancellation of an Auditor's certificates is a measure taken by HCO when these conditions exist: (a) The auditor has consistently refused supervised processing; *and* (b) the auditor has committed anti-social acts liable for prosecution under criminal law; or (c) continues to associate with a de-certified auditor and balk efforts of HCO to bring the person into an HGC for auditing.

Wild tales and rumours are often spread by a person who has been de-certified and his "friends" to prevent the public from recognizing the truth of the action. That truth is: HCO is trying to get somebody to have auditing that is effective before he irrevocably harms himself, and that HCO has evidence of criminal activity or association.

Support HCO's efforts to get auditors in for supervised processing when they have gone wrong. You can assist HCO by doing the following: (a) Realize that the whole "punishment" by HCO consists of getting the auditor to have processing that is effective and at very low rates, (b) realize that HCO has evidence of criminal actions or association when the certificate is "pulled" and (c) support HCO's efforts to keep certificates in clean hands and the repute of Scientology beyond reproach.

If they don't believe Scientology will help *them*, why are they auditing?

Please assist HCO to make auditors keep their code. Don't buy auditing from de-certified auditors. Don't pay bills to de-certified auditors (they have no right left to sell processing for money). Force them in to the HGC where we can care for them. Very few get de-certified. But they do *all* the public damage to Scientology. In HCO we have to choose between two overt acts:

1. An overt act against the offending auditor by de-certifying or
2. An overt act against you, the public and Scientology by ignoring their anti-social actions.

In HCO we always choose 1.

Many are the cunning rebuttals and tales put out by an auditor whose certificate has been pulled. Just remember when you hear them that the person putting them out refused auditing for a long time before he lost his certificates and that HCO has evidence of criminal activities by that person it is not publishing. We don't "pull" two certificates a year in all the thousands around the world. Help us keep it low by making our demand that offenders get audited, where we can supervise it, stick. It's only kindness. When we don't get them to an HGC they sometimes die, sometimes ruin their lives, and they hurt all of us. Back HCO so HCO can back the honest and the good.

SECURITY CHECKS

The Organization Secretary in Washington is here at Saint Hill for briefing on future US campaigns.

When I showed her how to do a security check and gave her a demonstration, she made the following notes. They are of considerable interest to all Central Orgs and HCOs as well as auditors. Therefore, I give them to you in full.

Security Check

1. Stable data—you are not processing but looking for needle or tone arm action that will not blow off. (Clear up on investigation—further questioning and E-Meter exploration.)
2. Rising needle means nothing except you aren't asking right questions.
3. You are looking for significant drops or tone arm changes that will not clear up. It is something that person is consciously withholding and as he continues to withhold it on further questioning the needle or the tone arm action will increase.
4. You start out by asking non-significant questions—50% of questions are to be these, i.e., if you have 10 significant (security) questions to ask you start out with 10 non-significant questions. If you have a needle pattern on non-significant questions you note it and it doesn't count on security questions.
5. On significant questions—any question that gets drop or TA action—you don't go any further but explore on this question. You may be getting action on past life or rather unimportant this life acts—i.e., sniping a balloon from a store as a small child. Clear this out. The needle may cool off (less action) but still be reacting. If so, explore further—see if you can clear it off. If on exploration the action increases, the person is consciously sitting on something he doesn't want you to know. If he's handing you up something else to explain the needle action (i.e., trying to clear it up by handing you something else) the action will increase because he's basically lying. If the action increases you can tell him he's sitting on something he won't tell and that he's a risk. He may break down and let go of it at this time. If so—he still needs processing on it and is a risk until he's responsible for it. Just letting go of the withhold doesn't make him responsible for it. He is not retained on staff while being processed to clear it up. What you are looking for is that which won't cool off. You can cool something off and go on to the next security check question and then later come back to the reacting question. It may have built up again. If so, explore some more.
6. On a Security Check Sheet you only note those questions that wouldn't clear. If something won't clear or cool off the person is a security risk. If he does tell you and clear it, if it's a heavy crime, note it.
7. E-Meter—use of in security check—check out meter before connecting person to be checked. See former bulletin on checking out E-Meter. Generally you set the sensitivity straight up on American meter unless the needle is very very sticky. English meter is

more sensitive—so you set it lower. Then set the TA—have the person squeeze the cans. You want about a 1/3 dial drop so you can adjust the sensitivity if the action is too much or too small on the can squeeze. Put the person at ease. Don't act accusative. You don't want to restimulate all the interrogation in the bank. It'll just take that much longer to clear it off.

8. There may once in a while be a person who reads nicely at their clear reading with no action and you're very suspicious the guy isn't clear. This could be a complete "blab" no responsibility case—a mockery of clear. You can check this out as follows. Make a somewhat accusative statement to the person that would be real to him—i.e., "You never get your work done." The mockery of clear person will wildly justify and blame. Check this person out on help—2-way—on an employer, etc. They will be real nowhere on help—i.e., can't conceive of helping an employer—can't run 2-way help, etc. This person, no matter how secure he may seem, is an employment risk because he can't help and will only cause difficulties on a post. He'll be a camouflaged hole.
9. Along with security check on staffs a help check should be given. If the person is sticky on help (can conceive of some help in some areas but has several areas of no help, especially on 3rd dynamic), he needs processing before he can be hired. If he's nowhere on help—can't run 2-way or can't conceive of helping an employer or an organization, he is not hireable until he's flat on help which will probably take many hours. He's probably a CCH case.
10. Remember, as a security checker you are not merely an observer, or an auditor, you are a detective.

I trust these notes will be of use.

HCO BULLETIN OF 27 MAY 1960

MA (not a lead
article Issue II
but a 2nd place)

Dear Scientologist:

For a long ten years I have had to wear many hats. Amongst them is an Ethics hat by which I have had to protect, often with small support, the good name and standards of conduct of Dianetics and Scientology.

To say the least the hat and necessary actions of counter-attack and defense have been distasteful to me. And in this regard, I humbly ask your help.

We have the answers today as to the why of "squirrels". We know the reason for their overts against Dianetics and Scientology. Technically, with overt-withhold and the phenomena of help we not only understand them but can straighten out their insecurity and hates to their own benefit.

Could you help me in this? It must be evident by now after ten long years that if there were any twist or untruth, betrayal or insincerity intended by me or organizational people, we long since would have passed away. The rumours that are put out by unbalanced people achieve only harder work for me and for good people everywhere.

In ten consistent years you should have proof enough that I'll stay at my post and do my job and overcome barriers, technical or administrative, organizational and field, somehow.

I dislike punishments and quarrels and entheta as much as any of you. Sometimes I haven't handled these things well, but I have tried to do my job as best I could here on a muddy earth.

Today nothing can destroy us or our works. I have no fear for our future and I know what we can do. Available to your hands is the technology necessary to handle rumor mongers, unethical persons and enturbulators. You can help me by handling them and getting them to good auditors, preferably an HGC, and preventing them from upsetting others and our task. Winning is so easy now, success is in our very grasp.

What failure do you think I feel when I am asked to cancel a certificate? With all the wealth of truth before him, someone avails himself or herself of no part of it and with a glass of water held in hand, dies of thirst.

Yet some of this burden lies with you. When an auditor forgets his personal auditing, and audits without being clear, why does the field permit him to crack up? Why haven't his friends and associates thought enough of him to force him to get processing from a reliable source? Why do they wait for him, overworked already, to emerge from the tangle of some emotional crisis utterly unstrung and hating everything, before they offer processing?

Clearing the executives, the auditors, the people of Scientology is your job now. When you hear somebody "going bad", running away and raving against us all, don't harbour him and sympathize—you'll kill him. Make him go to the nearest HGC or an auditor with altitude over him and get his overts off and his ability to help increased.

There are thousands of auditors across the world. Few of them are clear. Once or twice a year amongst all these one of them turns upon us. Rumours fly. People wonder. Eyebrows

raise. Why? In a few years they'll be clear. We've just begun the project. Right now they are not. Instead of standing around blinking, wondering even believing such wild tales, why aren't you being effective? The person doing bad and untrue things needs assistance. The least you can do is drive or force him to an HGC where supervised auditing (and not patty-cake) will straighten the person out and make life bright again.

My lines are heavy. My days are long. To these should we also add my Ethics hat?

A breakthrough has happened here in 1960's spring bigger even than O/W. We're clearing people fast in HGCs. It just began to happen. But it isn't happening to auditors in the field yet and it won't for quite some while. Meanwhile must I go on and act to minimize the damage being done by people not only not yet clear but heavily caved in?

You could help me by pressing these people in toward auditing, by understanding the why of their rumours and hates and getting them processed. And you can help by insisting that "names" in Scientology get processed regularly by competent auditors in an HGC (not by some "friend" who'll patty-cake) until they're really cleared. I myself have had scores of hours of processing since last fall. If I could be clearer than I am, what's that make the case of other Scientologists?

You could lighten my lines, and my heart, if you'd share this burden even a little bit. Hold the field together until they are all clear.

Now, certain you will help in this and let me get on to wider work, I wish to celebrate the occasion of HGCs, using new technology, beginning to make clears again, by announcing the complete and unqualified restoration of all certificates and awards ever cancelled since 1950. They're all in force again. Let's get on with our job.

BY THEIR ACTIONS

By their actions you shall know them, whether bad or good, whether on another side or ours.

And what in their actions gives us the keenest insight? Their ability to *help*.

Some think that help cannot be done. Shun them. Some think that help is always an effort to betray. Process them for here you have the criminals of Earth.

Some people cannot help. They can only injure and destroy. And if in the name of help they only injure and destroy then know them carefully for they are criminals.

What is a criminal? One who thinks help cannot be on any dynamic or uses help on anyone to injure and destroy.

Who are these men with covert ways who bring Earth its pain? They are the men who cannot help. Who are the women who must be helped but who can only maim? They say, these men and women, that they'll help and then they make a thorough shambles of it all.

From where did Earth conceive her traps and aspects that are grim? Earth would be a lovely place if all men helped to help, not to destroy.

Think heavily on this point. Judge men from what they think of help. Judge women too and find the good ones from the bad.

The good can help. The bad will not or if they do, they "help" only to betray.

The good of Earth comes from above the point of make and break where help is help and honestly. The pain of Earth comes from the tones where help does not exist or where it's used to pull us into agony.

Know your friends. It's strange that those who argue with us against our goals and Scientology cannot conceive of honest help. Discuss help with them and you'll find their tone and whether they are worth a lot as friends.

This is the test that you can use to separate the good from bad and then clear-eyed begin to make a world in which all life can live.

**THE BASIC ASSUMPTIONS OF
SCIENTOLOGY VERSUS OVERTS**

The entire secret of all overt-withhold mechanisms is *valences*.

I have known for a long while that a profile on our tests is a picture of a valence.

If the preclear were in no valence, but was himself completely, he would have a perfect test response and would be wholly clear. In this statement we have one of the background structure points of Scientology.

This was an assumption point for some time, a point of departure, like “conservation of energy” in physics is the primary assumption point of 19th Century physics—if we assume this point then we have the “truths”, axioms and other data in elementary physics. The point, assumed and never proven (and not even well phrased) is the start point in physics from which all deductions are made. It is an “understood”, a non-examined theory. Physics was demonstrable truth, but only in a limited and finite sense. The moment nuclear physics, my dear companion that haunted my college days, came into action, the assumption point began to crumble and is not now considered to be truth. Hence while elementary physics works in a finite limited sense, it is not a considered true science any longer—it is only elementary science.

Freud, for instance, had as his start point (or assumption point), the Libido Theory of 1894 in which he based all on sex.

It is rare that a science ever embraces its own assumption point and resolves it. Freud was stuck with his Libido Theory, just as Newton’s successors were stuck with “Conservation of Energy”. So long as elementary physicists were concerned only with energy which “could not be destroyed or created” they tread-milled themselves into a dead-end mirrored in such things as inadequate costly engines, difficult construction and a complete lock out from space and other planets.

The great Einstein, not a physicist but a mathematician, established a *new* science which deserved the name of *the* physical science “physics”, a name already purloined by the natural philosophy of the 19th Century. Old time physics was the science of the age of fire and ended with the age of fire. It died to whimpering embers under the down blast of atomic fission. We are no longer scientifically nor politically in the age of fire. We are in the age of freed energy. We do not yet have an atomic physical *science*. We have only a number of guesstimates like the bronze worker of early Greece who knew nothing of the facts of fire metallurgy. The fire age, begun by Prometheus, whoever he really was, is ending on Earth. The raw energy age has begun with all the teething troubles of any new era. Called the “Atomic Age” just now, it started with hints of others before Einstein but was actually born when Einstein wrote his Theory of Relativity. This, a crude guesstimate, was yet a great departure point in the history of this planet. It has unlocked space to Man, promised him new engines, widened his scope. Unhappily it has also unlocked vast opportunities for political bungling—but I would rather say that it exposed political diplomacy as a bungling subject which must now urgently improve. Nations can no longer afford political ineptness.

Now the assumption point of physics, the science of the fire age, became disproved and the science is in question and the fire age is in fact over. The holes in physics have begun to

glare. Some day a new science will be organized from the assumption point of Einstein's work (no matter if he's debunked, forgotten or becomes a legend like Prometheus, the professors of tomorrow can teach as a myth [Einstein stole the secret of eternal fission from a Heaven named Princeton where the goals...]) And ages hence somebody will prove or expose the basic assumption and the fission age will resurge or die, depending on whether or not the assumption is found to be true or false.

In Freud's case in a lesser sense, a short and ineffective but highly interesting age of psychotherapy began with the Libido Theory in 1894 and began to disintegrate through lack of progress and development about 1920 although the subject itself became an intellectual football in the late 20s, an artist's cross in the early 30s and a teenager's subject in the late 50s. His contemporaries added nothing effective to Freud's work and the subject, like psychology, which originated in 1879 and assumed men were animals, failed in all fields but wide popularity.

Back of all work on mental states, however, lie various assumption points, most of them hidden or undelineated, from which the remainder of the subject evolves and grows. If the cornerstone is proven only relatively factual, a long enduring career is guaranteed to the subject. Freud used as his assumption point more than his Libido Theory that all impulses and behaviors are sex-motivated. He assumed that if one were sex-motivated, then if one unblocked this drive by removing an early traumatic sex experience that was impeding the drive, the patient would recover from neurosis. All manner of interesting complications proceed from this: art, being considered a sublimation or aberration of the sex drive, had to be considered wholly neurotic: success, being most desirable as sexual success, was a product of a blessed neurosis if achieved in any other field. As treatment it was common for a Freudian practitioner to cut through the Gordian knot by ordering a patient to go out and have sex with everyone, prove his or her prowess and thus become well and happy. While this secured the popularity of the subject, it did little to reduce asylum statistics as these were on the increase throughout the Freudian age and were highest at its end, and indeed were higher in Freudian dominated areas than in others where Freudian treatment was not used. (Not my propaganda, just a recorded fact.)

The psychiatrist, following a Russian science, has a more basic and brutal assumption point which is that a shock cures aberration. The idea goes back a very long way, making psychiatry a long, if sporadic, age. Psychiatry ebbs and rises in use since it is a dramatization rather than a science. It springs from the same impulse that assumes punishment cures wrongdoing. The limited workability of this is apparent around us on every hand. We could do nothing socially about crime so we *inhibited* crime by striking at criminals. This gave us suppressed criminality and more criminals *but* it must be said that lacking *any* solution that worked *well*, then any solution that even seemed to work occasionally was considered better than nothing.

Perhaps at some early date in whole history this worked better, but all expedient cures tend to become a new illness. Alcohol, in any alcoholic, once cured something but now produces with amazing similarity the malady it once cured. These are stop-gap cures that do this, not cures in any absolute sense.

As the earliest punishment was the production of a shock in the offender whole track history continues to repeat the treatment for misbehavior as a dramatized action, not an intellectual undertaking. If a person misbehaves, he should be punished. Thus if a person misbehaves insanely he must be punished. Psychiatry is not, then, a science, but a legalized, at present, dramatization. And this is the very dramatization that makes this a cruel universe when it is. Punishment is unworkable as all the statistics show. Punish the criminal and he becomes, too often, a confirmed and hardened criminal.

All this, however, is based on a yet earlier lie. The last two years of my researches have been devoted to establishing or not, as the case may be, whether anything could actually be done to a person, or whether it was not the person himself who did it. I "knew" the latter was

theoretically true but I had not found means to demonstrate it-and indeed was quite prepared to discover that something *could* be done to a person without his being prior cause. This work will be found under all 1958-59 data released all overts and withholds.

The earlier assumption to punishment is that something *can* be done to another being.

By evidences to date, odd as it may seem, it appears, by all processing tests, that one becomes aberrated only by means of his own, not another's actions. I do not say that *nothing* can be done to a person or a being by another person or being. Obviously communication exists. I am only saying that all aberrative effects of action are created by the person who has them. Indeed none could be processed successfully through a burn or engram unless he himself were holding the aberration there—for the fire, location and other people are not consulted and are not even there in fact at the time of processing. A preclear being audited on a past incident can recover from its ill effects. Therefore it seems conclusive that he himself must be causing the ill effects in present time or he could not eradicate them since the "sources are not present". Thus they must not have been the sources of his "ill effects". The preclear must have been.

Inspecting the assumption points of Dianetics and Scientology one finds now that what was originally assumed is fact. Thus we are to be here as a science for a very long time.

As no science before ever proved its assumption point that I know about, we are suddenly unique in that our results tend to verify more than our basic truths. The further we go forward, in other words, the more basic are the assumption points. Unlike, then, physics or psychoanalysis or other sciences, we have examined and improved our assumption points.

We assumed in Dianetics that if we removed engrams, life would resurge and become good. This assumed that a being was all right until injured and that eradicating the injury would find him all right again. This is not the same as Freud for Freud never assumed goodness or rightness in Man, but on the contrary seemed to warn that we had better not go too far, art and all that depending on the madness of us all. As God seems to be blamed for most of the art work in this universe this seems a most impudent evaluation of God's sanity on Freud's part, although I do not think he ever displayed an actual professional sign saying "S. Freud, Psychotherapist by Appointment to God".

The Dianetic assumption that Man is basically good and is damaged by punishment holds valid in practical practice and in some tens of thousands of cases (and we're the only ones in history that validated our findings by strict long, long precise testing on cases); we find that the more we process successfully, the kinder and more ethical our people become. That disposes of the vile nature of Man by staggering poundage of evidence. The assumption that "all art is derived from aberration" is discounted by the numbers of singers and artists who sang better and painted better after they were made saner by us.

The basic psychiatric assumption that enough punishment will restore sanity is disproven, not only by psychiatric statistics but by actual observation and removal of the effects of "punishment" by processing.

That a being, without aberration, would be good, ethical, artistic and powerful, is still a basic assumption in Scientology. It has just been demonstrated as factual for our practice. This is news. Our assumption point has just become a basic truth. It is not just an assumption. Therefore we will now find ourselves on a new plane of progress, perhaps with new teething troubles, certainly with even further goals.

The truth was demonstrated in this wise:

I knew valences, those mocked up other-beingnesses a person thinks he is, were the source of test profile patterns.

When we rid the pc of an undesirable valence his profile rose on the graph and he felt and acted better. When we did not alter the valence in tested cases the profile remained much the same. If the preclear were driven into undesirable valences by experiment, his profile worsened apparently, although this is more difficult to verify, since the tone of the existing valence was undoubtedly dropped as well.

Now from this I have found the mechanism by which a being gives himself pain that is actually self-inflicted but is apparently other-inflicted. And this is a vast stride for it resolves O/Ws and we can consider it a broadly completed cycle of research ending two years with a victory for our assumption point.

By being a valence, not himself, a person confuses the source of pain. Inflicting it himself upon the valence he is in, and by experiencing the pain from the valence, a being can counterfeit the effect of being an effect of punishment. By being Valence A, he can conceive the environment is guilty of striking Valence A, but as this is in fact an overt by himself against Valence A (if only by failing to protect it) he feels the pain of Valence A. As he thinks of himself as Valence A, he can then feel his own pain.

The conclusion is that to feel pain and for pain to persist one must be in a valence.

The remedy for pain, illness, aberration, insanity and the lot, then, is to free the preclear of valences. Apparently, freed of all valences of an unconscious level, the preclear would yet be able to experience, but would not be involved with pain, etc, except by postulate.

The way to free him of all valences or unconscious counterfeit beingness is not the purpose of this paper.

Here I only wish to examine with you the aspects of assumption points of subjects and sciences (each of which has one, usually unknown to the originator) and to pass along the interesting intelligence that our former assumption point of "remove the aberration and you have a worthwhile person" has become demonstrable in practice and can be considered truth.

This means a new level has opened to the future with new certainty.

An overt recoils upon one because one is already in a valence similar to that of the being against whom the overt is leveled.

The mechanism is exposed. And as it is exposed, we find it is not needed since a being without valences is basically good. Only a being *with* valences has his overts recoil upon him. Only a being with valences commits overts harmful to others as he is behaving as he supposes the "evil" valence would behave but as no unvalenced being does.

HCO BULLETIN OF 10 JUNE 1960

MA

WHAT WE EXPECT OF A SCIENTOLOGIST

We inherited, when we began, a great many hidden errors in the society, so deeply laid they seemed right. "Everybody knows that" is a tombstone of progress for it contains uninspected lies that bring the wittiest of us to grief. "Everybody knows that Man is Evil" was only one of the many things we found wrong, exposed and dropped from our own knowledge.

However, in the field of what is expected of a Scientologist, we have for ten years carried along an inherited error. It is this: "Everybody knows that a specialist in a science hangs out a shingle and, if a professional, becomes a private practitioner."

Now listen. Psycho-analysis was developed in 1894 by Sigmund Freud. Everybody who studied it was expected to hang out a shingle and start practising. It took half a century for psycho-analysis to become generally known by the people. Yet how could it miss? Its tenet was that if you were sexually uninhibited you would be happy.

The psycho-analyst took his cue from the medico of his day. If you could heal you were a healer with a shingle.

Well, I'm afraid a lot of us have bought this too. If we were trained in Scientology as a professional we should hang out our shingle as a practitioner. With all due respect to the Scientologist in professional practice (where they have every right to be) this is not a true idea. It is a borrowed idea. It's as old as the witch doctor.

A Scientologist is the being three feet behind society's head. And society runs on eight dynamics, not in a sick room. Some of us, of course, would become professional practitioners. But a professional Scientologist is one who expertly uses Scientology on any area or level of the society.

A housewife who does not have professional level skill in Scientology could not expect to run a wholly successful family or keep order in her neighbourhood and keep her family well. A factory foreman could not possibly handle his crews with full effectiveness without professional Scientology skill. The personal assistant to a corporation executive could not do a fully effective job without being a professional Scientologist. A corporation president without a certificate will someday fail. And the head of a country would go to pieces if he didn't know Scientology from a professional angle.

How can these people handle life if they have no expert knowledge of how to handle life.

Now we don't expect everyone in the world to become a trained auditor. But we expect the people who are making the world to have a knowledge of how to make it go.

A *trained* Scientologist is not a doctor. He is someone with special knowledge in the handling of life.

We have many, many personal success stories in Scientology. They begin with a book acquaintance and bloom when professional skill enters the background. These people, small people, big people, drove a wedge for themselves into companies, societies, with Scientology and then took over control of the area. They succeeded where they never would have dreamed they could. And every time one of us drives in such a wedge, we all win because the world is brought nearer to a sane and decent world.

The factories, the marts of trade, the homes, the neighbourhoods, these are the places we want *trained* Scientologists. In that way alone, we're on the busy, still healthy communication lines of the world.

Some of us need to run centres and schools just to give the rest of us service when required. Training at a pro level must continue and *must* be kept good. And service and communication must be given. Hence, we have Central Organizations on every continent and HCOs. But if we avoid the throbbing comm lines of the world and act like doctors, we will not win soon enough as a group.

Any trained Scientologist can win to success in society. Heightened IQ, a knowledge of life, a forthright attitude—with these things it is easy for him or her to improve 2 social or business position, to get higher pay, to exert wider personal influence. This we know we can do, we have done it so often so let's improve the ability.

Process people weekends, run a co-audit some evenings of the week at home, but get on the active lines of the world and make your presence felt.

It takes full training to do it. It's been done from our books alone but not always well. It takes tough Academy training to make a Scientologist, so don't go at it half armed.

And stop feeling apologetic because you are not a "full time auditor". We are the auditors to the world, not to a handful of the sick.

We are not doctors. We are the world's trouble shooters. When we make a company win, the whole world wins, when we make a neighbourhood win, we all win.

A full time Scientologist makes life better wherever he is. And that is enough pro activity for anyone.

What do we expect of you? To become the best Scientologist that can be and to get on the comm lines of the world and bring a big win where it counts. We don't expect you to hang up a shingle as a doctor and have a private practice. We'll respect you if you do. But we'll respect you just as much and even more if you get trained as a pro and go out and up in the world of action and of life.

Hit for the key spots by whatever means, the head of the women's club, the personnel director of a company, the leader of a good orchestra, the president's secretary, the advisor of the trade union—any key spot. Make a good sound living at it, drive a good car, but get your job done, handle and better the people you meet and bring about a better earth.

And stop feeling hangdog because you "aren't auditing full time". Nobody expects you to.

We'll keep centres going to service your needs, some of us, we'll provide ammunition and books. And the rest of us had better invade every activity there is on a high level of success and make our influence felt on the comm lines of the world.

Scientology is the only game on Earth where everybody wins.

So let's help the world win.

HCO BULLETIN OF 10 JUNE 1960

All HGCs

HGC PRECLEAR ASSESSMENT

With considerable data accumulating on Help when used in conjunction with Alternate Confront and Havingness, and with Help even working on vague past terminals in concept form (“Get the idea of helping a____“ “Get the idea of not helping a____“), it is time to pick up any cases that have been in processing more recently, by starting them again on the first terminal they were ever run on.

You will find that Help O/W will move a case that was begun unsuccessfully no matter how long ago, providing that you discover with a meter what terminal the case was started on originally and address that terminal and audit it until it is flat.

This experimental approach should work, because it has worked that when cases were started again and the first process ever run was flattened, the case began to move.

This will work even though the first approach was engram running or straight wire away back. It should be discovered what the pc’s first goal in auditing ever was, or his first hope for auditing, and get the terminal closest to that goal. It will often be found that the pc was trying to help his eyes or his wife or himself as the first Help terminal in auditing.

When this terminal was not totally flattened the pc, finding he had not helped whatever he was trying to help, got an auditing lose. By finding out what the pc was trying to help at the very first contact with Scientology and by giving him sessions on it with Help O/W a most important win can be obtained.

This bulletin should be given very serious attention in HGCs where the cases always come that have real heavy auditing problems. HGCs get the toughest cases and usually all the old time cases. Where any case is being handled in an HGC it should be suspected that there has been an auditing flub somewhere along the line. Perhaps the pc won wonderfully with the first auditing session but failed heavily down the line somewhere. In such a circumstance always convert the loss to a win.

HGCs do more patch-up than virgin work. Thus it is safe to assume first that any applying pc has had something he tried to help in his own auditing that he received, and that it isn’t flat, and second that the pc has had a lose on some terminal.

HGC auditing as a rule should regard itself as parasitic upon other auditing already done. HGC staff auditors should rarely be attempting the new and strange in an assessment of a case but should be trying to recover past data dredged up in earlier than HGC sessions and converting the losses to wins. This is a type of assessment peculiar to an HGC and we should study it.

HCO BULLETIN OF 16 JUNE 1960

Fran Hldrs

HINTS ON RUNNING CASES WITH HELP

Pre-session Help—Two Way Comm.

Rudiments Help—2 way Help, Auditor and pc.

PTP—Use ordinary overt-withhold not help on personnel involved with PTP.

Assessments—There are several Assessments. Dynamic Assessment (HCO Bulletin of May 30, 1960, “Dynamic Assessment on Help”, covered this) terminals found should be handled with Concept Help. Use lots of havingness when running such a terminal.

There is another new assessment, Know to Mystery Scale Assessment. This is done by using the E-Meter on the buttons of the Know to Mystery Scale. That level which most changes the pattern of the needle is the target. Use Concept Help on it.

The most profitable, fast way to get a case moving is to find out what the person was most trying to help when he or she came into Dianetics and Scientology.

This may be “an arm” or “my friends” or “myself”. But whatever it is run it on any help process until it is flat. Concept Help is a good starter for the terminal thus located. This gives the pc a big primary win.

Flatten the Terminals

We stalled on ACC Clearing Procedures because auditors did not flatten help before starting on Step 6. Let's not lose this horrible lesson.

The technical reason for this is that when *help* is unflat, a pc is still in a valence. Running Step 6 in a valence is courting disaster as the pc is in a picture that increases in mass and gives him somatics.

We are not returning to Step 6. We have better processes. But we are returning to help with far more knowledge of it.

Flatten every terminal on which you run help. By flatten is meant *no needle* change when the terminal is mentioned. A way to test this is to depart by two way comm from the terminal and then ask about it again. If the needle reacts the terminal mentioned is not flat. Just talk about something else, like the weather, and then mention the terminal again. You'll see.

It is better to use a general form of a terminal than a specific form. It is better to run “a young man” than “Joe”. If the E-Meter reacts to “Joe” it is best to find out what Joe is to the pc and find the general form that reacts most (“a friend”, “a young man”, “a bum”) and run that, *not* “Joe”. You will get a lot further than when you run a specific close to present time terminal.

Help As Valence Problem

When people become a valence, they do so for at least two reasons.

First and probably most powerful: The thetan takes a valence that he believes will help others or the universe.

Second and more mechanical: The thetan tries to help something or somebody and fails and the last stage of his effort is to mock up a picture of the thing and try to help it.

There are various aspects of all this, more and more complicated. The thetan becomes a man to help women. He fails and thinks men can't help women. So he restrains men, or he becomes a woman.

A thetan can become very involved with his computations on the subject of help. One black case I know is seeking to help others by absorbing all the blackness in the universe !

There is a formula for handling 1. above. Find out what a thetan is being and find out what that beingness helps and not helps by using the command, "What would ____help?" "What would ____not help?"

There is a general form which discovers beingnesses in a pc. Find out something, very general, that a pc is trying to help or has failed to help and run "What would help ____?" "What would not help ____?" on the discovered terminal. The pc will get cognitions on what he or she is being and what the pc is restraining himself or herself from being.

Finishing Off a Difficult Terminal

Any terminal that is being run on help that was unwisely chosen can be eased off by running old overt/withhold, alternate confront or responsibility. This is a crude way out but it will work.

In any event, any session should contain general alternate confront "What can you confront?" "What would you rather not confront?" and havingness. These take the edge off unwise choices, any rough auditing and make the case feel better.

If the pc can do it, responsibility can get a pc off a bad choice fastest. *If* a pc can run responsibility easily. The pc has to be running rather well in general before it can be attempted. The pcs who are suffering because of an auditor choice of-wrong terminal usually can't run responsibility easily. Of course, successful auditing is "What you can get away with".

The best and smoothest way to get off a bogged terminal is alternate confront. But when the case has afterwards been run on other terminals with help, it's best to go back and clean up the ones that earlier bogged with help by running more help on them.

General Processes

The general processes which assist help sessions are alternate confront—"What can you confront?" "What would you rather not confront?" and Havingness, "Look around here and find something you could have."

Any couple hours of help should be followed in the same session with fifteen minutes of alternate confront and fifteen minutes of havingness. These times are approximate and are given just to communicate some idea of ratio. A truly boggy case could do with a ratio of 1:1:1 such as 45 minutes of help, 45 minutes of alternate confront, 45 minutes of havingness. As the case gets out of long, long comm lags on help, increase help in the ratio to 1 :1/2:1/2 or one hour of help, a half hour of alternate confront, a half hour of havingness. All this is auditor judgment established by observation. As it is the help in any form that does it, remember to use help to advance the case, and alternate confront and havingness to make the pc feel good.

Alternate confront and havingness improve a case, of course, but are long, long hauls as processes if we think of clearing with them.

Help on near present time terminals is far less effective in clearing than help on general terminals that have a lot of track to them. As general terminals can get a pc into a lot of confusion on the back track, alternate confront and havingness keep the pc from getting too bogged to run. Alternate confront also takes the edge off invented answers by the pc. (Create—confront phenomena.)

There are lots of help processes and many ways to run them. They all win to some degree. It is the amount of help run rather than the number of terminals cleared that clears the case.

Help basically sheds valences. Therefore havingness is needed. But the valences are all “can’t-haves” so when the valence is off at last the havingness of the pc comes up.

Almost any brand of help run long enough by good auditing should clear a pc. Hence, the idea is to run help and run it flat.

SPECIAL ZONE PLAN
The Scientologist's Role in Life

Ten years ago, on about this date, I was up against third dynamic confusion of such magnitude that within a few months, I was to decide to forget organization problems and concentrate on research.

Because of this decision for years we were poorer in numbers but richer by far in knowledge.

It evidently was not enough to be able to help the basic problems of an individual. There were eight dynamics. It was necessary to take in at least some of all eight dynamics before we could be effective.

And toward the end of June in 1950, I first sensed that truth. And the maxim—bring order to your own house before you attempt order next door.

In June, 1950, the Foundations were already beginning to shatter under the enthusiastic door pounding of the public. I had built the proverbial better mousetrap and all the world was beating a path to our door—and was breaking the door down!

Yes, we could do wonders with people. Greater wonders than had been done in recent millenia. But we were ignorant beyond the first two dynamics. The moment we sought to handle the third we were done.

That was ten years ago. Within months of that date all that was left of the first organizations was rubble and newspapers blowing by in the wind.

I worked hard, and studied and researched, never friendless, often helped and worked ahead for ten years.

The First Dynamic, self, fluctuated in results and has stabilized with unsurpassed processing technology. In proof, our people are individually in better shape than any other group.

On the Second Dynamic, family and sex, we have gotten into a winning position. We know the answers to marriage, children and sex. The material isn't all published broadly enough yet even for Scientologists to know it but it's there and we're living better lives.

The Third Dynamic, groups, is the spectacular breakthrough of today. It's happened so gradiently we've hardly realized we have won. But observe: we have a magnificent organization. In America, England, South Africa and Australia we have just about the most wonderful organizations Man has seen for their size, cost and defensibility. Here we have achieved spectacular stability. Largely self-determined, yet co-operating smoothly these third dynamic examples compare with June, 1950, Foundations like the Royal Ballet compares with the aftermath of Hiroshima.

Just as we can represent in ourselves the grip we have on the first dynamic, so do we represent in our organizations that we have the third dynamic well in hand.

The technology of our third dynamic in organizations *and* the field is an exact one, as skilled as an auditor's know-how. And having applied it to organizations we are now applying it to the field, which is the main subject of this bulletin. You in "the field", you are about to win, too, with a complete new level of policy and action if you want it: you are about to be included "in".

The Fourth Dynamic, Mankind, is now an understood zone of operation and is declared herewith to be operational for a Scientologist. The prize of understanding Man as a racial and political species has fallen to our hand. Don't smile. I know it's an incredible announcement. But it's factual.

On the Fifth Dynamic, that of living things, I have been making headway since last year and know quite a bit now about them. Many of the secrets have dropped into our hands.

On the Sixth Dynamic, the physical universe, we have for some time stood well above what they know in physics.

On the Seventh Dynamic, the spirit, we covered this ground very thoroughly in 1953-54-55 and it's still all true but too advanced for general consumption. The best record of this was in the 1953 Philadelphia Lecture Series of 64 hours.

On the Eighth Dynamic, the Supreme Being, we have at least found the key question and in a little while we should have it answered on a demonstrable basis. Far from presumptuous it is about time somebody neither atheist nor zealot asked some questions, and arrived at some answers that have no self-interested curves in them.

So you can see where we are going and have at least a passing acquaintance with developments. Here we are with the largest fund of information of life and its patterns that has been assembled in a factual package on Earth.

Now the question is, what are we going to do with it?

Until we had the third and fourth dynamics demonstrably in hand technically we could not answer the question. We've each had his own idea of what we should be doing with it and each of these ideas is right to the degree that it's right for each of us. I have never discussed this point strongly because I did not want to shake anyone into an uncertainty. So let's say that all these ideas are right and then add a Third Dynamic Idea with which we can all agree.

Improvement is the common denominator of all our ideas. And of course each one has a zone of interest where he or she feels improvement is most needed or where he or she would be most comfortable in doing the work of improvement.

And that's the gist of this Third Dynamic Idea. It's a rather deceptive idea at first glance since we are each of us doing something of that.

But let us be far more definite. And let us expose a fallacy that has long been riding with us, as an unknown passenger.

People think of professional practitioners as doctors who, aloof from all other concerns, practise on the sick. This is a very novel idea. Dreamed up, probably, by the first lazy witch doctor and used forever thereafter by most specialists in human livingness. And here I want to as-is and banish that idea from amongst us all.

If we are doctors (by which might be meant "repairers") then we are doctors on the third and fourth dynamics and handle the first and second dynamics only to achieve better function on the third and fourth.

And true enough, most Scientologists agree, I think, with this concept. But it itself is as new and novel as the idea of being a professional practitioner to individual health once was.

I believe our third dynamic organization, taking in *all* Scientologists, should go this way:

The Central Organization and Centre Scientologists should service the remaining Scientologists, doing administration, instructing and auditing. Instruction to a professional level of *all* Scientologists should be entered upon as a must. Central Organization and Centre Auditing should be special and referred cases and the Scientologists themselves when they want it as part of service.

Being trained and cleared need not hold up the next zone of action, though it is taken for granted that these will occur for each.

The “field auditor” should be included wholly “in” to the general activity as a large zone divided into smaller specialized zones. The “field auditor” should of course run a group some evenings (he will find he has to) and audit not only members of his family but contacts in his zone on weekends or evenings. But, as you will see, he or she is largely wasting time by trying to be an individual doctor type practitioner where he or she is only partly successful at it. Some of course will have to work full time in centres as we get into action but centres are mentioned above as a special activity along with Central Organizations.

The largest majority of Scientologists should, I feel, consider themselves as “doctors” on the third and fourth dynamics. And if we work well at this, we will have answered all our various needs and brought it off on the third and fourth as well.

Now I wouldn’t be talking to you like this if I didn’t feel I had this studied to a conclusion.

Consider our position: we have arrived at a very special plateau of knowledge as has been reviewed above. Data on our know-how is being codified for use in these zones of action.

Consider the position of the world. The story is often repeated on the whole track. As Mest is made to help too much, a plateau of civilization is reached in which the individual is downgraded to a number. The end of this—the lights eventually go out through lack of personal initiative and ability.

We are in a fantastic position, at the right time and place, to halt this cycle of decay and start a new one on Earth. And I believe we should overtly do so.

How?

We are masters of IQ and ability. We have know-how. Any of us could select out a zone of life in which we are interested and then, entering it, bring order and victory to it.

Of course, there’s a heavy challenge in doing this. Some of the victories would be hardly won. But we would win across the world if we kept our vision bright.

The third and fourth dynamics subdivide. Any third breaks down into many activities and professions, a neighborhood, a business concern, a military group, a city government, etc, etc, etc. The fourth dynamic breaks down just now mainly to races and nations.

Now just suppose a Scientologist were to consider himself a professional only for the purposes of treating and repairing or even starting again these third and fourth zones?

See this: a housewife, already successfully employing Scientology in her own home, trained to professional level, takes over a woman’s club as Secretary or some key position. She straightens up the club affairs by applying comm practice and making peace and then, incidental

to the club's main function, pushes Scientology into a zone of special interest in the club—children, straightening up marriages, whatever comes to hand and even taking fees for it—meanwhile of course going on being a successful and contributing wife.

Or this: a Scientologist, a lesser executive or even a clerk in a company, trains as a professional auditor, and seeing where the company is heading, begins to pick up its loose ends by strengthening its comm lines or its personnel abilities. Without “selling” anybody Scientology, just studies out the bogs and remedies them. If only as “an able person” he would rapidly expand a zone of control, to say nothing of his personal standing in the company. This has been and is being done steadily across the world. Now that we have pre-sessioning, it's easy to straighten up other people. Our unreleased technology on handling third dynamic business situations is staggeringly large. You'd be surprised how easy it is to audit seniors. They and their families have *so* many troubles. Or how easy it is to spot the emergency-maker and audit him.

And see this: a race is staggering along making difficulties for itself. Locate its leaders. Get a paid post as a secretary or officer of the staff of the leaders of that race. And by any means, audit them into ability and handle their affairs to bring co-operation not trouble. Every race that is in turmoil in a nation has quasi-social groups around its leaders.

And this: a nation or a state runs on the ability of its department heads, its governors, or any other leaders. It is easy to get posts in such areas unless one has delusions of grandeur or fear of it. Don't bother to get elected. Get a job on the secretarial staff or the bodyguard, use any talent one has to get a place close in, go to work on the environment and make it function better. Occasionally one might lose, but in the large majority, doing a good job and making the environment function will result in promotion, better contacts, a widening zone.

The cue in all this is don't seek the co-operation of groups. Don't ask for permission. Just enter them and start functioning to make the group win through effectiveness and sanity.

If we were revolutionaries this HCO Bulletin would be a *very* dangerous document. We are not revolutionaries any more than we are doctors of sickness in individual patients. But we are not revolutionaries, we are humanitarians. We are not political. And we can be the most important force for good that the world has ever known. Who objects to a company functioning better to produce a better civilization? Who objects to a race becoming sane and a stable asset to its communities? Who objects to a neighborhood smoothing out?

Only the very criminal would object and they are relatively ineffectual *when you can* know and spot them. And there are no criminals except the mentally disabled.

So this is a challenge on the third and fourth. Almost all Scientologists are in a position to begin to help on such a programme.

And I am studying now first the popularity with you of this plan and, if great, how best to help us all achieve it. The first thing required is an understandable designation for Scientologists undertaking their portion of this Special Zone Plan. I should think the word “Counselor” is acceptable with an appropriate additional designation such as “Family Counselor” or “Company Counselor” or “Child Counselor” or “Organization Counselor”. What we would do is issue an HPA or HCA as a certificate as always and would issue a special zone certificate to any person operating in that zone after he or she had completed an additional correspondence type briefing course covering that general zone. In other words anyone would have to have a professional certificate before he or she could be designated as a special zone counselor. The costs of obtaining such a certificate would be kept slight, no more than bare administration. The advantages of having such a designation are plain. A clerk with a certificate on the wall from the Academy of Scientology designating that he or she has been graduated as a “Company Counselor” would startle even a complacent executive into conversation about what was wrong with the place and as he was talking to a pro auditor any scepticism would quickly

fade. A pro would know! As it all starts with being a good auditor and as the additional technology is exact in any of these fields, the programme is feasible.

We are at this stage of this programme: I have found that Scientologists operate with high success on the third and fourth but that it rarely occurs to them to try it and when they do they think I want them to audit full time and they are apologetic about their attempt. I have the technology pretty well to hand and can write zone manuals. I feel we now have clearing well in hand in Central Orgs and will soon have it broadly so for Scientologists in “the field” but I do not feel we need wait on that but take it and further training in stride. I feel that we are ripe for an overt attack on the third and fourth down spiral. I feel our auditors should take advantage of their increased personal ability and should be regarded accordingly by society and its zones. I see clearly that we have to win on the third and fourth if we are to attain our goals of a better world.

The special zone plan is made possible by a slight shift of approach. Take the case of a police officer who got interested on a PE course and read some books. He tried to “sell” his chief on Scientology as a subject and was given a heavy loss. One, our PE level trainee was insufficiently schooled to be effective. Two, as a pro his approach could have been any one of several. He could have eased himself nearer a command source area in the department, or he could have taken over a pistol marksman on the force and made him a champion as we did with the Olympics team once. The slight shift is that we would have made this police officer get pro training before telling him “sell Scientology” to the force and then would have advised him to *sell it by action*, not words. Handling the familial problems of the commissioner as his driver or making the rookies gasp at how fast he could train them would be *selling by action* only. And no other kind of selling would be needed. He’d be running an evening coaching class for his fellows or superiors on Scientology in a few months and making some of *them* follow the same route. How long before he had altered the whole character, ability and effectiveness of the police force and through that how long before he would have civilized the whole approach to law enforcement in that area? For, once we have created an opening, we always avalanche to fantastically swift gains.

That’s the Special Zone Plan. Several hundred thousand are ready for the first steps. Those that aren’t trained as pro HPAs and HCAs could start in soon. There are special ways to get training at an Academy now. And even while awaiting this training and working toward clearing such Scientologists could begin to determine their zone goals and work on them.

Our impact on the society is already weighty. With Special Zone Plans we could move that impact up thousands of times greater and have in our present lifetimes our goals at least in part accomplished and a decent world to come back to again.

What do you think of it? Write to me in care of Central Organization HCO in your area to give me your views on the Special Zone Plan.

When you write please advise me as follows: whether you like or do not like the idea. If you like it tell me the zone you are in or would like to be in (what area do you want to help?). But whatever you say *please write* as your letter will be considered as a *vote*. We have arrived at a crossroads where our action now could well affect the future history of this planet.

CREATE AGAIN

As you know, the basis of a reactive mind is creativeness done below the level of consciousness.

The source of all engrams is the pc who creates a picture of the incident below his level of knowingness and recreates it into a "key-in". He uses the engram to warn and restrain himself, but this as a solution to trouble is a faulty one. It might have cured trouble once but like all cures became itself a new trouble.

In 1957-58 we attempted to handle this before we had HELP flat-flat-flat. Step 6, used then, made the whole bank toughen up, if HELP was unflat.

If a person is in any valence, he is victimized by his own creation. To produce or create anything is to invite a toughening of the reactive mind.

If HELP is flat on numerous terminals and if the E-Meter no longer reacts to help questions of any kind, the person is Mest clear. Only now is it really safe for any auditor to handle the subject of create.

Several things reduce the toughening up of a reactive mind due to aberrations concerning creation. Chief amongst these are *alternate confront* in any form, particularly general. Responsibility processes also reduce the bank's heaviness. Havingness also takes the edge off a bank. And of course *help* on terminals reduces a heavy or thick bank. Therefore Help, alternate confront and havingness are the keys. Responsibility is less workable in early stages since the pc is usually in some valence and when he says "I could be responsible for...." he means "Valence could be responsible for...." which runs in fact irresponsibility, not responsibility, since valence, not pc, is responsible.

There are some ways to run "create" in early stages before help is wholly flat on other terminals. Best of these subordinate methods is "What creation have you helped?" "What creation have you not helped?" One that is pretty high but sometimes works well if the person is not in a valence is "What creation could you be responsible for?" (Combination suggested by Dick Foster.)

O/W on other people's creations is not very good but very spectacular. Using create with alternate confront ("What creation could you confront?" "What creation would you rather not confront?") is of course workable.

Enough people are coming up toward or have arrived at Mest clear now that you had better have the next stage.

I would advise help and not help on creations until the needle is floating with no reaction to questions of any kind on them. Alternate confront on creations and havingness should still be used as in help.

But first be sure help is flat on all terminals including the thing the person came into Dianetics or Scientology to help and also flatten help on every terminal that has been contacted or run on O/W processes or any help process first. Then you can try the above.

HCO BULLETIN OF 6 JULY 1960

HCO Secs
Assn Secs
D of Ps

MAKING CLEARS AND PICKING UP HGC QUALITY

To the HCO Sec: IMPORTANT

To improve the auditing results of an HGC, put the following programme into effect: Results are good today but they can get faster in any HGC.

Appoint a competent Instructor from the Academy (not a staff auditor). Give this Instructor the many HCO Bulletins on Pre-sessioning, Model Sessions, Help, Alternate Confront, Havingness. Have him gen himself up on those and this present HCO Bulletin.

Convene the HGC, including the D of P, for one hour three days a week immediately after they complete auditing for the day.

Have the Instructor drill them on the following subjects:

First — Teach them Regimen 1.

Second — Get them easy with Model Sessioning.

Third — Get them easy on Pre-sessioning.

Fourth — Make them study all the data on Help, Alternate Confront, Havingness.

Fifth — Check them out on Dynamic Assessment, meters and flat needles.

Lay down and permit them to run as your first step, as of now, only the following:

REGIMEN 1

(Only Regimen I can be used until an auditor has excellent results on several pcs)

- (a) Assessment—ask the pc what is wrong with him. Take the pc's answer, make it into a general terminal. Run that and nothing else. When it's cooled off, assess again, same way, run that. Don't argue or dispute or change what the pc says except to convert it to a general terminal.

Example: Auditor: "What do you think is wrong with you?"
PC: "My wife."
Auditor: "OK, we'll run *a* wife."

Example: Auditor: "What do you think is wrong with you?"
PC: "I'm impatient."
Auditor: "Can you think of somebody who was impatient?"
PC: "My Father."
Auditor: "OK, we'll run *a* Father."

Example: Auditor: "What do you think is wrong with you?"
PC: "Well, I think I'm attenuated."
Auditor: "Did you ever know an attenuated person?"
PC: "Yes."
Auditor: "Who was it?"

PC: "George James."

Auditor: (since this is a specific terminal and we want a general one) "What was George James?"

PC: "A Loafer!"

Auditor: "OK, we'll run help on 'a loafer', all right?"

PC: "Fine."

When "a loafer" is flat, flat, we do the same assessment again and as above get a new general terminal.

- (b) Use as a process two-way concept help. Example: "Think of a father helping you," "Think of you helping a father," etc. Flatten it down to a no reaction on meter. (Lay meter aside for most of sessions. Use only to check.)
- (c) For a quarter of any session time run alternate confront. "What could you confront?" "What would you rather not confront?"
- (d) For a quarter of every session's time run havingness to end with—"Look around here and find something you could have."
- (e) Start session with checking for PTPs and ARC breaks. Handle PTP with "What part of that problem could you be responsible for?" only.
- (f) Handle ARC break with "What have I done to you?" "What have you done to me?" only.

Regimen 1 omits pre-sessioning. It does a rough kind of Model Session, as good as one can get but skip being critical of it.

It will take the instructor a week or two to get the staff to buckle down on Regimen 1 only. Don't let the instructor get off into anything else than Regimen 1 while teaching it, except these above points and the following:

1. Handle pc pleasantly.
2. Don't chatter at pc.
3. Get pc to execute every command given.
4. Run good TRs.

Now with the D of P, stress all auditing points *and* handling the auditors with heavy 8c. Teach D of P not to Q and A with auditor problems. Example: Auditor comes in, demands unusual solution. D of P gives it. Auditor comes back saying "It didn't work." It didn't work of course, because auditor never used D of P's solution. The only reply of D of P should be "What didn't work?" and all is revealed. D of P is taught not to give solutions or sympathy, just to demand adherence to instructions and get results. Auditors don't have personal cases where the D of P is concerned. The instructor must get this effective attitude into effect. Good 8c on staff auditors. No excuses accepted.

The instructor can be given this as an added assignment and can still instruct in the Academy. It's only 1 hour 3 days a week, probably between 3.30 and 4.30. Switch the tape hour in the Academy or something.

Now on *all new* staff auditors, use Regimen 1, no matter what else comes out that's new. While he's learning Regimen 1 he can still audit pcs. How? You ask the new staff auditor, "What process have you been most successful with?" He says, "8c." You say, "OK, that's what you run on pcs until further notice." Meanwhile he learns Regimen 1 out of session and when he has it cool, switch him to that. You could do this on the whole HGC staff while they learn Regimen 1 if desired.

SUMMARY

Here's the point on the above. An uncertain D of P or staff auditor is guaranteed if he or she is using stuff that's unfamiliar. Raise familiarity with the simplest version of modern processes and you raise confidence.

This is good for *any* HGC even if it is doing well.

And this *is* the way to handle new staff auditors.

You want clears? OK, build up the confidence of the HGC on a gradient scale. You'll have clears.

It is envisioned this programme will go on for months until it is complete and all auditors are handling all varieties of help and doing assessments well enough with meters to be turned loose with everything. They are turned loose on a gradient scale as they win.

It is also envisioned that staff auditors, like other staff members, will be getting auditing evenings or on staff clearing courses.

Regimen 1 is recommended for staff clearing courses.

THE ASSESSMENT OF HELP

You should realize at this stage that we are still feeling around for the most adequate and fastest method of running HELP. Everything which has been given to you thus far is near the mark, and pre-sessioning, model session and flattening help are right on the mark. However there are certain things that make auditors unhappy with running help. Chief amongst these is the fact that it is a tremendously restimulative process when one has not had any run. This means that we had better get the staff theta clearing course or staff co-auditing going fast on a supervised basis.

The second thing is that help does not flatten very easily on a late specific terminal. Of course, this is true of all processes. But help is a peculiar process and is slower on late terminals than other buttons, and here is why.

Help resolves cases because it is the basis of all association, and as you know association leads to identification. And identification is the basis of all mental upsets. The action of help is not aberrative. The failure to help is what does it, or the lack of things to help. However all valences and all identification stem from this button and no other. Now do lights dawn and bells ring? Help is the button which, if run, settles all difficulties with association and identification and all problems of beingness.

Thus there is something peculiar about help which is not true of any other button. Any help run is a gain even (Gawdelpus) if it is left wholly bogged with a half hour comm lag. All bits of help run are chewing away at all tangles of identification. So chew away and to the Dickens with it. Any help run is better than no help run. And because the PC is a bundle of aberrated identifications, any help run untangles some of him. And any help run on any terminal tends to "get at" any other terminal.

So that's why help run in any old way will sooner or later make the grade. But this is no reason to believe there are not also smart ways to run help.

Any late specific terminal, being so confounded far from basic-basic on the time track, runs tough and endlessly. Therefore as always it is better to run general terminals than to run specific terminals. However in the case of a PTP you can go ahead if you have to and run help on the PTP personnel, but as soon as the edge is off the PTP for Heaven's sakes shift to the general form of the specific terminals you have been running, and flatten those a lot or a little.

Keep a very close record of what you have run on help as the only precaution you have to take, and when the PC is running toward mest clear check back with help on these terminals and make sure they are flat. When a lot of help has been run on basic material then of course you will find that what ran very arduously before will now run much better. It is almost a waste of time to run specific terminals, but still you must run things that are real to the PC, and if only yesterday was real to him then you are stuck with running the PC on later terminals or even specific terminals.

A much faster way to run help than by sorting out real terminals on an E-Meter (which is still necessary sometimes) is to do an assessment on the PC using help and the dynamics, and finding a button that is entirely off dynamic and that the PC can't imagine helping. This is a trigger to a case. Unusual results happen very fast.

Another way to go about this is a simple questioning of the PC on the subject of his dislikes. Watch the meter and when you get a silly reaction on a dislike, like a rock slam or a heavy drop or a sudden theta bop, then pick this out, make a general form out of it that registers like the first mention, and run that on the PC. This is a rather loose and sometimes misleading assessment. But remember that all help run leads to untangling all buttons and so it is a perfectly good approach, and as the PC gets run on something he is awful darn sure he ought to be run on he is often very happy and co-operative in this. Whereas on a dynamic assessment he is made intensely curious as he didn't know he was aberrated on what you found out. In other words just asking the PC what is wrong with him, getting it into a general form that registers on the meter and running Help O/W or concept help on it, is good reasonably fast processing. It is better than assessing for just a terminal that drops or for a specific late terminal that drops.

As a comment it should be noted that help is the last thing that folds up in the dwindling spiral of aberration. About the first thing that folds up is interest. But when it is gone there are still three buttons left on which the person can function. The next one to go is communication. This becomes a contest of overts as in the ARC breaky case. Anybody below this lives his or her life this way. The next one to vanish is control. So don't be surprised to find somebody around who does plenty of overts and who can't stand control who can yet be run on help and who can still function in life. When interest, communication, control and help are gone, that's it. You haven't got a person left. So beware people who are below help. Beware of them in living. But in auditing when you can't get HELP to bite at all (and if he can talk to you you can get help to bite) you have nothing left but the CCHs. You can make it on them too but with tremendous investment in hours. And when you've got the CCHs flat then you can start running help.

But as I said above I have not yet been able to say the PERFECT way of running help. I am still investigating it like mad and am giving you all the gen as it comes visible. However have patience with me. I have learned that people not only have it twisted a bit, they've got it shattered, and that's the majority of people. So we're in there slugging away and we're making clears, and if I get hold of any faster ways to do you'll be the first to get the gen.

CURRENT RUNDOWN

CONCEPT HELP

Concept processing is very old (1953). The original version of concepts goes:

“Get the idea of”

The modern version of Concept Help O/W goes:

“Think of helping a”

“Think of not helping a”

Two-way Concept Help goes:

“Think of a ...helping you”

“Think of you helping a”

Five-way Concept Help would go:

- (a) “Think of a ..helping you”
- (b) “Think of you helping a”
- (c) “Think of a ..helping others”
- (d) “Think of others helping a ..”
- (e) “Think of a ..helping a ..”

Concept Help has the value of being below, in its effect, the level of articulate thought which of course means that it bangs away at reactive thought.

Just exercising a pc in thinking at command is a sort of CCH on thinkingness, with which, of course, pcs have trouble. They have more trouble with creating than thinking and concepts are more in kind with confronting than with creating. Making a pc invent answers is, of course, right on his worst button. Therefore Concept Help goes a long ways on a case. It is quite unlimited, no matter what form is run, so long as some attention is paid to flow direction. (A flow run too long in one direction gives anaten—unconsciousness, remember?)

ALTERNATE CONFRONT

Concept Help, however, has the liability of making things “muggy” at times because of its indefiniteness.

Aside from create, the primary button that is awry (but which cannot be directly attacked without often overshooting the case or involving it in heavy bank reaction), the next things mechanically wrong with a pc would be unconsciousness and confusion. Help, of course, is the primary point of association and identification and is WHY things go wrong with a pc. But a scale of WHAT is right with a pc in descending order of importance would be, as above:

Creativeness
Consciousness

Order
Control

and these would be flanked by the things wrong with these items which make them decline:

Create—Irresponsibility
Consciousness—Refusal to confront
Order—Unwillingness to bring order
Control—Lack of control.

Help fits in somewhat on this order. One creates to help (and fails). One goes unconscious to help or makes another unconscious to help him/her (and fails). One sees difficulty for others in too much order, seeing that two systems of order clash, and lets down his to help.

One conceives that control is bad and ceases to control and resists control to help others. These are all wrong helps, apparently, and when done, bring about aberration.

Aberration consists, evidently, of wrong-way assistance as follows:

Optimum Condition -----> Response -----> Resulting Condition
Creativeness -----> Irresponsibility -----> Disowned Creations
Consciousness -----> Non-Confront -----> Unconsciousness
Orderliness -----> Unwilling conflict -----> Confusion
Ability to Control -----> Consequence of control -----> Mis-control.

Confront is a remedy for the consequences of the first three conditions and also communication. An auditing session itself by its TR mechanics, improves control and communication. Therefore Confront in one form or another is needed in routine sessions.

Havingness is an objective and somewhat obscure method of confronting and using it as we do objectively, it is a specialized form of confronting, possibly its best form, objective or subjective, even though a series of subjective havingness in Washington in 1955 tended to show that profile gains were not made by subjective confront, a conclusion still subject to further checking.

Confront straightens out any “mugginess” churned up by Concept Help. No vast tone arm improvements should be expected from Alternate Confront, but even if it doesn’t work well, like havingness, as a primary process, it has very good uses. Alternate Confront gives us a stabilizing tool. Pc feels weird = run Alternate Confront. He’ll feel saner. Following this subjective process with the best objective process, havingness, we achieve stability for the gains reached by a help process.

As a comment, beingness is more involved with havingness than with confront.

Confront, on short test, can be run lop-sided, and does disturb the tone arm. “What would you rather not confront?” run all by itself in *one* pc (a BMA type test series!) did very well. “What can you confront?” of course did very well. Alternate Confront has enough wrong with it to be poor as a process for getting gains but wonderful as a process for stabilizing a case. I’ll run some more tests on Negative Confront and let you know. But it is a fluke. By theory it is improbable as it is a cousin to the no-good “What could you go out of communication with?” But “What could you withhold?” is the greatest IQ raiser known! And it works. So perhaps Negative Confront, “What would you rather not confront?”, will work too. Of course it’s a fundamental button. All unconsciousness, stupidity, forgetfulness and enforced beingness result from problems in confronting.

IDENTIFICATION

A=A=A=A is as true today as it ever was. The inability to differentiate is, of course, a decline in awareness. Identifying Joe with Bill or Rocks with Smoke is loony. This is identification, a word that is amusing semantically, as its exact opposite, “Identify”, is its cure, but is the same word!

Association of things or thoughts into classes is considered all right and may even be necessary to “learn” things. But this is the middle ground, already half way to lazy thinking.

Help, as assistance, is an identification of mutual interest in survival. Thus we have (1) possible confusion of beingness and (2) continuation. This makes *help* ripe for trouble. When one *fails* to help he keeps on helping! No matter how. He does keep on helping what he has failed to help. One of many mechanisms is to keep the scene in mock-up.

Help is a fundamental necessity, it appears, to every person. But it is dynamite when it goes wrong.

As a symptom of its continuance (survival factor—see Book ONE) pcs running help readily get the idea that help on some terminal “will never flatten” even though it is flattening nicely!

To handle this as a special item, one can run the confront part of a session with “Continuous Confront”, the Alternate form of which is:

- (a) “What could you continue to confront?”
- (b) “What would you rather not continue to confront?”

The positive form (a) can be run alone for case gain. And I am going to test the negative form (b) as a single run to see if it can be “gotten away with”. In theory, as all anaten is unwillingness to confront and as all help is continuous survival, form (b), Negative Continuous Confront, should do marvels for IQ and *may* become the proper companion for help processes if the session is *ended* with havingness.

At the present moment auditing routine is:

- Pre-session
- Model Session
- Help Processes
- Alternate Confront
- Havingness

all in every session.

SOME HELP TERMINALS

ASSESSMENTS

The basic method of finding a help terminal is of course the E-Meter, using an ordinary or dynamic assessment.

A simple and very satisfactory way of making a pc happy and getting results is to ask the pc what he thinks is wrong with him/her and run whatever the pc says—providing it's a terminal—in a general form. If it's not a terminal, get the pc to convert it to one.

Example: Auditor: "What do you think is wrong with you?"
PC: "My wife."
Auditor: "OK, we'll run *a* wife."

Example: Auditor: "What do you think is wrong with you?"
PC: "I'm impatient."
Auditor: "Can you think of somebody who was impatient?"
PC: "My Father."
Auditor: "OK, we'll run *a* Father."

Example: Auditor: "What do you think is wrong with you?"
PC: "Well, I think I am attenuated."
Auditor: "Did you ever know an attenuated person?"
PC: "Yes."
Auditor: "Who was it?"
PC: "George James."
Auditor: (since this is a specific terminal and we want a general one) "What was George James?"
PC: "A Loafer!" Auditor: "OK, we'll run help on 'a loafer', all right?"
PC: "Fine."

TERMINALS BY PROFESSION

There are however some "professional" terminals you can run which do a lot for a case.

Find out what the pc was professionally in this lifetime and sort out what this profession helped as a terminal and run that.

Then run the beingness of the pc in this lifetime as a terminal and you've cleaned up a lot of track.

Always use, of course, the general form of any terminal—not Aunt Agatha but *an Aunt*. Not "the works mechanic at Pulman" but a works mechanic or a mechanic. The less adjectives the better.

This does much for a case, and rapidly.

ASSESSMENT BY GOALS

A pc also gets very happy when you run a beingness the pc is trying to be or hopes to be or even once hoped to be.

For instance, the pc wants to be a painter or wishes he were a painter or wishes he could be a painter again. Fine, just run help on “a painter”.

The pc wanted to be a singer. Run it as “a singer”.

The pc is trying to be a good housewife or husband. Fine, run “a housewife” or “a husband”.

In short, when you explore why the pc wants to be processed the pc often is either trying to correct something wrong (see above) or is trying to be something. Your assessment is done when you establish either item and the pc will recover, do better and be very happy with you.

RECOVERY OF PAST SKILLS

When a pc is getting processed to be able to recall Sanskrit or German, *if* the pc is in good shape by reason of other processing as above, you can recover it for him by finding out *what* spoke the language or had the skill and run Concept Help on that terminal.

Example: (typical) Pc can't learn Spanish, desperately wants to learn Spanish. E-Meter will tell you it's overts against the Spanish people (or Iberians) that occludes it all. Overts, run, will improve the situation but *help*, neglecting the overts, should recover the ability. Run “Think of helping the Spanish people (or Spain or whatever falls hardest on the overts)” and “Think of the Spanish people (or same as first command terminal) helping you.” Level it off with a version of Continuous Confront and Havingness on the room and you should attain the goal.

ODDBALL PROCESSES

Some particularly vicious and penetrating terminals can be run on a pc providing his case is already in good shape.

These terminals stem from HCO Bulletin of July 14, 1960. They are run in the order below:

a confusion
an unconscious person
a creative person.

Two other deadly terminals that probably should be used to finish off the last stage before clear on an auditor should be “a victim” and “a practitioner”.

Concept Help is the only known version of help that can be run on the five terminals named here as the first three are the fundamentals of a reactive mind.

“A responsible person” can be run before “a creative person”.

These are all rather deadly, over-the-average-ability-to-run, terminals so they should be reserved for the end of clearing.

By the way, just as a comment, clearing is happening with help processed in various forms and by various auditors, around the 250 hr mark, with no reference to time spent on earlier auditing. This is an early datum, based on two cases. On one of these there was auditor trouble and a change of auditors. The processes used were:

Help O/W
Concept Help
Confront Havingness.

The terminals used on these two cases were selected by myself, which renders this data specialized.

DOUBLE ACTION CYCLES

POLICY ON NEW DATA

Although no change is anticipated on current processes, Regimen 1, Pre-session, Model Session, and Help, since these are making clears very easily when well assessed and letter-perfectly run, I still have a research line running and new facts appear. Thus I will continue to present this data even though it is not for immediate use in processes.

OLD ACTION CYCLES

The oldest cycle of action is of course the early Vedic hymn, probably written by the monk Dharma himself, so far as I recollect. It shows the dawn becoming the day, becoming the night, and out of nothingness a progressive development into a new nothingness. This has been written as, I think, "The Hymn to the Dawn Child", available probably in most libraries as the Vedic Hymn.

The next cycle of action is the Create—Survive—Destroy of early Scientology. The dominant part of this cycle of course appeared in Dianetics as the primary law of Book One—Survive. The Dynamic Principle which motivates most biological life is SURVIVE.

The more fundamental urge of a thetan, as different from biological existence, is Create. Thus, in *Fundamentals of Thought*, the cycle of action becomes Create-Create-create-create—No create (or Counter-create).

Survival is the apparenity of creating. Creation brings about an effort to continuously create which becomes "Survive".

DOUBLE CYCLES

It is interesting now that behaviour, particularly as applied to work, is easier to understand by a closer viewing of the cycle of action.

There are two "double actions" in the cycle which give a better grasp of the actual value of a worker, as well as other areas of life. These then become valuable, at this time, as an evaluation of human beings.

The lowest double action in the cycle is the most difficult to handle when it is present in an organization. This is "destroy in order to survive".

We see this most easily to-day on the Fifth Dynamic with Eating. One destroys form in order not to die. One kills to live. Of course this involves some very degrading consequences as it is not a duplication. Out of this we can evolve the overt-motivator sequence.

Duplication would be "killing in order to die" or "making survive in order to survive". As soon as one "Destroys in order to Survive" he is in a mis-communication situation. There is no duplication possible. Individuation results. The intention is double and contrary. One destroys something over there in order not to be destroyed over here. The violation of duplication brings about the upset of feeling bad here when one tries to kill there.

There are too many workmen who enter this upon the whole programme of work. Around them machines, structures and people collapse. Such workmen are trying to survive only by destroying everything around them. And this reaction is not confined to workmen. Anyone in an aberrated state may have some tinge of it.

Another double cycle action is to create in order to survive. This is fairly sane. An artist sometimes will not work unless his survival is threatened. Then he creates. This principle of threatening survival is common to most actions in business and the arts.

The middle ground double is of course making things survive in order to survive. As Survival is translated for processing as Continuous Confront (“What could you continue to confront” + rather not continue, etc) we can find persistences in this category.

We also see “destroy in order to be destroyed” and “create in order to be created” in phases of life.

Probably the worst double is “destroying in order to survive” and the most susceptible to psychosis is “creating in order to destroy”. Science, dedicated to the last as weapons people, go quite mad. And even the farmer’s decline is found here.

Concept running on these doubles is quite interesting. “Destroying in order to survive” is the first concept to be run, being the lowest.

USE IN PROCESSING

All this data is of value in the area of theta clear processing to operating thetan.

L. RON HUBBARD

P.S. I am developing some processes which promise to run out engrams about one thousand an hour for a theta clear while holding havingness up.

P.P.S. I am getting some intensives and am stabilising along the + theta clear level. It’s wonderful. Standard modern processes are being used.

HCO BULLETIN OF 4 AUGUST 1960

Fran Hldrs

REGIMEN 1

For some time it has been obvious that we needed an auditing procedure that would serve to train auditors using for the first time Model Sessions.

Some weeks ago I developed "Regimen 1". This was primarily for use in training HGC auditors. It has been so sweepingly successful that it is here given for general field use.

It must be clearly understood that a complete session would consist of pre-sessioning, the exact use of Model Sessions, and the new techniques that are producing Clears. Regimen 1 then is a stop-gap bridge between old style formal auditing and a complete grasp of pre-sessioning and Model Sessions.

It is intended when using Regimen 1 that the auditor come as close as possible to a Model Session but not be critical of it. As Regimen 1 is more and more used by the auditor he should continue to study Model Sessions (HCO Bulletin of February 25, 1960) until he can do one letter perfect.

Once he has the Model Session pat he should then study up on pre-sessioning until he has that perfect.

Naturally all the TRs and knowledge of the E-Meter go into a session. These, with pre-sessioning, the Model Session, give us an auditing form which should be mastered before complete clearing results become inevitable.

REGIMEN 1

(Only Regimen 1 can be used until an auditor has
excellent results on several pcs)

- (a) Assessment—ask the pc what is wrong with him. Take the pc's answer, make it into a general terminal. Run that and nothing else. When it's cooled off, assess again, same way, run that. Don't argue or dispute or change what the pc says except to convert it to a general terminal.

Example: Auditor: "What do you think is wrong with you?"
PC: "My wife."
Auditor: "OK, we'll run a wife."

Example: Auditor: "What do you think is wrong with you?"
PC: "I'm impatient."
Auditor: "Can you think of somebody who was impatient?"
PC: "My father."
Auditor: "OK, we'll run a father."

Example: Auditor: "What do you think is wrong with you?"
PC: "Well, I think I'm attenuated."
Auditor: "Did you ever know an attenuated person?"
PC: "Yes."
Auditor: "Who was it?"

PC: "George James."

Auditor: (since this is a specific terminal and we want a general one) "What was George James?"

PC: "A Loafer!"

Auditor: "OK, we'll run help on 'a loafer', all right?"

PC: "Fine."

When "a loafer" is flat, flat, we do the same assessment again and as above get a new general terminal.

- (b) Use as a process two-way concept help. Example: "Think of a father helping you," "Think of you helping a father," etc. Flatten it down to a no reaction on meter. (Lay meter aside for most of sessions. Use only to check.)
- (c) For a quarter of any session time run alternate confront. "What could you confront?" "What would you rather not confront?"
- (d) For a quarter of every session's time run havingness to end with—"Look around here and find something you could have."
- (e) Start session with checking for PTPs and ARC breaks. Handle PTP with "What part of that problem could you be responsible for?" only.
- (f) Handle ARC break with "What have I done to you?" "What have you done to me?" only.

Regimen 1 omits pre-sessioning. It does a rough kind of Model Session, as good as one can get but skip being critical of it.

GENERAL REQUIREMENTS

Naturally there are some general requirements which make up the background music, or lack of it, in sessions, and while there may be many of these, four of them are vitally important. These are:

1. Handle pc pleasantly
2. Don't chatter at pc
3. Get pc to execute every command given
4. Run good TRs.

It also goes without saying that one should follow the Auditor's Code in session as well as the Code of a Scientologist out of it.

So far as the Auditor's Code is concerned, the only modern error which keeps repeating itself and coming to attention is "evaluation". Apparently this is because very few newly trained auditors have a good grasp of what evaluation is. Briefly, evaluation consists of telling the pc what to think about his case. This is something an auditor should never do. It is directly contrary to Scientology practice, and enormously inhibits a pc's gains. Nothing will cause an ARC break like an evaluation. An example of this is to say "Good" with a question mark on it, or to say "All right" as though you don't believe the pc.

Another difficult point in auditing consists of the auditor thinking he has to *believe* the pc utterly and accept his story completely in order to have any reality with the pc. A little study of this will demonstrate that one acknowledges what the pc believes. He acknowledges it as something which is believed by the pc. The auditor is quite entitled to his own opinion of it and quite ordinarily supposes that the pc will change his idea of it after more auditing, but this does not mean that one should take what the pc says in a state of mind of "Well that's reality for you, but I have my own reality on the situation."

There is at this late date, now that we have the various TRs, no excuse for command flubs. An auditor should not make errors. If an auditor is found to be making errors he should get himself run on Op Pro by Dup.

THE LAWS OF ASSESSMENT

The most important part of auditing is assessment.

This became apparent when I realized that I had assessed all the clears of the 20th ACC and most other clears. Therefore, it follows, I must have been doing something in assessing that I had never articulated and with the advent of the 1st Saint Hill ACC, I managed to do this for Dick and Jan. I have reduced a file cabinet of data on assessing, not before co-ordinated, to two primary laws as the common denominators of assessing.

While assessing still requires judgment, we now can check proper assessment and can begin to teach accurate assessment.

This is a preliminary paper on the subject.

The Laws of Assessment are:

- I: A thetan's Reality on a terminal depends upon the degree of outflow a thetan can tolerate from that class of terminals.
- II: A thetan tends to become that on which he has produced non-beneficial effects. A thetan tends to move from source beingness to effect beingness.
- III: A thetan tends to maintain a position on the tone scale where inflows are comfortable and to change that position it is necessary to accustom him by auditing, to higher terminals.

LAW I

The fall registered on the E-Meter, when a terminal is mentioned, registers the amount of inflow the thetan is aware of. When he is not aware of inflow he is totally unreal on it or he is completely aware of the terminal.

Therefore when any terminal is mentioned to a pc it will be:

- (a) Too forceful
- (b) Barely tolerable
- (c) Completely real
- (d) Too weak
- (e) Ignored

The E-Meter registers on (b) type terminals with a fall. It registers on (a) type with a rise or no reaction. It does not register on (c) type.

A pc has no concept of (a) type. Even though he flinches from it (steady needle rise) he does not *know* it. He cannot confront on (a) type but may not even realize it.

A pc reacts to (b) type because it is slightly above his tone scale position but is difficult to confront. Therefore he can be run with moderate success on any terminal that produces a fall.

A pc does not react to type (c) since he can confront it with comfort.

Type (d) is so weak that a thetan at a higher position tends to outflow toward it and thus possibly interiorize into it.

Type (e) terminals are too insignificant to a thetan in any given tone scale position and tend to be ignored. They are still real.

LAW II

A thetan moves from source beingness to effect beingness so therefore any time a fall is noted on an E-Meter, it can be assumed that the thetan has become an effect beingness. It is necessary to find what would create or handle the terminal that caused the fall. This is better to run than the fall terminal, even though it barely checks a rise.

One runs causative terminals always, never effect terminals. But what may seem an effect terminal to the auditor may be a causative terminal to the preclear.

LAW III

Always seek to run terminals that do not clear by two-way comm and which are causative to some slight degree to terminals that produce a fall on an E-Meter.

A TERMINAL IS IMPROPERLY ASSESSED IF IT DOES NOT CLEAR DURING AUDITING

1. Produce a loosening and a tightening of needle action;
2. Produce a change of position on the tone arm of at least (minimum) three tones of difference up or down per hour of auditing;
3. Produce longer and longer periods of loose needle as the intensives continue;
4. Produce a change of comm lag from command to command in the pc;
5. Produce cognitions; and
6. Improve the ability of the case to confront.

VITAL INFORMATION

Having developed now a process package which makes Mest Clears, Theta Clears and OTs without further special uses on many cases, I hasten to send you the data and ask that you yourself at once get audited on it and audit those persons who are surest and best around you in order to obtain a "control of areas" with the increased ability.

Nothing in this process discards the main line of theory of Dianetics and Scientology but since results can be obtained so swiftly with it, it must be asked that persons uneducated in Scientology must not be run too far on it, as they will obtain high levels of action without any understanding which would be an overt against them. In short, do not complete this process on any pc beyond the level of Mest Clear unless the pc has been sent for a course. This will save considerable upset and instability in the long run. It is a technical fact having nothing to do with economics of Central Orgs.

The only overt we can do is to fail to disseminate correct data. We can refuse to process without any overt occurring. But we cannot fail to disseminate without an overt. Study it out and you'll see it's true.

I will not give you much theory on this at this writing beyond a statement that all apparent dynamics on people are inverted from their sixth dynamic and that the theory of confusion and the stable datum is paramount here.

In the process we remove the confusion and permit the pc to release the various terminals and ideas.

Later assessment and the running of terminals is probably needful.

The basic process was looked for first in 1951. There was a lecture on it called "Motion and Emotion" and a talk about the "governor" of a pc's speed of advance. Since then I have had to search very hard and it has taken eight years to match up processes to hit at this.

I have now done this.

The rundown is as follows, every session:

Pre-session
Model Session
Help
Alternate Confront
Havingness

The thing on which Help is run is MOTION. The commands are these:

"What motion have you helped?"
"What motion have you not helped?"

Do not run "What motion could you help" or any invent process. Help, being a responsibility process, gives us the only practical way to get the pc to face a non-terminal like Motion.

This is Mest Clear Route, Theta Clear Route, OT Route.

If the pc runs to flat meter, assess for a terminal, run that terminal flat, then run more Motion as above exactly. The assessment is the most difficult part. If the assessment is right one gets a fast run, if wrong, it takes ages.

But start now on Motion.

We're off the launching pad. Glad you're with us.

POWERFUL PRESESSION ADDITIONS

Pre-sessioning had some missing points in it which I have been filling in in order to clear as many 1st Saint Hill ACC students as possible.

Seeing that students were not obtaining as much tone arm action as HGC auditors would for the same amount of auditing it was necessary to study the fact. Students audit each other without altitude and so I had to resolve *altitude* as such.

Altitude is the factor that makes a pc receive and execute an auditing command. Any good auditor in the field and certainly HGC auditors audit from altitude. Therefore they get more tone arm action and faster clearing. Students auditing each other audit without altitude. As one can't build up the altitude of students to one another, it was necessary to reduce the need of altitude on the part of the pc.

I have developed then a new pre-session step at the level of *control* to care for altitude. It turned out to be a possible one-shot clear command.

This step should be run hard on any pc and very hard on pcs who do not have much effect on their banks. Many pcs cannot run a "think" command. The gradient of cases is the increasing ability to affect the bank with new thought. A low level case can't. A high level case can.

As low level cases also cannot execute an auditing command cleanly without alterations, vias or non-execution, it follows that the *process* run is not in question. What is in question is the pc's ability to follow a command.

Therefore if a tone arm on an E-Meter does not swing at least through 3 tones in an hour of auditing the pc is not following the command clearly or the pc can produce small effect on his own bank. If such a condition exists then the pc is allergic to orders and will be a slow case or hangfire in auditing.

The remedy of this is a pre-session process at the level of Control.

The process is Pre-session Control Processing.

The commands are:

- (a) "What order was disobeyed?" or
- (b) "What intention was not followed?"

If (a) does not work go to (b). In any event eventually run both (a) and (b) at the level of Control in Pre-sessioning.

As this is a heavy gain process, if the pc is low scale on a graph, run it instead of help in a Model Session for many sessions.

Pre-session Commands which are now set are:

PRESESSION INTEREST: (Live or Die)

“What is worse than death?”

PRESESSION HELP: (two-way help on auditor-pc)

“How could I help you?”

“How could you help me?”

PRESESSION CONTROL:

“What order was disobeyed?” or

“What intention was not followed?”

PRESESSION COMMUNICATION: Rapid handling of possible overts. There is a set procedure for this that removes life computations which will be expanded later.

As noted, *Pre-session Interest* (Live or Die) belongs actually fourth as *Interest* and may be so placed later.

On the new Pre-session Control Process the tone arm is the clue. If it doesn't shift rapidly (3 tones at least per hour of Help processing) the remedy is the Pre-session Control Process as given above.

HCO BULLETIN OF 25 AUGUST 1960
Issue II

NEW DEFINITION OF PSYCHOSIS

After a careful study of cases, based on new data, I have a method of detecting and an answer to psychosis which is simple and useful.

The lower a person is on the tone scale the less they can receive and follow orders and directions.

That person who raves and screams at the very thought of receiving an order is of course completely insane.

That person who obsessively fights an organization that gives him clean instructions to help him is, of course, insane.

All persons who have been too much around a bad military or who have had military fathers are very likely to be subject to a derangement. This derangement multiplying brings an insanity. They rave and scream if even their best friends try to help them.

What is gone is the control level. Help may still be there but on obsessive cause of help only. No help may be received.

Look around you, look it over. The criminal will not receive the orders called law. The psychotic will not receive the orders that bring real help.

This gives you a real weapon.

A psychotic is that person who cannot receive orders of any kind, who sits unmoving or goes berserk at the thought of doing anything told him by another determinism.

Want to know if they're crazy? Give them a simple order.

REGIMEN TWO

Regimen Two requires no assessment.

This regimen is run with pre-session and Model Session and contains a complete set of processes for the Model Session.

MODEL SESSION

It should be noted that the *patter wording* of a Model Session is what is set and fixed. By always using the same words to open, continue and close a session, to begin and end processes, a duplication of sessions is achieved which as they continue, runs them out. The patter wording of a Model Session should be learned by heart and not changed. The commands of regimens of processes used in Model Sessions may change. But not the patter. It is this patter which makes a Model Session a Model Session, not the commands run in it.

ASSESSMENT

No assessment is used in Regimen Two. The E-Meter is employed to determine the advance and stage of case. Advance is determined by change of tone arm position and loosening or tightening of needle, per unit time of processing, the sensitivity knob always being set the same, session after session. The stage of case is judged by the rapidity of the repetitive loosening and tightening of needle action and the width and rapidity of change of the tone arm.

CLEAR INDICATION

When a case has at last a steady tone arm near clear reading for the sex of the pc and when the needle is loose and does not respond to elementary pre-session questions, the person is Mest Clear. (See chapter on this in Book I and read it carefully.)

STEPS OF REGIMEN TWO

Step (a) “What motion have you helped?”
“What motion have you not helped?”

Step (b) “What can you confront?”
“What would you rather not confront?”

Step (c) “Look around here and find something you could have.”

Step (a) is run for the bulk of the session and Steps (b) and (c) are given equal times at session end.

Step (c) may be run at any time if pc's havingness drops. Step (c) must however always be run until the pc can have each one the bulk of the objects in the room.

Cases which do not respond to Regimen Two should be pre-sessioned until the tone arm becomes active, no matter how many sessions this requires.

PRESESSION TWO

A reshuffling of theory during the past few weeks in order to improve all ACC cases and clear as many of them as possible has given us new weapons for the difficult case and new heights for all cases with evidence of increased speed in processing and easier handling of processes by auditors. I have been very busy on this and myself received some eighty hours of processing to iron out commands and get a subjective reality by case synthesis on these new approaches.

I evolved a new basic theory of processing from observation of what did not move some ACC cases and what did.

This has been a strenuous research period and though by no means at end, results should now become much easier to obtain in other areas.

Pre-session Two is not composed of new processes but is a new combination.

In 1956 I discovered that talking reduced a difficult pc's tone level. Now it is obvious that *no* significance process moves a low graph case. Therefore, Pre-session Two is to be used on *all* cases until a pronounced change of tone arm and needle reaction is attained as below.

Pre-session Two cannot be run without a good E-Meter.

When a pc has been steadied at his clear reading by many sessions of Pre-session Two then Regimen Two (or Three as will be issued) may be embarked upon.

PRESESSION TWO

The pre-session is begun by stating to the pc, "If it is all right with you, we will begin auditing." On his assent the auditor says (Tone 40), "Start of session. We will begin by running havingness. Here is the first command," and gives it.

No discussion is begun or permitted with the pc, no rudiments. No chatter. The auditor starts briskly and crisply and invites no discussion of anything and if any is offered by pc, says, "We will take that up later on in processing. Right now we have to begin."

A case can be retarded by talk in its first stages. Therefore, no talk, just processing.

The Havingness Process is "*Look around here and find something you could have.*"

This is run to a loose needle and any closer approach (up or down) of the tone arm to the clear reading. The best action on which to end the process is a "blow down" of the tone arm (or a "blow up" in the low tone arm case), meaning a sudden approach of the arm from a non-optimum reading toward the optimum read. The first "blow down" (or "blow up") is the signal to change to the second process.

The auditor then says, "I will run two more commands of this and end the process if that is all right with you." And then does so. When he reaches the last command he says, "That was the last command of this process. Is there anything you would care to say before I end the process?" He acks whatever pc says, keeps it brief and then says, "End of process." At once the auditor adds, "We will now begin alternate confront if that is all right with you. Here is the first command." And gives it.

The commands of alternate confront are:

"What could you confront?"

"What would you rather not confront?"

This process is run to a relatively tight or sticky needle and, secondarily, to an abnormally high or low tone arm.

As soon as the meter shows the pc is now "getting sticky" the auditor says, "I will run two more commands of this and end the process if that is all right with you." He does so and says, "Is there anything you would care to say before I end this process?" The auditor acks whatever pc says, keeps it brief and says, "End of process (not Tone 40)."

At once the auditor says, "We will now begin havingness if that is all right with you." He acks pc's consent and does so. "Here is the first command. Etc."

The action of the tone arm is the signal to change processes—loose needle to change from havingness, tight needle to change from alternate confront. This may take three minutes to happen on either process or a half an hour. There is no set time. It is all done by the E-Meter.

One runs these two processes one after the other, on and on, pre-session after pre-session, until the tone arm is stabilized at the clear reading. Then one begins Regimen Two (or Three).

That is the entirety of Pre-session Two. No goals, no check-out on help, control, comm, no PTPs, no ARC breaks handled. It runs out PTPs and ARC breaks anyway.

It is smoothly audited, crisply with good TRs, almost muzzled.

This will move any case that can go through the action of the commands.

Even if the havingness does not seem real to pc, keep pc at it. It will become real by and by.

The alternate confront answers do not have to be subjective but usually will be.

Here is an auditor trick that permits better attention on pc's answers and less command mistakes on alternate command processes. When you give the plus command (could you) put your thumb on your index finger. Hold it there until it is answered. When the minus command (rather not) is given, put your thumb on the second finger tip until it is answered. This sets up a physical universe tally and keeps one from mucking up the command sequence without having to "hold it in mind". This permits better observation of the pc. If he fogs out and needs the question again, thumb position tells the auditor which one it is without recall. I have been using this to free up all attention units for observation of pc and meter and find the additional attention helps the pc. The thumb system is done unobtrusively, of course. This may seem a bit silly to propose but your auditing attention is for the pc and the state of the meter, not holding a command like a concept. The mental holding of the command starts some uncleared auditors into self-audit during a session and may be a cause of session self-audit.

A pre-session is ended by the auditor asking after his last "End of process", "Do you have anything you would like to say before we end this session?" He can now take up whatever the pc says and gracefully ease the session to a close. The pre-session activity is closed by saying,

“I am now going to end processing for (this morning) (this afternoon) (today) (tonight). Here it is. (Tone 40) End of session.” He can add, “Now tell me I am no longer auditing you (this morning) (this afternoon) (today) (tonight).”

AN AUDITING PRESESSION

In actuality, a pre-session of this type is a session of sorts, minus rudiments and end rudiments. But in very real actuality I now find a pc isn't enough there before he is consistently reading at clear to do anything but cut up his havingness with talk in session. His postulates aren't sticking well yet. He ARC breaks unexpectedly. Any talk by the auditor invites upsets. And havingness and alternate confront handle PTPs and ARC breaks better for somebody who reads off clear than most other processes. Further, as above, the more pc talk, the more chance for flubs and ARC breaks.

SUMMARY

Pre-session Two is based on the theory that one is taking the 6th Dynamic off the Seventh Dynamic. This is opposed to taking the Seventh Dynamic out of the Sixth Dynamic. There's so much to this and so many mechanical facts involved that I'm going to write a book about it shortly as it's too lengthy for bulletins.

We're going right ahead now and make *lots* of Book One Clears through the HGCs and the field. Only these will be whole track Book One Clears. Pre-session Two and Regimen Three are the first process arrangements I have done which require only repetitive commands, no assessment or judgement of a case beyond E-Meter needle and tone arm readings. As assessment and discussion with the pc have been the major impediments to broad modern clearing by others, I am happy to be able to remove them. It has been quite a feat. As this also gets those stuck arm, stuck needle cases really going, some moving swiftly for the first time, I feel we've achieved something. The processes have been to hand but a new theory of processing had to be evolved to isolate them from thousands of other good processes and to get them run exactly right in the correct order.

Pre-session Two, by the way, is not for HAS Co-audit use or any co-audit use, where meters are not in every auditor's hands. It is vital that they be run by meter. Otherwise these two processes just stall each other. Co-audit people would just get involved in engrams here and there and be unhappy. Use help on supervisor-assessed terminals in co-audits. It's good. Don't run alternate confront. Run havingness afterwards if you like.

One further comment on needle action in running Pre-session Two. The fastest case advance is probably achieved by getting off alternate confront and back to havingness immediately after a consistent needle rise or steady creep downward (for a low arm case) sets in. A steady rise means the pc has just hit something he can't confront (the source of rise or steady slow fall for a low tone arm). It's all no have from there. This requires watchfulness. Be certain to catch it and return to havingness again each time there is a sticky needle coming about.

(All comments on needle and meter reaction in this bulletin are subject to review as the matter is still under study but the above meter data is already proven to be workable and should be used for now.)

HCO BULLETIN OF 8 SEPTEMBER 1960

Fran Hldrs

THE PRESESSIONS OF THE 1ST SAINT HILL ACC

The 1st Saint Hill ACC is being very successful.

The advanced process used on higher cases is Regimen 3. Help on Motion, Alt. Conf., and Havingness done in a Model Session. (Regimen 3/II.)

This has been preceded by Preessions. The preession only is used until pc rides at clear reading with a loose needle during session. Then the preession that cracked the case is combined with Help on Motion as a new Regimen 3. This is designated as follows: Regimen 3/V. This means that a Model Session is run with Help on Motion, the Confront command being that of Preession V, the Havingness command being that of Preession V. In the Model Session, the sequence of processes is the Havingness process, the Help-Motion process, the Havingness process, the Confront process, the Havingness process, the Help-Motion process, etc. The Havingness process is run briefly until Havingness is up. The Confront is run until pc is in p.t. Help-Motion is run until pc gets high on the arm or gummy on the needle.

The following preessions are those that have been effective on one or another of the ACC cases. A more detailed report will be made later.

Preession II is for a fairly easy case. Preessions V to VII inclusive moved, one or another of them, all difficult cases, Preessions VIII and IX have not been used but are included for completeness.

The rule is that if a tone arm does not shift more than one division on a meter dial in an hour of processing, you should try another preession.

If you have the right one for the case, you should get rapid shifts of the tone arm and should flatten it as a preession (pc reading during its use at clear read) and then go into Model Session using your same preession as the Havingness and Confront commands of Regimen 3.

No rudiments, no two way comm of any kind is used while auditing the preession only.

COMMANDS FOR PRESESSIONS II—X

PRESESSION II:

Havingness: "Look around here and find something you could have."

Confront: "What could you confront?" "What would you rather not confront?"

PRESESSION III:

Havingness: "Point out something in this room you could confront."
"Point out something in this room you would rather not confront."

Confront: "What unconfrontable thing could you present?"

PRESESSION IV:

Havingness: "What part of a beingness around here could you have?"

Confront: "What beingness could others not confront?"

PRESESSION V:

- Havingness: “Point out something in this room you could confront.”
“Point out something in this room you would rather not confront.”
- Confront: “Point out a place where you are not being confronted.”

PRESESSION VI:

- Havingness: “Look around here and point out an effect you could prevent.”
- Confront: “What would deter another?” “Where would you put it?”

PRESESSION VII:

- Havingness: “Point out something.”
- Confront: “Tell me something I am not doing to you.”

PRESESSION VIII:

- Havingness: “Where is the (room object)?”
- Confront: “Recall something really real to you.”
“Recall a time you liked something.”
“Recall a time you communicated with something.”

PRESESSION IX:

- Havingness: “Look around here and find an object you are not in.”
- Confront: “Recall somebody who was real to you.”
“Recall somebody you really liked.”
“Recall somebody you could communicate with.”

PRESESSION X:

- Havingness: “Look around here and find something you could have.”
- Confront: “What beingness could you confront?”
“What beingness would you rather not confront?”

Notes:

By finding the Pre-session Havingness process that moved the tone arm well and the Confront process that moved the tone arm well, the auditor can make a pre-session out of this new pair.

On all “POINT OUT” commands: Have pc hold both E-Meter cans in one hand with a piece of paper, or cardboard, between to prevent shorting out, so pc has one hand free to point with.

Havingness command of Pre-session IV: Unless more than one auditing team present in auditing room, must be run as a walk-about, or in room where pc can see people from window.

Confront command of Pre-session VI: Use either no acknowledgement, or a very light, continuing sort of acknowledgement, between these two questions.

(Data on the use of Pre-sessions as part of Regimen 3 as given in this HCO Bulletin is subject to further study.)

HUBBARD COMMUNICATIONS OFFICE

HCO BULLETIN OF 15 SEPTEMBER 1960

Fran Hldrs

THE TONE ARM

If you haven't got an E-Meter, you can't clear people. That has now emerged as a final datum.

For without an E-Meter you cannot tell, the way it has now developed, whether a case is really moving or not or whether a process is biting.

This startling fact was proven in the 1st Saint Hill ACC (7th London).

In late 1959 I began to study the tone arm as a means of discovering more data about a case.

A year later I can assure you of the following truths:

1. A case which is not registering a rapidly moving tone arm during a session is not progressing well.
2. A case which has no wide tone arm movement during processing has not remedied objective havingness.
3. Extreme low arm and extreme high arm cases only have low objective havingness.
4. A case should move three tone divisions of the tone arm dial up or down in an hour of processing before it can be considered to be running well.
5. If a tone arm doesn't change under processing the case is not progressing.
6. The keys to a moving tone arm are:
 - (a) Havingness
 - (b) Overts
7. No case should be processed on anything else but some form of objective havingness or O/W before the tone arm is moving freely.
8. Extreme high and extreme low tone arm cases alike are unable to *have* the room of the session.
9. Extreme high and extreme low tone arm cases alike cannot have the auditor or people.
10. Until a case is made to read around the clear read, it should not be processed on anything but havingness, O/W, confront (or duplication) processes.

The tone arm tells you, by its motion, the extent of case advance, long before you get another graph. Inadequate tone arm motion during processing means inadequate case gain.

If the case isn't gaining, try another objective havingness process.

HCO POLICY LETTER OF 17 SEPTEMBER 1960

D of Ps
Assn Secs
HCO Secs

GIVING THE PC FULL HOURS

It has come to attention that pcs are sometimes deprived of a part of their full 25 hours in an intensive by including coffee breaks in the auditing time.

As this is one of the most fruitful sources of pc dissatisfaction even when unexpressed, the practice is forbidden.

If the pc demands a break or if the auditor declares one, the time so spent is added to the 25 hours, which is to say the time is made up in actual auditing in the same day it occurred. Careful count must be kept of a break since it must be added to session time and given in actual auditing.

Auditing time is very precious to pcs. Please don't waste it.

HAVINGNESS INJUNCTION

No pc may be run on two-way comm, confront, help or other process until a process has been found that remedies his havingness and brings the tone arm to clear read.

Overt-withhold on the auditor or other terminal may be considered a preliminary process as it assists duplication and therefore havingness. It is not, however, to be considered a havingness process for purposes of running a case.

Havingness processes meant herein are those of the 1st Saint Hill ACC issued in contemporary bulletins.

MODEL SESSION

HGCs will hereafter use Model Session form immediately that a havingness and a confront process are established for a particular pc. Thereafter all sessions shall be in Model Session form.

The purpose of this is to get the rudiments covered to the end of obviating ARC breaks and present time problems, the only two things which can stall a case which has once gotten started.

BPI

CAPTIVE BRAINS

Pity the poor Scientist. He is a captive brain.

Today he has no liberty. He may not, must not utter blasphemy against his captors.

All he is permitted to do is slave.

The cause for which he slaves derives from an accident of geography. If he was born in the "West" he gets to slave for the Extreme right. If born in the "East" he slaves for the Extreme left.

Should he find anything or invent anything, his discovery becomes the boast of Leftist or Rightist.

At once, he has been persuaded, he must *deny all further responsibility* for his creation and sign over the whole thing for a rouble or one dollar to his captors and must remain anonymous.

And then he must also wear his old school tie and belong to the right society. His credentials must always be in order. If he invents or discovers anything his credentials are examined first, its political use is examined next and then he's given his microcosm of security and sent back to his cell.

His government, his society, his employer all have managed to insist that these conditions exist and, more, are normal and fitting.

If he utters blasphemy such as "I feel radiation is not assimilable for babies" or "Science was invented to serve Man", he is sacked. His security is taken roughly away and they tear up his old school tie. They say nasty things about him in the papers and glare at his former fellows hoping they start no nonsense now.

When you make a man grind enough years at the mouldy texts of yesterday's prejudices, he is already on the ropes. He is dimly peeping through bad eyesight at a myopic world. He has been made to feel that if he doesn't treat life like a tightrope, he'll fall.

And so he is piteously grateful to receive his old school tie. He is cringing with gratitude when they offer him anonymous rewards. If he destroys Mankind thereby by dreaming up a bomb, he never finds it out. He forgot Mankind. He denied all responsibility for his creation.

Once scientists stood for Truth and tried to serve humanity. Now they serve economics and political creeds.

Why has no defence been built against fission? Because nobody wrote a cheque to build it. Scientifically it is a problem only slightly more complex than Atom Bombs. Why has no *scientist* started to work on it, cheque or no cheque?

Can it be they gutted scientists of guts when they perverted Newton?

Can it be he or she is a coward, this scientist? Can it be a pay cheque and old school tie mean more to him than life?

Ah yes—I well recall seeking to shame some apple-cheeked young officers, strayed like blinking lambs, into a man-of-war. I graded them on their watch standing with A and B and C and put gold stars on their records on the bulletin board. Such was my irony, so heavy was my hand, as I stood back, that finally I could only weep. They thanked me!

So the product of the group-think, the death of the individual in a university of today, extends further than the scientist.

Slaves it has been said, love their chains. No more so than a scientist who sells his tiny spark of a soul for a pat on the head from a political boss.

And so, as the responsibility of the individual for his creation dies, so we enter in upon a madness of destruction where all human suffering is made available to all.

The man who would destroy all Man for pay, not even vengeance, is so far below contempt he is no longer man but animal, a beast unclean who cares not what he kills so long as he is fed.

You want to end the threat of bombs, then please awake. Politics died with Victoria. Government is no longer done that way. It's done not by appeals to men but appeals to their bellies and their fears. The world is now controlled by economic groups who debase laws and rewrite texts and so make slaves.

For anything to happen now, enough to end this crazy dance, it will be needful to amend Man's pride and confidence and teach him he can stand alone on his two feet. The re-creation of the individual is all that's left, no matter what you would improve.

Man buys his lies from cowardice. Afraid to face the truth he cannot view his death-coming fast, for all Mankind.

In companies, in every path of life, show men they can be free and you'll have courage back for them.

How do I know this about Scientists? For thirty years I've been a maverick, an iconoclast. Each old school tie they sought to hang me with I painted its stripes comically. And I have watched in thirty years almost every other maverick go down. I've seen them denied security, given bad notices. I've seen them produce brilliant work and have it lie neglected even though their nation bled.

America had the V-2 in 1932. Why did she have to import a foreign Scientist to "recover its secret"?

America had helicopters in 1936. Why did she copy a German machine, the Focke-Wulf, ten years later?

America had a thousand things she would not buy from men who would not wear the old school tie and bow their heads in abandonment of their creations.

I was myself once threatened with expulsion from a university because I said that students should be allowed to think. A terrible crime.

We go into the teeth today, we Scientologists, of the greatest slavery of them all, the slavery of thought. The battle is not ended yet—but listen, we've broken through!

We today are the only group on earth that is not owned by either camp or any creed. We serve no flighty masters.

Once there was only me, sickened sometimes by Lying press inspired because I would not be a slave. But now there's you and you. Sometimes we've lost a man or a girl but only because they were not brave enough to stand upon a mountain top and say "I'm me! I think. I feel. I am no slave. Come on! Be free!"

But even in our very trying days, we still kept most of us and now we grow into a crowd whose mutters shake the cornerstone of prisons.

And we've won technology. Why should I give you sales talks now? Upon every continent an HGC is turning people into clears.

We're winning or why should the press begin again to growl? On one hand on the stands we read that a grayayayt university now believes that IQ can change, while in the same day a huge scientific group says we are no good.

Our hands lie heavily on destiny, yours and mine. We've turned a downward trend upward again. And so as we mount higher, be clever and understand what's happening.

Attacks in press and elsewhere will mount up. Upon me. Upon us. No. No violence. Just entheta. And money, lots of money will be sent to scream out more and more. Be gratified. Their hysteria is our index of win, nothing less.

Pity the poor slave master! There in his Extreme Right or Extreme Left den, he's penned successfully the cream of brains and wit. And just as he licks his chops to say, "You're now all slaves!", a mighty host cries back, "Who us?" and strikes the fetters from his prey. Poor fellows. Commissar Gulpski and Capitalistic Grab will have to unite to have a quorum in their caves.

Oh no. It's no mad dream. Politics is dead. Economics now dominates the world. And we sit laughing with technology to undo all their buttons and their charms.

As we improve organisations, we will improve people. And as we improve people we make men brave. And then at last the slave looks down and says, "Why, what *are* these chains?" and shakes them off.

The vested interest of the world, since its beginning, made but one mistake. They thought that punishment and hard duress were all that made Man work. But Man just worked so long as he could help. And when his wares were turned to bringing hate and death, he struck. Until someone, you and me, give back his willingness to help, the world, like tired wheels, will grind down to a stop.

It is an overt act by you and me to leave in power any group that denies men freedom, knowing what we know. Therefore, attack.

We are the only men and women left on Earth who are no longer slaves.

And we are now all past the point in knowledge and in numbers where we will wear their chains.

The men who need us most are the slave masters.

We will get around to them last, I think. It is more fitting so.

P.S. And *now* do you wonder why the mutter grows: "Scientologists are *dangerous*". But Scientology is the only game where all dynamics win!

**ORDER OF TEST OF HAVINGNESS
AND CONFRONT COMMANDS**

Based on data of the 1st Saint Hill ACC which I have now tabulated for what moved cases it is possible that the following processes should be tested on pc in the given order.

The Havingness Processes should bring needle down or up toward clear read for pc's sex with a loosening needle.

The Confront process should move the tone arm at least 3 tones per hour of processing. The test should at least move arm and change needle pattern. While testing Confront processes run the Havingness process already found between tests until the needle is free and back at clear read.

In testing, first find the Havingness Process that suits the pc. If you can't get one on the list to return the tone arm to clear read, use CCH 3 or 4 or both until Tone Arm is at clear read with a loose needle.

O/W also assists obtaining a clear read, so does a PTP run with O/W or an ARC break run with O/W. A PTP or an ARC break can stop or prevent a process from being found or from continuing to work when it has already worked before. Get off the PTP or the ARC break and the former workable Havingness will work again. If pc ARC breaks too easily to permit a cleanup with O/W, use Havingness XXXI (two objects) or CCH 3 or 4 or both. If pc still can't be handled use CCH I and CCH 2, then get run what pc wouldn't run.

A dozen commands is enough to show if a Havingness process is going to work or not. If the needle fails to free and the Tone Arm starts to go away from clear read, stop at once and bridge to next test process.

Only when the Havingness process is found should the Confront process needed be searched for.

When the two have been found, this is the pair which should be flattened. When they seem flat, combine them with a Help O/W process and run a regimen in this order:

The pc's Havingness Process.

Help O/W on a terminal assessed or on a factor of Mest (Matter, energy, space, time, form or location as assessed per Regimen 6). (For Regimen 6 hear ACC tapes.)

The pc's Havingness process.

The pc's Confront process.

The pc's Havingness process.

The pc's Help O/W process.

The pc's Havingness process. Etc. Etc.

A Havingness process is always run to Tone Arm clear read with a freed needle. The Help process is run to a sticky needle and off Tone Arm. The Confront process is run to present time if possible.

Don't run anything else on pc until you have found pc's Havingness process or proved out what he says it was according to last auditor.

By definition:

A pc's *Havingness process* is one that returns the Tone Arm to clear read and frees the needle.

A pc's *Help process* is one that moves the Tone Arm at least 3 tones per hour and brings the reading always a bit closer to the clear read. (5 to 6, 5 to 6 on and on won't do.)

A pc's *Confront process* is defined in the same way as his *Help process*, except that it should move pc on the track, going further and further into the past and easier and easier into present time. Pc's pictures should improve on a confront process.

Run all tests and processes in Model Session Form in HGCs now.

Here are the commands in possible order of likelihood they will locate the pc's Havingness process and Confront process.

Havingness Commands in Order of Test for Pcs

- VII "Point out something."
- VI "Look around here and point out an effect you could prevent."
- XIX "What is the emotion of that (indicated object)?"
- XI "Notice that (indicated object)." (No acknowledgement) "What aren't you putting into it?"
- XIII "Look around here and find something you could have."
"Look around here and find something you could withhold."
- XXIV Outside Process. "What is the condition of that person?"
- XXXI (Two *small* objects in auditor's hands.) Exposes them alternately to pc, with as little motion of arms and hands as possible.
"Look at this." (No acknowledgement) "What around here isn't this duplicating?"
- VIII "Where is the (room object)?" (Pc points.)
- IX "Look around here and find an object you are not in."
- XII "Look around here and find something you can agree with."
- XVI "Point out something around here that is like something else."
- XVII "Where isn't that (indicated object)?"
- XX "What is that (indicated object) not duplicating?"
- XXI "What scene could that (indicated object) be part of?"

- XXVI “What bad activity is that (indicated object) not part of?”
 II “Look around here and find something you could have.”

Confront Commands in Order of Test for Pcs

- VII “Tell me something I am not doing to you.”
 X “What beingness could you confront?”
 “What beingness would you rather not confront?”
 IV “What beingness could others not confront?”
 XVI “What is something?”
 “What makes sense?”
 XVII “What unkind thought have you withheld?”
 XI “Tell me something you might not be confronting.”
 VI “What would deter another?”
 “Where would you put it?”
 III “What unfrontable thing could you present?”
 XXIV “What is a bad object?”
 XXVI “How would you not duplicate a bad person?”
 “How would you not duplicate a bad thing?”
 V “Point out a place where you are not being confronted.”
 IX “Recall somebody who was real to you.”
 “Recall somebody you really liked.”
 “Recall somebody you could really communicate with.”
 XIX “What intention failed?”
 XXII “What would be a betrayal?”
 XV “What would you rather not duplicate?”
 XII “What is understandable?”
 “What is understanding?”
 XIII “What have you done?”
 “What have you withheld?”
 XXI “What past beingness would best suit you?”
 “What past thing would best suit you?”
 II “What could you confront?”
 “What would you rather not confront?”

The following *Havingness* Pre-session Process may be considered nul:

XXII.

The following *Confront* processes may be considered nul:

XX; XXIII; XXV.

None of the above four moved cases in the 1st Saint Hill ACC.

TIPS ON HOW TO CRACK AN HGC CASE

Run lots of “What question shouldn’t I ask you?”, and get them *all* off.

Find and solve all PTPs with O/W on the terminals involved.

Lots of O/W in general.

Lots of discussion about failed help. Have pc check over many help failures.

Then check for havingness process.

Here are some good tips.

“Look around here and find something you can have” always works on any pc if the rudiments are *done*, done, done thoroughly.

New Experimental Havingness Processes:

“Look around here and find something you don’t have to make duplicate you.”

“Feel that (indicated room object).”

“How could you have that (indicated room object)?”

“How could that (indicated room object) make somebody guilty?”

“Notice that (room object). How long can you be absolutely sure it will be there?”

“What problem could that wall be?”

Confront Processes:

“What unworkable situation could you confront?”

“What unworkable situation would you rather not confront?”

“What sexual activity could you confront?”

“What sexual activity would you rather not confront?”

“What sound (or other perception) could you confront?”

“What sound (or other perception) would you rather not confront?”

“Think of a problem.”

HAVINGNESS AND DUPLICATION

After several years of trying to find the precise mechanics of havingness, I think I've come very close.

Havingness is apparently the willingness and ability to duplicate in all senses of the word. It also has many lesser connotations but the havingness ability of a pc apparently depends upon his willingness and ability to duplicate, again in all senses of the word.

That which makes *communication* work in processes is the duplication part of the communications formula (Axiom 28).

The position of a being on the tone scale is determined by his willingness and ability to duplicate. The lower the tone of the being the less willing the being is to permit similar incidents to happen again. This outlaws the experience factor and leaves the being with an "experience-scarcity" which causes him to refuse further experience.

All this is remedied by objective havingness processes (objective duplication increase). The bank additionally must be adjusted by subjective confront processes (subjective duplication increase).

A case will not advance appreciably until the being can remedy objective havingness. Objective havingness, the ability to remedy it, determines the entrance point of a case. Before a process to improve a pc's objective havingness is well established, the case *will not* advance, no matter what else is run. After a process that remedies objective havingness is sufficiently established to bring the E-Meter tone arm down to the clear read for the pc's sex, the case will advance on confront and help and other processes so long as objective havingness is re-established frequently.

Objective havingness is probably incapable of making a case totally stable in the absence of other subjective processes.

As havingness is the willingness to duplicate room objects (Axiom 28), then anything which improves the pc's ability to duplicate improves his or her havingness.

If a verbal process, after considerable test of various verbal command objective havingness processes, fails to work, the pc may be run on the new Pre-session XXXI or CCH 3 or CCH 4 or both CCH 3 and CCH 4.

Various old mimicry processes have some workability and we now know why. They are duplication processes and work only because they raise havingness.

I feel sort of slow on this one. It took me six years to find and establish it. But it gives us now the entrance point of all cases. *This is* why they did or did not make gains. They could or could not remedy objective havingness. Possibly (by 1st Saint Hill ACC case standards only) some 25 out of 40 pcs are *not* able to run "Look around here and find something you could have" and successfully remedy their havingness without havingness undercuts being used. Therefore this is a critical point in cases and demands care at the very start of a case.

An objective havingness process must be found for every case which will reduce or increase the tone arm to clear read for the pc.

Thirty-seven new havingness processes now exist. Use them.

People go out of present time because they can't have the mest of present time. That's it. Present time is the only referral point that exists. In its absence all becomes "bank".

HCO BULLETIN OF 6 OCTOBER 1960R
REVISED 8 MAY 1974

Remimeo

THIRTY-SIX NEW PRESESSIONS

The following material was developed for the 1st Saint Hill ACC. All cases of this ACC were well started toward clear, 25 of them started for the first time. These new presessions were employed. Two of the cases started with two-way comm on failed help only after which some of the presessions following worked.

NOTE: These presessions are subject to revision after my further study. Their numbers will not be changed. I will probably change some of the processes and commands. They are given here exactly as developed and in the order of development, not workability.

NOTE: The assistance of Dick and Jan Halpern, ACC Instructors, is gratefully acknowledged for the discussion and testing of these presessions.

NOTE: Pre-session I is to be found in HCO Bulletin of 25 August 1960 and is not actually part of this series, not being a havingness confront pre-session.

PRESESSION II:

Havingness: "Look around here and find something you could have."

Confront: "What could you confront?" "What would you rather not confront?"

PRESESSION III:

Havingness: "Point out something in this room you could confront."
"Point out something in this room you would rather not confront."

Confront: "What unconfrontable thing could you present?"

PRESESSION IV:

Havingness: "What part of a beingness around here could you have?"

Confront: "What beingness could others not confront?"

PRESESSION V:

Havingness: "Point out something in this room you could confront."
"Point out something in this room you would rather not confront."

Confront: "Point out a place where you are not being confronted."

PRESESSION VI:

Havingness: "Look around here and point out an effect you could prevent."

Confront: "What would deter another?" "Where would you put it?"

PRESESSION VII:

Havingness: "Point out something."

Confront: "Tell me something I am not doing to you."

PRESESSION VIII:

- Havingness: "Where is the (room object)?"
- Confront: "Recall something really real to you."
"Recall a time you liked something."
"Recall a time you communicated with something."

PRESESSION IX:

- Havingness: "Look around here and find an object you are not in."
- Confront: "Recall somebody who was real to you."
"Recall somebody you really liked."
"Recall somebody you could really communicate with."

PRESESSION X:

- Havingness: "Look around here and find something you could have."
- Confront: "What beingness could you confront?"
"What beingness would you rather not confront?"

PRESESSION XI:

- Have: "Notice that (indicated object)." (No acknowledgement.)
"What aren't you putting into it?"
- Confront: "Tell me something you might not be confronting."

PRESESSION XII:

- Have: "Look around here and find something you can agree with."
- Confront: "What is understandable?"
"What is understanding?"

PRESESSION XIII:

- Have: "Look around here and find something you could have."
"Look around here and find something you could withhold."
- Confront: "What have you done?"
"What have you withheld?"

PRESESSION XIV:

- Have: "Notice that (room object). Get the idea of making it connect with you. "
- Confront: (First ask: "Is there anything around here that is absolutely still?" If the answer is yes, continue. If no, use another pre-session.) "Look around here and find something you could stop," (to change of needle pattern or tone arm) then: "Look around here and find something you could start," (to change of needle pattern or tone arm) then, when neither command unsettles needle pattern or tone arm any more, use 5 or 6 commands of "Look around here and find something you could change." Then return to "stop".

PRESESSION XV:

- Have: "Look around here and find something you could withhold."
- Confront: "What would you rather not duplicate?"

PRESESSION XVI:

Have: "Point out something around here that is like something else."

Confront: "What is something?" "What makes sense?"

PRESESSION XVII:

Have: "Where isn't that (indicated object)?"

Confront: "What unkind thought have you withheld?"

PRESESSION XVIII:

Have: "What else is that (indicated object)?"

Confront: "What would make everything the same?"

PRESESSION XIX:

Have: "What is the emotion of that (indicated object)?"

Confront: "What intention failed?"

PRESESSION XX:

Have: "What is that (indicated object) not duplicating?"

Confront: "What two thoughts aren't the same?"

PRESESSION XXI:

Have: "What scene could that (indicated object) be part of?"

Confront: "What past beingness would best suit you?"
"What past thing would best suit you?"

PRESESSION XXII:

Have: "Duplicate something."

Confront: "What would be a betrayal?"

PRESESSION XXIII:

Have: "What is the condition of that (indicated object)?"

Confront: "Describe a bad case."

PRESESSION XXI V:

Have: "What is the condition of that person?"

Confront: "What is a bad object?"

PRESESSION XXV:

Have: "What aren't you putting into that body?"

Confront: "What beingness would it be all right to confront?"

PRESESSION XXVI:

Have: "What bad activity is that (indicated object) not part of?"

Confront: "How would you not duplicate a bad person?"
"How would you not duplicate a bad thing?"

PRESESSION XXVII:

Have: "Where would that wall have to be located so you wouldn't have to restrain it?"

Confront: "Describe an unpleasant environment."

PRESESSION XX VIII:

Have: (a) "What around here would you permit to be duplicated?" or,
(b) "What is the safest thing in this room?"

Confront: "Describe a removal."

PRESESSION XXIX:

Have: "Who would that (indicated object) be a good example to?"

Confront: "What would that person be a good example to?"

PRESESSION XXX:

Have: "What would you have to do to that (indicated object) in order to have it?"

Confront: "Spot a change in your life."

PRESESSION XXXI:

Have: (Auditor holds two *small* objects, one in each hand. Exposes them alternately to pc, with as little motion of arms and hands as possible.) "Look at this." (No acknowledgement.) "What around here isn't this duplicating?"

PRESESSION XXXII:

Have: "How could you deter a?"
"What have you not given a?"

Confront: "What could you own?"
"What have you denied owning?"

(To clean up Scientology auditing or instruction run on "auditor", "pc", "instructors", "student", as indicated.

*"What would a.....own?"
"What would anot own?")*

PRESESSION XXXIII: (This is used as a "post-session" to clear up an intensive at the end.)

Have: Whatever havingness runs best on pc, as havingness command.

Confront: "What have you done in this room?"
"What have you withheld in this room?"

(To clean up all auditing, use "an auditing room".)

PRESESSION XXXIV:

Have: Whatever pc runs best, as havingness command.

Confront: "Who have you overwhelmed?"
"Who have you not overwhelmed?"

PRESESSION XXXV:

Have: “Notice that (indicated room object).” “How could you get it to help you?”

Confront: “Whom have you failed to help?”

(This will fish up a case who is out the bottom with ARC Breaks. Corrects alter-
isness.)

PRESESSION XXXVI:

Have: “Notice that (room object).” “How could you fail to help it?”

Confront: “Think of a victim.”

Replace Havingness of Pre-session XXV with:

Have: “Notice that body.”
“What aren’t you putting into it?”

3 Versions of—Regimen 6 O/W Commands:

1. “Get the idea of doing something to”*
“Get the idea of withholding something from”*
2. “What have you done to ?” *
“What have you withheld from?”*
3. “Get the idea of having done something to”*
“Get the idea of having withheld something from”*

*Assessed 6th Dynamic terminal.
(Number 3 runs regret.)

SCRIPT OF A MODEL SESSION

A Model Session is a Model session because of its “patter”, not because of specific processes. This is a handy script of the “patter of a Model Session”. Use it. Don’t vary it. Know it by heart. It’s the mark of a well trained auditor. By making all patter the same later sessions run out earlier sessions.

This does not enjoin against two-way comm. But keep auditor comments and chatter out of sessions if you want smooth results and no ARC breaks.

TO START SESSION:

Auditor: “Is it all right with you if we begin this session now?”

Pc: “Yes.”

Auditor: “All right. Start of session!” (Tone 40)

Note I: If pc says “No”, Auditor two-way comms concerning objections, then asks again, “Is it all right with you if we begin this session now?”

Note II: If pc doubtful as to whether session has started:

Auditor: “Has the session started for you?”

Pc: “No.”

Auditor: “All right, *Start of session.*” (Tone 40)

RUDIMENTS:

1. Goals:

Auditor: “What goals would you like to set for this session?”

Pc: Sets goals.

Auditor: “All right. Any goals you would like to set for life or livingness?”

Pc: Answers.

Auditor: “Good.”

2. Environment:

Auditor: “Is it all right to audit in this room?”

3. Auditor Clearance:

Auditor: “Is it all right if I audit you?”

4. Present Time Problems:

Auditor: “Do you have any present time problem?”

STARTING A PROCESS:

Auditor: “Now I would like to run this process on you.” (Name it.) “What would you say to that?”*

Pc: "All right."
Auditor: (Clears command with pc) then—
Auditor: "Here is the first command." (Gives command.)
Pc: Answers. Auditor: Acknowledges.

**Note I:* If, after discussion, it seems that the pc will not be able to handle the announced process, auditor says, "According to what we have been talking about then it would seem better if I ran (names another process)."

ENDING A PROCESS:

Auditor: "If it is all right with you I will ask the question two more times and end the process."
Pc: Answers.
Auditor: (after last command) "Is there anything you would care to say before I end the process?"
Pc: Answers.
Auditor: "End of Process."

REPEATED COMMANDS:

Auditor: (Gives command.)
Pc: "I don't know, I can't find any answer."
Auditor: "All right, I'll repeat the auditing command." (Repeats command.)

COGNITION:

Auditor: (Gives command.)
Pc: (not having answered command yet) "Say, that mass in front of my face just moved off."
Auditor: "Very good." (Repeats command without announcing that it is a repeat.)

END RUDIMENTS:

1. Present Time Problem.

Auditor: "Do you have a present time problem now?"

2. Auditor and ARC Breaks:

Auditor: "How do you feel about my auditing in this session?" (needle twitches)
Auditor: "I am going to run some (name of process) on you, so here is the first command."

3 Auditing Room:

Auditor: "Look around here and see if you can have anything." (needle twitches)
Auditor: "I am going to run a bit of havingness on this. Here is the first command."

4. Goals:

Auditor: "Do you feel you have made any part of your goals for this session?"

FINAL COMMANDS OF SESSION:

Auditor: "Is it all right with you if we end the session now?"
Pc: "Yes."
Auditor: "All right. Here it is. End of session." (Tone 40)
Auditor: (optional) "All right. Tell me I am no longer auditing you."

Pc: "You are no longer auditing me."
Auditor: "Good."

TERMINAL STABLE DATA

Terminal chosen must:

Fall on meter

Fit pc's case (interest)

Must cover lots of track

Avoid adjectives

If *Man is* run, then sometime in the future, *Woman* and then *human being* must be run, then *body* must be run.

Run any terminal assessed flat before *any* reassessment.

THEORY 67

Midway in the 1st Saint Hill ACC it became obvious to me that cases would not move adequately on significances.

As all cases (and banks) are an inversion of the 8 dynamics into the Sixth Dynamic and that they then invert into the Seventh Dynamic, it seemed better sense to me to take the Sixth Dynamic *off* the Seventh rather than the Seventh off the Sixth.

This is Theory 67.

It at once produced results. The new preessions and then the new definition of havingness came out of Theory 67.

Several correlative data were observable. If you exteriorize a pc he does not remain stable but goes back sooner or later into his head. Only a theta clear would remain out. Therefore taking the Seventh out of the Sixth has limited workability. If a thetan were to be able to stay out it would be because he was used to Mest. Therefore the way to make a theta clear would be to handle the Sixth to obtain a straight Seventh Dynamic.

Also, pcs permitted to talk too long go down tone scale.

Therefore to clear a circuit, don't strip the thought out of it. Take the motion and Mest off the thought.

The target of Theory 67 is Mest. Mest has six parts—Matter, energy, space, time, form and location.

Get the pc to handle Mest and you can clear him easily.

Some pcs are further inverted so that the Seventh is the Sixth (see "modern" science). In such one has to handle the Seventh first, then the pc finds the Sixth. Thus the new preessions have some beingness havingness commands.

Theory 67 revolutionized Scientology. It was first announced at the beginning of the fourth week of the 1st Saint Hill ACC 29th August, 1960.

It has ended failed cases according to the results of the 1st Saint Hill.

REVISED CASE ENTRANCE

I am having no technical difficulty in South Africa getting cases started. As these have included the roughest cases in Scientology, you can see that my confidence in processing as it exists right now is well taken.

The only difficulty I am having is compliance with auditing rundown and this is not much of a barrier as, in general, the South African staff auditor is very good. -So D of Ps, be warned. If cases aren't moving today with the following rundown in use, look for *gross* auditing errors.

This is what I am using on all cases:

Check for the Havingness process. If the one that works is found it will *loosen* the E-Meter needle and bring the tone arm *toward* (not necessarily *to*) the clear read for the pc's sex. The right Havingness process will do this in a dozen commands. So only use a dozen commands to test each Havingness process. If the process doesn't work in 12 commands (which is to say, doesn't loosen the needle), then skip it and go to the next for test.

If you have found the Havingness process for the case, and it ceases to work after a session or two, look for ARC Breaks, PTPs between sessions. With these cleaned up the Havingness process will start working again.

Rule: The Make-Break Point of any case is getting the case to run consistently on an Objective Havingness process. No gains will be stable unless an Objective Havingness process is established for it and used often in sessions.

Rule: When a Havingness process ceases to work, ARC Breaks and PTPs must be cleaned up before the Havingness process will work again.

In clearing up PTPs and ARC Breaks use only O/W on related terminals which is the havingness version.

Rule: A case must be prepared and repaired with O/W to make a Havingness process work.

Exception: If a Havingness process is not clearly established in a few hours (not more than ten) revert to "Failed Help" only.

To prepare a case to run a Havingness process, I have been "shaking the case down" for withholds as follows:

Run "What question shouldn't I ask you?" until needle no longer quivers in response even though meter sensitivity is increased to 16.

Run "What have you done", "What have you withheld" (general form) until needle is unresponsive and tone arm moves toward clear.

If case does not respond well, if case gives thinkingness answers for mass, I at once go to Failed Help.

Failed Help

This is the best case-cracking process now known. I have worked with it since 1957 as a line of examination and it emerges as the *lowest verbal entrance* process. Therefore this process is a very important one.

Help is actually the most effective version of taking responsibility. When O/W will not run well, when the case just doesn't respond on the meter even though giving out with hair-raising overts, the responsibility button is out. This is recovered by "Failed Help".

Failed Help is run in this fashion, alternately.

"Who have you failed to help?"
"What have you failed to help?"

Two-way comm on failed help is not always well handled. The auditor should not direct the pc's attention to time periods or terminals. The process is run permissively.

All cases will run on Failed Help. It is a one-shot clear process. But used exclusively it introverts too hard. Havingness must be discovered as a process and run, as havingness is the make-break point of the case.

To go further, here is the proceeding so far:

For Average Cases

Try for Havingness.

If you find it go on to locate the right Confront process.

If you have the Havingness and the Confront, assess for a good, general whole track terminal. Using the Havingness and the Confront liberally, run Alternate Help on the terminal found.

Typical session thereafter is run with Model Session Form (all in one session).

- 1st Process — Objective Havingness.
- 2nd Process — Alternate Help on the assessed terminal.
- 3rd Process — The Objective Havingness process.
- 4th Process — The Confront process.
- 5th Process — The Objective Havingness process.
- 6th Process — Alternate Help on the terminal.
- 7th Process — The Objective Havingness process.
- 8th Process — Alternate Help.
- 9th Process — The Objective Havingness process.

How long to run each? Run Havingness always to a loose needle and TA nearer clear. Run Alternate Help or Confront process to a tight needle and pc near present time (cyclic aspect). If needle gets very sticky and TA ceases to move well on the Confront or Help, get over to Havingness fast. Run Havingness only until needle is loose and case feels better. Don't run Havingness as the process that solves the case. Run Havingness only as the process that stabilizes the case. Havingness runs to loose needle. All other processes run to a tight needle. All processes (except Objective Havingness) if they are working make the TA move. If the TA doesn't move, the process isn't working. Run Havingness and try again.

Poor Cases

If Havingness cannot be found at once, go into “What question—” and O/W. Then try to find Havingness. Be very careful to keep ARC Breaks and PTPs cleaned up.

Find the Confront process and proceed as in an average case.

Low Cases

If pc is diffident about having auditing, if pc critical of others, if pc ARC Breaks easily, if pc favours significances over objects, start in with Failed Help as above and try as above to get case up to Havingness.

Patch up case frequently with Failed Help, O/Ws. Keep the case running and the Havingness established and effective.

The difference between average/poor cases and low cases is that one keeps up the Havingness with O/W in the average/poor and in the low case keeps Havingness running with Failed Help and O/Ws.

This should get some understanding around.

I believe as of now that there are no impossible cases.

If a case won't talk or be audited as a chronic condition (not just as a result of ARC Breaks) we still have the CCHs.

The lions say to tell you hello.

FAILED HELP

Probably the most sensational case cracker of all time is Failed Help.

In that the pc has many times tried to help his own case and failed, the most accessible button is failed help.

This is run as “Who have you failed to help?” “What have you failed to help?” alternately. More difficult cases run on either one or the other. It can be distracting when the pc hits an automaticity on who or what. However even the alternate version will win.

This flattens PTPs and ARC breaks, so on a very low case whose havingness is down, the rudiments may be omitted the first few sessions.

Failed Help may also be run on a terminal. If the pc is always having PTPs with a certain type of terminal (woman, man, etc) then failed help can be run in a specific or general fashion. How have you failed to help your wife? This is run repetitively. Or: How could you fail to help a woman?

A lower dichotomy could be run in this fashion. How could you prevent help? How could you fail to help? This last pair are experimental. They would be run alternately.

While running failed help one should attempt every now and then to find the pc's havingness process.

If the pc's havingness process cannot be found even with overts off, run failed help as above, but continue to search for the havingness process at least once a session. If failed help is running very well indeed do not chop into it to search for the havingness process. Do that toward the end of the session.

A quarter of a division of the Tone Arm in three hours auditing is a good shift for a low case on failed help. Do not expect big changes at first.

As any failed help run is good, it's all right to make an error and use it on cases that could have better gains on something else. Cases that don't need it move the least on the Tone Arm with it.

No one has yet run 75 hours of failed help on a previous CCH case. So I cannot tell you how much it will take or how far it will go. But I would be prepared to run 75 hours of it of the Who—What version on a case before it could run a havingness process.

This is a marvellous process. I thoroughly recommend it. Just be careful not to lay in ARC breaks and try to keep the case coaxed along and I think you'll make it with some version of failed help on cases we found hard to start before.

FORMULA 13

I am having very good luck undercutting beginning or old unmoving cases in Scientology by using a new formula called Formula 13. This consists of running failed help as the confront process and O/W on specific present time terminals as the havingness process.

Failed Help is almost the lowest rung of help processes. It is run with the commands "Who have you failed to help?" "What have you failed to help?" alternated. There's a lower help process than this. That is "Who have you intended not to help?" "Who have you helped?", but this is not Formula 13.

Overt Withhold is a havingness process. This comes about since havingness is duplication and one will not care to duplicate what he has overts against. Therefore the source of low havingness is overts against people and mest. It might be commented that overts against mest are more important than against people in the reduction of havingness, but this again is not Formula 13.

The essence of running Formula 13 is running in model session form a little failed help, with O/W on a present time terminal. It is done in this fashion. One opens the session, even uses Pre-session I if needed, does rudiments using O/W to clear PTPs and ARC breaks, and then does about ten minutes on failed help. Then he makes an assessment from a prepared list of people the pc knows in PT, and assesses for a needle fall on one of these. Then O/W is run on that specific person until the fall vanishes regardless of TA position, and returns to failed help for ten minutes or so, then reassesses for a PT terminal from his list until he finds one that falls, and flattens O/W on this, and then runs failed help and so on.

It will be found that this is the best case undercutter for general use I have so far developed. It is generally recommended and urged for all HGCs.

Formula 13 is followed by finding the havingness process then the confront process, and then Regimen Three is used, assessing for a general terminal and with the havingness and confront process running alternate help on the general terminal.

CHANGE ON MODEL SESSION

A gross typographical error is found in HCO Bulletin of October 13, 1960, "Script of a Model Session", under "Starting a Process".

The line, "Auditor: (Clears Command with pc) then—", is completely incorrect and in error. This at the most would be done on a vague pc and then only once in his auditing career. Delete the line.

CLEARING ROUTINE

It is urgent that the following clearing routine be adhered to if clears are to be made. These are *musts*. Some are new, some are old. Some of the old ones are being ignored grandly.

1. Get the pc in session. Definition: Interested in own case and willing to talk to the auditor.
2. Use Model Session script exactly and continuously. (Delete command clearing except once on low graph cases.) Learn the script *exactly*.
3. Clear PTPs with O/W on connected terminals. Never neglect a PTP.
4. Clear ARC Breaks whenever they occur with O/W on the session's auditor ("me").
5. Get case started with Pre-session One or a Formula.
6. Early in auditing don't scout for more than 15 minutes without running Who/What Failed Help or some version of it.
7. Early in auditing don't run any O/W for more than 15 minutes without running 10 minutes of Failed Help or a new help version.
8. When case knows improvement has occurred on a Formula and E-Meter is changing—(not clear reading), check for Havingness process.
9. Don't scout for more than 15 minutes for the Havingness without running more Failed Help for 10 minutes.
10. When Havingness is found, use it and Failed Help while looking for the Confront process.
11. When both Havingness and Confront processes are found, run them one after the other until case seems stable. (Two hours to two sessions.)
12. Regardless of the clear read on the TA run Havingness and Confront while scouting for the help terminal.
13. Regardless of later data than July, 1960, find the help *terminal* by doing a dynamic assessment, find the dynamic that changes needle pattern, then ask pc what represents that dynamic. Search around for terminals associated with what pc said on same dynamic you found until you get one that drops most. This must take in lots of whole track, be without adjectives and understood by pc.
14. Start Regimen 8. Using Havingness, Confront and Help on the terminal found.
15. Put the most time in sessions in on Alternate Concept Help or Help O/W on this terminal found. Get in some of the Confront and run a bit of Havingness often.

16. Run the help terminal for at least 75 hours regardless of needle action freeing, tone arm movement or lack of it. **DO NOT CHANGE THIS TERMINAL** for 75 hours of sessions. Graphs demonstrate poor gains when terminals are changed because they are “flat”. Graphs demonstrate high stable gains if the terminal for help is run *at least 75* hours. It’s an auditing error to change a help terminal once begun. It’s *help* that clears, not the terminal.
17. You can change the Havingness process, change the Confront process in Regimen 8 but *never* the help terminal.
18. Havingness is only required to loosen the needle. It need not shift the TA. It is run only until it loosens the needle. This may be 5 to 12 commands. A good test for loose needle is to have the pc squeeze the cans before the 1st command of Havingness, squeeze the cans after 5 commands. If the drop is greater on the second squeeze, the Havingness is working. If Havingness tightens the needle after an overrun like 10 minutes pc has picked up an ARC Break.
19. Don’t overrun Havingness. It is only to stabilize the gains and the pc.
20. The Confront process must move the TA. If it consistently doesn’t, find a new Confront process.
21. The Havingness and Confront process may be changed in Regimen 8, the help terminal never.
22. The way help is being run may be changed in Regimen 8 from, say, Alternate Concept Help to Help O/W or Two Way Help on the terminal, but the terminal may not be changed.
23. End a long period of auditing such as several intensives with O/W on the auditor, the room, Scientology, etc.
24. New Formulas of getting cases started do not alter the above stable data.
25. From Mest Clear to Theta Clear requires an address to the 6th Dynamic with help processes.

One assesses for the greatest fall on Matter, energy, space, time, form or location and runs help on it in the same pattern as Regimen 8.
26. OT requires all parts of the 6th and 7th to be cleared on help and responsibility using a Regimen 8 pattern.

The above are musts if you want to make clears.

STARTING CASES

It should be remembered that most *processes* and routines for auditing require first that the pc be in session.

This is a factor often lost in processing.

Unless an auditor is aware of the definition for “in session” and uses it, very low, slow results will occur. The key to fast, high results is “pc in session”.

There are various degrees of being out of session. The most severe of these is the person who refuses auditing. The answer is usually old Pre-session One (Help, Control, Communication, Interest). The next degree is sitting in the chair but refusing to answer questions. Pre-session One or its Two-Way Help part is generally the answer. Failed Help is a useful tool here. The next degree is sitting in the chair and being uncooperative or even choppy. The best answer is Pre-session One or Two-Way Help.

Now in all the above “out of sessions” is meant the pc coming to have processing for the first time. There are similar aspects from different causes during session.

A pc used to processing can go out of session in varying degrees. A pc who refuses to answer questions is suffering from an ARC break or has a withhold.

If it's an ARC break, then run O/W on “me” (the auditor) or, better, run O/W on *an auditor*. If the pc appears vague or nervous, it's probably a PTP, and the specific terminal or terminals connected with it should be run on O/W. The withhold case can be handled with “What have you done?” “What have you withheld?” alternated.

The definition of “in session” is (a) Interested in own case, (b) Willing to talk to the auditor. When either of these is violated the pc is “out of session” and is receiving no benefit from processing.

For the beginning pc, these two factors must be established. If the above remedies do not suffice, then the auditor must run by definition. The auditor must find something in the pc's case in which the pc is interested and something about which the pc will talk to the auditor. An E-Meter will fall on things that the pc is interested in and will talk about.

If a case already accustomed to processing goes out of session, the rudiments long ago were designed to get the pc running again. Rudiments can be used at any time during a session.

All the clever processes in the world will fail if the pc is out of session.

It is a high sign of auditing skill to get the pc into session—which is to say, interested in own case and willing to talk to the auditor.

There is an exception to case interest—when the pc goes upscale on any one process he or she will hit boredom before enthusiasm. Don't stop at that point. Go on even if pc infers it will slay him or her with boredom. The period of time they hang up in this is brief—a few minutes or at most a session.

Discussions of people the prospective or out of session beginning pc has failed to help usually solves this difficulty. Here is a lower point—people the pc intended *not* to help.

But however they get started, start them and get them *into session* before you worry too much about what's wrong and what's to be run. It pays off in results.

HAS CO-AUDIT ENDED

After a long trial, HAS Co-Audit is suspended.

While it did do well on procurement and in its original state, got good results (communication processes), it has been abused and has caused some to blow Scientology.

Unreported to me for a long while, HAS Co-Audit and Franchise Holders have been converting any individual process released into an HAS Co-Audit process.

This has worked great hardship on many cases. First, newcomers to Scientology in crowded rooms have not dared to get off their overts and auditing became stagnant. Further, the very processes that could clear them have thus been abused and nulled.

Formulas and Regimens were never for co-audits, yet many instructors have been putting into effect in co-audits anything released for individual use.

Thus, HAS Co-Audit has been abused and has stalled some cases. The idea is good, in many places the results were good and if we had no better ideas I would go on with it, stating only not to use Formulas and Regimens on it but only communication processes and Pre-session One.

The facts are that for new people, Group Auditing from Group Auditor's Handbooks One and Two were better for early mass case gains.

I have just completed a repatterning of all PE type activities which I will give you in due course and which stampede the people in. HAS Co-Audit is omitted from the rundown for the above reasons as well as the strength of the new pattern.

But HAS Co-Audit deserves by itself a special mention with its decease. Run by careful instructors on the original rundown it has done some wonders.

It would still be used, and may be used in the future if I had any idea that instructors would not go crazy enough to run individual clearing processes on it and make rash promises or have ambitious hopes for clearing on it.

HAS Co-Audits are out because:

- a. They may mess up the only processes known that will clear people at individual processing level, thus barring the road;
- b. Instructors have not noted or realized the stress done cases when they had to hold on to heavy overts, thus making the person blow Scientology;
- c. They do not procure well in comparison to other activities now under development by me in Johannesburg;
- d. They develop a false sense in attendees of knowing all about Scientology when they have not begun;

- e. They slow clearing by making individual auditing seem like a Co-Audit and therefore lacking value;
- f. They have not resulted in large numbers of people getting clear.

The new Johannesburg routine for PE courses is easier to run, makes more informed people, paves the road to clearing, and tends to keep people with us.

Furthermore, now that I can guarantee that any trained auditor can crack *any* case (a fact borne out daily for months now), I am turning Scientology activities all the way up. We will shortly have thousands where we had one.

The new programme for Central Orgs and Franchise Holders procures at a fantastic rate never before known. It is the largest administrative-procurement development since the PE and is thousands of times as effective. *25 new* people a *day* are enrolling in the Central Org in Johannesburg.

So stand by to re-organize. A first step is to shift HAS Co-Audit to one hour early type group auditing sessions.

More will be sent on this. But meanwhile groove group auditing in.

Any Group Auditing session begins, by the way, with the group auditor explaining what he means to do and why. Otherwise some newcomers think it is pointless. Then he opens session and runs the random type processes of 1953 and onward.

But a final salute to HAS Co-Audit—if instructors hadn't been so fixated on turning every individual process issued into an HAS Co-Audit process, it might be in the line-up still—and if people learn this lesson, may be with us again in a more exact form.

THE UNMOVING CASE

Formula 13 will move almost all cases satisfactorily up to finding the havingness, finding the confront, help O/W terminal and thus clear.

But there remain certain very few cases that do not move on Formula 13 as such. A variation is required. These are:

1. The hyper-critical case
2. The big withhold case
3. The case that wants no processing

Case 1 does not move because he is continually chopping Scientology, Auditors, the Org, etc behind the auditor. This should be suspected when Formula 13 does not work. The chopping is severe to prevent ordinary Formula 13 from working. The answer is to run Formula 13 with assessment on Scientology terminals for the O/W PLUS any Scientology invalidative person or persons our pc is in contact with in PT.

Case 2, the Big Withhold, has a crime of magnitude when it will not move on Formula 13. "What question shouldn't I ask you?" may not remedy this if it's big. "Think of something you've withheld" interspersed with the casual question, "Is there anything you'd like to tell me?" every half dozen O/W questions should produce an unburdening of the withhold to the auditor. There may be more than one withhold of this nature.

Case 3 is the person who has never had processing and wants no processing but sits in the chair and runs off answers misemotionally. The oldest approach was "Tell me why you shouldn't have processing." Pre-session One is more modern. The latest experimental process is "Tell me something you don't want," repetitively.

All cases above are followed by Formula 13 when willing to be audited or make gains.

NEW FORMULAS

A Formula is a method of getting a case started. The numbers are in order of development, not case level.

Formula 13: Model Session. Run 10 minutes or so of Who/What Failed Help. Make a list of everyone pc knows in pt. Assess from list until needle drops. Run O/W on that terminal only until drop is off (10-20 mins at most). Run 10 minutes Failed Help. Assess from list (add to it if new names come up) only until one gets a drop. Run drop off with O/W, 10 minutes Failed Help, etc, etc. When pc's condition warrants go on to locate Havingness process, running Failed Help between tries.

Formula 14: Same as 13 except one uses the present time most objects of pc instead of people for O/W. Failed Help and O/W handled the same as 13.

Formula 15: Case (1) of HCO Bulletin of November 24, 1960. List Scientology, Scientology terms and Org and persons instead of pt people as in Formula 13. This is for hypercritical unmoving pcs. It is also used for other reasons on students and old time Scientologists.

REGIMENS

A Regimen is the workhorse combination of processes that boosts the case to clear after it has been started.

Regimen 3: Alternate Help on a terminal, Alternate Confront, Factual Havingness.

Regimen 8: Find Havingness process from the presessions while running Failed Help between tests for 10 minutes or so. When established (loosens needle), find Confront process from the presessions, (changes TA well). Use Havingness process between Confront tests. When established, run these two found processes, the Confront to a tight needle or pt, the Havingness to a loose needle (as little as 8 commands, rarely more than 20). When pc reads around his clear reading, assess for a terminal to run Help O/W upon. When found, run session as follows: Havingness, long time on Help O/W, Havingness, Confront, Havingness, Help O/W, Havingness, Confront, Havingness, Help O/W, Havingness, etc, etc.

All Formulas and Regimens are run in Model Session form with the exact patten wording.

HCO BULLETIN OF 15 DECEMBER 1960

Franchise Holders

PRESESSION 37

A pre-session is run without a model session.

Pre-session 1 and 37 are the only pre-sessions now in regular use.

Pre-session 37 is a method of getting off withholds. This problem is the primary case problem. Pre-session 37 resolves it. This pre-session is now the proper way to run "What question shouldn't I ask you?"

The auditor runs "What question shouldn't I ask you?" for a few times.

Then the auditor runs "Think of something you've done." "Think of something you have withheld." Alternated for a short time (maximum five minutes).

Then the auditor runs "What question. . ." a few more times.

If the pc develops an evasion system such as "You shouldn't ask me if I have murdered anybody," the auditor asks it. The pc says, "No, I never have," etc. Then the auditor must reword "What question . . ." to "What question would embarrass you?" or "What would you hate to have the police or your husband or whatever find out about you?" Vary "What question" so that you get off the withholds.

Always run Pre-session 37 until you have a no-response to question needle with E-Meter sensitivity at 16.

The O/W on this is to keep up the havingness.

FORMULA 16

A formula is always run in model session early in the case or to get it moving again.

Formula 16 is as follows:

Failed help is run with:

"Whom have you intended not to help?"

"Whom have you helped?"

This is run for about 10 minutes, then the following is run for about twenty commands or so:

Assess PT terminals. Take first one that falls. Assess every time. Run:

"What unkind thought have you had about (terminal)?"

Then switch back to the above failed help version.

This is for cases that don't respond well on ordinary O/W.

FORMULA 17

Help is run as two-way failed help on an assessed terminal which has to do with a healing profession or religious or mystic person.

Then “What unkind thought have you withheld from a person?” is run for havingness.

This is for the person who has been to healers, hypnotists, spiritualists, psychologists, ministers, religious family members, psychoanalysts, etc, etc. This also works on doctors, psychologists, etc.

One makes the assessment list from general terminals and specific persons connected with pc’s past. One assesses each time from the list and takes the first one that drops. The drop is barely run off before switching to the thought O/W on “a person”.

Two-way failed help is run as follows:

“How could you fail to help a ?”
“How could a fail to help you?”

Positive failed help:

“How could you help a ?”
“How could a help you?” should also be run if indicated. (If pc insists they helped.)

Franchise (Merry Christmas)

HAS CO-AUDIT RESUMED

I am testing a new series of processes I have developed to replace all former processes used on HAS Co-Audit.

Co-Audit stalled cases when:

1. HGC Processes were used (ruining the process for the pc because of its being run against heavy O/Ws still on case) and
2. Pcs on Co-Audit felt unable to get off their overts amid so much company (the processes would not bite and even upset cases since the pc was not free to run his withholds), and
3. Rudiments were not used or were badly used to the end of driving people away.

I have remedied these matters and as soon as I have any bugs out, probably by next week, I will release the new Co-Audit processes.

Co-Audit will only be permitted if the new routine is followed and no other. I dislike losing people we could help and messing up cases.

The new series by-passes the need of rudiments, O/W or HGC processes, yet gives, by a startling new advance and process type, very good results—better than the average obtained two years ago in individual auditing. I am sure they will keep the people coming and advancing.

O-W A LIMITED THEORY

Before I would permit you to believe that the overt-withhold mechanism was a total way of life, I would point out that it applies only to a strata of existence and that it stems from failures to help.

The theory that what you do to others will then happen to you is a punishment control mechanism peculiar to this universe. It derives from a deteriorated willingness to duplicate. It *is* the law of physics of *Interaction*—for every action there is an equal and contrary reaction.

“Love thy neighbour”, when it is no longer a willingness, is enforced by the theory of O-W. “Love thy neighbour” can exist only when help, control and communication are high. When all these go, then O-W comes into vogue as a method of enforcing peace.

O-W is a theory which sets in when aberration sets in. It is not a high natural law. It is junior to the various laws of Communication, Control and Help.

O-W can occur only when help has failed. Help is a co-joining of vectors of life. When two beings who have joined forces to help fail each other, only then does O-W come into existence.

The forces of two beings cannot come into dispute until after they have first joined. Thus there is no war like that seen between brothers or husband and wife.

The cycle is this:

INDEPENDENT BEINGS
COMMUNICATION
MIS-COMMUNICATION
CONTROL
MIS-CONTROL
HELP
FAILED HELP
OVERTS AND WITHHOLDS
OVERTS AND WITHHOLDS BY TRANSFER
WORRYING OTHERS
WORRYING ABOUT OTHERS
BEING CRITICAL
BEING CRITICAL OF SELF

Basically, O-W is an effort to regain the status of independent being without taking responsibility for any of the intervening steps.

The reason we run O-Ws is that most pcs are on O-W by Transfer, which is to say, when they kick George in the head they get a headache themselves. This makes them think they are George. We use O-W since it explains phenomena found at a low humanoid level. We do not use it because it is a senior governing law of the universe.

When Help comes up, O-W as a mechanism drops out. We *could* run a full case, it would appear, with Help. However, in practice it is better to run lots of O-W with failed help as they complement each other and move the case faster. By running O-W we disclose many new

failed helps. Why? Look at the cycle above and see that O-W occurs only when Help has failed.

Similarly, on the same cycle we see that worry undercuts O-W. But if it is run, it should be worked with O-W. The worry cure has commands as follows:

Get the idea of worrying something. Get the idea of not worrying something. Get the idea of something being worrisome.

People, animals, things can be used in place of “something”. The process, going rapidly up toward failed help, is a bit limited and should be run with another process of the type of “Get the idea of attacking something” “Get the idea of not attacking something” to keep it going. The worry process bogs if run too long just by itself. It is a very valuable process as it explains many reactions and undercuts many cases. Worrying something is close to the lowest level of overt. It is the lowest effort to individuate.

But just as worry is not a way of life nor an answer to all of life, neither is the O-W mechanism an end-all law.

Many cases are not up to recognizing their overts. They will also have trouble recognizing their failures to help. Usually, then, they can recognize being worried or worrying people and thinking unkind thoughts and even attacking things.

Failed help also lies as a harmonic below O-W and so runs on any case if assisted with O-W as in Formula 13 or assisted with the Worry Process as above.

Worrying people is almost a way of life for the juvenile, just as O-W is with a criminal. People who feel childish or act that way are stuck in the violent motion of childhood *and* worrying others. Many pcs use their processing just to worry the auditor. Worry is the most easily dramatized O-W.

O-W, whether as worry or being critical (unkind thoughts), *is* the result of failure to help. O-W is the reason one gets another’s valence. O-W is why pcs have somatics. But O-W is not a high order law.

You will not always have to be careful not to bump Joe. It would be a horrible universe indeed if O-W was its senior law, for one could then never *do* anything.

Fortunately, it drops out, both as a governing law and a necessity in life.

THE NEW PE AND THE NEW HAS CO-AUDIT

The new HAS Co-audit takes company in a PE Foundation with the free PE Course, the new Anatomy of the Human Mind Course (requisite for HPA/HCA) and a tape play.

The PE Course can run 3 nights a week or 5 nights. The Anatomy Course (consisting of 20 lectures) should run 2 nights a week. HAS Co-audit can run 3 to 5 nights a week but might work better running the same nights as free PE. The tape play can be run at any time—5 nights or two hours on Saturday afternoon or Sunday.

As to materials, I am now assembling these. This HCO Bulletin gives the backbone of the HAS Co-audit. I am readying up full texts of the Anatomy Lectures. PE Text will shortly be more fully released. I have installed a new PE Foundation in HASI Johannesburg and it is successful at the rate of 30 new people a day. But to smooth it out and make it economical is taking me a bit longer.

An HAS Co-audit should be run only for people who have been “trained” on a PE free Course. The PE free Course should consider itself a training activity for the Co-audit, rather than a selling activity for Scientology. One should assume in teaching a PE that the student wants to help people and get help for himself. Elementary (very) Comm Course TRs should be sketched in and a touch assist taught. The only selling is defining Scientology and saying that to know the parts of the mind one should take an Anatomy Course.

The following is conditional, subject to review:

People who take a Free PE and an Anatomy Course get an HAS Certificate. It is also required that they spend 3 weeks on the Co-audit. Free PE is the only requisite for Co-audit attendance.

The HAS Co-audit consists of the same elements as always. The people come in, show the Instructor their paid invoices, are put in their chairs and auditing started by the Instructor. Cans can be held by the pc if a switchboard E-Meter rig exists. But individual E-Meters are not used.

At the end of the first period of auditing, the teams are shifted but not just exchanged. People are not audited by their pcs. They are started again by the Instructor. The session is ended by the Instructor.

Extreme muzzle is used. The auditor needing help puts his hand back of his chair for the Instructor to arrive.

The commands are written on one or two boards for the auditors to see. They are also issued on sheets of paper.

The pc faces outward into the room. The auditor inward.

The fee should now be per evening, perhaps 5s. or 50 ¢ per person.

There are just two processes to be used. These are to be called the HAS Co-audit Process I and HAS Co-audit Process II. They are complicated enough to hold interest. HAS Co-audit

Process I runs ARC breaks, PTPs, Somatics, the bank and the room and hits all case levels. Leave standard O/W, help and other clearing processes alone, no matter the temptation. The HAS Co-audit processes are what the attendee can do, not what the Instructor can do in individual session. The Instructor runs all cases present, and he needs something that bites just enough to improve the case but not enough to make a bog.

The HAS Co-audit Process I, I developed from the 1950 ARC triangle. A new process type that is permissive between bank and room makes this new development unique.

HAS CO-AUDIT PROCESS I

The commands are as follows:

- “Find something you disagree with”
- “Find something you agree with”
- “Find something you would rather not communicate with”
- “Find something you would communicate with”
- “Find something that seems unreal”
- “Find something that is real”

HAS CO-AUDIT PROCESS II

The commands are as follows:

- “Get the idea of attacking”
- “Get the idea of not attacking”

HAS Co-audit Process I is of course a fundamental way of raising tone. It also has a taste of Rising Scale (8-8008) in it. This is the confront process. If the pc gets sticky or dopey or choppy, one shifts to II but HAS Co-audit I is the workhorse—it is done longer than II.

HAS Co-audit Process II is of course the havingness process. If a pc looks too belligerent or too mild, the Instructor should run II heavily on the pc. The worse off a case is, the more automatic the attack factor is and the less the pc can attack anything. All psychosis is dramatized attack, so this process runs from low to high. Naturally you can see that it is an O/W version, but no withholds need be announced.

In HAS Co-audit Process II the Instructor may substitute “think” for “get the idea” at his discretion with cases that have trouble with “Get the idea”, but a higher percentage of cases, I believe, bog on “think” than on “get the idea”. In II the Instructor may in some cases at his option assess a generalised terminal and add it after “attacking” in the command.

Process II may be run on a case before I. But a little II goes a long way. If a central meter switchboard is used, cases that get sticky on I can be shifted to II. Try to end a session on I, not II.

I think you will find that II makes roaring tigers out of pcs and I makes them into serene angels.

Both processes are unlimited. I and II could be run for 500 hours. They might actually clear people if used long enough but the fact is not yet known.

If a pc continually stays in PT and uses only the room on I, shift the pc to II for he is afraid of his bank, just as some are afraid of past lives.

These are both new, powerful processes. I think you will find Co-audit attendees very happy with them.

6012C31 AHMC-1 The Genus of Dianetics and Scientology

The genus of scientology and dianetics was in the 20's, when LRH was a kid in the orient, seeing all kinds of oddities. While a George Washington University, he conducted tests and found that poetry gives the same wavelengths in all languages. He went to the psychology department with this discovery, got rebuffed, and found that none of them understood the mind. He calculated that there cannot be enough bits of information carried on the protein molecules in the brain to store all the memories that men have. In Austria this got published as "This is how man remembers." LRH was well known at the Explorers Club for his ethnological studies. In 1938, he got to "survival" as the common denominator to all races and possibly all life. At this point in his studies, he met Commissar Golinski from Amtorg (a diplomatic trade channel with Russia). He offered LRH a job in Pavlov's lab, \$200,000, plus expenses for research. etc. LRH refused. "About two years later they broke into my quarters -- or some unknown people did -- and stole the original manuscripts. I have a flimsy copy of the research, but it's not complete."

In 1946 and 1947, LRH did the research that culminated in DMSMH. At this time, a high-ranking naval officer offered him a job with the Office of Naval Research. He was to find ways to use his knowledge of the mind to make people more suggestible. When he was refused, he was threatened with being pulled back into military service. He figured out a way to resign from the service. This was the end of a beautiful friendship with the American government. They didn't make up their minds that we were con men until LRH said no. Any government is interested in how the mind works, but against anyone that knows more about it than they do.

This has left us the only free organization on the earth.

NEW HELP DATA

Failures to help on the various dynamics can bring about confusion of identities.

This is normally resolved by a thetan by obsessive efforts to individuate (blow phenomena or merely insistences upon individuation).

The end product of failures to help is aberrated self-determinism.

At an overt-withhold level, the thetan is trying to individuate and is therefore proceeding to individuate after failing to help. Thus a thetan is at obsessive cause while trying to do overts or get motivators.

As I have stated before it makes little theoretical difference whether help is run two-way or on an O/W basis.

I also promised to inform you when more data was to be had on this.

Apparently there may be some virtue (in terms of case gain and saved time) in running help on a pan-determined basis.

The theoretical look at this (see recent table in HCO Bulletin of January 5th, 1961, "O-W A Limited Theory") is that overts are below help and that when one enters upon an improvement in help, obsessive individuated cause falls out and pan-determinism moves in.

Possibly, very early in running help at Regimen 3 level one could run Help O/W but after a few hours on the same terminal could shift to two-way help, and after a few more hours could change to 5-way help and finish the bulk of the 75 hours of run of help on the same terminal with the 5-way version.

I think not doing this is slowing clearing.

In other words, when the pc starts on his help on a terminal, he is still rather in the O/W band. Very soon he is moving higher and into pan-determinism. And shortly after this should move very broadly into pan-determinism.

My evidence on this is technically light at the moment but I do know of at least one case that needed this. So let's shift now and run this gradient for a while and see if it isn't generally faster.

ADDITIONAL HAS PROCESSES

HAS III

“Something you wouldn’t mind forgetting” unlimited. Run in particular on any pc who has the goal of improving his memory. This process may also be used in the HGC where the pc has the chief goal of getting reality on the whole track or just improving memory.

HAS IV

“Get the idea of changing.”
“Get the idea of not changing.”

The Instructor may add “something” (HAS IVa), “somebody” (HAS IVb) or a meter selected terminal (HAS IVc) to these commands at his discretion.

HAS V

“Get the idea of solving a problem.”
“Get the idea of not solving a problem.”

The HAS Instructor may add a terminal if the pc complains about having lots of problems with that terminal.

HAS VI

“Communicate with (body part).”
“Don’t communicate with (body part).”

For persons who come into a co-audit chronically or temporarily ill. The person is asked by the Instructor what part of the body is ill. The Instructor takes whatever body *part* the pc names, not body condition, and uses it in above process.

HAS VII

“Tell me something worse than a (body part).”

For more violent chronic or temporary illnesses assessed by Instructor exactly as above in HAS VI.

HAS VIII

“Get the idea of making people friendly.”
“Get the idea of making people unfriendly.”

Instructor may use a specific person or the singular “a person” at discretion.

In all HAS Co-audits, the newcomer should fill out a goals sheet once a week and the Instructor should pay attention to it in choosing processes.

Further HAS Co-audit processes will be released when checked over.

HANDLING OF RUDIMENTS

On goals, the preclear should never be challenged as to what he establishes as his goals. The auditor accepts and acknowledges any and all goals the preclear has for the session and for life and livingness.

In handling the environment, if there is charge on the E-Meter after asking, "Is it all right to audit in this room?" and if charge does not blow with a little two-way comm, then run TR 10, "Notice that ____." However, if you have already located the Havingness process for the case, you would run that Havingness process until there was no longer any charge as far as the auditing environment is concerned. Only be careful in using TR 10 to flatten any somatic turned on while running it.

Auditor clearance is the most important of the rudiments, because if the auditor is not cleared, negative results will be obtained on the profile of the preclear. To handle charge on the auditor, TR 5N should be run, if charge does not blow on a little two-way comm. TR 5N is:

"What have I done to you?"
"What have you done to me?"

Overt-withhold on the auditor is far too accusative and invalidates the pc.

If the relationship between the auditor and pc is one of long standing then you would run TR 5N as follows:

"What have I done to you in this session?"
"What have you done to me in this session?"

On asking "Are you withholding anything?" under auditor clearance, you can say, "What did you think when the needle dropped? There it is again. What did you just think?" This can blow the charge on this question; however, if the charge does not blow, Pre-session 37 ("What question shouldn't I ask you?") or Formula 19 ("Who have you failed to help?" "Who has failed to help you?" "What have you failed to help?") with General Overt/Withhold can be run.

As regards a Present Time Problem, the first thing you want to know is whether it is a problem of long duration or a problem of short duration. Only short duration problems are handled. If the pc has a problem with regard to the fact that he promised to call his wife at 4:00 p.m., and it is 4:00 p.m., the best way to handle this problem is to end the session and let him call his wife. When the session is resumed, you start the session again and go to where you were in the rudiments and ask, "Do you have a present time problem?" If the pc has a present time problem of being excused, you would not in this case end the session, as he will remain in the building and be back shortly.

The process of handling the present time problem of short duration and one which cannot be handled as above, is: "What part of that problem have you been responsible for?"

Problems of long duration are run on Pre-session 38, as will be given. These problems of long duration are not handled as a part of rudiments, but these long duration problems tell the auditor what it is he will have to process on the case.

Overt/Withhold on the auditor, or on an auditor, or on a practitioner, may also be used in Auditor Clearance, if considered advisable—see Note 17, HCO Bulletin of 21 March 1961, “Script of a Model Session”.

THE “ULTIMATE” PROCESSES

The “ultimate” processes—*when* they can be run on the pc—now exist. And they can be run providing the pc is first brought up into the vicinity of Mest Clear by the current rundown (Pre-session 37, Formula 15, 14, 13 or 16 as needed, Regimen 3 derived from Pre-sessions 2 to 36—SCS and Connectedness also for some—with the Regimen being run with Help on a terminal for at least 75 hours without changing terminals).

If all this is gotten out of the way, the pc should be in very good shape indeed. Then, after perhaps another process or two, these ultimates could be attempted.

It is very important to remember these as they wipe out any liability of having been active in mental “healing” on the whole track, or, more importantly, having abused the field of the arts.

Remember, however, that, just as it says in *Creation of Human Ability*, there is a lot of agony attached to running “a thetan” or some allied word. Unless havingness is away up and stable, as is achieved in Regimen 3, it can’t be done.

With these warnings, here are the basic versions of the processes:

ULTIMATE 1

“Get the idea of doing something to a thetan.”
“Get the idea of not doing something to a thetan.”

and

ULTIMATE 2

“Get the idea of doing something to a thetan’s pictures.”
“Get the idea of not doing something to a thetan’s pictures.”

and

ULTIMATE 3

5 way help on a thetan

and

ULTIMATE 4

5 way help on a thetan’s pictures

and

ULTIMATE 5

“Get the idea of allying oneself.”
“Get the idea of not allying oneself.”

and

ULTIMATE 6

“Get the idea of creating.”
“Get the idea of not creating.”

These processes should probably be run with a Regimen 3 form, certainly with model session.

Each should be flattened in turn several times around.

This is our nearest data approach to OT at this time. Only Ultimate 5 could be run without having brought the pc to Mest Clear first.

The word “picture” is used instead of “creation” because of Step 6 phenomena and for other reasons.

Responsibility could be run afterwards on all items mentioned in these “Ultimates”.

Although you get this at a much later date, this HCO Bulletin was written on Christmas Day, 1960, in Johannesburg. So it's a Christmas present. And I hope *all* of you, regardless of any fancied differences, had a Very Merry Christmas and will have a very fine and successful AD 11.

NEW ASSESSMENT SCALE

I have developed a new assessment scale which takes in most possible formulas and regimens.

The scale and its use follows:

The Pre-Havingness Scale

Havingness
Failed Havingness

Interest
Failed Interest

Communication
Failed Communication

Control
Failed Control

Help
Failed Help

Overts
Failed Overts

Withholds
Failed Withholds

Importance
Failed Importance

Leave
Failed Leave

Protect
Failed Protect

Abandon
Failed Abandon

Inverted Help

Inverted Control

Inverted Communication

Inverted Interest

Obsessive Can't Have

This scale may have other points I have not located yet.

ITS USE

The use of the Havingness Scale in auditing is as follows:

Havingness is the make-break point of a case. Before havingness can be tested for, all heavy areas on the lower part of the scale must be flat.

The most elementary use of the scale and the one recommended at this time is to assess the points on the scale upwards until a fall is observed and then to run this fall out. Then to assess again from the bottom until a fall is observed and run it out.

All auditing to be done in Model Session form. The assessment follows either after the rudiments or after a discovered button has been flattened.

The upper nine points of the scale are best run as Regimens (from Help upwards).

I have not accumulated cases using this type of approach on this scale but I feel, by past experience, that it should catch even those cases that "failed help" hasn't reached.

I do not know how long it should take to flatten one button on this scale. I would guess, from failed help down, that it would take a few hours per button.

Probably this will develop into running pairs as in all formulas but until it is established how that should be done, the above simple system should be used.

UK CASES DIFFERENT

In finding the bugs in running the South African case, I also had a chance to study the UK case somewhat as the country is full of English people fresh from home and I've already had years of experience with it in England.

I believe that clearing a UK case easily requires between finishing off the Formulas and starting the Regimen a lot of S-C-S or 8C + the Havingness found effective for the case.

Control seems to get inverted on a UK case more easily than on some other nationalities and I think the inversion must be cleared up before Help (as in Regimen 3) can be effectively run.

This isn't a criticism on the UK case. It's just an effort to speed up clearing. A close study indicates that the UK case tends strongly to alter-is a command. It's no wonder, looking over the country's history, that commands got dangerous.

Therefore, in the HGC in London, I am now going to require an addition to procedure for clearing as follows:

When the Formulas are gotten out of the way and, while still running Failed Help between tests for havingness, the Havingness is found, a period of at least forty-five hours is instituted where the pc is run on S-C-S or 8C interspersed with a few commands of his Havingness every half hour. The last five hours will be run on Op-Pro-by-Dup.

Only when this is done will the auditor locate the Confront and then continue with Regimen 3.

If a test by the auditor, on any case, regardless of nationality, shows that the pc is poor on control, the above routine should be followed.

This data is backed up by enormous success with S-C-S and Op-Pro-by-Dup in England and the general success of 8C.

I have been looking for the bug in UK clearing for some time and feel that this is its remedy.

S-C-S

S-C-S now has four stages, instead of three. It has been found that at least one pc never flattened *start* because the body was "already started" being in constant motion and so the *pc* never could start it. The added command is "When I tell you to stand still, I want you to make that body stand still." "All right?" "Stand still."

The remainder of S-C-S is as always.

Personal Integrity

L. Ron Hubbard

WHAT IS TRUE FOR YOU is what you have observed yourself
And when you lose that you have lost everything.

What is personal integrity?
Personal integrity is knowing what you know—
What you know is what you know—
And to have the courage to know and say what you have observed.
And that is integrity
And there is no other integrity.

Of course we can talk about honor, truth, all these things,
These esoteric terms.
But I think they'd all be covered very well
If what we really observed was what we observed,
That we took care to observe what we were observing,
That we always observed to observe.

And not necessarily maintaining a skeptical attitude,
A critical attitude, or an open mind.
But certainly maintaining sufficient personal integrity
And sufficient personal belief and confidence in self
And courage that we can observe what we observe
And say what we have observed.

Nothing in Dianetics and Scientology is true for you
Unless you have observed it
And it is true according to your observation.
That is all.

L. RON HUBBARD

6102C14 3SAACC-14 Fundamentals of Auditing (Jo'burg)

The fundamentals of auditing are designed to handle fixations and changes of attention. Attention is fixated or in a constant state of flux to the degree that a person is creating and counter-creating. That's what a thetan's attention gets fixed on: the creates or the counter-creates. All other things (ruds, havingness processes, etc.) fall into line on that understanding. The case is fixed on or fluctuating amongst the masses and energies it has created. The things that put them out of existence or make them unreal are of course created by the case. The person is at war with himself. That's why an "attack" process works. It's a counter-create. Most cases, especially downscale, are more dedicated to counter-creation than creation. The case is in a state of unreality about the fact that he's doing it (mocking up things on which he is then fixing his attention). Sometimes a person may know he's doing it or not doing it. But often thetans don't know that they are creating what they are fighting. So you could have a level of processing of doingness on creating, e.g. "What wouldn't you mind creating / would you rather not create?"

We're dealing strongly with havingness these days, with success. The axiom of aberration is, "All doingness harms self." Doingness processes address this fact. You could ask, "What liability would there be to doing something?" or "What could you do which wouldn't be harmful to you?" This could fall flat because the person is doing so many more complicated things that he has to come up to these basics. This process is too high for most cases.

Beingness processes are relatively easy to run. You could run an engram with, "What, in that incident would you be willing to be?" The PC must have the ability to be something before this would be a workable process. Some people can't be anything, so you have to test for this with, "Look around here and find something you could be."

You could develop the whole rationale of processing at the level of beingness or doingness or havingness, though they must eventually merge; all three are needed.

If a PC doesn't move just with elementary rudiments: no TA; no change of case, it's probable that the PC is withholding some big recent overt. Or the PC may have some unusual or secret goal not imparted to the auditor, or the trouble may be a big PTP. So in going over a case on the basis of rudiments, one takes it easy until one finds out that the havingness scale, as you have been taught to use it, doesn't move the TA. Why ask for trouble before you've got it? You go over the ruds pretty well -- no wild drops, go on in search of the prehav level, find where the PC lives, get one of his principal goals aligned, convert it into a terminal which drops as well as the goal dropped, assess the prehav scale with that terminal, then run anything that fits that level. The commands are, "What was _____?" for positive and, "What _____ failed?" for negative. For a terminal it's, e.g., "What (terminal) was _____?" and "What (terminal) failed to _____?" or "What (terminal) was not?" These are the all-bracket commands. They could be repeated for each level. You could run 15 brackets against the prehav scale "When has (terminal)(action)(terminal)?" There are possibilities of 32-way brackets, but five-way is enough.

[More details on prehav running]

If a PC isn't interested in the process, the ruds are out, as it's an interesting process. So beat the ruds to death. If you can't solve it with ruds, run CCH's. The PC needs this when he can't control attention and your command isn't reaching him, a no-effect case on whom no command has anything to do with him, etc.: totally on automatic, etc. So use CCH's to give them an example that control and duplication can exist, and to increase their alertness, havingness, and effectiveness. Ten to twenty-five hours of CCH's must be done, with good auditor control and presence. If the auditor can't impinge on the PC, however, and has no auditor presence, even CCH's won't work, since they depend on impingement. LRH impinges more than most auditors because of his certainty that something will happen and his not being scared to confront the PC. To LRH, it's a personal affront if the PC isn't moving.

He can even get bad research results because even when using a process that shouldn't work, his postulate that the case should change and his wanting to do something for the PC will cause the process to work. So he depends on HGC results, etc., to test processes. Just asking the PC questions can do a tremendous amount for the PC. Don't underestimate what auditor presence, confidence, and interest can do.

CCH's depend on auditor presence more than any other process. Maybe 6 percent won't get gains, because of needing CCH's. The rest have ruds out, if they don't win on goals and prehav.

[More data on goals and prehav running]

The havingness processes are arranged in order of their frequency of effectiveness. A command that works on cases that have relatively uncontrolled banks and can't run engrams is, "Where is _____?" Frequently a person with low havingness is in a universe of objects that are mad at him, etc. As you run, "What is the emotion of that (object)?", the object goes downscale and the PC cuts in across the bottom and goes upscale. When he's upscale about the object, the process is flat. This havingness process can change, when emotion disappears out of the physical universe, to "What is the condition of that (object)?" If the havingness process stops loosening the needle, first check to see if there is an ARCB about the command, and then, if not, find a new havingness process.

Other processes: are TR-10: "Notice that (indicated object). What aren't you putting into it?" A good outside process is, "What is the condition of that person?"

When you get a rise on a can squeeze, the PC may have heavy withholds, maybe inverted interest, and won't lie-check. Perhaps the havingness test would be how much less does the needle rise in this case. If the case ARCB's all the time, you can run, "Who would I have to be to audit you?"

The prehav scale running runs subjective havingness; the hav processes run objective havingness. The objective havingness determines his havingness of the physical universe; the prehav scale determines his havingness of the subjective universe. You only run enough objective havingness to keep the PC in PT and loosen his needle.

NEW PRESESSION DATA AND SCRIPT CHANGE

Preessions

The use of Preession 37 should be limited to about 2 hours at the most.

As a case progresses it becomes conscious of more withholds. Therefore Preession 37 can be run at intervals as a case goes along, briefly each time.

Model Session Script Change

For the purpose of getting all the withholds off a case, a new line is now added to the Model Session.

Immediately after "Is it all right if I audit you?" insert the line "Are you withholding anything?"

With the discovery that many non-progress cases are not progressing because of heavy undisclosed withholds, the subject of withholding is graduated up to take permanent residence in the rudiments as above. Therefore it could be said that Preession 37 is actually repeated in the rudiments but, of course, remains itself.

Formula 19 is a better thing with which to slug a case than long runs of Preession 37. If you suspect withholds you can't rapidly get, Formula 19 speeds up the whole case and gets real gains at the same time.

FORMULA 19

Formula 19 is developed to give a general form to Failed Help and O/W running.

It is better to use this than Pre-session 37 for long runs. Pre-session 37 must be done. Formula 19 is, however, a better case digger as it improves case up to where pc realizes he has withholds. As a case improves it becomes more aware of overts and withholds since the overts “unlessen” and the case responsibility rises.

Formula 19 improves responsibility and brings up awareness of withholds *and* improves the case.

Formula 19 consists of Who/What Two Way Failed Help and general O/W, about a ten minute or a to present time run for each.

The commands are:

“Who has failed to help you?”
“Who have you failed to help?”
“What has failed to help you?”
“What have you failed to help?”

The above commands are run consecutively.

“What have you done?”
“What have you withheld?”

S.O.P. GOALS

**Marvellous New Breakthrough
BE—DO—HAVE Coordinated**

On all staff cases without exception the following Goals Standard Operating Procedure will be used.

This data I developed for the 3rd S.A. ACC is a major breakthrough. I want it run on all staff cases *now* no matter what was being run before. Take note of what was being run for later application or for use as terminals after Goals Assessment if they fit and are only partially flat on older processes.

S.O.P. Goals Intensives

Use Model Session throughout. Heavily stress Rudiments. Use “What part of that problem could you be responsible for” for PTPs. Use TR 5N for ARC breaks (“What have I done to you”, “What have you done to me”).

1. Go over *Rudiments* carefully .
2. Do a *Goals Assessment*.

Find out every goal the pc can recall ever having. Make a list. Get in particular any secret goals, or withheld goals. Go over list with a meter. Take goal that falls the most.

3. Convert goal to a *terminal*.

Get wording of terminal simple but make sure the version you select falls as much as possible on meter. HCO Bulletin of February 2nd, 1961 (some issues were dated March 9, 1961, from HCO Saint Hill), gives sample general commands to which terminal can be added.

4. *Assess* this *terminal* on the *Pre-Havingness Scale* from bottom to top.

Take level that falls the most.

5. Develop an auditing command, preferably two-way, that uses terminal and pre-havingness level.

The right commands fall as much as goal or terminal did.

6. *Run* the *command* until tone arm becomes less active.
7. *Go one down* on the *Pre-Havingness Scale*.

Develop a command for next level that falls.

8. *Run the command* until the tone arm becomes less active.
9. *Return to first commands* and run them (the first level found).

Alternate the higher and one-down level commands, ten minutes of one level, ten minutes or so of the other level.

10. When the tone arm loses its action on these two commands and tends to stick, no matter whether high or low arm (one half hour is a good test), REASSESS TERMINAL ON PRE-HAVINGNESS SCALE from bottom up until a level falls hard.
11. Proceed as in Steps 5 to 11.
12. When the first terminal selected, run at several levels of the scale and the one just below, seems flat, return to Goals Assessment, REASSESS GOALS. Proceed from Steps 5 to 12.
13. When tone arm stabilizing around clear read (two or three terminals run), LOCATE HAVINGNESS PROCESS from the 36 Presessions.
14. Add the havingness process into the processes run, using it at appropriate places (certainly at session end) while continuing Goals S.O.P.
15. When havingness process has been used for a couple of sessions to help Goals S.O.P., find the CONFRONT PROCESS.
16. Add the Confront Process into the Model Session.
17. If you run out of goals, get a NEW LIST OF GOALS from the pc and proceed as above.

Beingness, Doingness and Havingness must be balanced. Each must be flexible in the pc for a stable gain.

Goals processing finds the beingness and the mind's doingness toward it (Pre-Hav Scale) and results in Havingness.

On Assessments you may find, going from bottom toward top of the PreHavingness Scale (No Effect upwards), that after several levels the pc's needle begins to rise consistently. It is probably useless to go higher on the scale as a rising needle means "no confront". A quicker way than assessing the whole scale would be, then, to assess upwards to a rising needle action and then go back down until the needle stops rising. Hunt from that point down for the biggest fall and you won't go very wrong.

Tone arm movement is the keynote to Case gain—No tone arm action = no gain. 1 to 2 Divisions of the Six Divisions of the Tone Arm Circle movement per half hour is good movement.

If a pc does not respond well to Goals S.O.P. (about 15% won't) do the following: Go over Rudiments with high sensitivity setting on meter. Clean up the withholds.

If that doesn't work, run the following for a few hours (it's the lowest but most general process now known):

What was your attention concentrated upon? When was your attention shifted?

This should get the tone arm moving. When tone arm is moving well for a few hours move back into Goals S.O.P. Step 2 and get the case going. It may be necessary to run Formula 15 and/or Formula 13 on some cases if Goals S.O.P. still finds a quiet tone arm.

Cases don't move when heavy withholds or PTPs are present. Cover Rudiments and End Rudiments carefully every session.

Example

Model Session is begun. Rudiments well covered. Goals Assessment shows up strongest goal to be "to get over having a painful body". Terminal is chosen, "Painful Body" is shown to fall most as terminal wording.

"Painful Body" is assessed on Pre-Havingness Scale. Endure falls most.

Auditing command is developed which falls on meter, "What should a painful body endure?" No additional command developed for Endure.

Developed command is run (heavy somatics) until the tone arm ceases to get 2 divisions of action, gets only one. Process ended.

Command is developed for Failed Endure, next lower level, "What has a painful body failed to endure?" This starts heavy tone arm action again.

When action cooled, same "endure" command is run again.

After three runs of *Endure* and two of *Failed Endure* command tone arm stiffens at 5 on the scale. A 15 minute test of both commands fails to get it moving; "Painful Body" is reassessed in the Pre-Havingness Scale and is found now to drop at Withheld.

Command is developed for Withheld that falls on meter (the command causes the fall), "What should be withheld from a painful body?"

This new command run and tone arm again in motion. TA motion gets less.

Dropping down one level of Pre-Havingness Scale to Failed Withhold, command is developed that falls on needle—"What have you failed to withhold from a painful body?"

Command is run and restores motion to tone arm. When motion dies down a bit, Withhold command is resumed.

After 2 runs of Withhold and two of Failed Withhold, tone arm became slow at 3.

"Painful Body" reassessed on Pre-Havingness Scale, is now found at *Inverted Communication*. "Painful Body" added to command given on HCO Bulletin, 2nd February, 1961, for Inverted Communication. This run for 1 hour. Then Inverted Interest run on "Painful Body". Etc. Etc.

Data on all this will be found on the 17 hours of tape lectures of the 3rd S.A. ACC. This condensation is not on the tapes.

The Pre-Havingness Scale referred to has been the subject of two February 1961 HCO Bulletins. (Some issues were dated March 9, 1961, from HCO Saint Hill.)

An expanded scale will shortly be released. The shorter scale works, however.

As this is the fastest road to Clear, I want all staff members to be processed on nothing else, from scratch, former auditing not to be taken into account. We want clear staffs. They deserve it.

IMPORTANT DATA ON GOALS S.O.P.

It is vital to know that cases run on Goals S.O.P. or the Pre-Havingness Scale may slump between sessions and become misemotional even out of session until the scale is flat—flat—flat on any assessed terminal.

It is also important to know that a case run on the Pre-Havingness Scale in such a way as to leave a level unflat may hang-fire thereafter and will move only when that process is completed.

This scale is hot and fast, *but* its very workability can unstabilize cases during an intensive.

Use the scale. But use it intelligently. Do not permit it to be used by untrained unsupervised Auditors.

Flatten Terminals

Flatten *every* level started, get tone arm and needle to a stick or no action before assessing another level for the terminal.

It is all right to alternate two levels, running the one assessed and the one below, back and forth. But do not leave either level unflat before assessing again.

When is a Goals Terminal Flat?

An assessed terminal taken from the heaviest reacting goal of the pc *must* be run, reassessed and run at various levels of the scale until the goal terminal has no reaction on a cranked up sensitivity needle for any level of the Pre-Havingness Scale. If a reaction is found, run it off and check again.

Don't quit a terminal because the pc wants to. Quit it only when meter has no reaction.

Use the Pre-Havingness Scale.

Don't be disturbed by the misemotion of a pc during or between sessions.

Run any goals terminal you assess flat on all levels of the scale before going on to assess new goals.

PT PROBLEM AND GOALS

It will be found that PT Problems are often disclosed by the goals announced by the pc.

A PT Problem can wholly stall a case. Only withholds, PT Problems, and ARC Breaks (gross auditing errors) can stop a case now.

Definitions: A *problem* is an intention counter intention that worries the preclear.

A *Present Time Problem* is a problem that exists *now* in the physical universe.

The pc often announces a PT Problem when asked for his goals.

Example: Asked for goals, pc says he wants to improve his memory. Memory is a PT Problem to him. Until something is done about this, the case stalls. Auditor runs "Something you wouldn't mind forgetting," so long as pc is happy with it and unhappy with memory. This may be 25 hours or more.

Example: Pc says his goal is to get rid of paralysis in his leg. This is his PT Problem. Auditor runs "Tell me something worse than a leg" until it is no longer a problem to the pc.

The Dianetic Assist is Pre-session 38. Finding an engram or secondary and running it, but only to resolve pc's PT Problem and only as a prelude to formulas, takes care of the goal-PT Problem situation in most cases. In any event you have 11 years of technology to handle these PTPs that exist as goals.

I'm happy to have found this data and to have found new ways of handling engrams. But it does not supplant Formulas and Regimens as announced.

Most of this modern rundown will be found on the 22nd American ACC tapes, January 1961, 10 hours, now being used to train Central Org Personnel.

Research wise, I am trying to find a way to resolve the goal-PT Problem situation with new ways of handling failed help on the basis that *whatever* the pc thinks is wrong he has failed to help.

NEW PRE-HAV COMMAND

Here is a new command for Communication on the Pre-Hav Scale.

It comes as a surprise to me to find a new Comm process after Comm being in prominence 11 years, but that's what's happened. Also this process is foreshadowed by the Code of Honor.

It replaces the Pre-Hav Command in HCO Bulletin of February 2, 1961 (dated March 9, 1961 from Saint Hill).

The basic command from which the others are derived is:
"RECALL NOT WANTING TO COMMUNICATE."

The full commands that can be run in sequence are:

"Recall not wanting to communicate."
"Recall another not wanting to communicate."
"Recall not wanting another to communicate."
"Recall another not wanting you to communicate."
"Recall another not wanting others to communicate."
"Recall a communication."
"Recall a no-communication."
"Recall a communication."
"Recall a no-communication."
"Recall a communication."
"Recall a no-communication."

The command structure, having so many possibilities, has only been partially sorted out. The first five commands of the above or the last six commands of the above or all of the above may be run. The last six, of course, handle loss incidents.

It just may be that the first line as a process underlies all withholds and gives later withholds power. This may then, just as a process, considerably ease the task set in getting off withholds on secretive cases.

Using all the first five lines in sequence is probably easiest on the pc, afterwards flattening the last six commands.

FORMULA 20

Formula 20 is an effort to run Control on a thought level. It is relatively experimental.

It is for cases that have much alter-is as represented by inability to duplicate commands.
Also for cases that have unsteady engram banks that shift.

The commands are:

“Who has failed to control you?”
“Who have you failed to control?”
“What has failed to control you?”
“What have you failed to control?”

and

“Who have you helped?”
“Who has helped you?”

SCRIPT OF A MODEL SESSION
(Cancels HCO B of October 13, 1960, same title)

I have brought the Model Session up to date, including “withholds” and changing “we” to “I” and “the” to “this” session throughout to reduce randomness. I have also added the proper processes to run at Rudiment level.

A Model Session is a Model Session because of its “patter”, not because of specific processes. This is a handy script of the “patter of a Model Session”. Use it. Don’t vary it. Know it by heart. It is the mark of a well trained auditor. By making all patter the same, later sessions run out earlier sessions.

This does not enjoin against two-way comm; but reduce auditor comments and chatter in sessions, if you want smooth results and no ARC breaks.

START OF SESSION

Auditor: “Is it all right with you if I begin this session now?”

Pc: “Yes.”

Auditor: Acknowledges. “Start of Session!” (Tone 40)

Note 1: If pc says “No”, Auditor two-way comms concerning objections, then asks again, “Is it all right with you if I begin this session now?”

Note 2: If pc is doubtful as to whether the session has started:

Auditor: “Has this session started for you?”

Pc: “No.”

Auditor: Acknowledges. “*Start of Session!*” (Tone 40) Then, “*Now* has the session started for you?” If pc still says “No”, the Auditor says, “We will cover it in the Rudiments,” and continues the session.

RUDIMENTS

1. Goals

Auditor: “What goals would you like to set for this session?”

Pc: Sets goals.

Auditor: Acknowledges. “Are there any goals you would like to set for life or livingness?”

Pc: Answers.

Auditor: Acknowledges.

2. *Environment*

Auditor: "Is it all right to audit in this room?"

Note 3: If not, use TR 10 (see Note 15) or pc's Havingness process.

3. *Auditor Clearance*

Auditor: "Is it all right if I audit you?"

Note 4: If not, clear objection, or use TR 5N (see Note 16) or "Who should I be to audit you?" or "Who am I?" depending on nature of difficulty. If TR 5N seems to worsen the ARC break, run O/W on Auditor (see Note 17).

4. *Withholds*

Auditor: "Are you withholding anything?"

Note 5: If so, get withhold off or run Pre-session 37 (HCO B Dec 15, 1960).

5. *Present Time Problem*

Auditor: "Do you have any present time problem?"

Note 6: If so, clear problem, or use "What part of that problem have you been responsible for?"

START OF PROCESS

Auditor: "Now I would like to run this process on you (name it). What would you say to that?"

Pc: Answers.

Auditor: Acknowledges. Clears the command for pc only for the first time the command is used.

Note 7: If, during clearing of the command or failure of need to react, it seems that the pc will not be able to handle or do the announced process profitably, Auditor says: "According to what we have been talking about, it would seem better if I ran (name another process)."

END OF PROCESS

1. *Cyclical*

Auditor: (Wishing to end process) "Where are you now on the time track?"

Pc: Answers.

Auditor: Acknowledges. "If it is all right with you, I will continue this process until you are close to present time and then end this process."

Pc: Answers.

Auditor: Acknowledges. Auditor continues the process, asking after each pc answer, "When?" until the pc is close to present time.

Pc: Answers close to present time.

Auditor: Acknowledges. "That was the last command. Is there anything you would care to say before I end this process?"

Pc: Answers.

Auditor: Acknowledges. "End of process."

2. *Non-Cyclical*

Auditor: "If it is all right with you I will give this command two more times and then end this process."

Pc: Answers.

Auditor: Acknowledges and gives the command two more times.

Pc: Answers.

Auditor: Acknowledges. "Is there anything you would care to say before I end this process?"

Pc: Answers.

Auditor: Acknowledges. "End of process."

Note 7a: The cyclical ending is only used on terminals that exist also in present time, or when pc is going into the past in his answers. It is not used after pc says he is in present time. Non-cyclical is used when the pc is running terminals which do not exist in present time or when the cyclic aspect can be neglected.

REPEATED COMMANDS

Auditor: Gives command.

Pc: "I don't know. I can't find and answer."

Auditor: Acknowledges. "I will repeat the auditing command." Repeats the command.

Note 8: If pc still cannot answer, two-way comm to discover why.

COGNITION

Auditor: Gives command.

Pc: (Not having answered command yet) "Say, that mass in front of my face just moved off."

Auditor: Acknowledges. Repeats command without announcing that it is a repeat.

END RUDIMENTS

5. *Present Time Problem*

Auditor: "Do you have any present time problem now?"

Note 9: If so, run “What part of that problem have you been responsible for?”

4. *Withholds*

Auditor: “Are you withholding anything?”

Note 10: Pulls withhold or runs Pre-session 37.

3. *Auditor Clearance*

Auditor: “How do you feel about my auditing in this session?”

Note 11: Use only TR 5N or O/W on present auditor, “What have you (done to) (withheld from) me in this session?”

2. *Environment*

Auditor: “Look around here and see if you can have anything.”

Note 12: Run TR 10 or pc’s Havingness process.

1. *Goals*

Auditor: “Have you made any part of your goals for this session?”

Note 13: Auditor may remind pc of session goals if pc can’t remember them.

END OF SESSION

Auditor: “Is there anything you would care to say or ask before I end this session?”

Note 14: Auditor may show pc relative TA positions reached in session or tell pc what he cares to know about session.

Pc: Answers.

Auditor: Acknowledges. “Is it all right with you if I end this session now?”

Pc: Answers.

Auditor: Acknowledges. “Here it is. End of Session!” (Tone 40)

Auditor: (Optional) “Tell me I am no longer auditing you.”

Pc: “You are no longer auditing me.”

Auditor: Acknowledges.

Note 15: Commands of TR 10: “Notice that (room object).”

Note 16: Commands of TR 5N: “What have I done to you?” “What have you done to me?” alternated. “In this session” may be added if auditor-pc have long known each other.

Note 17: Commands of O/W: “What have you done to me?” “What have you withheld from me?” or in general form if pc berates auditors, “What have you done to an auditor?” “What have you withheld from an auditor?” or if the pc has been psychoanalyzed

heavily, “What have you done to a practitioner?” “What have you withheld from a practitioner?”

Note 18: Present Time Problem for the purpose of rudiments must be what is called “a problem of short duration”. A problem of long duration (such as a goal or psychosomatic difficulty) is not handled as in rudiments but in proper session and will emerge in the normal course of assessing S.O.P. Goals.

Note 19: If any rudiment difficulty can be blown with a very small amount of two-way comm, no process is run.

Note 20: Only the meter reaction shows if the environment, ARC break, withhold or PTP is still in existence. In all questions of whether something is blown or not or if a terminal is flat or if the process is flat, take what the meter says if it is different from what the pc says. The meter knows even if the pc says something else.

Note 21: After running a process on a rudiment because a meter reaction showed it should be run, always ask the rudiment question again before bridging to end the process. If it still reacts, audit the process further. Do not abandon a rudiment until the meter gives no reaction to the question.

Note 22: Always get an answer to every auditing command.

Note 23: Never expect two answers for one question even in doing an assessment.

Note 24: It is not obligatory for the pc to actually set goals. He must always be asked. He cannot be forced to do so. Ordinarily when he does not care to set goals for this part of the rudiments, he is suffering from an ARC break.

Note 25: Follow the Auditor’s Code.

S.O.P. GOALS MODIFIED

A slight modification to make S.O.P. Goals easier to run is made herewith:

As I am expanding the Pre-Hav Scale with several new levels and as these levels are not necessarily in exact position, it is no longer possible to derive an exact formula using two levels. Only one level will be run for each assessment.

Strike out Steps 6, 7, 8 and 9 of HCO Bulletin of February 18, 1961.

Strike out the word "two" in Step 10, first line.

At Step 11, add: "omitting Steps 6, 7, 8 and 9."

At Step 12, first and second line, omit "and the one just below". Add to end of step: "omitting Steps 6, 7, 8 and 9."

Adjust example accordingly.

**ASSESSING FOR GOALS AND TERMINALS
OR ELIMINATION**

As the only weak spot in S.O.P. Goals is assessing for the right goal and terminal, I have given this a lot of study and am utilizing something new I have observed that should cancel out any doubts about rightness in the auditor's mind.

Do all S.O.P. Goals steps in Model Session form. This gives you two cracks at the withholds and ARC breaks. If in doubt about how the pc is standing up to a long assessment end the session, give pc a short break and start a new session.

GOALS LIST

To do Goals, get pc to give you every goal he or she can think of. Then start using the meter to find goals and keep on finding goals until when you ask for one you get no drop on the meter. In other words, look for goals like you look for withholds.

Ask for:

Secret goals.
Withheld goals.
Anti-social goals.
Childhood goals.
Goals you've just remembered.
Silly goals.
Goals you've failed at.

Your resulting list may be as long as a hundred or more or as short as fifty. Just clear the meter on the subject. Make sure you write down every goal you get.

Now to assess the goals. Tell pc he or she doesn't have to answer aloud, and start reading the goals off to the pc. Write down how much each goal fell by divisions or fractions of divisions. Lightly cross out every goal that does not fall.

Go over list to pc again, still watching needle. Read off to pc every goal that fell before. You will find some of these have gone nul. Mark present divisions of fall for each goal. Cross out every goal that now does not fall.

Read remaining goals off to pc. Mark divisions they fell and cross out those that went nul.

Read now the goals that remain and cross out those that go nul.

Keep doing this until you have only two or three goals.

Discuss these with the pc. They may be all the same goal. Get a better definition of the goal.

Now read the remaining goals to pc and cross out the ones that go nul.

You will have at least one heavily falling goal left that does not go nul on two way comm. This of course has to be run.

This assessment is assessment of goals by elimination.

TERMINAL LIST

We have the goal. Now to get the terminal.

We get the pc to suggest terminals that represent this goal we have found.

We keep on urging the pc to give us more terminals for that goal.

We list every terminal the pc thinks up. We are not content until we have a list of about thirty possible terminals.

We now treat this list exactly as we did the goals list.

We read the list to the pc, marking divisions of fall and crossing out terminals that don't fall now.

We take the uncrossed-out terminals and read these to the pc. We mark divisions they fall and cross out those that no longer fall.

We keep doing this until we are left with one terminal.

This is our terminal. The only way it will nul is by auditing.

This is terminal assessment by elimination.

Commands are pretty easy to get.

The best command is the five-way bracket as follows:

You _____ terminal.
Terminal _____ you.
Terminal _____ another.
Another _____ terminal.
Terminal _____ terminal.

The *How* type of command is very good.

The additional data on terminals commands is to add "bad" or "badly" at the inverted levels.

On the Pre-Havingness Scale you should add WASTE below FAILED ABANDON.

You should add REGRET, SHAME and BLAME going upwards from somewhere around PROTECT. I will give you the full Pre-Hav chart in a week or two, but you need these right now.

HUBBARD COMMUNICATIONS OFFICE
Saint Hill Manor, East Grinstead, Sussex

HCO POLICY LETTER OF 7 APRIL 1961

HCO Secs
Any Directors
of Security

JOHANNESBURG SECURITY CHECK

This is the Johannesburg Security Check sheet further amplified by myself. This is the roughest Security Check in Scientology. We will call it the "Jo'burg Security Check". It does not necessarily replace other check sheets but it is probably the most thorough one we have now.

In reprinting this form use legal (foolscap) length and double-space everything except directions.

Joburg Security Check Sheet

HCO Security Form 2

Name of Person

Date

Name of Security Checker

Directions: Attempt to clear any fall observed. Mark any fall observed or any meter reaction change elicited by the question. Then write what it cleared on. Mark largely if the fall could not be cleared since this constitutes a failure to pass. Only fail somebody if there is no needle motion of any kind even with sensitivity at 16 on any question. If they are failing because it is hard to clear a question, work very thoroughly on it in an effort to clear it. In all cases complete the test.

If an important question fails to clear even after Security Checker has worked very hard to get it off, the test is flunked.

The following statement should be read or quoted to the person being Security Checked:

"We are about to begin a Security Check. We are not moralists. We are able to change people. We are not here to condemn them. While we cannot guarantee you that matters revealed in this check will be held forever secret, we can promise you faithfully that no part of it nor any answer you make here will be given to the Police or the State. No Scientologist will ever bear witness against you in Court by reason of answers to this Security Check. This Security Check is exclusively for Scientology purposes. The only ways you can fail this Security Check are to refuse to take the test, to fail to answer its questions truthfully or if you are here knowingly to injure Scientology. The only penalty attached to failure of this check is processing or our refusal to employ you or issue you a certificate, and this will only happen if we find that you are trying knowingly to injure Scientology. You can pass this test by (1) agreeing to take it, (2) answering each question truthfully and (3) not being a member of a subversive group seeking to injure Scientology."

The first questions are nul questions to determine your reaction pattern.

We will now begin—

Lie Reaction:

Are you sitting in a chair?

Are you on the moon?

Are all cats black?

Am I an ostrich?

Is this Earth?

Have you ever drunk water?

Are you holding up a tree?

Am I an elephant?

Are you a table?

Is this a Security Check?

Have you ever lived or worked under an assumed name?

Have you given me your right name?

Are you here for a different purpose than you say?

Have you ever stolen anything?

Have you ever forged someone else's signature?

Have you ever blackmailed anybody?

Have you ever been blackmailed?

Have you ever smuggled anything?

Have you ever been in prison?

Have you ever indulged in drunkenness?

Have you ever done any reckless driving?

Have you ever burgled any place?

Have you ever embezzled money?

Have you ever assaulted anyone?

Have you ever been in jail?

Have you ever told lies in Court?

Have you ever had anything to do with Pornography?

Have you ever committed Arson?

Have you ever been a Drug Addict?

Have you ever peddled Dope?

Have you had any dealings with stolen goods?

Do you have a Police Record?

Have you ever raped anyone?

Have you ever been involved in an abortion?

Have you assisted in any abortion?

Have you ever committed adultery?

Have you ever practised Homosexuality?

Have you ever had intercourse with a member of your family?
Have you ever been sexually unfaithful?
Have you ever practised Sodomy?
Have you ever consistently made a practice of sexual perversion?
Have you ever slept with a member of a race of another colour?
Have you ever committed culpable homicide?
Have you ever bombed anything?
Have you ever murdered anyone?
Have you ever kidnapped anyone?
Have you ever done any illicit Diamond buying?
Have you ever betrayed anyone for money?
Have you ever threatened anyone with a fire-arm?
Have you been in illegal possession of fire-arms?
Have you ever been paid for giving evidence?
Have you ever destroyed something belonging to someone else?
Have you ever been a spy for an Organization?
Have you ever had anything to do with Communism or been a Communist?
Have you ever been a newspaper reporter?
Have you ever had intercourse while under the influence of drugs?
Have you ever had intercourse while under the influence of alcohol?
Have you ever used drugs or blackmail to procure sex?
Have you ever ill-treated children?
Have you ever taken money for giving anyone sexual intercourse?
Have you ever had any connection with a brothel?
Have you ever had anything to do with a baby farm?
Have you ever been a spy for the Police?
Are you afraid of the Police?
Have you ever done anything you are afraid the Police may find out?
Have you ever falsified the books in any firm you worked for?
Have you ever done anything your Mother would be ashamed to find out?
How could you help yourself generally?
What represents yourself?
How could you help your family?
What represents your family?
How do you feel about sex?
What represents (the Org (others (a group to you?
How could you help (the Org? (others? (a group?
How could you help mankind?
Have you ever controlled people?

How do you feel about being controlled?
What represents mankind to you?
How could you help animals and plants?
What represents animals and plants to you?
How could you help material things?
What represents Matter, Energy, Space and Time to you?
How could you help Spirits?
What represents Spirits to you?
How could you help God or Infinity?
What represents God or Infinity to you?
What is Communism?
Do you feel Communism has some good points?
Have you ever been a member of the Communist Party?
Have you ever been a member of any group with similar ideals as the Communist Party?
Do you know any Communist personally?
Have you ever injured Dianetics or Scientology?
Have you ever committed any overts on a Scientology Organization?
Have you ever stolen anything from a Scientology Org?
Do you have any overts on LRH?
Have you ever had unkind thoughts about LRH?
Do you have any overts on Mary Sue?
Have you ever had any unkind thoughts about Mary Sue?
Have you ever injured any Scientologists?
Have you ever had any unkind thoughts about Scientologists?
Have you ever betrayed Scientology?
Do you know of any secret plans against Scientology?
Have you ever taken money to injure Scientology?
Have you ever used Dianetics or Scientology to force sex upon someone?
Do you know of any plans to injure a Scientology Organization?
Are you upset about this Security Check?

TRAINING DRILLS

These “TRs” are those released to the 18th ACC. They are in their original form. They are the correct drills for use in all instruction.

L. RON HUBBARD

NUMBER: TR 0

NAME: Confronting Preclear. COMMANDS: None.

POSITION: Student and coach sit facing each other a comfortable distance apart—about five feet.

PURPOSE: To train student to confront a preclear with auditing only or with nothing.

TRAINING STRESS: Have student and coach sit facing each other, neither making any conversation or effort to be interesting. Have them sit and look at each other and say and do nothing for some hours. Student must not speak, fidget, giggle or be embarrassed or anaten. Coach may speak only if student goes anaten (dope off). Student is confronting the body, thetan and bank of preclear.

HISTORY: Developed by L. Ron Hubbard in Washington in March 1957 to train students to confront preclears in the absence of social tricks or conversation and to overcome obsessive compulsions to be “interesting”.

NUMBER: TR 1

NAME: Dear Alice.

COMMANDS: A phrase (with the “he said” omitted) is picked out of the book “Alice in Wonderland” and read to the coach. It is repeated until the coach is satisfied it arrived where he is.

POSITION: Student and coach are seated facing each other a comfortable distance apart.

PURPOSE: To teach the student to send an intention from himself to a preclear in one unit of time without vias.

TRAINING STRESS: The command goes from the book to the student and, as his own, to the coach. It must not go from book to coach. It must sound natural, not artificial. Diction and elocution have no part in it. Loudness may have.

HISTORY: Developed by L. Ron Hubbard in London, April 1956, to teach the communication formula to new students.

NUMBER: TR 2

NAME: Acknowledgements.

COMMANDS: The coach reads lines from “Alice in Wonderland” omitting “He said” and the student thoroughly acknowledges them. The coach repeats any line he feels was not truly acknowledged.

POSITION: Student and coach are seated facing each other a comfortable distance apart.

PURPOSE: To teach student that an acknowledgement is a method of controlling preclear communication and that an acknowledgement is a full stop.

TRAINING STRESS: Teach student to acknowledge exactly what was said so that preclear knows it was heard. Ask student from time to time what *was* said. Curb over and under acknowledgement. Let student do anything at first to get acknowledgements across, then even him out. Teach him that an acknowledgement is a stop, not beginning of a new cycle of communication or an encouragement to the preclear to go on.

HISTORY: Developed by L. Ron Hubbard in London in April 1956 to teach new students that an acknowledgement ends a communication cycle and a period of time, that a new command begins a new period of time.

NUMBER: TR 3

NAME: Duplicative Question.

COMMANDS: “Do fish swim?” or “Do birds fly?” Communication bridge between.

POSITION: Student and coach seated a comfortable distance apart.

PURPOSE: To teach a student to duplicate without variation an auditing question, each time newly, in its own unit of time, not as a blur with other questions, and to acknowledge it; and to teach him how to shift from one question to another with a communication bridge rather than an abrupt change.

TRAINING STRESS: One question and student acknowledgement of its answer in one unit of time which is then finished. To keep student from straying into variations of command. To insist on communication bridge when question is changed. Even though the same question is asked, it is asked as though it had never occurred to anyone before. To teach student that a communication bridge consists of getting three agreements—one agreement to end this question, second agreement to continue session in general and maintain ARC, third agreement to begin a new question. Teach student that preclar is part of these agreements. To teach student never to vary question or shift question or command without a bridge.

HISTORY: Developed by L. Ron Hubbard in London in April 1956, to overcome variations and sudden changes in sessions.

NUMBER: TR 4

NAME: Preclear Originations.

COMMANDS: The student runs “Do fish swim?” or “Do birds fly?” on coach. Coach answers but now and then makes startling comments from a prepared list given by Instructor. Student must handle originations to satisfaction of coach.

POSITION: Student and coach sit facing each other a comfortable distance apart.

PURPOSE: To teach a student not to be tongue-tied or startled or thrown off session by originations of preclar and to maintain ARC with preclar throughout an origination.

TRAINING STRESS: The student is taught to hear origination and do three things: 1. Understand it; 2. Acknowledge it; and 3. Return preclar to session. If the coach feels abruptness or too much time consumed or lack of comprehension, he corrects the coach into better handling.

HISTORY: Developed by L. Ron Hubbard in London in April 1956, to teach auditors to stay in session when preclar dives out.

NUMBER: TR 5

NAME: Hand Mimicry.

COMMANDS: All Commands are by motions of one or two hands. The auditor makes a simple hand motion, holding his hand or hands in the final position. The coach bobs his head as having received it. The coach then, mirror-wise, makes the same motion with his hand or hands. The student then acknowledges. If the motion was not correctly done by coach the student acknowledges doubtfully, then repeats the motion to the coach. If the coach does it well, student thanks coach by shaking own two hands together (prize fighter fashion). Keep motions simple. Student must always be able to duplicate own motions.

POSITION: Student and coach are seated facing each other at a short distance, coach’s knees inside student’s.

PURPOSE: To educate student that *verbal* commands are not entirely necessary. To make student physically telegraph an intention. To show student necessity of having preclar obey commands.

TRAINING STRESS: Accuracy of student repeating own commands. Teaching student to give preclar wins. Teaching student that an intention is different from words.

HISTORY: Developed by L. Ron Hubbard in London in April 1956, from the principles of body mimicry developed by L. Ron Hubbard in Camden, N.J., in 1954.

TRAINING DRILLS MODERNIZED

(Reissued 5 January 71, substituting word “supervisors” for “instructors”, adding the words “a command” to TR 3 and substituting the words “and coach’s remarks about self as pc” in TR 4 in place of “and remarks aimed only at the student.”)

Due to the following factors, I have modernized TRs 0 to 4:

1. The auditing skill of any student remains only as good as he can do his TRs.
2. Flubs in TRs are the basis of all confusion in subsequent efforts to audit.
3. If the TRs are not well learned early in the HPA/HCA, BScn/HCS Courses, **THE BALANCE OF THE COURSE WILL FAIL AND SUPERVISORS AT UPPER LEVELS WILL BE TEACHING NOT THEIR SUBJECTS BUT TRS.**
4. Almost all confusions on Meter, Model Sessions and SOP Goals stem directly from inability to do the TRs.
5. A student who has not mastered his TRs will not master anything further.
6. SOP Goals will not function in the presence of bad TRs. The preclear is already being overwhelmed by process velocity and cannot bear up to TR flubs without ARC breaks.

Academies were tough on TRs up to 1958 and have since tended to soften. Comm Courses are not a tea party.

These TRs given here should be put in use at once in all auditor training, in Academy and HGC and in the future should never be relaxed. Seven weeks on a Comm Course until he does the TRs perfectly lets the student receive at least one week’s training in the eight. A poor Comm Course in one week can wipe out the whole eight weeks.

NUMBER: TR 0 Revised 1961

NAME: Confronting Preclear.
COMMANDS: None.

POSITION: Student and coach sit facing each other a comfortable distance apart— about three feet.

PURPOSE: To train student to confront a preclear with auditing only or with nothing. The whole idea is to get the student able to *hold* a position three feet in front of a preclear, to BE there and not do anything else but BE there.

TRAINING STRESS: Have student and coach sit facing each other, neither making any conversation or effort to be interesting. Have them sit and look at each other and say and do nothing for some hours. Student must not speak, fidget, giggle or be embarrassed or anaten. It will be found the student tends to confront **WITH** a body part, rather than just confront, or to use a system of confronting rather than just BE there. The drill is misnamed if Confront means

to DO something to the pc. The whole action is to accustom an auditor to BEING THERE three feet in front of a preclear without apologizing or moving or being startled or embarrassed or defending self. After a student has become able to just sit there for two hours “bull baiting” can begin. Anything added to BEING THERE is sharply flunked by the coach. Twitches, blinks, sighs, fidgets, anything except just being there is promptly flunked, with the reason why.

Patter: Student coughs. Coach: “Flunk! you coughed. Start.” This is the whole of the coach’s patter as a coach.

Patter as a confronted subject: The coach may say anything or do anything except leave the chair. The student’s “buttons” can be found and tromped on hard. Any words not coaching words may receive *no* response from the student. If the student responds, the coach is instantly a coach (see patter above).

Supervisors should have coaches let student have some wins (coach does not mention these) and then, by gradient stress, get the coaches to start in on the student to invite flunks and then flunk them. This is “bull baiting”. The student flunks each time he or she reacts, no matter how minutely, to being baited.

This TR should be taught rough-rough-rough and not left until the student can do it. Training is considered satisfactory at this level only if the student can BE three feet in front of a person without flinching, concentrating or confronting with, regardless of what the confronted person says or does.

HISTORY: Developed by L. Ron Hubbard in Washington in March 1957 to train students to confront preclears in the absence of social tricks or conversation and to overcome obsessive compulsions to be “interesting”. Revised by L. Ron Hubbard April 1961 on finding that SOP Goals required for its success a much higher level of technical skill than earlier processes.

NUMBER: TR 1 Revised 1961

NAME: Dear Alice.

PURPOSE: To train the student to deliver a command newly and in a new unit of time to a preclear without flinching or trying to overwhelm or using a via.

COMMANDS: A phrase (with the “he said” omitted) is picked out of the book “Alice in Wonderland” and read to the coach. It is repeated until the coach is satisfied it arrived where he is.

POSITION: Student and coach are seated facing each other a comfortable distance apart.

TRAINING STRESS: The command goes from the book to the student and, as his own, to the coach. It must not go from book to coach. It must sound natural not artificial. Diction and elocution have no part in it. Loudness may have.

The coach must have received the command (or question) clearly and have understood it before he says “Good”.

Patter: The coach says “Start”, says “Good” without a new start if the command is received or says “Flunk” if the command is not received. “Start” is not used again. “That’s it” is used to terminate for a discussion or to end the activity. If session is terminated for a discussion, coach must say “Start” again before it resumes.

This drill is passed only when the student can put across a command naturally, without strain or artificiality or elocutionary bobs and gestures, and when the student can do it easily and relaxedly.

HISTORY: Developed by L. Ron Hubbard in London, April 1956, to teach the communication formula to new students. Revised by L. Ron Hubbard 1961 to increase auditing ability.

NUMBER: TR 2 Revised 1961

NAME: Acknowledgements.

PURPOSE: To teach student that an acknowledgement is a method of controlling preclear communication and that an acknowledgement is a full stop.

COMMANDS: The coach reads lines from “Alice in Wonderland” omitting “He said” and the student thoroughly acknowledges them. The coach repeats any line he feels was not truly acknowledged.

POSITION: Student and coach are seated facing each other at a comfortable distance apart.

TRAINING STRESS: Teach student to acknowledge exactly what was said so preclear knows it was heard. Ask student from time to time what was said. Curb over and under acknowledgement. Let student do anything at first to get acknowledgements across, then even him out. Teach him that an acknowledgement is a stop, not beginning of a new cycle of communication or an encouragement to the preclear to go on.

To teach further that one can fail to get an acknowledgement across or can fail to stop a pc with an acknowledgement or can take a pc’s head off with an acknowledgement.

Patter: The coach says “Start”, reads a line and says “Flunk” every time the coach feels there has been an improper acknowledgement. The coach repeats the same line each time the coach says “Flunk”. “That’s it” may be used to terminate for discussion or terminate the session. “Start” must be used to begin new coaching after a “That’s it”.

HISTORY: Developed by L. Ron Hubbard in London in April 1956 to teach new students that an acknowledgement ends a communication cycle and a period of time, that a new command begins a new period of time. Revised 1961 by L. Ron Hubbard.

NUMBER: TR 3 Revised 1961

NAME: Duplicative question.

PURPOSE: To teach a student to duplicate without variation an auditing question, each time newly, in its own unit of time, not as a blur with other questions, and to acknowledge it. To teach that one never asks a second question until he has received an answer to the one asked.

COMMANDS: “Do fish swim?” or “Do birds fly?”

POSITION: Student and coach seated a comfortable distance apart.

TRAINING STRESS: One question and student acknowledgement of its answer in one unit of time which is then finished. To keep student from straying into variations of command. Even though the same question is asked, it is asked as though it had never occurred to anyone before.

The student must learn to give a command and receive an answer and to acknowledge it in one unit of time.

The student is flunked if he or she fails to get an answer to the question asked, if he or she fails to repeat the exact question, if he or she Q and As with excursions taken by the coach.

Patter: The coach uses “Start” and “That’s it”, as in earlier TRs. The coach is not bound after starting to answer the student’s question but may comm lag or give a commenting type answer to throw the student off. Often the coach should answer. Somewhat less often the coach attempts to pull the student in to a Q and A or upset the student. Example:

Student: “Do fish swim?”
Coach: “Yes”
Student: “Good”
Student: “Do fish swim?”
Coach: “Aren’t you hungry?”
Student: “Yes”
Coach: “Flunk”

When the question is not answered, the student must say gently, “I’ll repeat the auditing question,” and do so until he gets an answer. Anything except commands, acknowledgement and, as needed, the repeat statement is flunked. Unnecessary use of the repeat statement is flunked. A poor command is flunked. A poor acknowledgement is flunked. A Q and A is flunked (as in example). Student misemotion or confusion is flunked. Student failure to utter the next command without a long comm lag is flunked. A choppy or premature acknowledgement is flunked. Lack of an acknowledgement (or with a distinct comm lag) is flunked.

Any words from the coach except an answer to the question, “Start” “Flunk” “Good” or “That’s it” should have no influence on the student except to get him to give a repeat statement and the command again. By repeat statement is meant, “I’ll repeat the auditing command”.

“Start”, “Flunk”, “Good” and “That’s it” may not be used to fluster or trap the student. Any other statement under the sun may be. The coach may try to leave his chair in this TR. If he succeeds it is a flunk.

The coach should not use introverted statements such as “I just had a cognition.” “Coach divertive” statements should all concern the student, and should be designed to throw the student off and cause the student to lose session control or track of what the student is doing.

The student’s job is to keep a session going in spite of anything, using only command, the repeat statement or the acknowledgement.

The student may use his or her hands to prevent a “blow” (leaving) of the coach. If the student does anything else than the above, it is a flunk and the coach must say so.

HISTORY: Developed by L. Ron Hubbard in London in April 1956, to overcome variations and sudden changes in sessions. Revised 1961 by L. Ron Hubbard. The old TR had a comm bridge as part of its training but this is now part of and is taught in Model Session and is no longer needed at this level. Auditors have been frail in getting their questions answered. This TR was redesigned to improve that frailty.

NUMBER: TR 4 Revised 1961

NAME: Preclear originations.

PURPOSE: To teach a student not to be tongue-tied or startled or thrown off session by originations of preclear and to maintain ARC with preclear throughout an origination.

COMMANDS: The student runs “Do fish swim?” or “Do birds fly?” on coach. Coach answers but now and then makes startling comments from a prepared list given by Instructor. Student must handle originations to satisfaction of coach.

POSITION: Student and coach sit facing each other at a comfortable distance apart.

TRAINING STRESS: The student is taught to hear origination and do three things: 1. Understand it; 2. Acknowledge it; and 3. Return preclear to session. If the coach feels abruptness or too much time consumed or lack of comprehension, he corrects the student into better handling.

Patter: All originations concern the coach, his ideas, reactions or difficulties, none concern the auditor. Otherwise the patter is the same as in earlier TRs. The student's patter is governed by: 1. Clarifying and understanding the origin. 2. Acknowledging the origin. 3. Giving the repeat statement "I'll repeat the auditing command," and then giving it. Anything else is a flunk.

The auditor must be taught to prevent ARC breaks and differentiate between a vital problem that concerns the pc and a mere effort to blow session. (TR 3 Revised.) Flunks are given if the student does more than 1. Understand; 2. Acknowledge; 3. Return pc to session.

Coach may throw in remarks personal to student as on TR 3. Student's failure to differentiate between these (by trying to handle them) and coach's remarks about self as "pc" is a flunk.

Student's failure to persist is always a flunk in any TR but here more so. Coach should not always read from list to originate, and not always look at student when about to comment. By Originate is meant a statement or remark referring to the state of the coach or fancied case. By Comment is meant a statement or remark aimed only at student or room. Originations are handled, Comments are disregarded by the student.

HISTORY: Developed by L. Ron Hubbard in London in April 1956, to teach auditors to stay in session when preclear dives out. Revised by L. Ron Hubbard in 1961 to teach an auditor more about handling origins and preventing ARC breaks.

As TR 5 is also part of the CCHs it can be disregarded in the Comm Course TRs despite its appearance on earlier lists for students and staff auditors.

Training Note

It is better to go through these TRs several times getting tougher each time than to hang up on one TR forever or to be so tough at start student goes into a decline.

CHANGE PROCESSES

I have been studying change processes in relation to the tendency of the pc to alter-is commands and have found that if a pc is bad off on change (which includes about eighty per cent of the pcs you get), he cannot run another auditing command cleanly as he never really runs the command but runs something else. Therefore the only thing that can be run is a change process and it must be run until motion is removed from the Tone Arm. (This does not mean a "stuck" Tone Arm, but a motion of about one-sixteenth of a division on the Tone Arm dial.)

DISCOVERY

What has made the change process so important is a recent discovery I made that resisted change is the basis of all mass in the physical universe. Resisted change is the basis of every stuck point on the track.

There are probably dozens of versions of change processes.

The safest way to dope out what change process to run on the pc is to read it on the needle and get each different command of the whole process to fall properly, and then to run whatever has been figured out.

SAFE RULES FOR CHANGE PROCESS

Run at least two ways of flow.

Run positive and negative change.

Run a version that is real to the pc, with each command cleared on the meter (to get each command to fall before actually using it). This is meter clearing the command. It's new.

Examples:

"Think" vs. "Get the idea of" can be sorted out on the meter. The right one will fall. The wrong one won't or will fall less.

Get the flows sorted out with commands.

Process Versions:

- "Get the idea of changing yourself."
- "Get the idea of another changing himself."
- "Get the idea of changing another."
- "Get the idea of another trying to change you."
- "Get the idea of another trying to change another."
- "Get the idea of not changing yourself."
- "Get the idea of another not changing himself."
- "Get the idea of not changing another."
- "Get the idea of another not changing you."
- "Get the idea of another not changing another."

Another Version:

“How have you changed another?”
“How have you failed to change another?”

Another Process:

“How have you tried to change yourself?”
“How have you tried to change another?”
“How has another tried to change you?”
“How has another tried to change himself?”
“How has another tried to change another?”

Another Process:

“Think of something changing.”
“Think of something failing to change.”
“Think of changing somebody.”
“Think of failing to change somebody.”

Another Process:

“Get the idea of changing another.”
“Get the idea of failing to change another.”

Another Process:

“Recall a change. “
“Recall a failure to change.”

SUMMARY

There are many many versions of change. To get the best result, adapt a process to the pc. Before leaving a change process you have been running, because motion has come out of the Tone Arm, try to find another change process that will get the motion going again.

Change does not particularly cut down havingness, but after a while you can scout the pc's havingness process out and use it from time to time during and at the end of a session. The reason change does wreck havingness is that resistance to change prevents the pc from having, and as the ideas of change are sorted out the pc has increased havingness anyway, similar to O/W which is a havingness process.

CHANGE BRACKETS AND COMMANDS

(Only changes are correction of typo errors whereby
“not” was omitted from commands 8, 9 and 10 of the
15 Way Bracket and inclusion of the terminal assessment.)

The basic commands of CHANGE form a series of brackets.

The basic curve of change compares to the CYCLE OF ACTION.

Therefore the basic versions of CHANGE would consist of *Change*, *No Change* and *Failed Change*.

The Standard bracket is a five way bracket. The general form of this is as follows:

You Terminal
Terminal..... You
TerminalAnother
AnotherTerminal
TerminalTerminal

Change as a five way bracket would be somebody or something as the terminal (whichever falls most on a meter) and:

Assess: Somebody_____

 Something_____

5 Way Bracket

(Use whichever gave best read above.)

1. “How have you changed something?”
2. “How has something tried to change you?”
3. “How has something changed another?”
4. “How has another changed something?”
5. “How has something changed?”

or:

1. “How have you changed somebody?”
2. “How has somebody tried to change you?”
3. “How has somebody changed another?”
4. “How has another changed somebody?”

5. "How has somebody changed self?"

15 Way Bracket

(something or somebody)

1. "How have you changed something?"
2. "How has something tried to change you?"
3. "How has something changed another?"
4. "How has another changed something?"
5. "How has something changed?"
6. "What have you not changed?"
7. "What has not changed you?"
8. "What has not changed something?"
9. "What has something not changed?"
10. "What has not changed self?"
11. "What have you failed to change?"
12. "What has failed to change you?"
13. "What has something failed to change?"
14. "What has failed to change something?"
15. "What has failed to change self?"

The above commands are run consecutively as one process. This process is the basic Release Process.

Another version:

1. "What change have you avoided?"
2. "What change have you sought?"
3. "What no change have you avoided?"
4. "What no change have you sought?"
5. "What failed change have you avoided?"
6. "What failed change have you sought?"

Another version:

1. "Recall a change."
2. "Recall a no-change."
3. "Recall a failed change."

Another version:

Sort out "Think" or "Get the idea" by the meter's reaction. Use one that produces the most fall.

1. "Think (get the idea) of a change."
2. "Think of a no-change."
3. "Think of a failed change."

E-METER ESSENTIALS

1961

CLEARING SERIES VOLUME 1

by

L. Ron Hubbard

A startling and thorough coverage of the E-Meter incorporating all modern developments and its use in Assessments, Security Checking and S.O.P. Goals

THE HUBBARD ELECTROMETER is an electronic instrument for measuring the mental state and change of Homo Sapiens.

| SUMMARY | 19 |

E-METER ESSENTIALS

THE FOLLOWING essential points concerning the Electrometer must be known to an auditor.

2. There is no known way to clear anyone without using a meter.
3. There is no guarantee that scrap or non-standard meter will behave properly.
4. The only way known to learn to use an E-Meter is use one, handle one, practice with one. Skill in meter use depends upon familiarizing oneself with the actual meter.
5. Get familiar with the meter by holding it, watching it, turning it on and off. Touch it. Reach and withdraw from it. Play catch with it. Don't just read books about it.
6. Put various persons on the meter. Check them out on Security Checks, rudiments checks, and release checks. Check out dates of incidents.
7. Do Dynamic Assessments. Do goals assessments.
8. The person who says the meter is not a precision instrument is either unfamiliar with one or has something to hide. The auditor's questions can be off. The meter never is.

THEORY

1. The meter tells you what the preclear's mind is doing when the preclear is made to think of something.
2. The meter registers before the preclear becomes conscious of the datum. It is therefore a pre-conscious meter. The meter passes a tiny current through the preclear's body.
3. This current is influenced by the mental masses, pictures, circuits and machinery. When the unclear pc thinks of something, these mental items shift and this registers on the meter.
4. Some preclears are in denser masses than others. Therefore the ToneArm reads very low (most dense), very high, or normal.
5. A low-toned preclear may not be able to influence his mind or body at all and reads the same as a dead body around two or three without action. A low-toned person may read at two or three on the Tone Arm with a sticky needle.
6. A middle-toned preclear reads actively on the meter both Tone Arm and Needle, with low sensitivity setting.
7. A Very high-toned person (clear) reads at two or three on the ToneArm with a free needle.
8. The key difference between a low-toned preclear and a high-toned one is seen in needle response, the low-toned having a sluggish needle or a sticky one, the high-toned person having a free needle.
9. The low-toned person cannot answer questions about help intelligently.
10. Thus we see that the E-Meter basically registers the body at two (female) or three (male) on the Tone Arm. If a thetan is 'dead' he doesn't add to or subtract from the reading. If a thetan is 'partially alive' he adds or subtracts from the reading. If a thetan is 'fully alive' he is not necessarily inside the body he controls and so does not add to or subtract from the reading.

PRACTICE THE TONE ARM

1. The three general states have many way stops. There is always a lower-toned mockery of higher tones. A low-tone case, to the relatively unskilled, can be at clear read, unreactive on a sticky sort of needle. He cannot, however, do things in Life. He or she cannot answer questions intelligently about Help or Control.
2. The first advance of a very low-toned case may be to drop into theminus two area on the Tone Arm Dial.
3. Because of the construction of an E-Meter, the Tone Arm cannot pass through the bottom of the dial. As a low-toned case gains responsibility, theTone Arm goes from three or two to 1.5 to 1 to 6 to 5 to 4 to 3 (for a male) and then to 2 (for a female). This occurs over a long term of processing, of course, and takes many, many hours of processing and the Tone Arm ebbs and flows back and forth.
4. Very few cases are in a 'dead' state. Most cases will be found on theTone Arm around four or five.
5. The Tone Arm registers Density of Mass (ridges, pictures, machines, circuits) in the mind of the preclear. This is actual mass, not imaginary, and can be weighed, measured by resistance, etc.
6. Therefore the Tone Arm registers State of Case at any given time in processing.
7. The Tone Arm also registers advance of case during processing by moving. An unmoving case has an unmoving Tone Arm. A moving case has a moving Tone Arm.
8. If a case is not moving, no matter what the preclear says, the ToneArm is not moving.
9. If a case is moving, no matter what the preclear says, the Tone Armis moving during processing.
10. If the Tone Arm shows motion, continue the process, no matter whatthe preclear says.
11. If the Tone Arm shows no motion, you can change the process.
12. To change a process while the Tone Arm shows good motion is a breachof the Auditor's Code Clause 13. Also to continue a process that is producingno Tone Arm motion is a breach of the same Clause.
13. When a level of the Pre-Havingness Scale is flat for terminal. the Tone Arm is showing very little motion. One must reassess for a new level for the same terminal on the Scale, whereupon the Tone Arm will again show motion.
14. When all levels that needle-register on the Pre-Havingness Scale are flat, the Tone Arm will no longer show motion, but neither will it stick in a frozen way.
15. It is a nice judgment when to leave a process. The judgment is done by the Tone Arm action.
16. When the Tone Arm slows down and isn't moving more than a quarter of an inch up or down, it is time to reassess. To go longer would stick the ToneArm and make needle action too stuck for a reassessment to be possible. You will always find any unflat level in future reassessments on thePre-Havingness Scale so it is not dangerous to so leave one. It is

dangerous to leave a level of the Pre-havingness Scale when the Tone Arm shows motions of one inch up or down the Tone Arm Dial, as the preclear will get confused.

17. Take hold of the Tone Arm of your E-Meter. Set it at 4.5 on its dial. Move it to 3. Move it to 5. Now pretend a period of twenty minutes. Move the Tone Arm from 5 to 4, then from 4 to 4.5. then from 4.5 to 3.5, then from 3.5 to 4.8, then from 4.8 to 4. If all that happened in twenty minutes of processing, that is terrific Tone Arm motion. The case would be changing very, very well. You would not change a process. You would go on running the same process.

18. Take the Tone Arm in hand again. Set it at 3.5. Pretend a period of twenty minutes. Move it from 3.5 to 3.3. Move it from 3.3 to 3.6. Move it from 3.6 to 3.4. If that's all that happened in twenty minutes of processing, be alert, for you'd better reassess for a new level for the terminal on the Pre-Havingness Scale. The Tone Arm may be getting ready to stick.

19. But don't be surprised if the Tone Arm motion suddenly picks up again. If it does, carry on with the same process.

20. The above give you two extremes of Tone Arm motion. The first example is excellent motion. The second example is poor motion. Between these two examples you have a variety of types of motion.

21. In using the meter you are trying to (a) assess for a process that will produce Tone Arm motion and (b) run the motion out of the Tone Arm.

22. When the Tone Arm does not move under processing one of two things is true: (a) you did not get the right process to run or (b) you have run it flat. The remedy for (a) is to do better assessment and run another process. The remedy for (b) is to do another assessment.

23. That the Tone Arm moves under processing denotes a change in the preclear's mind. That the Tone Arm doesn't move under processing denotes no change of mass, pictures, machinery or circuits in the preclear.

24. When a preclear is clear he may occasionally get some Tone Arm motion due to purely body electronics but in the main reads at male or female on the arm (3 or 2) according to his or her sex.

25. As a preclear nears clear, an assessment plus a few commands will 'blow' the connected masses and thus flatten the terminal chosen. As a preclear gets even nearer, assessment alone blows the remaining masses. Therefore, when the state is approached, the Tone Arm motion gets less and less, no matter what you do. But the condition is self-evident when observed, the preclear gaining more and more effect on his bank with less and less time necessary to remedy a condition.

MECHANICS

1. The Tone Arm stops moving and sticks because the assessment and process have dragged in a picture, chain, or mass upon the pre-clear that the command as-is only part of. When the process is no longer as-ising the picture or mass, yet is still restimulating it, the Tone Arm registers that the picture, chain or mass is there but not changing. Another process from the Pre-Havingness Scale for the same terminal is now needed to as-is another portion of the picture, chain or mass. Thus the Tone Arm starts moving again.

2. When you overrun a process level of the Pre-Havingness Scale, particularly early in processing, you can pull this picture, chain or mass in so strongly (running a stuck Tone Arm) that reassessment becomes very difficult as nothing moves the meter.

3. Stop running a level while you can still read the meter.

4. If you do overrun too far, still try to read the meter for a new level of assessment. If you can't, run the change process to get back action and then reassess the same terminal. You will now be able to read the meter. To have to do this, however, is pretty dull.

5. Processes move in or activate pictures, chains, masses, machinery, circuits, and nullify them, thus clearing people. Life is doing this to them all the time without running them out.

6. The mechanics of the mind in clearing are only those mentioned in this section. To try it without a meter, or without knowing a meter well, is of course beyond the observational ability of Homo Sapiens.

7. Only a meter registers these mechanics. Only processes blow these barriers to living.

THE SENSITIVITY KNOB

1. The sensitivity knob increases the swing of the needle.
2. To run with too high a sensitivity makes the auditor's work unreliable.
3. To run with too low a sensitivity makes the needle unreadable.
4. The sensitivity knob is adjusted at the start of the rudiments, any assessment, or any process or when the auditor wants to know.
5. The exact setting of the knob is done as follows: Have the preclear hold the electrodes comfortably in his hands. Have him tighten his hands and then relax them, still holding the cans. The needle should drop exactly one-third of a dial. Adjust the sensitivity knob by asking the preclear to squeeze the cans again and observing the needle fall.
6. On older meters, as the preclear gets to release, you can't get just one-third of a dial -- you get more even with the knob on the lowest sensitivity. Set it as low as you can and use it anyway.
7. In short, adjust the knob to a still needle that will yet move on needed responses.
8. If at any time the needle doesn't react and you want a comparative reaction between two or more questions, increase the knob, read the question responses, and then set it back again for running.
9. If you change the sensitivity knob during an assessment, you have to do the whole assessment again on the new setting as the amount of needle fall will be changed.
10. In running rudiments, when suspicious, set the sensitivity knob higher.
11. In looking for suspected withholds in particular, read with a high knob.
12. By holding a constant sensitivity knob during an assessment or during a process, you find out how the preclear is reacting on the needle relative to the start of the assessment or process.

THE NEEDLE

1. A needle is monitored by the sensitivity knob, the Tone Arm and the momentary or changing reactions of the preclear.

2. There are ten main needle actions:

- (1) Stuck
- (2) No reaction (nul)
- (3) Fall
- (4) Change of characteristic
- (5) Rise
- (6) Theta bop
- (7) Rock slam
- (8) Free needle
- (9) Body reactions
- (10) Stage Four

3. In a totally stuck needle (1) the preclear would not even register being pinched. It looks stiff. In a nul needle (2) the question does not change the needle behavior.

In the presence of an ARC break with the auditor, the needle is liable not to register any reaction at all, and to look like a nul needle; therefore, before writing off any assessment item, prepcheck, or security check question as nul, be sure to check for -- and repair -- any ARC break.

4. A falling needle (3) makes a dip to the right as you face the meter. A fall may consist of half a division (about one-eighth of an inch) or may consist of fifteen dials (the whole meter face dropped fifteen times). It is still a fall. A fall always happens with rapidity, within a second or two. It is also called a drop, a dip and a register. It denotes that a disagreement with life on which the preclear has greater or lesser reality has met the question asked.

5. A fall is the most used and observed needle action. It means to the auditor, 'I've found it', or 'I've gotten a response in the bank'. (It is the click of the light switch illuminating where we are going.

6. Falls are measured relative to falls. That's why we leave the sensitivity alone when we are looking for something question by question.

7. Given two falls, the longer fall is the right one. For instance, a question about 'Joe' gets three-eighths of an inch of fall. A question about 'Mabel' right after gets five-eighths of an inch of fall. The right answer is Mabel.

8. Any fall denotes there is something there. Any fall at any sensitivity level on rudiments questions denotes the presence of a bad reaction to the room, an ARC break, a withhold, or a present time problem and must be cleared no matter what the preclear says.

9. A fall follows at once upon the question being asked. A fall can be in two stages or more providing they take place within a second or two after the question.

10. A fall is the diagnostic meter action. Set for falls from a still needle as given under Sensitivity above.

11. In starting out the first thing you want to know is, 'Is the preclear reading on this meter?' You get the preclear to squeeze the cans. You get a fall as he does. Oh. He or she is reading on the meter. The meter is not broken or turned off or disconnected. It is the fall that tells us.

12. The next thing we want to know is rudiments. It is the fall that tells us what we must handle.

13. The next thing is the assessment. It is degree of fall that tells us what is right, for we always take the greatest fall we can obtain, the sensitivity being kept constant.

14. The next thing is the running. We ignore the fall now and watch the Tone Arm instead. The needle, of course, has to move if the Tone Arm is going to move, but, until we want more rudiments type answers or until we want a new assessment, we ignore the needle and watch only the Tone Arm.

15. Change of characteristic (4). Sometimes, as in old Dynamic Assessment, we cannot get clean falls on what we are looking for. Another guide is "change of characteristic" of the needle.

16. The needle is doing a pattern of small rises and falls. We ask a question, it stops moving. We ask another question, it resumes idly rising and falling as before. That stop is a change of characteristic. Or the needle is stopped while we ask a long series of questions but suddenly does a small dance. That is a change of characteristic.

17. Change of characteristic occurs when we hit on something in the preclear's bank. It occurs only when and each time that we ask that exact question. As the question or item alone changes the needle pattern, we must assume that that is it and we use it.

18. A question that stops a rising needle is a change of characteristic question and like a fall means we have struck something. Further exploration usually develops it into a fall.

19. By using 'change of characteristic' we can sometimes get our foot in the door and get into a channel that brings about falls.

20. A whole assessment can be done by change of characteristic as well as by falls but it is not usual and, in fact, will develop falls anyway; if you are on to something hot.

21. It is not much used but must be known as it may have to be used sooner or later when we can't get falls.

The only needle reactions in which you should be interested are those which occur INSTANTLY, i.e., within one-tenth to one-half of a second after you have asked a question of the preclear.

22. Rises (5). A rising needle means 'no confront'.

23. Of course a needle must rise at times or the Tone Arm would never move. But it still means that the preclear has struck an area or something he isn't confronting. One never calls his attention to this. But one knows what it is.

24. The only use a rising needle has at this time is to stop going up the Pre-Havingness ladder with a terminal assessment when the needle begins a marked rise. You have exceeded the preclear's reality and he isn't confronting, so you'd better turn around and go down the ladder again before you get things too unreal for him by asking if the terminal can do things the preclear cannot imagine it could do.

25. The right circuit, valence, machinery, called off, will stop a rising needle. This was once used but is not necessarily employed at this time.

26. The rising needle is, therefore, not much employed, but one should recognize one. It is a steady, constant movement of the needle, rather slow, from right to left.

27. A needle returning to position after a fall is not a rising needle.

28. A Theta Bop (6) is a small or wide steady dance of the needle. Over a spread of one-eighth of an inch, say (depending on sensitivity setting -- it can be half an inch), the needle goes up and down perhaps five or ten times a second. It goes up, sticks, falls, sticks, goes up, sticks, etc., always the same distance and a constant speed.

29. A theta bop means 'death', 'leaving', 'don't want to be here'. It is caused by a yo-yo of the preclear as a thetan vibrating out and into the body or a position in the body. It's as if the needle is jumping between two peaks across a narrow valley.

30. Mention death to anyone (or make them think about it) while they're on a meter and you'll see a theta bop.

31. Its use is to detect whether a preclear is being left stuck in death, or to locate death or departures.

32. If a preclear wants badly to get out of session he or she may start theta bopping without being stuck in a death. But few theta bops mean the preclear wants to leave session. It's most often turned on for 'desire to leave session' during a security check.

33. If you get a 'bop' turned on during an assessment (or a security check) it takes it quite a while, sometimes, to turn off. The next several questions after a 'bop' turns on are therefore seldom validly readable. Just keep on with an assessment but be careful to go over the ground again and again if you're getting a 'bop'. Theta bops turn on fast and turn off slowly.

34. They are not very important in diagnosis. They're more interesting than vital.

35. Rock slam (7). In assessing or running you occasionally get a Rockslam. This originally meant (and still does) that you are on the rock chain.

36. A Rock slam is a crazy, irregular, unequal, jerky motion of the needle, narrow as one inch or as wide as three inches happening several times a second. The needle 'goes crazy', slamming back and forth, narrowly, widely, over on the left, over on the right, in a mad war dance or as if it were frantically trying to escape. It means hot terminal or hot anything in an assessment and takes precedence over a fall.

37. It differs from a theta bop, which has no precedence over a fall, in that a theta bop is even and gentlemanly and a Rock slam is as crazy as a Commie agitator.

38. If found in an assessment, use it, but make sure of what turned it on before you buy. It means the item is hot.

39. If found in running a process, just carry on. It means the going is hot, so for Heaven's sakes don't stop the session.

40. Free needle (8). This is probably the least understood term and needle action in all of E-Metering.

41. It means an idle, uninfluenced motion, no matter what you say about the goal or terminal. It isn't just nul, it's uninfluenced by anything (except body reactions).

42. Man, it's really free.

43. You'll know one when you see one. They're really pretty startling. The needle just idles around and yawns at your questions on the subject.

44. It doesn't happen until a person is well above release, so don't worry about it until you see it.

45. Use NUL as a word, not Free, if you're in doubt about it. A NUL just doesn't fall on a question. It might fall on a similar question. A Free Needle wouldn't fall if the psychiatrists surrendered in a body or the Empire State Building fell down.

46. A Free Needle means, when it is used as a term, 'The preclear is getting awful close to clear'.

47. Tight needles (stuck) are far from free. A stuck needle can be made to fall by advancing the sensitivity 'way up. Thus even a 'stuck needle' can be 'nul'. But a Free Needle is not stuck or nul. It just floats around.

48. Body reactions (9). The deep breathing of a preclear, a sigh, a yawn, a sneeze, a stomach growl can any one of them make a needle react.

49. Get a person on the cans. Turn the sensitivity high. Make him do the following one at a time: sigh, yawn, breathe deeply, cough, laugh, knock the cans together, lift a finger off the electrode (can), convulsively grip the cans, scratch his head while holding the cans, scratch his leg, rub a can against his or her shirt or skirt, rub his fingers together without letting the cans touch, and stretch. Note the needle reactions. Now have the person do all these things again as you read them off. Now turn down the sensitivity knob so that the needle drops one-third of a dial (about one and a half inches). Now with that setting, read off the list to him and watch the needle.

50. Do you see now why you don't run with high sensitivity?

51. These are body reactions.

52. The meter will also read Basal Metabolism, interesting because it tells you if the preclear really is eating, or has eaten breakfast. Have the preclear on the cans take a very deep breath. If a moment later the needle falls half a dial (two inches or more) the preclear has a good high Basal Metabolism. If he hasn't eaten breakfast, it won't fall like that. On the second or third deep breath let out, the Basal Metabolism stops registering, so the first time is the test, not subsequent tries.

53. You can also make a high sensitivity set needle jump by 'imagining' the preclear's hands being better connected to the cans and 'seeing' a whitish glow between cans and finger tips. That is, if you're in good shape. You can also do it by 'seeing' this glow in the area of a preclear's old injury. That is the extent of your influencing the preclear and the meter reading outside of auditing.

54. You can also (after you've been talking to, not processing, a preclear) set the meter on yourself, then give the cans to the preclear and he or she will read the same adjustments for a few moments.

55. These are all more or less Body Reactions. They get in your road as to movement and sneezes and they don't affect your processing as to 'crosscurrents' between auditor and preclear.

So bear up under them and skip them. They're not important once you know what they are.

56. Stage Four (10). This is the sole survivor of an old system (20thACC) that used four stages of meter reaction as a test of state of case.

57. A Stage Four Needle is still important to identify when met as it means this preclear is from No place as a case.

58. A Stage Four is below a merely stuck needle. The preclear's thoughts and few of your questions have any bearing on the preclear's case. This is most promising as CCH stuff. But not only a Stage Four takes CCH. (See Director of Processing Check Type One for case reactions that take CCH.)

59. Possibly the change process or attention process may bite here.

60. A Stage Four needle goes up about an inch or two (always the same distance) and sticks and then falls, goes up, sticks, falls, about once a second or so. It is very regular, always the same distance, always the same pattern, over and over, on and on, and nothing you say or the preclear says changes it (except Body Reactions).

61. Break through this meter action by pulling withholds or unkind thoughts or the Jo'burg Security Check or the CCHs or processes, and you have busted the lowest level of the case.

62. But it's a disheartening phenomenon. The E-Meter just doesn't react to anything except a kick in the head. Up, stick, fall, up, stick, fall. On and on like a metronome set for the Dead March of Saul. Know it when you see it. Until you break it, there's no case change.

FINDING HAVINGNESS AND CONFRONT PROCESSES

1. The Thirty-six Havingness and Confront Processes are tested for on the E-Meter in an exact way.
2. The Havingness Process is located on the needle by the preclear squeezing the cans before the command is tested and after it has been run five to eight commands.
3. If the second squeeze shows the needle looser (wider swing) than the first squeeze did, you've got it. The command you are testing is the Havingness Command for the preclear and may thereafter be used at intervals to set up the room in Rudiments, gain havingness before or after processes and at session end, using only ten or twelve commands at a time.
4. The Confront Process from the Thirty-six Preessions is located on the Tone Arm. If eight or ten commands of one of these moves the Tone Arm, that's the Confront Process to be used after other processes and before the Havingness Process.
5. Havingness is tested on the Needle with can squeezes.
6. Confront is tested on the Tone Arm by its motion.
7. If the process tested for Havingness tightens the needle during the test, get rid of it. Don't bridge off. Just get off now.
8. If the process being tested for Confront fails to move the Tone Arm during test after eight or ten commands, get off it, don't bridge off. (No more commands of it.)
9. The Havingness Process selected, even if the right one, if run too much (more than ten or twenty commands), will start running the bank. It doesn't harm the preclear, but that isn't its use. The Tone Arm may 'blowdown' toward clear if you run fifteen minutes or half an hour of the Havingness Process. Again, it might not. The purpose of a havingness process is to get the preclear stabilized in his environment. It will also do other things if overrun, none bad, but other processes do them better.
10. The Confront Process gets the preclear to present time from areas on the track where his attention was fixed by an earlier process.
11. Use of the Havingness Process of the preclear (ten to twelve commands at a time) plus the Confront Process of the preclear (run ten or fifteen minutes, ended with preclear in or near present time) followed by the Havingness Process, followed by the Confront, etc., etc., just as above, often can bring the preclear down to his clear reading if carried on. This is known as stabilizing a case. It should be done before a person is pronounced a Release. It is never done now to start a case, despite the name of the Thirty-six Havingness and Confront Processes (Preessions). We can now start cases faster using S.O.P. Goals or attention or change or the CCHs. But the meter behavior and the necessity of Havingness and Confront Processes remain the same. It must be done at some stage of the case. It is usually done after the first S.O.P. Goals terminal and goal are flat on the Pre-Havingness Scale, and should be done before the person is pronounced a Release. It can only be done on and with an E-Meter.

SECURITY CHECKING

1. In using the meter for Security Checking you establish needle response to common (non-meaningful) questions. Seeing this, you do not mistake a real fall when it comes.
2. On meaningful questions you look for falls. A fall means 'Oh, oh! He's got me.' You don't leave a question that is getting a fall response until you are sure you have been told all and the needle no longer falls when you ask that question.
3. If the needle still falls on the question, you have one of two things: (a) the preclear hasn't told all; or (b) it's in a past life and he does not consciously know about it (since the meter precedes preclear consciousness).
4. In the case of (a) you keep asking in various ways until it is cleared (no fall even with a high sensitivity knob -- and you do turn up the knob on a question that didn't respond well at first and then turn it back before you go on to the next).
5. In the case of a past life possibility you add, 'In this lifetime' to your security question. As you repeat that, if the misdeed was in a past life, the fall will vanish.
6. A person being security checked is subject to mental dispersal. You may get only one fall and then no fall at all for one or two repeats and then a fall. You haven't asked quite the right question. The preclear is trying to ignore it. The rule is, if you get a trace of a fall or reaction on a question, beat it to death by varying your wording of the question or slightly shift the type of question. In any event, be sure not to leave a trace of a reaction or a single reaction until you are certain it won't develop.
7. If the preclear tells you a withhold, always (as in all Rudiments) ask the question again as this might not be all of it.
8. The fall comes out if the preclear tells all. The fall stays or gets worse if the preclear is hedging.
9. On a security check sheet, follow up every change of characteristic before you go on. Change of characteristic, if it amounts to anything, will develop into a fall.
10. If the preclear has not told all (or it's a past life) the meter won't be clear.
11. Don't be fooled by excuses. Don't discredit the meter (the preclear's first attempt when he's in a really tight spot).
12. The meter is right.
13. If a question will not clear it's (a) or (b) above and that's the total of it.
14. Grim experience of a decade has taught me that it's (a) or (b) and never 'I moved the needle myself' or 'I feel nervous just generally'. The E-meter is right even when it seems to make the preclear wrong.
15. The mark of a good Security Checker is thorough, swinish suspicion and no belief in mankind or the devil -- only the meter.
16. PEOPLE'S CASES WILL NOT MOVE UNTIL THEY ARE CLEAR ON ALL WITHHOLDS, SO A THOROUGH CHECK IS REALLY A KINDNESS AFTER ALL.

METER ODDITIES

1. There are few exceptions to the rule with E-Meters. They are a study composed of facts which have right or wrong answers and the answers to E-Meter questions are, all in black and white.
2. These are the known exceptions:
3. Some people (a very few in very bad shape) get a rise when they are asked to squeeze the cans. This is a reverse action. It means nothing except they need to be started in low levels.
4. Some preclears, in very bad shape, rock slam when security checked and one can't find what is rock slamming. As nothing clears the slam, they have to be flunked, audited, and tried again.
5. In South Africa a Bantu's withholds read not on the needle alone but on the Tone Arm as well. The Tone Arm goes up as much as two divisions (3 to 5) just before you get off a bad withhold on one.
6. High Tone Arms on anyone (or very low) mean lots of withholds -- but they might not be conscious of them all at once. They come off session by session as we run along.
7. Holding the two cans in the right hand with a paper between so they don't short is the way to free a preclear's hands for pointing out things. If you change hands and he holds them in the left, the meter will read differently. This only means he is electronically imbalanced (old Epi-Centers) and has no other use.
8. Preclears claim sometimes they are pushing the meter about, 'that's why it reads'. You could also ask, 'Then why didn't you prevent it from reading?' -- but don't really ask them that.
9. The meter 'knows' more about the preclear than the preclear. It is reading created masses he is withholding himself from. The preclear won't confront all he is creating. Hence the omniscience of the meter.
10. Dating things on a meter is not as important as it was, but a skilled auditor should be able to do it. It isn't covered here because few can do it well and it looks so complicated you might miss the important things and they are all in this book. Dating is well covered in ELECTROPSYCHOMETRIC AUDITING, the first book on the meter, and the later book, THE HUBBARD ELECTROMETER.
11. Another E-Meter oddity occurs when asking a preclear to do a lie reaction test. Some will get a fall only on the truth. Some will get a fall every time they are asked to answer only in the negative, or will get a fall only with the positive replies. This is not very important. The important thing about a lie reaction test is whether or not the person is reading on the E-Meter and the characteristic needle response to vital questions remains unchanged. The lie reaction test is given to study needle pattern for the preclear, not to establish his lies.

METER FRAILTIES

1. E-Meter faults occur in new meters or after long use. They are few.
2. If the meter doesn't register the squeeze the preclear gives the cans, it isn't turned on or connected up or it isn't working. See the mechanical direction sheet for setting up a particular meter and follow it before you decide a meter is out of order.
3. If a meter registers the can squeeze, it is usually in good working order.
4. The batteries rarely run down in a British Hubbard Electrometer, the drain being 'the shelf life' of the battery even if you left it on for weeksday and night. This is not true of the American Hubbard Electrometer (steelcase). Its batteries can run down if it's left on for days.
5. If the meter is not in working order when you get it, send it to the manufacturer or the Director of Materiel in a Central Organization or HCO for repairs. Do not try to fix it yourself.
6. If it is responding to a can squeeze when turned on according to directions, it is undoubtedly faithfully all right throughout. The Hubbard Electrometers do not go slightly wrong. They either work or they don't.
7. One exception: The British and American Hubbard Electrometer early models had a 'carbon pot' which is to say the Tone Arm was in 'pure carbon bearings', if you could call it that. A speck of dust can get in the 'pot' and cause the needle to rock slam whether connected to the preclear or not. Pull the lead wire jack (disconnecting cans) and if the slam continues, it's the 'pot' that's wrong. Work the Tone Arm vigorously for a while. If that doesn't stop it, squirt some lighter fluid into the Tone Arm 'bearing' from the meterface side. If that doesn't stop it, turn it in to be repaired. Later models of the British and American Hubbard Electrometer have 'wire wound pots' and this does not happen.
8. If the batteries go down after a year or two, the 'test' will not register in its needle dial area. Be sure the meter is set up for use before you use rest as in the British meter Test can be thrown off by the zero setting knob ('Trim') and you'll think the batteries are down when they're not. If they are down get some new ones. They are available anywhere there's an electric shop. Anybody can install them. It is cheaper than shipping, but HCO will do it if you like.
9. The ancient (tube valve) meters that connected to the Mains still work on all the above rules. But they pass an uncomfortably strong current through the preclear and sometimes shock him. Also, after the 1950 models, they became too fancy in design with too many dials and knobs for intelligent use -- too many variables could be run in on them.
10. Squirrel meters or home-built meters may be right or wrong but they are noted for inaccurate needle behavior. Some don't show bops because the Potentiometer used was too cheap.
Some register a half a second or a second late on questions. Some are so lightly needled that they register everything they can. I only trust meter types I've checked out myself, making sure they register the preclear, not the local TV antennae. Cheap meters at cut rates usually prove to be very expensive in the long run. I developed the present E-Meter with hundreds of tests and expert assistance and I know how wrong a meter design can go.
11. The new British (now ready) and American (when built) Hubbard Electrometer Mark IV are the best meters we have ever had and will be the standard meter for a long time to come. They are built by one of the best instrument people in England and their parts are specially made by a very old firm.

FUTURE METERS

1. I have an entirely different meter for an entirely different purpose under development. It is for use above Clear up to O.T., a range not covered by an E-Meter.
2. They are to be available toward the end of 1961.
3. They will be called O.T. Meters. I've been working on this since 1952 and have it pretty well solved.
4. The O.T. Meter will not outmode the E-Meter, which will continue in use so long as we have Homo Sapiens to audit.

NOTE: Since first publication of this book the advanced Hubbard Mark V has become the single authorized E-Meter. For information on purchasing a Mark V see the page following the Index in this book. -- The Editors.

SUMMARY

1. It will be seen that the Tone Arm, the Sensitivity Knob, and the Needle form three distinctly different parts of E-Meter operations.
2. The Tone Arm shows case change and process action. The Needle shows case significance and reality. The Sensitivity Knob is a magnifying glass for the needle.
3. The Needle shows (except for finding Confront Processes) What to run. The Tone Arm shows How it is Running.
4. When searching, watch the Needle.
5. When running a process, watch the Tone Arm.
6. The Needle's most looked for reaction is the fall.
7. The Tone Arm's most looked for reactions are: (a) change of position, and (b) ceasing to change position.
8. Skill with the meter comes from gaining great familiarity with it, by handling and using it.
9. Handle the meter. Study this book. Handle the meter. Study this book.

**PROCESS LEVELS
NECESSITY FOR TRAINING**

Here is some good news and some bad:

After considerable study of the use of SOP Goals by Auditors, it is apparent that the technology, while very effective in the strictly supervised auditing of HGCs is beyond the average training level of the field at this time in TRs, E-Meter and Model Session.

This means that we can do Releasing at once but we are confronted by an enormous retraining programme before broad field auditor clearing can begin. But great advances can be made on cases now with the Change Processes.

My findings indicate that the chief reason auditors fail to handle the E-Meter expertly is to be found in the TR failures, mainly confront.

SOP Goals, to be effective, demands a precision of auditing skill common only in HGCs. SOP Goals is pure dynamite to cases, but it becomes pure backfire when used by a poorly trained auditor.

SOP Goals works too fast to admit of bad technical application. Before SOP Goals becomes effective it must be applied with perfect technical precision.

However, there is no cause here for alarm because concurrent with SOP Goals, I have made another discovery which was released in last week's HCO Bulletin, *Change Processes*, which wrap up (really and truly) all cases from "answers intelligibly" to Release.

Thus we have a simple basic process which takes a preclear to Release, a basic accurate test for Release (all brackets of change nul on the needle), and another full process package from Release to Clear in SOP Goals.

This gives us the most orderly division of training levels we have ever had and rather smooths out what we do, where we go and why.

HCA /HPA LEVEL

Training to perfection in the use of TRs, Model Session and E-Meters and CCHs.

One Basic Process taught: Change Processes.

Goal of Auditing: Release.

Level of training for HPA/HCA: To accomplish without exception the state of Release in all pcs audited.

B. Scn/HCS

Training to perfection in the use of the E-Meter in SOP Goals.

One SOP taught: SOP Goals.

Goal of Auditing: Clear.

Level of training of B.ScN/HCS: To accomplish clearing in persons who have already obtained a State of Release.

D. Scn/HGA

Training in theory and practice of Dianetics and Scientology and the use of advanced meters.

Processes Taught: Theta Clearing.

Goal of Auditing: Theta Clear.

Level of training of D.ScN/HGA: To accomplish Theta Clearing in persons who have already attained the State of Clear.

The levels of Release and Clear are established facts process-wise as of now.

The level of Theta Clear and Advanced meters is still under research.

I have to hand adequate evidence now to see that auditors can and *will* audit Change Processes easily and successfully with enormously swift results on pcs.

When all Change Processes are flat on a pc, the State of Release is easily tested and observed.

When SOP Goals is flat on a pc you have a Clear.

Apparently SOP Goals should not be run on a pc by an average auditor until all Change Processes are flat, since many pcs don't do the actual commands until change is flat.

Thus I am very happy to be able to tell you of lots of wins and orderly progress ahead even if I have to warn you not to run SOP Goals until your pc is a Release and you are a perfect technician.

Any auditor should use all the Change Processes he wishes on a pc, and until Change is fully flat, and until the auditor is perfectly trained in TRs, Model Session and the E-Meter, no SOP Goals should be run.

I hope you are happy with this news. I am.

6105C07 SHSpec-1 E-meter Talk and Demo

SOP Goals running: Assess for all the goals the PC ever had. When all are out and no longer give a fall on the meter, the list is complete. When the list is complete, the meter no longer registers. Reassess the list until only one goal continues to read. Now list all the terminals for the goal -- all the terminals which would represent that goal -- until the meter goes flat. Null the list until only one terminal reads (falls) on the meter.

SOP Goals is the entirety of data needed to clear all cases. This is unlike the situation earlier when LRH would develop a regimen to handle one PC's case, then develop the theory which matched it. Sometimes this was picked up by others and a whole school of therapy was based on it, For instance, the dianetic tech used to handle one individual -- Altman -- later became Gestalt Therapy.

The E-meter is a tension machine: the more tense the individual, the more off-beat is the read. Clearing is taking the tension off the meter. At the lowest level of tension, there's no point in doing anything about anything; you've got a dead thetan, totally incapable of influencing the machine. He reads as a clear, but this kind of case can still be detected because the needle is tense; it doesn't react favorably at all; the person cannot answer to his satisfaction or yours any questions about help. The needle also shows no reaction to anything, even a kick. The sensitivity has to be way up to get a third of a dial drop on can squeeze. The guy can be machine-motivated, feels he had "bad luck", doesn't believe anything can be done, so he can get no help, etc. He's a very obvious "can't do" case. Doingness is the common denominator of the prehav scale. Someone who can't do isn't even on the scale. The best case detector is the sensitivity knob, not the TA or needle. The worst case is where a person is super tense but doesn't know it. This guy would be a long job to sec check.

A rock slam is a stronger indication than a fall. It shows that you are on the chain of the first time the person ever decided to be another valence. The theta bop is diagnostic; it has to do with leaving and death, the thetan moving in and out like a yo-yo. It can be dial wide or small. It can be repetitive or even, at an extreme, one cycle (this is not very useful). "Returning" will also give you a theta bop. The rise means the PC isn't confronting. We used to be concerned about what stopped the rise, which was what was producing it, or rather the PC's non-confront of that thing caused it. Stage four needle is an indicator of a total no-effect case. It can be very tiny. It always has a stick at the top of the rise, unlike the theta bop. The bottom of it is very relaxed. It just means lousy case shape. Sometimes, you see the needle vibrate. This means that the PC has an alternating current ridge. 4.5 means a crowd; if he's stuck there, he's afraid of people or stuck with people. Stuck at 2.5 means a robot, a machine. There's a seven on the TA dial that can't be read on the meter. As a person develops responsibility (say he's a dead thetan at 2.0), he'll go down to 1.5, then "go out the bottom" through 7 to 6.5, 5, 4, etc., to in range.

A PC can have a consistent pattern; he can even repeat the same fall. In this case, a change of characteristic is diagnostic. When the PC has a charged question in his level of reality, you get a change of pattern.

The meter that would be used above clear would be an oscilloscope meter, an O-meter or theta meter, which registers flows. This is not comfortable to audit with. The meter has to be very sensitive. Someone could be clear and still have "bugs" -- because he's still using a body. The E-meter measures the games condition called the physical universe. You need something which shades the tiniest things from 20.0 up.

We have theoretically transcended MEST weapons. As someone goes theta clear, his tolerance of motion is so great that he wouldn't be hurt by a bullet. He probably couldn't even be hit by it.

E-METER HORROR

Dick Halpern reports from the 22nd American ACC that out of 48 students, many trained on earlier ACCs, 48 did *not* know what FALLS, RISES or THETA BOPS *were* or *meant* on the E-Meter.

The moment one starts on SOP Goals it becomes painfully apparent when he or she cannot do TRs, Model Session or read an E-Meter. SOP Goals works when one knows it and these items.

I have just written a book, *E-Meter Essentials*, which details these things. You better study it.

I am opening up Unit One of Academies for retread on TRs, METER and Model Session.

Special Briefing courses will be taught.

A very special clearing course is being taught at Saint Hill.

Every effort is being made to enable you to release and clear *pcs fast*. *You* have to make the effort too to avail yourself of this data.

IF you know TRs, MODEL SESSION, METER, CHANGE PROCESSES and SOP Goals you *can* Release and Clear Anyone. We're proving it daily.

Auditors who can't run or read a meter (100% of the 22nd American, remember, that had old-timers in the majority, did not know how to read a meter) can't release or clear anyone.

Auditors who can't do TR 0 Revised 1961 aren't enough there to read a meter. (An actual fact.)

Auditors who make technical flubs on SOP Goals wind up wasting 66 2/3 of the auditing time. (We just proved that, too.)

We've got the tools. They're easily available. Let's go.

6105C12 SHSpec-2 Assessment

“You, in trying to equate a relatively simple fundamental in scientology, are of course picking up a fundamental which sits right in the middle of anyone’s case. And you tend to blow off a little confusion in trying to get a hold of it. It would be easy to teach you to run a Diesel engine, but the data we’re teaching goes straight into the middle of a reactive computation. SOP Goals does this exact thing, exactly reversing how the mind got aberrated.” The most hidden factors of a mind were the things that aberrated a mind, because no one’s ever freed a mind before, so they must have been the most concealed or they would have as-ised. SOP goals undoes all the things that plowed someone in; it consists of all the solutions a person adopted to fix all the oddball circumstances he got into, ever, that no longer apply. Who wouldn’t want to have the kind of mind that could be happy doing something simple? Basically, what you’re afraid of is getting bored. This happens because what you are doing is somehow inadequate to the demands of the environment. If one’s simple game gets invalidated, one looks for a more complicated one. This could only happen if one had invalidated someone else already. To get kicked in the butt, you must have kicked someone in the butt and postulated that it’s bad to get kicked in the butt.

If the way to do a perfect assessment were put on paper, there’s a high probability that it wouldn’t be followed, because we’re dealing with the basic stuff of which the reactive mind is composed. And on this subject more than any other, you’ll find more confusion, more silly questions. The datum restimulates the whole confounded bank. What happens is that the guy does something which eventually recoils on him in a way which gives him a new problem. He gets his motivator and gets a new beingness to have a new game. But he’s now not being himself, he’s being a solution to the problem of livingness. The solution eventually ends him up with a new problem which he solves with some new beingness, some new game. Every time he gets overwhelmed in some game, he shifts beingness to the new game which solves the old one. If you clear someone without clearing up his be/do/have condition, he’ll realize he has no game and he’ll recreate his old condition or be bored or worried. He’ll go unclear. He thinks it’s less dangerous to be aberrated than to have no game. If you clear (erase) his games conditions, across the boards, he’ll do this.

The essence of all games is beingness and doingness towards havingness. The problem is that they get jammed into a can’t have / must have situation. In a games condition, the person “has to be something, but he can’t be it. There is something wrong with being what he is being, so he can’t be it, and he dare not be it, and yet he must be it, and this emerges when you are auditing SOP Goals. A game or goal is abandoned because it was invalidated too many times. A guy goes into a new game and valence and ends up not being himself. In assessment, you are backtracking these valences, expressed as goals. Since by this time, the PC’s comm with the world is very poor, you have to handle what’s real to the PC, so that’s what you handle. What’s odd is that there’s only one valence that’s real to the PC at one time. In life, as the valence goes up, the PC comes down. This ends up with a serene valence and the PC out the bottom. So the individual goes around acting psychotic in a serene valence. This is the theetie weetie case. As you audit the person, the valence comes down and the PC starts taking over handling the game and the environment on his own determinism. As the PC gets out of fixed games, he can look around and find he’s got more games. If he’s got more games, he’ll go more clear; if less, he’ll go unclear. The act of finishing off clearing (doing more and more SOP Goals) is what stabilizes the clear. Having to play the game is what prevents one from playing the game; one can play the game as long as one doesn’t have to.

[Details on running of SOP Goals]

Any goal which is to put up a mockup is liable to be a false one and is a dangerous one to audit. It is perishable, because the result of failure is to create a mockup, so that you get into an arts goal. Always be suspicious of an arts goal, because there’s always the thing you can do when all else fails, and that’s usually the arts. When actual masses don’t work to overwhelm the

opposition, they turn to aesthetic masses, which are closer to the thought band. If you go just a little further with assessment, the case will likely get into a better goals channel. You can ask, "What did you want to do before you went into the arts?" This also applies to professions in the thought band, like philosophy and law. A featherweight goal denotes a hell of a failure just ahead of it.

HCO BULLETIN OF 19 MAY 1961

CenOCon

URGENT

ASSESSMENT DATA

On SOP Goals assessments the following mistakes are being made:

1. Auditors are assessing with a high sensitivity knob setting.
2. Auditors are taking up to an hour and a half to assess on the Pre-Hav Scale.
3. Auditors are trying to run the whole case on Rudiments only.

These rules which follow become *very* important. They prevent endless assessing for goals and terminals on SOP Goals and save session time.

RULE ONE

Assess with the sensitivity knob set for one third of a dial drop on the can squeeze, no more. Rule: *High sensitivity knob settings for more than a third of a dial drop are for any Joburg Security Check or getting off withholds only.* Only increase sensitivity beyond a third of a dial on withholds. Assess with only a third of a dial drop sensitivity setting.

If the sensitivity knob setting won't decrease enough to get only a third of a dial drop get your meter rebuilt.

If you have a larger setting than above, the SOP Goals assessment by elimination will take ten times as long.

RULE TWO

Assessment on Pre-Hav Scale is not by elimination. One assesses with *one* read up and *one* read down and takes the largest (not the lowest) read on the needle. The needle read for the proper Pre-Hav level will repeat on the trip up and the trip down. Only say the level *once*. Don't keep saying one level over and over. That's auditing.

You can get all the Pre-Hav data you want with one coverage upward from scale bottom and one coverage downward to scale bottom.

This rule applies to assessing for a general command and assessing for a terminal.

Goals and terminal searches *require* a repeat over and over of the goal or terminal on the list in order to get them to go nul (as nul as they go with the sensitivity set for a third of a dial drop as above). The Pre-Hav assessment for level does not require a repeat of a level over and over in assessing. In fact you had better not.

This *one time Pre-Hav Rule* will also apply to the new Pre-Hav Scale now being compiled. In that one you will read levels *once* upwards, once downwards on the Primary Scale. Taking the largest reaction of the needle as your level, go over to the Secondary Scale

and do the same thing—once up, once down, and then take the resultant greatest needle reaction.

For purposes of assessment a RISING NEEDLE has NO meaning. Don't even remark that it is rising. You don't know *what* the pc couldn't confront that starts the rise so you ignore a rising needle ALWAYS in any modern assessment. Anything that Stops a Rise is meaningful. The Rise has no meaning. Don't even list *Rise* on an auditor's report.

Further, RISE means nothing as a reaction in Rudiments.

RULE THREE

Don't *ever* run a rudiment only because a needle was rising. Only run a rudiment if the needle rock slams, theta bops, or falls. Only run a rudiment as long as a reaction (rock slam, theta bop, fall) remains on that rudiment. A Rise indicates *no* meaningful data.

The rule about Rudiments is this:

Don't run a case by rudiments. The reason you use and clean rudiments is to get the pc in session so you can have the pc 1) in communication with the auditor and 2) interested in own case. Therefore you run rudiments with the sensitivity set that will give the needle a third of a dial drop with a can squeeze. You can *increase* sensitivity when asking for withholds in rudiments but if you do, decrease it when finished with withholds back to a third of a dial drop.

The purpose of rudiments is to set up a case to run, not to run a case.

SUMMARY

I developed the above rules to correct various mistakes being made that were taking an assessment as high as thirty-five hours (the auditor was *erasing* goals by repeater technique with the sensitivity set to a full dial drop), and to help auditors get on with auditing, not trying to solve the whole case with rudiments.

6105C19 SHSpec-3 E-meter

When the E-meter is reading sporadically on something, chances are what you are talking about is quite close to what it's reading on. When you ask just the right question, it reads hard and consistently. You must then get an answer to every auditing question, or the read will persist forever.

If you don't audit the hidden standard, the PC will seem to progress in the session and then say he didn't make any of his goals for the session. He'll be putting a via on every command answer to slant it through the hidden standard. You can ask the PC if there's some goal there he hasn't told you. It's necessary to getting case progress to get it out of the way. The E-meter won't be reading well either, as it's not the question if you don't ask for the hidden standard.

A PC will not improve if he has withholds or undisclosed overts on his auditor or scientology. In fact, he'll pull in motivators and get no case gain. You can't accept help from quarters you have overts on because it seems like betrayal, since you've betrayed and the overt motivator sequence is in force. A person who has specialized in teaching by implant down the track will develop an identity which gives themselves implants. They amount to perhaps 5% of the human race.

HCO POLICY LETTER OF 22 MAY 1961

CenOCon
Franchise

THE ONLY VALID SECURITY CHECK

(Amends all existing data on Security Checks)

HCO Sec Form 3.

Name of Person _____ Date _____

Name of Security Checker _____ Location _____

Since a Security Check failure can compromise or injure a person's position or economics, and because *we are not moralists*, it is better to be more positive on the subject of a Security Check failure, leaving no part of it up to judgment.

The question of what constitutes a Security- Check failure has now troubled enough people to make it necessary to lay down the following policies.

A Security Check to be used for any organizational reason must be made on an HCO WW form.

There are only three ways a Security Checker may flunk any person.

1. The Security Check may be considered flunked if there is *no* needle response of any kind to any question with meter sensitivity even at extreme high. Rise as a reaction is ignored throughout a Security Check. A rise is not a useful reaction.

2. The Security Check may be considered flunked if any compromising or important question still persists in getting a consistent reaction (not a rise) even after the Security Checker has done his best to get the person being checked to clear it by answering truthfully.

3. Refusal to be checked.

Lie Reaction failure may no longer be considered a flunk. Important questions always have enough charge on them to cause a reaction even on bad criminals and the reaction will continue consistently or sporadically if the person is still withholding information.

The question of something reacting because of past life crimes is ruled out if, when a question fails to clear, the Security Checker adds "In this lifetime?" to or in the question and works on that question continuing to use that added phrase. Reactions by reason of past lives tend to drop out and clear if this is done.

The task of the Security Checker is to carefully question and *clear if possible* changes of meter needle behaviour caused by the question. Plainly note any level that failed to clear. This fails the person.

The Lie Reaction questions were originally used in Scientology only to study the needle pattern of the person being checked so that changes in it could then be judged in their true light. Some pcs, for instance, get a slight reaction every time *any* question is asked. Some get a

reaction only when there is heavy charge. Both can be Security Checked by studying the common pattern of the needle demonstrated in asking the Lie Reaction questions. The purpose of the Lie Reaction questions is returned to the original intention.

A totally stuck needle can be freed by processing, or by getting off withholds. If a person is flunked by reason of 1 above, they require auditing before another check is taken, the auditing to be taken at the responsibility of the person being checked.

All Security Check sheets of persons Security Checked should be *forwarded to Saint Hill*, complete with all markings and the reason why the question would not at first clear, if important, or the drop marked which would not clear and whether or not the person was passed or failed.

Nothing in this Policy Letter changes the responsibility of the Director of Training in preventing Scientology from being taught to persons who would use it in violation of the Code of a Scientologist.

In reprinting this check sheet leave all directions as part of every sheet.

Directions: Attempt to clear any reaction observed. A Rise is *not* classed as a reaction. Mark any reaction observed or any meter reaction change elicited by the question. Then write what it cleared on. Mark largely if the reaction could not be cleared since this constitutes a failure to pass. Only fail somebody if there is no needle motion of any kind even with sensitivity at 16 on any question. (Rise is not a reaction.) If they are failing because it is hard to clear a question, work very thoroughly on it in an effort to clear it. In all cases complete the test. Run check with a high sensitivity setting (more than 1/3 of a dial drop).

If an important question fails to clear even after Security Checker has worked very hard to get it off, the test is flunked.

The following statement should be read or quoted to the person being Security Checked:

“We are about to begin a Security Check. We are not moralists. We are able to change people. We are not here to condemn them. While we cannot guarantee you that matters revealed in this check will be held forever secret, we can promise you faithfully that no part of it nor any answer you make here will be given to the police or state. No Scientologist will ever bear witness against you in Court by reason of answers to this Security Check. This Security Check is exclusively for Scientology purposes. The only ways you can fail this Security Check are to refuse to take the test, to fail to answer its questions truthfully or if you are here knowingly to injure Scientology. The only penalty attached to failure of this check is processing or our refusal to employ you or issue you a certificate, and this will only happen if we find that you are trying knowingly to injure Scientology. You can pass this test by (1) agreeing to take it, (2) answering each question truthfully and (3) not being a member of a subversive group seeking to injure Scientology.

“The first questions are nul questions to determine your reaction pattern.

“We will now begin—”

Establish needle pattern:

_____TA_____Sensitivity for 1/3 dial drop

_____Sensitivity setting for check.

Are you sitting in a chair?

Are you on the moon?

Are all cats black?

Am I an ostrich?

Is this Earth?

Have you ever drunk water?

Have you ever been Court-martialed?

Have you ever deserted from a military service?

Have you ever illegally prevented conscription?

Have you ever been a mutineer?

Have you ever had anything to do with Pornography?
Have you ever committed Arson?
Have you ever been a drug addict?
Have you ever made anyone into a drug addict?
Have you ever peddled Dope?
Have you ever PDH'd anyone?
Have you had any dealings with stolen goods?
Have you ever divulged government secrets for pay or political reasons?
Do you have a Police Record?
Have you ever raped anyone or been raped?
Have you ever been involved in an abortion?
Have you ever assisted in any abortion?
Have you ever committed adultery?
Have you ever committed bigamy?
Have you ever practised Homosexuality?
Have you ever practised or assisted intercourse between women?
Have you ever had intercourse with a member of your family?
Have you ever been sexually unfaithful?
Have you ever practised sex with animals?
Have you ever publicly exhibited yourself sexually?
Have you ever hidden to watch sexual practices?
Have you ever practised Sodomy?
Have you ever consistently made a practice of sex with a member of your own sex?
Have you ever slept with a member of a race of another colour?
Have you ever committed culpable homicide?
Have you ever committed a justifiable crime?
Have you ever bombed anything?
Have you ever murdered anyone?
Have you ever hidden a body?
Have you ever attempted suicide?
Have you ever caused a suicide?
Have you ever kidnapped anyone?
Have you ever done any illicit Diamond buying?
Have you ever acted as an informer?
Have you ever betrayed anyone for money?
Have you ever betrayed a trust?
Have you ever betrayed an employer's trust?
Have you ever speculated with somebody else's funds?

Have you ever knowingly implicated an innocent person?

Have you ever withheld a communication concerning a crime or misdemeanour committed by another?

Have you ever threatened anyone with a fire-arm?

Have you ever been in illegal possession of fire-arms?

Are my questions embarrassing?

Have you ever been paid for giving evidence?

Have you ever acted as an informer?

Have you ever injured somebody's reputation by knowingly spreading lies?

Have you ever injured somebody by spreading tales you knew were true?

Have you ever destroyed something belonging to someone else?

Have you ever plotted to destroy a member of your family?

Have you ever had a member of your family in an insane asylum?

Have you ever been pronounced insane?

Have you ever been a spy for an organization?

Have you ever looted any place?

Have you ever stolen from the armed forces?

Have you ever conspired with anyone?

Have you ever had anything to do with Communism or been a Communist?

Have you practised fraud?

Have you ever been a newspaper reporter?

Are you hiding anything?

Have you ever had intercourse after placing another under alcohol or drugs?

Have you ever used hypnotism to procure sex or money?

Do you collect sexual objects? Have you ever ill-treated children?

Have you ever practised sex with children?

Have you ever practised masturbation?

Have you ever taken money for giving anyone sexual intercourse?

Have you ever sexually coerced a servant?

Do you have any bastards?

Are you withholding anything?

Have you ever had any connection with a brothel?

Have you ever coerced anyone into giving you sex?

Have you had anything to do with a baby farm?

Have you ever killed or crippled animals for pleasure?

Have you ever crippled a person?

Have you ever been a spy for the Police?

Have you ever pretended a disability?

Are you afraid of the Police?

Have you ever committed a misdemeanour?

Have you ever committed a felony?

Have you ever committed a capital offense?

Have you ever done anything you are afraid the police may find out?

Have you ever falsified the books in any firm you worked for?

Have you ever criminally avoided taxes?

Have you ever counterfeited money?

Have you ever fraudulently altered or issued certificates or documents?

Have you ever obtained money under false pretences?

Have you ever done anything your mother would be ashamed to find out?

How could you help yourself generally?

What represents yourself?

How could you help your family?

What represents your family?

How do you feel about sex?

What represents (the Org

(others

(a group to you?

How could you help (the Org?

(others?

(a group?

How could you help mankind?

Have you ever controlled people?

How do you feel about being controlled?

What is Communism?

Do you feel Communism has some good points?

Have you ever been a member of the Communist Party or any associated group?

Have you ever been a member of any group with similar ideals as the Communist Party?

Do you know any Communists personally?

Have you ever injured Dianetics or Scientology?

Have you committed any overts on a Scientology Organization?

Have you wronged anyone in a Scientology Organization?

Have you ever stolen anything from a Scientology Organization?

Do you have anything in your possession that you shouldn't have?

Do you have any overts on L. Ron Hubbard?

Have you ever had any unkind thoughts about L. Ron Hubbard?

Do you have any overts on Mary Sue Hubbard?

Have you done bad things to leaders in Scientology or Scientology Orgs?
Have you withheld anything from executives in Scientology?
Have you sought to get any staff member dismissed?
Have you knowingly planned not to do your job?
Have you ever had any unkind thoughts about Mary Sue Hubbard?
Have you ever injured any Scientologists?
Have you ever had any unkind thoughts about Scientologists?
Have you ever betrayed Scientology?
Do you know of any secret plans against Scientology?
Do you plan to steal a Scientology Organization?
Have you ever taken money to injure Scientology?
Do you deserve to be helped by Scientology?
Have you ever used Dianetics or Scientology to force sex upon someone?
Have you ever falsified a claim for money to be repaid to you or to be paid you?
Do you know of any plans to injure a Scientology Organization?
Do you know of any plans to injure a Scientologist?
Are you upset about this Security Check?
What question in this check shouldn't I ask you again?
Have you withheld from answering anything because it might injure someone?
What unkind thoughts have you thought while I have been doing this check?
Have any of your answers here been designed to injure another?
Are you upset about this Security Check?

HCO BULLETIN OF 23 MAY 1961

Central Orgs

Urgent for Use on All Cases

PREHAV SCALE REVISED

(This is the rough version. The Primary Scale is Accurate and Complete. The Secondary Scale is not necessarily complete or edited.)

This is the first major revision of the Pre-Havingness Scale I originated in January of 1961. This Scale now contains a Primary Scale and a Secondary Scale. The Secondary Scale contains nearly all simple verbs in the English Language, properly placed for Level and repeated on other Levels.

USE

The Scale is used for General Running of Levels (without specified terminal) in brackets of 5 or 10, using "Someone" or "Something" as the terminal, sometimes using plus and minus (Change, No Change).

The Scale is also used for terminals found for S.O.P. Goals by Goals and Terminal Assessment.

The two uses of the Scale are done exactly the same way with the single exception that for a general run one says, "Do you have _____ (Pre-Hav Level)" or "Are you _____ (Pre-Hav Level)" or "Do you _____ (Pre-Hav Level)", and in the use for goals terminals one says, "Would the (or 'a') _____ (goals terminal) (Pre-Hav Level)?"

General Run Assessment Example: Start at Bottom of Primary Scale 65 (Faith). Go up Pre-Hav Primary Scale asking about each level *once only* and carefully noting E-Meter Needle Reaction (ignore Rises of the needle) that responds or doesn't respond to the question. Convert the level to a sensible question without varying the actual level. The questions: "Do you have Faith?" "Are you Cause?" "Do things have No Effect upon you?" "Are you the Effect of things?" "Do you think people run a Can't Have on you?" "Do you Create?" "Do you Think?" etc, etc. When you have reached the top of the Scale, go back down again (from Level 1 to 65), still noting reaction. The one that *reacted most* when you went up and when you went down the Primary Scale is the Level. (Do not take the lowest level, take the level that reacted most, as the worse off people are, the higher terminals tend to be found on the Scale as a loose rule. Terminals come *down* scale as the pc goes up on successive assessments after runs.)

You now take the Primary Level found by E-Meter needle reaction and GO TO THE SECONDARY SCALE FOR THAT LEVEL. Assess this Secondary Scale for the level exactly as you did the Primary Scale. Go from the highest number (lowest point) up to the top (lowest number), asking once about each level and noting needle reaction (not rise). Take the Level that reacted most on the needle. Form it into a five way bracket (or 10 way) consulting the needle for the best expression of each "leg" of the bracket. Then run it. The motion of the TA should increase, then decrease, then tend to halt. If it remains unchanged (1/8 to 1/4 of a Tone Arm Division of motion only in 20 minutes) Reassess.

When reassessing on the Pre-Hav for a new level, assess exactly and as carefully as you did the first time—first assess on the Primary. Then assess on the Secondary Scale for that level.

Example for assessing a goals terminal (or a PT Problem or ARC break terminal). The assessment is done the same way as in a general run assessment except all questions have to do with the terminal. Example: If the goals terminal were “woman”. Start at the bottom (highest number) of the Primary Pre-Hav Scale and assess one level at a time. “Would a woman have *Faith*?” “Would a woman *Cause* things?” “Would there be *No Effect* on a woman?” etc, etc, noting the needle reaction (not rise). Then come down (lowest to highest number) the Pre-Hav Primary Scale one level at a time, again noting the needle reaction (always ignore rises). The right level will react going up and going down in much the same way. Take this level and go to the Pre-Hav Secondary Scale. Assess it from bottom (highest number) to top (lowest number) and then back down again. Choose the level that reacted both going up and down.

Any levels found may be checked cautiously (repeating only once) by comparing it to other levels in terms of needle reaction. You want the level with *most* reaction always.

If you take more than fifteen minutes to do a level assessment, you are doing something odd or unnecessary such as saying the levels several times or expecting the pc to answer you aloud (the pc should remain silent during an assessment) or you are unfamiliar with the Scale.

In asking assessment questions on the Scale always speak with the same degree of loudness and inflection, and always make the level the hardest and most stressed word in the question. If you vary loudness from question to question or change emotional tone, the needle may react to your change, not the Pre-Hav Level, giving you an inaccurate reading based on your goofs or changes, not on different Scale levels.

You can do an Assessment twice. You should come out with the same Primary and Secondary Levels. If you don’t, run, don’t walk, to the nearest Academy.

The Secondary Level is the one used in Commands. You will note that the Primary Level words are repeated in the Secondary Scale. Thus if the level comes out to be that Primary word, you’ll still have it as a Secondary word and can use it in the command.

Audit only *one* level at a time. Use only the word that caused the needle to react to make up your command. Do not combine two levels.

If you get Tone Arm motion running a level either generally or as a goals terminal, PTP or ARC break level, flatten it before choosing and running a new level. One knows when level is flat. The Tone Arm doesn’t move any more. You can cause a pc to feel “spinnny” by starting a new level before the old one is flat.

Do not *overrun* a level. The test of “flat” is the TA moving only 1/4 to 1/8 of a division up or down in 20 minutes of auditing (not cumulative movement such as “The TA moves 1/16th twice so that’s 1/8th of a division”—this is wrong. If it moves from 2.25 to 2.50 to 2.25 two or three times in twenty minutes, this is called “flat” and has moved only 1/4 of a TA division. This is right.)

The Secondary Level, if not the word in the Primary Level, may react on the needle far more than the Primary Level.

The Primary Level may not react at all in rare cases. If this happens, assess the whole Secondary Scale, all groups, independent of the Primary Scale, starting with the Secondary group for Faith and going right on through the groups. This is only likely to happen with rough beginning cases or with persons nearly clear who are being shaped up and stabilized.

When a pc assesses as a Rock Slam, it may be necessary after a level turns on the Rock Slam to say a nul word to the pc like “Floor, Floor, Floor....” until the Rock Slam turns off. Rock Slam carries over many levels unless it is shaken out of the needle in this way. Mark the Level that turned it on “Rock Slam”. This is the strongest react there is. If several levels turn on a Rock Slam, choose by reading the Rock Slam levels once each again (using a nulling word several times between each one) and choose the widest Rock Slam or the one that didn’t fall out (which will probably be the widest).

In auditing a Rock Slam, the rule “Assess by the Needle, Audit by the Tone Arm” seems to have an exception. However, if the needle that is Rock Slamming could be held at SET on the needle dial by moving the TA you would see that a Rock Slam *is* a Tone Arm reaction. Thus one can’t call a process flat while a Rock Slamming needle still exists on a level. The Rock Slam has to be run out before the level is flat.

The Complete and Edited Version of the Secondary Scale and the Primary Scale will appear first in the Clearing Series Book *S.O.P. Goals* to be published in about two months. This rough version will however serve your purposes for the moment.

SECONDARY SCALE

1 — HAVINGNESS

This is the Secondary Scale of Havingness. It is not usually used for assessment as subjective havingness does not run with benefit. If a case is, however, “live” on a havingness level, run them on it, using their objective havingness process at frequent brief intervals (10 to 12 commands of objective havingness).

**RELEASING AND PREPARING A CASE FOR
S.O.P. GOALS**

S.O.P. Goals takes a great deal of accurate Scientology to run. One has to be the kind of expert one would become from studying at Saint Hill or under a person who has been here who graduated with honors.

One has to have his TRs 0 to 4 *perfect*. One has to know an E-Meter backwards and forwards. One has to know Model Session so well that he or she can pass all TRs while doing it. And one has to know assessment.

There is nothing, however, so bad as to get a wrong S.O.P. Goals Assessment on a case. It condemns the pc to an infinity of auditing. He or she will never get Clear until a *right* assessment is done. And the auditing in between is wasted.

So until you get to Saint Hill or get a special course in S.O.P. Goals from a Saint Hill honor graduate, or from Australia's Peter Williams, whom I taught in South Africa, or unless I am right on the other end of a Telex as I am for London, may I please ask you to content yourself (and get marvellous case gains) releasing people with the preparatory steps of S.O.P. Goals and skip trying to run S.O.P. Goals on wrong assessments.

These Steps release people.

The Preparatory Steps of S.O.P. Goals consist of only two things:

1. The Johannesburg Security Check, well done (the revised issue of which will come to you next week), and
2. General runs on the Pre-Hav Scale after proper assessment of the *pc* on that scale.

You can easily learn to give a "Joburg". You can easily learn to assess on a Pre-Hav Scale. And you can't do any real damage and can get the fastest case gains you've ever seen.

THE JOBURG CHECK

If withholds make the pc get no gains, then what better way to clear them up than by a fabulously thorough check on withholds such as is found in the "Joburg Check".

Ask every question in various ways until the pc gets no further needle action on that question with sensitivity raised way up.

The General Runs on Pre-Hav: Assess the Pre-Hav Scale saying each level once to the pc on the meter going up it. Saying each level *once* to the pc going back down it. Write down every fall, theta bop or rock slam and how much. Take the level which gave the *most* reaction going up and down.

Take that Pre-Hav level that reacted most.

Using your good sense, make up a five-way bracket auditing command from the level.

Suppose the most reactive level was *Overts*. This translates as “DONE TO”. The 5-way command is “What have you done to someone?” “What has someone done to you?” “What has someone done to another?” “What has another done to others?” “What has someone done to himself?”

Run the process watching the meter Tone Arm.

When the Tone Arm moves more than 1/4 of a Tone Arm Division movement up or down (no matter how many times it went up or down), continue the process, no matter what the pc says about its being flat.

When the Tone Arm moves less than 1/4 Of a division of the Tone Arm Dial in 20 minutes, change the process. Bridge out, reassess on the Pre-Hav Scale as before. Take the next level, make up a five-way bracket the pc can do and flatten it off as above.

Audit by the Tone Arm (except in rock slam). Assess by the needle. For rock slam, just run the slam out of the level until it’s gone for 20 minutes.

Then, with two Pre-Hav levels flat on the Tone Arm, do a new “Joburg” Security Check.

It will have changed!

Do it all in Model Session. Handle the Rudiments. Do a “Joburg”, then a couple of Pre-Hav levels, then a “Joburg”, then a couple of Pre-Hav levels, then a “Joburg”, etc, etc, on and on.

The case will soar.

RELEASE

This is the production of a Release.

It is the simplest and fastest way to produce a Release.

It has to be done anyway to set a case up for an S.O.P. Goals Assessment.

MISTAKES

You can louse up a pc by:

1. Failing to get a nul needle on every “Joburg” question as and when you ask it. Get each question cleared, not by Auditing, just by watching the needle and asking until the pc tells you the withhold.
2. Running several levels without flattening any. This puts the whole case in a stew. The movement of the Tone Arm as you run it tells you when something is still unflat. As long as the Tone Arm of the Meter is moved by the process, continue the process. It’s a code breach not to!
3. Running a level too long. You can stick the Tone Arm by overrunning the level. This is more serious than leaving one slightly unflat. If a Tone Arm for twenty minutes is only moving between, say, 3.25 and 3.35, you are already in danger of sticking the Tone Arm. Get off of it! If you *do* overrun, it’s hard to reassess for the new level and hard also on the pc. A remedy for overrunning is to assess the auditor on the Pre-Hav Scale and run the auditor out of the pc for about ten, fifteen minutes—if the needle moves at all.

4. Dwelling on levels in the Assessment, repeating them over and over instead of just once each, can start an avalanche on the pc. Don't do it. Take the meter needle reads when they happen. Jot them down. Then take the most reaction. That's it.
5. Sad to relate, it's been done. But *don't* think you just take the first level of the Pre-Hav and run it and then go up one and run it and then the next one up. That's murder. Assess them with an E-Meter and run the levels of the Pre-Hav that react when they react.
6. Don't skip the "Joburgs" because they make pcs squirm. This is how you find and get the withholds off. The case won't move if you don't. And give *many* Joburgs, one after every long Pre-Hav run, one or two levels, for the case responsibility comes up and as it comes up new overts are realized and they've got to come off.

SUMMARY

You'll do the most for the pc by taking him or her to release with Preparatory S.O.P. Goals runs.

This is strong, powerful auditing. The pcs will thank you. They won't if you try S.O.P. Goals when you don't know how. That's the way to make enemies.

E-Meter Essentials is coming out soon. A new Pre-Hav (same one you have but extended) Scale is being issued in another Clearing Series book. And I'm giving you straight dope and the best tools in these Bulletins. How can you lose. You're sunk. You can't!

6105C26 SHSpec-4 On Auditing

Before you can change people, you have to increase their tolerance for change. Change is pain, because its fundamental is a shift of location in space. On a mechanical level, change is time. Time is a temperature, the hotter the faster. This is a discovery in physics. It goes along with the discovery that the speed of light is not a constant but depends on the velocity of emission, and that zero is a variable, not an absolute zero. Time is change on a mechanical level. Rate of change is measured by rate of change, not by time, but one pretends that it is measured by time. If you find the right temperature, you can speed time up or make something timeless. For instance, after the atomic bomb exploded, nothing moved for twenty minutes, not even the twenty minutes. Temperature alteration caused this. There is a zero. There is nothing, but a nothing of what? This is variable.

Society at present doesn't know that it doesn't know. This is dangerous. Scientology points this out to society, which is painful to society. The best approach to study is always to find out what you don't know and then to remedy the situation. One should not start out study by finding out something new. The gradient approach is:

1. Not knowing that one doesn't know.
2. Knowing one doesn't know, but not knowing what one doesn't know.
3. Finding out what one doesn't know.
4. Remediating the situation. The only thing wrong with one's case is the vast area of one's beingness that one doesn't know one doesn't know about.

Things you do reactively produce the opposite result from what you intend.

Gradient of states of case:

1. Release. A release is a person who knows he won't get any worse. He has a low state of case, but he is better than a non-release, since he knows he isn't there yet. On a meter, he would give a whole dial drop on a low-sensitivity can squeeze, and the TA would be fairly near clear read. He would also have reality on scientology as a way to improve. The communication, help, and control buttons are in good shape. He can as-is certain things by inspection.
2. Stable release. This is a tested release. He has no adverse needle reactions on help, communication, or control. Life can still mess him up, but he will come through better.
3. MEST clear. This individual has an F/N at sensitivity One and doesn't react to routine questions. He reads at the clear read for his sex.
4. Stable clear. This is a MEST clear who has run lots more SOP goals, where they start blowing by inspection. For this individual, engrams have no persistence. He can erase engrams or mock them up at will. His healing rate is fantastic. Thinkingness can have an effect on the bank before clear, but a clear has more effect on the bank.

In all case states up to clear, thinkingness has a varied effect on the bank. The lower the case state, the less effect one's thought has on the bank. A psycho is total effect of the bank and can produce no effect on the bank. Then we go up to more and more effect of person on the bank, up to no bank.

Memory trouble is withholdingness. Withholding from people results in withholding from self. The PC lessens the overt and pushes it out of sight. If you increase his responsibility, he becomes aware of more overts. The overts "unless" and one starts to feel bad, for instance

when you discover that you have been committing overts against the Org that has been so nice to you. This is what happens when you process a person towards greater responsibility without pulling withholds: the person will cave in again. Therefore you must pull these overts and withholds and get the charge off them as they become available. This is the rationale behind interspersing sec checks with other auditing. Otherwise the PC becomes unwilling to make case gain and is likely to blow.

HCO BULLETIN OF 29 MAY 1961

Central Orgs

CLARIFICATION OF “CHANGE PROCESSING”

The following despatch to D of P Washington, D.C., who had been using “Change” exclusive of the whole Pre-Hav Scale and had been having trouble, is of interest to all Technical staff.

29th May, 1961

Wayne—

Change is only one part of Pre-Hav Assessment. It is the only one that has a Secondary Scale. To “Assess on Pre-Hav” means to assess the whole Pre-Hav Scale of which Change is a part.

Change belongs at “Inverted Control”. Cross out “Inverted Control”, write in “Change” instead. Assess only on the whole Primary Pre-Hav. If and only if you get a reaction on “Change”, you assess Change Scale. When a level is flat you return to the whole Pre-Hav Scale and assess the whole scale.

Every Pre-Hav Level of the Primary will soon have its own Secondary Level. You always assess on any new assessment for level the whole Primary Pre-Hav Scale. You choose the most reactive (reacting on the needle) level of the Primary. Then you move over into that level’s Secondary Scale. You find the most reactive Secondary Level. You run just and only that level flat. Then you take the whole Primary Pre-Hav Scale for the next assessment. Once more you find the most reactive Primary Level. Then you move over into its Secondary and so on.

“Change” is the first one to have a Secondary Level. Every level now has one and they will be issued shortly.

So put “Change” at “Inverted Control” instead of “Inverted Control” and carry on.

The best routine is HCO Bulletin of May 13, 1961. It modifies nothing of this but gives you a sure approach to release, provided you keep rudiments cleaned up every session.

Best,
Ron.

6106C01 SHSpec-5 Flattening Process and E-meter

On running a prehav level, be sure that you run the process long enough to get it to bite. When the PC needs a high sensitivity for a third of a dial drop, you may not get much TA in the first three hours. This can happen on a sticky level at any time. It is not flat, or it wouldn't read in the first place. So run the TA in, then out. If it is getting a little TA and never did get much, you are getting some TA, and you want to continue to increase it.

The goal becomes less intense when you find the terminal. This is because the goal is the significance that surrounds the terminal, and the PC's attention has been yanked off the goal over to the terminal, where it was fixed anyway. So the goal, after you have found the terminal, will read less than the terminal. There's nothing in the goal for his attention to be fixed on, since the goal is just something he achieved reactively to solve a problem given him by a terminal that overwhelmed him. The goal is the tag hanging out from the bank and can be used to get in there and handle the bank. This phenomenon of tags was first noticed in 1949 with engrams. For instance, with a boy who is always worried about red caps, it turns out that red caps were in an engram about which he knows nothing. Goals work the same way. The goal that won't null is the toughest one, the one attached to the terminal that most overwhelmed the PC -- that he can still confront.

The Sad Tail of PDH

L. Ron Hubbard

Every time we get up to a high roar, such as now when we're clearing people as never before, we measure our progress by the violence of reaction in squirreldom.

They come down from the trees and start looking for nuts to convince how we're all wrong. If they weren't paid to do it I'd be happier.

The latest brainwave to greet our highest peak of helping Man is rumors of "PDH." This is Pain-DrugHypnotism as practiced by the Communists. Brainwashing, in fact. It is interesting that when the Commies fight you, they try to convince people that you're guilty of their own overt. It is also fascinating that a Commie rumor line is international in scope. The same rumor bursts out in a dozen quarters around the world, spread by paid agents at the same time.

This rumor of PDH started in Australia, where Scientologists laughed at it, went to South Africa where Scientologists got mad about it and then sprang up in the U.S. where some Scientologists "didn't know." Well, disregarding the fact that such don't know anything anyway, we now know who is helping the little red brothers with the sickle in one hand and the hammer in the other to make trouble in the U.S.

Anyway, I'm not writing this article to scold. I'm really laughing at the idiocy of it.

I've been showing the students here at Saint Hill who've come for special briefing and clearing (and who are getting clear) how to convince a pc, by flagrant meter reaction, that the cat has "PDH'd" him. It's very funny. But you'd have to know how an E-Meter works to appreciate the joke.

Here is the drill:

You put anybody on an E-Meter and say, "Have you ever been a victim of Pain-Drug-Hypnotism?" The meter reacts strongly. So of course the test subject on the meter is startled. He begins to gape. The meter action is so strong. It's so convincing.

"Now," you say, "who did this to you? Was it _____?" and name some person the subject knows or knows of. And we see another fall. The subject gapes, astounded. Has dear old Frank been giving him PDH's? How horrible. He never would have thought this of poor old

Frank. And you leave it at that and your test subject now believes he has been brainwashed by his best friend. But you don't leave it at that.

"All right," you say, "do you know of any pets?"

The test subject says, "Yes. I have a cat."

"Well!" you say, "did this cat give you a dose of Pain-Drug-Hypnosis?"

And the meter falls!

The test subject is bewildered or ridiculing now. But there it is.

"Did your cat make you a victim of Pain-Drug-Hypnosis?" you insist.

And the meter reacts!

"What date?" you say. And the meter reads for midnight 12 July 1960.

Our subject now has horrible visions of his cat sitting on his chest while he sleeps PDHing him.

Why?

Well, people who believe bad things instinctively often aren't capable of learning. But you are capable of learning so here's the explanation:

You say to the test subject, "Is this meter falling on the word: PAIN?"

The subject wriggles. Giggles. "I sure don't like pain," says the subject. The meter clears up on it.

You say, "Is the meter falling on the word: Drugs?" And that fall comes off as the person says, "No, drugs are pretty bad."

"Is the meter falling on the word: Hypnotism?" And that fall comes off because the subject realizes that he doesn't like hypnotists and says so.

"Or did the meter fall on the word: VICTIM?"

The subject now laughs or responds.

The meter is cleared up in this way.

"Now," you say, "have you ever been the VICTIM of PAIN-DRUG HYPNOTISM?"

The subject laughs. You repeat the question. The meter doesn't react at all.

"Now how about this cat?" you say. (Or J. Edgar Hoover or whoever.) "Did you ever kick this cat? Do you have overts on this cat?"

"Well, yes," says the subject. "I didn't kick the cat. I drowned a cat once."

"When?"

And after dating it on the meter, "Midnight 12 July 1960!!!" The exact date of the "PDH" (or one should say, the overt on the person [cat]).

For the meter reacts on any person or thing on whom the *subject* has committed *overt acts!*

And when these things are inquired into, the question, "Have you ever been the victim of Pain-Drug-Hypnotism?" draws a nul meter. If it were really true, the meter would still respond.

You have to *compartment* any meter question to get the truth. The E-Meter never lies. But you can ask a sloppy question. When a question, the basis of which is false, contains restimulative or charged words, one has to break the question down to phrases or words, get the charge off them and *then* ask the question again. *Now* if the fact is true the meter reacts on the *question* not the *words* in the question.

Example: (asking a pc about a goal) "Do you want to be a freeman and climb ladders and rescue beautiful women?" The meter falls madly. What is it falling on? To sort the goal out one must know. The whole goal is true or part of it or none of it. So one asks, "Do you want to be a fireman?" Meter is nul. "Do you want to climb ladders?" Meter is nul. "Do you want to rescue?" Meter is nul. "Beautiful women?" Meter falls off the pin. "Do you have a goal to have beautiful women?" Meter falls off the pin again. It was Beautiful Women, not Fireman that made the meter fall.

Meters are *accurate*. But sometimes people are sort of stupid.

L. RON HUBBARD

PS: If there were any advantage in Brainwashing (which there isn't) and *if* anybody *were* really PDH'd, it will clear up in a few minutes by assessing the PDHer on the Pre-Hav Scale and running the person off the bank. Takes about 30 minutes by the new processes. It takes the Russians 70 days to lay one in.

We're winning.

LRH

PPS: If the meter falls only on Overts, won't somebody *please* tie these squirrels down for a Johannesburg Security Check? Their PDH screams rather point the bony finger! Certificates must be in clean hands. Any HCO will give any certified auditor a security check, with or without witnesses. And any HCO can now stamp certificates "Clean Hands 1961." Personally I wouldn't let myself be audited by people who haven't had security checks. Every person in a Central Organization is security checked. There you *are* in clean hands. And don't try to tell people otherwise after all the work I do to keep orgs clean for you or I'll revoke not only your certificate but your Thetan, too.

ASSESSING

Clarifying how to do assessment on the Pre-Hav Scale, Primary and Secondary:

Assess Primary Pre-Hav. Locate most reactive level by most reactive needle response. If several levels react, clarify them by asking about one, then another, very briefly.

At the Primary Level you discovered (say “withhold”) move over to Secondary Scale (say, Withhold Secondary) for that level. In the same way as on the Primary Scale, find the most reactive verb on the Secondary Scale (say the Withhold Secondary).

Run that verb only. Don’t try to run nothing but that Secondary Scale for the next 5000 hours. Run only the one verb, made up into a multi-bracket command.

When that one verb no longer produces Tone Arm motion (less than 1/4 of a TA Division of motion in 20 minutes of auditing means flat, get off) the “level” assessed is flat.

You now assess again on the Primary Scale. You find the most reactive level of the Primary Scale as before.

Taking this Primary Level you move into *its* Secondary Scale. You assess the Secondary just like you assess the Primary.

You find one word, (one level) of this Secondary Scale, just one verb that reacts on the needle more than the rest. You choose this one verb. You run it flat on the Tone Arm. You don’t reassess inside this Secondary again unless its Primary comes up again in new assessments. You assess newly on the Primary Level, etc.

It is always the same system. You always do the same steps of selection. Find Primary Level. Find the One Point of its Secondary that reacts. Make up a command with brackets. Run the Tone Arm flat. Assess again on the Primary Scale. Go to its Secondary. Find the Secondary. Make up command and run the Secondary flat, etc, etc, etc.

At this writing only one Primary Level has had its Secondary Scale issued. That is Change which belongs at Inverted Control. But as this is written, all the Secondary Scales for 65 levels of the new Primary Scale are sitting in a box near my desk, being mimeoed one by one. Mary Sue, Jan and Dick Halpern assisted in the assembly for nights on end or it wouldn’t have been ready for 20 years if done by Ford Foundation or U of Pishtush standards.

So very shortly you will have *all* Secondary Levels complete. I will later cull them out and arrange them a bit neater in gradients but you need them and so they are being mimeographed and sent as they are.

When you have them all, don’t do as one person did—read that you ran the “Secondary Level” and so ran every one of the words in the whole Secondary Scale without further assessment. Ruined more pcs it did.

L. RON HUBBARD

6106C02 SHSpec-6 Flows, Prehav Scale, Primary Scale

A person that has flowed in one direction too long, e.g. a writer who has written too much, a shipping clerk who keeps shipping, etc. One day he will want to stop. It is an electrical phenomenon. People who are affected by gravity are affected to a degree by Newton's Laws of Motion: action and reaction. When a thetan pushes a particle out, there's a recoil effect. The law really only applies to masses of comparable magnitude. The stuck flow occurs when one neglects the return flows one is in fact receiving; one fails to as-is it, and creates a ridge from the resistance. If there's been too much inflow, a ridge may be formed from not-ised out-pushes. Newton's second law is thus the reason for solidification of flows. The facsimiles of back pushes are neglected. Therefore they stick. The stuck flow is reacted to with unconsciousness, which is dope-off.

If you have someone run a flow in one direction (in mockup), he can either get a field in front of his face going black, or an avalanche will be triggered where all the "things" come at him at once, or a reverse flow avalanche, an avalanche of resistance, an inversion. A flow too long in one direction produces a reverse flow, not just a stuck flow. This reverse flow is:

1. Not as-ised, because not noticed.
2. Resisted. [Then you get a flow in the original direction, but on an inversion.]

On running O/W, we can only do this when the PC is below the ability to tolerate change. O/W is reach and withdraw, but only from one terminal, and it doesn't account for all the possible motions. As long as the individual is below change, O/W only runs well on F-2 (See "O/W -- a Limited Theory" HCOB 5Jan61). O/W is 100% effective below change but not effective above it. [Cf. the later order of the grades.] Below the level of tolerating change, the individual's inflow and outflow get locked up, and change produces ridges on various flow lines. Therefore, the person is individuated, can't change his viewpoint. Resisting change, he gets left on some individuated point of the bracket. [E.g. he has a stuck outflow, so he can't relate to people.] If he was so bad off as to be psycho, he'd maybe get upset with flow three, and maybe get up to obsessive cause. If one is fluid on change, and doesn't resist it, he won't resist the flows and therefore, he won't create the ridge. When he sets up Newton's Second Law of Motion, he knows there'll be a consequence of every thing he does, so he knows better than to cause or experience much. The consequences of change is change; when he can't stand change, he'll go into O/W. That's why running brackets is a safety factor. When a ridge is set up, it has to be taken apart on both sides alternately. If a person goes unconscious on running a bracket, it may be that one flow is overloaded, or maybe he isn't really doing one leg of the bracket. So you have to check and see about that by asking once on each leg, "Did you answer that to your satisfaction?" The flow three on brackets is to handle his dispersal.

In connection with stuck flows, the concept of God is interesting. What kind of shape would you think God would be in, if he'd just been creating things and causing everything? You could never reach him or say anything to him. What kind of duress must he be under to propitiate to us all that much? He must be quite spun in. Anyone who's on such an obsessive cause must be practically nuts! We should have a society for the resurrection of God. He ploughed himself in for us, so we should help him out.

The Prehav Scale is a reactive bank scale. When a person is eventually able to have, he doesn't have to have a bank, so the bank disappears, at the point of Have. The bank wouldn't be there to measure on an analytical scale. The best description of the analytical Have scale would be Axioms One and Two. All other truths are the result of postulates, agreements, and considerations, so the scale would depend on what a bunch of thetans agreed on. It could change.

The Prehav scale is fixed, a “now-I’m-supposed-to,” “This is it -- why we’re here” scale. It’s the order of the value of postulates that are fixed and not changeable in the absence of

scientology. At some time early on the time track, this scale must have been dreamed up. Recovering it is quite a trick. All levels may not be there. Also some levels repeat in changed wording, and there are harmonics.

PROCESSES ALLOWED

(Cancels earlier Process directives)
(D of P Re-evaluate *all* cases, staff and public, on the basis of
this bulletin and apply this bulletin at once to all cases.)

As of this date only the following processes may be used in HGCs, Central or City Offices, excepting only Academies where any process may be used for training.

Process Routines

Routine One

For all cases that show one or more points near the very bottom of the graph on Traits A, B, C, D, E, F, and G regardless of other test or meter criteria, and for all cases that show all points within 25 points of the top of the graph, again regardless of other meter or test criteria:

1. CCHs.
2. Joburg Processing Checks.

1. The CCHs are to be run by their earliest criteria—London '57—which is to say CCHs 1, 2, 3, 4, are run in rotation and each only so long as it produces change and no longer. Change is measured by Comm Lag or alterations of pc in doing process. Do, for instance, CCH 1 only so long as it is producing changes in pc's responses to doing it. Twenty minutes of no-change of response should be regarded as nul for the moment. One then goes on to CCH 2. The same rule applies. Only if pc's responses are faster or slower or different each time, continue the process. Test for twenty minutes, again all of which must produce no marked difference of response to the process. If process is now nul, go on to CCH 3. Same rules apply. Go on to CCH 4. Same rules apply. Go to CCH 1. Same rules apply. Etc, etc. It is a Code Break (Clause 13) to change the process while the pc is giving differences of timing (comm lag) or attitudes of response. It is a Code Break (Clause 13) to fail to change the process when the pc is not giving any differences in timing or attitudes of response.

If done this way and with good Tone 40 wonderful results are achieved by the CCHs.

The case criteria is meant to embrace the "no auditor" case at the bottom and the "Theetie Weetie Case" (sweetness and light) case at the extreme top of the graph (who will go to graph bottom before the case starts up again as though the profile were a cylinder which when it goes off the top, then appears on the bottom when people are in "serene" valences [meaning they are wholly overwhelmed as a thetan].)

2. The Johannesburg Processing Check is the same as the Joburg Security Check only it is now being used for processing purposes with great results. I have rewritten it in HCO WW Form 3 as the Joburg Security Check and will rewrite it as HCO WW Form 4 calling it "HGC Gain Control Check" or some such name, but the questions are about the same. Meanwhile use Form 3 as is in HGCs. Don't rewrite or omit.

The directions are on the Check form. The difference is that in using the Joburg in Processing, these rules apply:

1. Clear *all* needle reaction from any question before going on to the next question. By-pass no reaction you see on the meter to the question. If you do let one slide, the pc will shortly complain about being given the check. If a pc starts complaining about the check, you have either passed a hot question without getting the withhold, or he has a hot withhold. Remedy: if pc complains continually while being checked during processing (*not* in pure Security Checking for the Org but in using the check in processing) you go back to the beginning and start over.

2. The Joburg used in processing only is done in Model Session only. However on the question, "Are you withholding anything?", don't spend more time than needed to clear PT withholds on the auditor as the whole check is devoted to withholds.

3. If pc refuses check altogether and you can't get on, return pc to CCHs, do them a few more hours and try the check again.

This is all there is to Routine One. CCHs and Joburgs. And the graph is now the full criteria of when you use Routine One.

Routine Two

This is covered very fully in HCO Bulletin of May 25, 1961, "Releasing and Preparing a Case for SOP Goals" and other current HCO Bulletins.

Routine Two consists of two steps *only*.

1. Joburg checks, given as above in Routine One.
2. General Runs on Pre-Hav Scale without terminal, using Primary and Secondary Scales.
3. On PT Problems of Long Duration (years or within this lifetime only) assess on meter for terminal and nul the Tone Arm for each level, level after level, using mainly the Primary Scale.
4. Find the pc's Havingness and Confront Processes and use them briefly early in each session and at each session's end and where needed.

For every general level flattened fully on the Pre-Hav Level found, do a Joburg. For every PTP of Long Duration, completed, run a Joburg.

The Hav and Confront Processes can be found at any time but are better found after one Joburg and one general level flattened.

Why all these Joburgs? As a case gains it gains in responsibility. As it gains in responsibility, the pc remembers more withholds and considers the things he has done more in the light of having been overts. If the case isn't given a chance to get rid of these, it stalls. Or the pc is half killed by realizations that he has been bad when the targets of his *overts* unless from pigs to people. Therefore it is brutally unkind to improve a case without then removing the withholds now realized. This is also an excellent therapeutic mechanism. It is also an excellent test of a pc's progress, i.e: if he has no more withholds on a new Joburg that weren't found on his last, the pc isn't progressing. On successive Joburgs if no new overts and withholds show up that weren't there before, the pc is *not* progressing. Yes, I've found why cases stalled and gained only so far and then blew. Your thanks are in order.

This Routine Two, closely followed and carried out, will bring out the state of Release in from 50 to 75 hours.

Routine Three

1. SOP Goals Assessments for goals and Terminals;
2. Running SOP Goals Terminals Flat on every level;
3. Joburg Processing checks (as in One and Two above);
4. Use of Hav and Confront Processes as in Routine Two or finding new Hav and Confront Processes as case gets more able.

This is the full extent of the things used in Routine 3.

Routines 2 and 3 are not crossed or intermixed.

Routine 3, if one is expert indeed, can be done on any case *but* one can make mistakes, find the wrong goal or terminal, and so, until fully briefed and flawless in TRs, E-Meter, Model Session and Assessing, an auditor will get more case gains per unit of time by using Routine Two. When he or she is a Release, it is much easier some day to have Routine 3 then completed if the person is Released first.

In short, for *sure* gains until you are sure of your tools, as listed above, use Routines 1 and 2. *When you* are perfect in handling SOP Goals, do Routine 3 on pcs.

W A R N I N G

On running general runs and SOP Goals Terminals on Pre-Hav Levels, the most serious mistake that can be made is not flattening a level before reassessing.

On a rough case, the TA motion required to end is present at the beginning and so auditors leave the level and leave it unflat.

If two or more levels are run and left unflat, the pc can feel he is spinning!

Flatten levels in this wise:

1. Run until TA is showing better motion.
2. Run until needle is practically stuck for the whole of 20 minutes.
3. Reassess.

Example on a sticky meter case:

Level Assessed: "Build"

First three hours of running:

Tone Arm dial reads:

4.2, 4.3, 4.1, 3.9, 4.2.

Second three hours of running:

4.2, 4.4, 4.1, 4.6, 4.0, 3.75, 4.9, 3.5, 4.3, 3.25.

Third period of two hours:

3.25, 3.5, 3.2, 3.6, 3.9, 4.1, 4.0, 3.0, 3.5, 4.7, 3.6, 4.8, 5.0, 4.7.

Last twenty minutes:

4.7,5.0,5.0,5.0,4.9,5.0,5.1,5.0.

Note that the “Leave it when the TA moves less than a 1/4 of a TA Dial in 20 minutes” seems to apply to first three hours. Actually the TA, on a rough case (sensitivity 2 to get a 1/3 dial drop) does not *begin* to move for quite a while. Then it begins to move. Then it nuls.

So be careful. It is better to have a TA stuck for 20 minutes than to leave a level unflat.

SUMMARY

Since February, 1961, I’ve been teaching auditors close up and far away how to clear.

I have now a pretty good grip on what they *can* and *will* do. I have been modifying the tools to fit hands more than to fit cases. They already fit the cases and have since February.

The auditor who can do CCHs and has a fair command of Routines 1 and 2 and who “keeps the Rudiments in” and doesn’t Q and A and who has a good D of P behind him to see that he does, can get wonderful case results with Routines 1 and 2.

Only the auditor who has perfect TRs, a total command of the E-Meter, Perfect Model Session, a good grip on assessing, and whose case is in excellent shape, should attempt SOP Goals—and that right now isn’t two dozen and aside from Peter and Eliz Williams, their two new ACC Clears and a few of their ACC Students, aside from the South African Clear Jean Kennedy and a very few S.A. ACC Students, the rest are right here at Saint Hill. At this moment there are *none* in America and there will only be one there by July 30th, 1961. There are none in England outside the boundaries of Saint Hill who could clear and only one genned in on Routine Two at HASI London.

So there’s what I’ve found out after an awful lot of work with you guys. I’ve found most of you can do Routine One, some of you can do Routine Two. None save the above named can (not by permission but by actual fact) do Routine Three.

I’ve also found out that all this is *very* easy to remedy and that your willingness is superb.

Our work is cut out for us, but boy, do we know where we’re going.

We have to get all auditors perfect on the TRs, Model Session, E-Meter, Security Checking, Pre-Hav Assessing and SOP Goals. And it can be done very easily. When we’ve got that we’ll have loads of Clears.

And what do you think *that* will do to this society?

6106C06 SHSpec-7 Routine One, Two and Three

Always check for what happened between sessions if the PC has a different TA read from the end of one to the beginning of the next session, even after just a break. The definition of rudiments is what's needed to get the PC in session. They are nothing more than that. Don't use ruds to waste auditing. Ruds processes are weak. Let the PC as-is it by telling you about it, but don't two way comm it. If the PC is still dramatizing something, it's too deep-seated for ruds anyway. If needed, you can ask in several ways to find what it is. This is not the same as two way comm. You can run a rudiments process if it doesn't clean up when he spots it.

With CCH's you are auditing out a valence end bringing the PC up. The valence will fight for survival, you will get comm lags, etc. The CCH's are not run in model session. You don't pick up ARC breaks, etc., because the person doesn't easily blow them and can get quite involved in them.

Routine One: CCH's and Sec checks

Routine Two: General run of the Prehav scale, Joburg, and havingness -- all in model session.

PTP's of LD are assessed for the terminal, which is run on the Prehav scale.

Routine Three: SOP Goals assessment, assess for terminals, run flat on Prehav, with Joburgs interspersed.

6106C05 SHSpec-8 Routine One, Two and Three

An auditing result is determined by:

1. The adequacy of the tool being applied.

Modified by:

2. What auditor's will use.

Which is modified by:

3. What they can use.

A good process is one that can be widely applied. A good procedure is to ask an auditor what he's had gain on himself. Let him run that until he gets reality (with training) on something else. He'll get a result where he himself believes he can get a result.

If you increase a person's potential responsibility without letting them be responsible for what they've done, it is vicious. The person will feel miserable, which is better than being irresponsible, but they'll stop getting case gain because they feel it's not deserved or safe. As a PC gets processed, his reality level on his life and overts comes up. That's why sec check reads change as the person gets new auditing. The point of doing O/W is to bring responsibility up, but this is only possible where there is some responsibility. The "dead thetan" case won't read on O/W. He has total irresponsibility. But a person can't take responsibility for his acts unless you let him do it and communicate them.

6106C07 SHSpec-9 Points in Assessing

The problem with communicating scientology is that there are no agreed-upon realities ready-made in words. If you give a person one of these concepts and its name and definition, he will recognize the truth of it, but it will take awhile for him to really grasp it. and he has to get the concept first. This is almost like processing. People read DMSMH and got an understanding that changed their physical condition. But the ideas of dianetics and scientology haven't been familiar to Man, so it takes awhile, or it takes familiarity with them, to grasp them. You could teach someone the principles of scientology by teaching him the vocabulary.

You've got to get the PTP of long duration off the PC's case if he has one, before you can go on with goals processing, because the PTP LD is more real to the PC than anything else on his case. His attention is fixed on it. If the PC has his attention fixed on the hidden standard, you've practically got a computation right there. It has to be gotten out of the way to get case gain. It is always right on the goals chain, or it wouldn't be a PTP of long duration, so when you get it out of the way, you've got the case flying. It has been a mistake not to assess the hidden standard, finding out who had it, when, and what. [This is Pre-session 38 -- a dianetic assist. See HCOB 23Feb61 "PT Problem and Goals".] Or a more certain method would be to run the hidden standard with a terminals assessment by elimination (Whose might it be? What might it be?, etc.) This line of questioning is interesting, both to the PC and casewise, because the hidden standard is the primary source of individuation for the PC. It is what makes him different from everyone else. It is the least well duplicated part of the bank, so it will fire off as an automaticity, because it is the area that is most out of communication and most out of control. The PC could get lots of terminals from this.

The hidden standard is a substitute for the case of the PC. It is more real to him than any case or life difficulties the PC may have. It is a form of individuation. The PC is the one with the earache. This distinguishes him from others.

6106C08 SHSpec-10 Q and A Period and Ending an Intensive

[A lot of specific data about running SOP Goals.]

6106C09 SHSpec-11 Reading E-meter Reactions

Auditing latent reads is auditing the analytical mind. It is the reactive mind that we are interested in auditing. The reactive mind is a mind that acts without inspection on the basis of stimulus. It puts into action solutions to problems it fancies must exist, which may never have existed, or which haven't existed for billions of years. Put in any part of the problem, and the reactive mind goes into forming the solution. A thetan is trying to survive, who has no necessity for trying to survive at all, which is the first idiocy. So the mind is trying to solve a nonexistent problem. Then it addresses itself to the survival of form, the perpetuation of an existing state, which would take out all the MEST in a sensible state and "garbleize" it. The reactive mind is the individual's accumulated goals for the survival of forms. The reason it destroys is to get something to survive. It creates to get a form to survive. The reactive mind is the part of the cycle of action that will never move, because its keynote is survival of a form. So it is trying to make something survive that is already dead: old bodies, identities, etc.

You could remember it if you weren't trying so hard to make it survive, but because of the survival effort, when you try to remember it, you get a restimulation as if you were still in the period, because all the impulse to survive has been trapped and rides up to PT. All of these forms have nothing to do with PT, but here they are. So the reactive mind has a starvation for the other parts of his old games, e.g. the opponents, and it acts without inspection and very fast. To get a form to survive, you can't take time for inspection. This leads to such idiocies as people attacking their own planes or ships in war when they'd gotten used to attacking enemy ones. The "safe thing to do" is not to inspect, under battle conditions. The jam of the time, not taking time to inspect, results in no-inspection. When you speed up things in the physical universe to too great a degree, on the false basis that you are prone to non-survival, but in the interest of keeping something surviving, you'll run into the timeless reactivity of action without inspection.

So therefore, what you are after is instant reads. Your auditing target is the reactive mind, not the PC. The only thing wrong with the PC is the reactive mind, and there is no inspection involved there, so he can't see what is wrong with him. If he could see it, it wouldn't be wrong. This is also why the reactive mind is more in control of the auditor than the PC: the no-inspection factor. He can't think on the reactive subjects; you can. So if you take his instructions on what to do or handle, you'll always do the wrong things. One of the PC's goals is to make his reactive mind survive, so he won't let you near any part that should be audited. It dictates to you that it must survive; it throws you red herrings. "When you turn around and look; when you're running from a [battle that you're losing], you normally get speared. Therefore it's very very bad to look at the things that are pursuing you ..., so you mustn't ... so you had better prevent the auditor from ... looking at the things that are pursuing you.

There is another obscuring element: withholdingness is the comm bridge between the PC and the reactive mind. When a withhold comes out of the reactive mind, the PC will do what the reactive mind tells him to do, which is to withhold it. Withholdingness is part and parcel of survival; it is protection of forms from attacks and destruction. It's a non-duplication too: you withhold your form from duplicating the form of someone you've killed. This sets the mechanics going for survival: it's actually prior to the actual idea of survival. So the PC gets into withholding thought. The withholding of form is super-basic to all sorts of other things, e.g. individuating. The PC also withholds his body from destruction.

When the PC gives up a withhold, he's conquered a dictate of the reactive mind by being controlled by a being (the auditor), rather than by his bank. This is the mechanics by which he feels better when he gets the withholds off. Because withholds add up to keeping him separated from the human race. He can always be counted upon to dramatize the withhold when it comes up. On the meter, there's first a tick, then a fall as the PC spots it. The secondary action is not to get the withhold off the PC, but to keep the PC from dramatizing his

reactive bank. So we say, "What was that?" When withholding, the PC is reactive -- he is dramatizing -- otherwise, he's talking to you analytically or at the dictates of the reactive mind. Early in the case, auditing the PC is like auditing the light bulb to fix the generators in the power plant. The E-meter helps you locate all the parts in the generator.

If the PC is left with a withhold in session, he'll ARC break half an hour later. What you're trying to do is to keep the PC from being fooled about himself. If you avoid the reactive mind, you're just doing a Q and A with the PC.

THE RISING NEEDLE: SKIP IT!

Former ACC students will well remember the E-Meter drill in which, among other “reactions”, they were to produce a rising needle on their coach. The time has come to change nomenclature on this one! For practical auditing purposes—such as deciding if a Sec Check question has been cleared, or whether a particular level of the Pre-Hav Scale should be run—A RISING NEEDLE IS NOT CLASSIFIED AS A “REACTION”.

Of the 10 needle actions described in Ron’s new book, *E-Meter Essentials*, let’s call the following “reactions”, in as much as they are of value to an auditor in deciding what needs to be run on a case, or what needs further work:

ROCK SLAM
FALL
THETA BOP
STUCK
CHANGE OF NEEDLE CHARACTERISTIC

The following might be called, simply, needle actions, or motions—in that you don’t use them in deciding to *do* something with a pc:

FREE NEEDLE
NO REACTION (NUL)
STAGE FOUR
RISE BODY
REACTION

About all a rising needle tells you is that the pc can’t confront, therefore has exceedingly low reality, responsibility, and knowingness on whatever significance it’s rising on. So, skip it! Treat a rising needle, for practical purposes like a Security Check or Assessment, like a nul needle. You needn’t pursue this particular subject any further at this point in the case, because the pc’s knowingness and responsibility on this subject is practically nil. There may very well be further material available on this particular subject *after* the pc has had some more auditing—but *not now*. So, let go of it. Skip it! So, it’s putting the Tone Arm up, this rise. All right. That’s why E-Meters are built with Tone Arms that rotate; sometimes they go up! Fine. You don’t need to do a blessed *thing* about it, and shouldn’t try. Just keep on with your check, assessment, or whatever it is you’re doing. Let your auditing guides be the rock slam, fall, theta bop, chiefly, plus stick and change of pattern.

If it’s a rise with sticks in it, you do find out what’s putting the *stick* into it. If it were a rising needle with rock slam in it you’d investigate the *rock slam*. But the rise itself, or a needle that is simply rising, you ignore.

In this way you will save hours and hours of auditing time. Trying to kill a rise by finding out what it’s rising on is attacking the case at its least approachable point—the point responsibility, reality, confrontingness and knowingness are at their lowest, the point when the pc (and the meter!) is least capable of helping you, or himself. Why try to scale a wall where it’s 20 feet high when you can walk through the breaches in it? So gear him in instead where the needle is reacting with rock slam, falls, theta bop, or sticks, where he has some reality and

responsibility, where he knows something about it, and can confront it a little. That way he'll move, and you'll both win.

6106C12 SHSpec-12 E-meter Actions, Errors in Auditing

The E-meter only reacts on those things that the PC is aware of or capable of becoming responsible for. This responsibility factor becomes a reality factor, so you can audit what appears on the meter. Things that don't appear are beyond the PC's zone of responsibility. Getting new reads on sec checks is thus a test of the PC's advance in responsibility. If no change, there is some gross outness countering the auditing. Don't get trapped by all the little minor errors. These gross efforts come from the impulse to make nothing out of something, which goes back to productivity. The effort to produce is one half of the dichotomy. All strikes are on the other half: the effort not to produce. Many people are dedicated to non-production -- no-survival. This comes about as a reaction to a stuck flow on "Must Survive" Many operations would go better if just left alone. Today's "planned balanced economies", reminiscent of Markab, which specialized in this, generally result in unbalanced messed up economics. Produce and Non-Produce should be on the Secondary Prehav scale. The goal could also be "No Results".

Here we are talking about continually recurring gross errors, not just occasional errors. Anyone will do that. Don't attempt total perfection or you'll never complete or accomplish anything. People get so tense about doing it right that they'll never get anything done. A good exercise to cure perfectionism is to deliberately decide something is finished without the finishing touches. When you can do perfect TR's, metering, etc., you can relax and just audit with no anxiety communicating to the PC. You must exude confidence in order to give people hope, which is a fundamental necessity to making someone well or better. Mainly, it has to appear that you are trying to do something for the PC, not that you are trying to be perfect.

Using instant reads, one gets at all the held down fives in the bank; using latent reads, one is handling all the PC's concerns about why the fives were held down. This is a longer road to clear.

6106C14 SHSpec-14 Seminar: Withholds

You don't destroy records when you are pulling withholds, and you don't agree with the PC to do this. If you do, it is as much as if you were telling him you'll withhold for him, and he won't get much gain.

The only liability to getting the PC to where he can't be influenced by the reactive mind is that, in a sense, you are auditing him towards a state of no-effect: total serenity, total no-effect, the way the Lamaist did it. The individual must be able to experience to live. It is possible to plough someone in on a level and make them look good, but not clear. This is education by fixation [see p. 37]. One should be able to do anything on the Prehav scale. Repairing his ethics will eradicate his impulse to do hasty things and get action on a rational basis, as a result of inspection, not based on inhibition. This is a new thing on earth in human behavior.

There's nothing wrong, in theory, with native state processing, as practiced in 1957 and 1958 -- knowingness deteriorating by postulate to not-know, to must know, to can't know (forget), to remember. This processing was too simple and of too much generality to be functional. An OT process, "Tell me an intention that failed," "Tell me an intention that succeeded," would be a one-button clear process if that could be run (since it's Axiom 10, Factor 2). But it's too simple to plumb the reactive mind with. A certain level of complexity is necessary to resolve cases. The worse off a person is, or the clearer they are, the more you need to run the secondary scale (greater complexity). How many buttons are there? There are all the beingnesses ever, all the doingnesses ever, all the things anyone ever had or could have. You can't force a person to grasp reactively things which are analytically obvious because it's reactive and nutty. A process must have some complexity to be effective at a reactive level and some simplicity to make it easy to administer.

If one invalidates the basic agreements and identifications of the MEST universe, MEST changes characteristics. For instance, if you stop agreeing that water runs downhill, and challenge that, it'll go all gelatinous and gloppy.

A security check is running all the not-know off the case that it has run on everyone and everything for God knows how long. You are actually running the native state cycle of sequences, not withholds at all. Overts consist of putting not-knows into the third dynamic. For instance, someone robs a store: the storekeeper comes in and doesn't know who did it or when, or when it might happen again. [Also not-knowing where the stuff is that was taken.] Then the storekeeper runs the not-know on the police. Now the area has a not-know that accumulates in the society, until people can't trust each other and can't produce and the society is aberrated. Someone feels better when he gets off the overt of creating ignorance. Eventually he'll realize that this overt worried people. That's another overt. Then, eventually, he cognites on the not-know overt, and he'll notice his memory improving, his IQ going up, as he runs out overts of making people not-know (or be stupid, in other words). Sometimes a case will recover totally by getting off one big overt. Auditors don't effectively run Pre-session ("What question shouldn't I ask you?", etc. See HCOB 15Dec60) because they aren't imaginative enough about all the evil in the world. It also requires the auditor to create not-knows about the PC. It works better to give the auditor a list of mean, nasty, vicious not-knows someone might have run on the world. This doesn't run a not-know on the auditor. This is the sec check. Different sec checks should be devised for different routines. Routine three cases need whole-track lists, otherwise, their whole track memory will get occluded. Whole track memory depends on some kind of whole track sec check. This also answers the question of why PC's feel better after giving up same withholds but not others. And what is a withhold? It's running a don't know or can't know on self or others. When the overt is on someone else, it gives a big resurge when it comes off.

Messing up time [by lying?] is a different breed of cat. It's creating, for one thing. All of life is an invented episode. Writing fiction is done with the intention to amuse and inform. The only not-know in it is to keep the reader from knowing the end before he gets there. The only

aberrating thing about it, for the writer, is that it's a creative effort, which can wind someone up in the soup [Cf. the effect on some people of Step six.] If you tell a lie to obscure your own guilt, that's another not-know or false knowingness, which eventually makes the person feel that all life is a pretense [Cf. the sociopath.]. Auditing then becomes just a literary criticism of life, as a romantic episode.

6106C15 SHSpec-15X Not-Know

There's a mechanical side and a thought side of boil-off. one is prone to worry when the PC boils off, but it is only a matter of concern if the auditor ceases to audit because of it. The mechanical definition of boil-off is a stuck flow. A lot of stuck flows got parked on the track, and when the PC hits them, he boils off. Most of the time, when the PC goes unconscious, if you kept giving the auditing command, the PC would keep on doing it at about the same speed or a bit slower as when he was awake, because the PC isn't really unconscious. If he didn't hear you, there's no harm done -- it's not an implant situation. He comes right through it. The thought definition of boil off is that it is the accumulated not-know the PC has run on everybody. Unconsciousness is merely the intensification of not-knowingness. (You could even run a not-know in the course of being "kind" by not telling people that they're upsetting or bugging people. They will make enemies who eventually hit them, surprising them because no one told them they were messing people up.) Immanuel Kant introduced not-know into philosophy with his transcendentalism. This killed philosophy until scientology came around. The Greek philosophies amounted to this: if you couldn't lick them, confuse them with entertainment and philosophy. This out-creation with philosophy and entertainment was a very effective means of conquest. Many philosophies have been mere dramatizations of Prehav levels, relying for their force on bank agreement. By observing what people underline in books you can see that what people go for is what agrees with their banks.

One gets into this frame of mind as a result of thinking, "Truth is merely subjective; there is no broad truth." This is the philosophy of the only one [solipsism]. Also General Semantics. Then there's Dale Carnegie's "1.1-ism", which tries to communicate with an unreality. They run a not-know on people by being nice, and the people sense it, too. Where a reality is not present, a not-know is substituted for it. An unreality is created whenever you substitute an unknown for a known. Communism does this well with the iron curtain. Or take someone who always says, "I'm fine," when you ask, "How are you?" They're substituting a non-fact for an observable fact, giving you an unreality that eventually makes them disappear. Curious phenomena will occur around someone who is doing this: they eventually do disappear. But if there's a terrific not-know about someone, he persists like mad. For instance, the monk, Dharma, who lived 10,000 years ago in India formed the basis for most Indian religions, but nothing is known about him or what he said. The least-known philosopher is someone whose name we don't even know. He's influential in the background of Lao-tse, Confucius, and Buddha. He is held in place by the not-know. This is Dharma, who is not even thought of now as a person, but as fate.

On a personal level, not-know shows up as boil-off. An extreme manifestation is unconsciousness; at a lesser level, it's death. Not-know, at its most extreme, is when a person cannot go unconscious. We call that insanity. Death is a state of beingness, not an action. Unconsciousness is lower, well below death. One can get knocked off and go on knowing what is happening. Insanity is where a person cannot not-know the fifteenth substitute for reality -- a delusory state. They worry about these things laying in wait for them. They're in a state of combat with the unknowable. This can go on the tone scale, on a level of not-know, from serenity about the unknowable on down. They may seem fairly sane at the top, but they don't know what it is they don't know about and are looking for. They get down to grief about not having found out what it is they don't know about. The guy will also be utterly fixed on the track. If you know what you are unhappy or bugged about, you are not insane. Merely wondering -- the fact that you can wonder why -- demonstrates that you are not insane. Knowing this, one won't be baffled about insanity, for bafflement is just a Q and A with not-knowingness. The reason one gets worried about the insane case is a Q and A of trying to find out what the case doesn't know. What he doesn't know is a not-know. If you can speculate about what you don't know, you will be OK. You can introduce some sanity into someone who is spinning by getting him to think of one person who doesn't think he is insane, because you have introduced a knowingness into his unknowingness. Or you could use one command, "Look around here and find something which is really real to you."

6106C16 SHSpec-16X Confront and Havingness

Havingness gets eaten up by valences and consumption circuits until the PC is clear, or nearly so. Then it orients him and stays with him stably. As long as he has a dominant valence or dominant machinery, havingness gets eaten up. Any gain it gives is in ten to twelve commands. Any more than that is a waste of time. ARC straightwire does a lot [for havingness] at first also. Havingness works by shifting attention but doesn't as-is the bank's masses; it just moves them around.

[Details on running Routines One and Two, and havingness and confront processes.]

If a case with a lot of auditing hasn't had significant change, the policy is that, regardless of graph, meter read, or anyone's opinion, you run Routine One [CCH's and sec checks]. This is the most rapid way to make the case change. It's just the effective thing to do. This prevents you from making a mistake on the case. The only reason someone gets upset about being run on CCH's is that pride enters into processing, which is in itself a sign of some nuttiness.

6106C19 SHSpec-15 Q and A Period: Auditing Slowdowns

Test for a release: The person should not be reading weirdly on a meter; the sensitivity knob should be down -- you should get a good drop with sensitivity zero. You should get no reaction on the questions, "Do you think you'll get any worse? Does scientology work for you? How do you feel about help? How do you feel about control?"

Every time you find something in the PC struggling for survival, it isn't the PC, because he can't do anything but survive. It's a valence. Every valence fights for survival. It can be such a clever valence that it can fool the auditor. The Auditor's Code is there so the valence won't feel challenged, so it won't kick back before you can jump it. The PC gets most upset by the auditor's failure to handle his case. The valence says, "See the red herring?" If the auditor complies, the PC will get unmanageable because he's lost confidence in the auditor's control. The auditor needn't apologize for positive, certain control. That's how to make valences lose and PC's win. Kindness validates valences, not PCs. Valences aren't hard to handle if you are certain and let it come across. Auditing weakly gives power to the PC's circuits and valences; auditing with certainty validates the PC.

Instant read is within a tenth of a second.

[The "death of the Ego" is the death of the valence.]

6106C20 SHSpec-16 Sec Check Questions. Mutual Rudiments

The perfect answer to any question is the exact question. When it is correctly asked, it is answered. Say you are trying to lay out serving equipment in a hotel kitchen. When you finally spot exactly what you're doing, you perceive that you are not arranging machinery but trying to accomplish some exact result, like trying to get food from A to B. In asking the person who's going to use it what he needs, you are getting a more precise phrasing of the real question you wanted to ask. When you have all the data to define the exact question, you will have the answer.

The borderline between the Reactive Mind and the analytical mind is the broad Savannah of "I don't know." Things get foggy on it; the PC knows something is there, but sees nothing very clearly. The auditor's action in compartmenting and clarifying the question helps to pinpoint the source of fog for the PC. [The exact answer to a problem is the exact problem, when correctly phrased, or as-ised. This is why a repetitive look at a problem and rephrasing of it will cause a resolution.]

We have made a recent discovery of magnitude. We've known that co-audit teams tended to make less progress than HGC Auditing, but not why. The answer is now known. The first clue was the D of P's finding auditors' ruds on PC's out even when the auditor found them in. It turns out that the ruds weren't out with the auditor.

It was mutual ruds of the team that were out with others but not the team. For instance, the pair agree the PC's family are swine, so it won't read on ruds, but someone else who isn't in on the agreement will find the PC's out ruds. The meter registers on disagreements. One way to solve it is Formula 13 [failed help and O/W on terminals, alternated. See HCOB 1Dec60.], cleaning up all the people who read, or on ruds, substituting "we" for "you". Even CCH's can do it.

6106C21 SHSpec-17 Seminar at Saint Hill

[Details on running Prehav 13. It's a process which combines overt running with prehav assessment and running of brackets, relative to a list of charged terminals]

At upper level strata, beingness is higher than doingness, and doingness is higher than havingness.

To do a can squeeze, get hands relaxedly in your lap, then squeeze them gently with the hand itself, not clear on up to the shoulders.

6106C22 SHSpec-18 Running CCH's

The way the CCH's are run is 1, 2, 3, 4 over and over and over. It is a breach of the auditor's code, clause 13, to run a process beyond the point where it is producing change or to stop running one which is producing change. The words in the process have very little to do with the process; they're run with meat and motion. They are all done by compulsion if necessary. The PC never has an opportunity not to execute the command. The consequences of letting a PC out of doing the command are grave. The CCH's run out surgery, shock, etc., as the PC dramatizes. You should run the process flat, which means the PC has the same aspect for twenty minutes, no matter what the aspect is, and no matter how nutty or unconscious (as long as the PC is doing the command). Change means such things as somatics, etc. It may be necessary to run CCH's for a few hours before they bite. You don't pay attention to what the PC says; it's what he does, though if he communicates to you that something is happening, that's a change. Running CCH's permissively will also screw up the PC; you must apply control to get communication and communication to get control. Irresponsibility denies havingness, so sec checks also raise havingness. All O/W running, since it raises responsibility, results in havingness. "Prehav" really means "prevent havingness" scale. It consists of those things that prevent havingness. This is gotten off in Routine 2 [see p. 34 or HCOB 5Jun61]: the fixed reactive buttons that prevent the PC from having things are gotten out of the road. On Routine 3, the PC gets out of the road all those unrealized goals, each of which has been a defeat, hence a denial of havingness. So havingness is the end product of all this.

O/W raises havingness because the individual individuates from things because he can't have them. So he develops overts only on those things he can't have. So when you get the overts off, he can have. If you could have the whole universe, it gives you no trouble. It's only the things you can't have that you have trouble with. Next time you have a PTP, see what's in it and what prevents you from having them. Individuation from the thing, the dynamic, the universe, is what brings trouble, because you get into an obsessive games condition, which adds up to -- you can't have it and it can't have anything to do with you.

The CCH's knock out individuation from the physical beingness which has been caused from the PC to his body and (apparently) his body to him. That's why they run out electric shocks, etc. And you have to let him take more responsibility or he won't improve his havingness. You have to maintain control, or you'll show him the body can't be controlled, so it can continue to overwhelm the PC. Also, the PC will become practically unauditible. Misguided kindness is all that could let you allow the PC to control the session. It's actually a vicious thing to do. Even if the PC is right in his advice, don't follow it. He'll gain more from being run wrong, but under your control, than right under his own. If you're going to err, err on the side of control and toughness, not sweetness and light. It's better to end the process wrongly on the auditor's determinism than to end it rightly on the PC's. If you let the PC take control, you're very liable to get an ARC break a half hour later. You may not notice that it's because you lost control, because of the lag. But the way to handle it is to spot the point where you lost control and reassert it. If the auditor is in control of the session, auditing takes place; if the auditor is not in control of the session, reactivity takes place. If you flinch from auditing, it's from those times when you didn't control the session and came under attack as a result.

HCO BULLETIN OF 16 JUNE 1961

Franchise

CCHs AND ROUTINE 1

The criteria on Routine 1 is as follows:

All cases that have had no significant or rapid change over long periods of auditing shall be run on Routine 1, HCO Bulletin of June 5, 1961, regardless of graph, Meter behaviour or objections.

This applies to over half the Scientologists in the world.

So get over the idea the CCHs are for nuts. And get over diffidence in having them run or being run on them.

Routine 1, Routine 2 and Routine 3, HCO Bulletin of June 5, 1961, each one will make Releases. Routines 1, 2 and 3 are choices made for speed. One is faster than another for different pcs. Some pcs release faster on Routine 1 than 2 or 3.

Any case could be run on any one of these routines, from any level, and still make it. The question is "How fast?" One chooses the routine in the interest of greatest effectiveness in the least time.

Having attained Release, a person then goes to Routine 3 inevitably.

Time economy is our criteria. Not necessarily case level.

So keep your "pride" or be run on Routines 2 or 3 to Release at ten times the auditing time—or attain Release via Routine I, if it's for you, in one-tenth the time.

The D of P may refuse to further audit any pc who:

1. Refuses to be run on the process ordered, or:
2. Refuses to take a Joburg, or:
3. Refuses to abide by the regulations of HGCs regarding alcohol, eating, sleeping, etc.

I don't want any super-defensive valence getting in people's road in clearing. CCHs, the degradation of being audited on, compares to the little boy refusing food because it might make him live.

6106C23 SHSpec-19 Q and A Period; CCH's; Auditing

Many people don't see objects -- they've been looking at facsimiles of the objects. When the facsimile as-is, the wall looks bright. Such people tend to have bad depth perception because they never see anything. They are easily invalidated because the reason he's making and looking at facsimiles is that the physical universe isn't safe for him. The auditor begins to be real as the PC sees that he can duplicate him, so if the auditor indicates [e.g. on CCH's 3 or 4] "You didn't do it," the auditor ceases to be real, and the PC will put pictures of him up instead. Overrunning the process tells the PC that he was wrong to think he'd got it. This makes auditing unsafe. The purpose of the CCH's is to make the auditor, the physical universe, and present time real to the PC, to show him he can observe the auditor, the room, and PT. His havingness on other-determinism is very low. The CCH's remedy it; he sees somebody else exists and the universe is here. You can run CCH's wrong by making the PC aware that the auditor and the room are real but dangerous. When running a child, take account of the child's shorter attention span. If it's biting, run it at least an hour before you'd expect it to flatten.

Exteriorization, as done in 1952-5 was unstable. LRH found that before a thetan could get along without a body, he had to be able to have a body, and people who exteriorize easily generally want nothing to do with one.

Philosophies that strive for peace are a covert operation towards making people succumb. Spots of sudden change of pace are spots which brake a person's life. They've got upsets in them and advice to take it easy, and from then on, it goes wrong. They were asked to confront motionlessness, which is most difficult to do. Medicine and psychiatry gave drugs, etc., to make a person be quiet. Unless a person can confront motion, he's dead; he can't confront life, can't work, and will become a criminal. The natural consequence of adopting a motionless philosophy is to get religion -- a peaceful one. If you enforce no-motion on someone and make him think motion is bad, he'll get Buddhist. Road safety campaigns make no sense because they emphasize going slowly, less motion, not keeping unsafe drivers off the roads or putting freight on trains. The more you make a population motionless, the higher the crime rate. T.V. corrupts the youth because it pins a child motionless, not because of the T.V. material.

The theory that people get seasick because of motion led LRH to think one should have pictures of very still scenes to counteract this. He chose some, thought about it, and started to feel seasick. He realized that what's needed is pictures of motion to accustom them to motion, not motionlessness. The cure for motion is motion, not stillness. Philosophies of motion don't necessarily mean no criminality -- e.g. space opera. If you could keep it up with no rest, you might manage to be OK. When you become incapable of handling the motion of life, you can then start to experience pain. The experience of pain comes about because of intolerance of motion. You can run motion or no-motion to handle this situation. Predictable motion is better, from the PC's viewpoint, than unpredictable motion, because with unpredictable motion, he doesn't know what to confront. When he gets the idea that it's bad not to be able to confront everything at once, he starts to butter all over the universe, stick on the track, etc.

Also, whenever a person gets hit hard by life, or as soon as he begins a program to coerce people into working harder, that person will obsessively start producing. Production follows defeat (as in Germany, Japan, etc.). Someone who's been defeated will produce more bank than someone who's doing well. So in eradicating, on the one hand, a person's intolerance of motion and, on the other hand, his failures or defeats, you are causing his bank to disappear. [The first can be done by CCH's], the second, by goals running. Everything becomes a cure for past failures; every goal is a consequence of not having done.

We don't erase the bank; the person gets accustomed to not needing one. The person himself takes over the automaticities of beingness (identities), doingness (creation), and havingness.

Most havingness is the result of a defeat and the whole cure sequence, where nearly everything in the universe is a cure for past failures. Every goal also is the result of not having done. So we get intolerance of motion, feelings of defeat, ability to have without having defeated anything. If you can remedy those things for someone, you've produced a new being, who is not the same as an old being who's never had the experience. His knowingness of what's happened doesn't leave him, but his knowledge of the consequences of what he's done lets him emerge as a veteran of campaigns unscarred by his battles -- tough and capable. That which strips all games from the universe would normally result in motionlessness. But how about ending certain games for somebody who doesn't have the consequence of ending in motionlessness? You've broadened the person's view of games he can play. This gives him more games, not less. Play is delusory motion, about which you're not supposed to be serious, so you're not supposed to as-is it. So a person gets trapped in it because it's not real. Play is a dishonest doingness; work is not a serious activity. A person can work at a sport and have fun as his job. Also, if you don't just do what you are doing but put an "I should be doing something else" in, you'll stick in it. If one just did what he did when he did it, he wouldn't get stuck in it. Morality is a now-I'm-supposed-to which makes people not willing to do what they're doing when they do wrong, so they never as-is their wrong acts, so they continue to do them.

It's a certainty, then, that one gets a persistence of the things he doesn't want, or a tanglement of the things he does want. Then he wonders why he feels odd. So auditing is straightening someone out so he has tolerance for motion and motionlessness and can have what he should have, or not, as the case might be, as he wishes. To do that, you have to erase all the oddities of doingness, all the pain and boredom of motion or no-motion.

The Prehav scale disentangles all the doingnesses. But if you make the PC intolerant of motion or be motionless when he can't, or give him failures in auditing, or don't make it duplicative so he can't have, then you reverse the process.

Goals are, to a large extent, a "do something else" or a "Now-I'm-supposed-to". If the individual isn't doing anything, he simply isn't doing anything. There should be no "Now-I'm-supposed-to" superimposed upon the situation.

6106C26 SHSpec-20 Dealing with Attacks on Scientology

Scientology doesn't have an Achilles heel, so it's in a good position to defend itself. People do get upset when confronted with a new idea, but new theories get accepted fairly quickly, e.g. Harvey on blood circulation, Socrates on the nature of man. Proponents of new theories don't necessarily get martyred. The ones that do generally are getting motivators for their overts as tyrants. Also, if one continually fails to advance an idea, one may get suicidal and die for it, e.g. Christ (and Socrates). LRH believes in making an idea effective, not to fail at it and make everybody feel guilty because they kill you. It's not necessary to sacrifice oneself for a new idea. That's just a way to protect old ideas. Man is a great believer in no-change, while he obsessively changes everything. So new ideas are rejected. Scientology is over the top, but it is still being fought, because to the degree that one is right, to that degree he is dangerous. We threaten to upset a lot of beliefs and customs. It's only safe for us to do it because we can undo what we do. For instance, we can run out bad auditing.

The reason there is a question on sec checks about overts on LRH is that, if one had a lot of overts on Ron and scientology, one could acquire a forceful, overwhelming valence called scientology. So this is the first time anyone has said, "Try it and see." In the early days, people said we should go big on aesthetics. LRH said no. You can always overwhelm a thetan with aesthetics, but it's not desirable to overwhelm a thetan. If it's true far you, it's true, not because we've overwhelmed you. We're attacked because we have no evil motives. People get frantic because they can't figure out, "What's the Ditch?" If you can make a thetan commit overts against you or set him up where he can commit the overts and remove any possibility of running the overts, you can overwhelm him and get him so stamped down with a valence that he can't even wiggle. [In other words, you set a person up where he can't receive an overt from you (you won't commit one), and on the other hand, you set him up where he can commit overts on you and cannot get them run out, then you've done him in good and proper.] Former efforts at this were entrapments. It isn't really an effort towards total freedom either, since it allows for games. Man becomes alarmed at the fact of there being this selfless philosophy that doesn't demand that one become subjugated and enslaved by it, and that it doesn't say that the originator of it must be carried on an imperishable valence that everyone should bow down to.

When attacked all one needs to do is to take effective actions, not get frantic. Just keep up effective pressure, investigate loudly, and don't feel rushed about it, let it coast. When people are in terror, they make mistakes. So let them make the mistakes. For instance, a man called Ettleman had been hired by the AMA and the APA to attack scientology. In this case, which went on for three years, when it finally came to trial, his attorney didn't show, so the case was dismissed. All that can be Zone to an organization or a person is to harass them to the point where they're too worried to do their job. So keep the reaction to attack to the minimal effective actions. Don't waste time, and keep the show on the road. The more you worry about the attacks, the more motion you waste and the less scientology you get done. So all the enemy can do is to get negative gain by reducing your effect. See if it's your game before playing it.

(Nothing wastes as much time as the law, because the law has overts against time.)

If no one anywhere fought scientology, it would be as nothing, unimportant. Think of all the philosophies that must have been developed in the past eleven years. None of them have been fought. A sure sign that we have ignorance and aberration on the run is that there are attacks and fights. [The process is biting.] Start worrying when there are no more attacks. Also note that our comm lines are far more rapid and effective than the enemy's, and must be kept up. This alone discourages the enemy.

ROUTINE ONE

It has been noted that "hour of Joburg" for "hour of CCHs" has been taken to mean you run the CCHs for an hour and then the Joburg Sec Check for an hour. This is very wrong.

If another auditor is giving the Joburg, it should be given in the same day. An auditor less skilled on CCHs could thus be employed for half the auditing day giving Joburgs.

But the CCHs must be run as they are supposed to be run. Run One, Two, Three, Four, One, each one to a temporary flat point (20 minutes of no Auditor-observed change of comm lag or demeanour [not pc's statements about change or somatics]), and when one is biting, you flatten that CCH as per the 20 minute test.

If one auditor is doing CCHs *and* Joburg Sec Check, whenever he has pc temporarily flat on a CCH, he can give a page of Joburg. Probably one-third of the auditing time is best for a Sec Check, rather than one for one in time with CCHs if one auditor is doing both.

A pc can go three days on CCHs without a Sec Check. At a time when a CCH that was unflat but is now temporarily flat, a Sec Check consisting of a couple of pages or more can be given (in any event about five hours worth for fifteen hours of CCHs for one auditor).

If you have two auditors on a case, one giving CCHs, one Sec Checks, this means 2 1/2 hours in the morning on CCHs, 2 1/2 hours in the afternoon on Sec Checks or vice versa. Some pcs getting Sec Checks in the morning and some pcs getting them in the afternoon would keep all auditors busy.

I hope this helps you to handle Routine One.

6106C27 SHSpec-21 CCH's -- Circuits

The way to bust up machinery on CCH-1 is to vary the pace. He'll jump the command if a machine is doing it.

One effect of the CCH's is to help the PC find the auditor. If he goes on automatic, he doesn't have an auditor. Just running the CCH's will run it out; varying one's pace will prevent it from starting.

If you just use intention on the PC and no verbal commands, your intention may be good, but the PC's command circuits may be goofed up, and you may not get the response you expected. He may not be hooked up the way he should. You can have fun with a meter talking to the entities in a body. You could start talking to the PC's circuit, but it hooks in harder and harder. It hooks in on a drop of havingness, and you are making a comm line talk across to his circuit. You're validating the circuit and lowering [the PC's] havingness.

If the PC has a problem and you try to run, "Think of a solution," repetitively, the PC caves in. You are running off the core of an Area of motion, leaving the motion on automatic. The PC is not confronting the actuality of the thing; he's not confronting what's going on at all; he's confronting a solution to it. That is, he's trying to not-is what it is, and the problem mass moves in on him. If you get him to spot the mass connected with the problem, then describe the problem, then spot the mass, it moves further away. If you get him to think of solutions, the mass will move in. Problems of comparable magnitude will also move the problem out. This occurs because of confront. If the PC avoids it, it moves in. You can also move the mass out with havingness. A solution is a stable, no-motion datum amidst a confusion.

Circuits can be used to get data, to verify answers to calculations, confirm if they are right or wrong, or to give you tomorrow's weather. The latter takes the increment of time that is tomorrow and inspects it. This is possible if you can look with equanimity at tomorrow, at least its insignificant aspects. You can predict to the degree that you can confront. People who can't confront PT obsessively try to confront tomorrow or yesterday, but it's not a real tomorrow, and probably not a real yesterday either. The way you go nuts on circuits is to ask yourself, "Who put that there?" or "Who else put that there and what does it mean?" This gives you a mystery. PC's who don't control their circuits and haven't inspected them for many years or eons have things popping up all the time when you audit them. Some get auditing answers from their circuits. The circuits were put up as a substitute for confronting and are so old and forgotten that now nothing about them is confronted. When the PC nears one of them, it tells him what to do or say. Since a circuit is just a no-confront, running havingness and confront improves circuits. The PC may have originally put a circuit there for convenience and then come to believe that it was unconfrontable because there was a circuit there.

You could say to the PC, "We're going to handle your primary aberration, so make a picture of it and look at it. Tell me what you see." You'd get amazing answers. The action of taking a picture of it, then looking is, of course, an alter-is of confront. In auditing, you want people to look directly at things. Circuits encourage them not to because they think they can't confront something. As you audit a PC, these things go live. As havingness drops, the PC gets anxious, keys in circuits to predict, or confront drops. Or, as the PC improves, and circuits can be activated as the PC comes up through them. So everything goes on a via. Auditing walks him up to less and less vias; more and more confidence. The reason confront isn't on the prehav scale is that it isn't a doingness; it's an ability. [Cf p. 22, where confront is described as an action.] [Also Cf. p. 40, where confront is defined as subjective havingness, or at least the process is defined as a subjective havingness process.]

That explains oddities you get running CCH's. You're activating and knocking out circuits because direct control and communication brings about continuous shift of circuitry in terms of

havingness. Then, since he's been gotten to PT, confronting the auditor, this brings his havingness up. If you talked to those circuits, they might well say anything, which is also true of the PC on CCH's. So the less attention you Day to what the PC is saying or thinking, the better. Dope off and comm lag indicate things happening to the PC's confront and havingness.

Circuits go haywire when they contain the postulate that the thetan is unable to confront. Apart from that, they can be useful.

6106C28 SHSpec-22 Raw Meat -- Troubleshooting Cases

[Details on handling raw meat cases -- tests, etc.]

If a PC has persistent out ruds, check for continuous PT overts, at least at the level of unkind thoughts on automatic. This is very common. You can handle this with Prehav 13.

6106C29 SHSpec-23 Wrong Target -- Sec Check

Herbie Parkhouse telexes from London: Auditors aren't getting sec checks done because it takes two to three hours to get ruds in. He wants to scrap model session for processing checks. This is an unusual solution. People are now in the same position about auditing that Ron was in when he started researching life. There's been so much alter-is and counter-create, the truth is obscured. Naturally in relaying comm about the simplicities of life, these things get restimulated and people start looking around corners, when the cop is right on the sidewalk. There is no secret about life; it is just surrounded by alter-is and obfuscation's.

People aren't doing their jobs because they are so busy doing other things. For instance, government is so busy doing the work or charitable organizations that it has no time to administer justice, protect citizens from criminals, etc. In a good government, production rises, people prosper; a welfare state government attacks producers with taxes. It's all off post. Everything is trying to make you wear its hat. So in scientology, the person who is on the ground observes. Parkhouse, by not observing, caused Ron to interiorize into his hat.

The analytical mind isn't really a computing machine; it is the PC. When he, or the analytical mind, is attacked by the auditor, you'll get no auditing done. Your target is the reactive mind. This is why LRH can do in 5 hours what it took other auditors 25 hours to do. The difference isn't that LRH is good and others are lousy; it is that the other auditors' reactive minds were apparently choosing the PC as their randomness, attacking the PC because he was aberrated. No. The target is the reactive mind.

You sit down; you take the E-meter; you say, "Have you ever stolen anything?" What you really want is for him to recall, ventilate, air the reactive mind. You shouldn't assume he already knows and purposely won't tell you. When you do a sec check, because of the specific question he remembers it and will ordinarily tell you. If you get heavy reads and he says, "No," have him keep looking; let him know there's something there, but maintain ARC. The proper attitude is, "You couldn't possibly remember this and not tell me. Let's just get the show on the road." When they look hunted, use a light touch to get them to tell you. If you're suspicious and accusative, you're cutting comm with the PC and encouraging him to withhold. Assume that if he remembers it, he'll tell it at once. It puts him in session that way. The meter check is "just to make sure we got all of it." It's up to the auditor to create an atmosphere of communication. You can use some dunnage to do it. This approach gets the PC comfortable, relaxed, confident. His knowingness comes up; he gets relief. After all, you are the auditor, not the E-meter. The guy gets to where he feels safe. His anxieties come from feeling unsafe in life, so your attitude alone can produce a great change in the PC. If you're using the meter and he says, "No," you don't assume he knows and won't tell you, but that he hasn't overhumped the reactive mind. You're disappointed, but you assume he can remember. This builds his confidence and gets him in a hopeful frame of mind. doing it this way speeds it up enormously; gives faster gains. It's not that he's getting more confident in you. It's that he's getting more confident in his ability to overhump his bank. You get far more off the case, faster, by this method. You'll slow it down by making sure he won't want to tell you and has to be trapped and beaten into telling you. Don't ever assume a games condition in auditing. This will also keep the rudiments in, since ruds go out with rough auditing. Set yourself up as someone who can be confided in, rather than as a cop sniffing out the crime.

Never assume a games condition (in auditing or not) if you don't want one.

STUDENT SECURITY CHECK

(HCO WW Sec Form 5)

This is a Processing or a Security Check. As a Processing Check it is given in Model Session.

The following Security Check is the only student security check (in addition to the standard Joburg and HCO WW Sec Form 6) to be used in Academies and courses.

HCO WW SEC FORM 5

SCIENTOLOGY STUDENTS' SECURITY CHECK

(For Academies, ACCs, etc.)

The first few questions below are for a student who has registered, but has not yet started on course, and who has never had a course in Scientology or Dianetics. The whole battery is given to a student actually on course, or who has had a previous course in Scientology, or Dianetics.

Has anyone given, or loaned, you money to help cover your tuition, or expenses, while on this course?

If so: Have you promised them something in return for this?

If so: What exactly have you committed yourself to?

If so: Do you intend to make good this obligation?

Are you coming on this course in order to get away from someone, or something?

Do you have any goal for being on this course which, if achieved, would result in harm to another person, his possessions, or his reputation?

Are you here in order to get into anything?

Have you promised anyone auditing which you do not intend to give?

Have you read, or had read to you, the course Rules and Regulations? If so: Are there any which you do not intend to comply with?

Are you here to find out whether Scientology works?

Are you here to prove that Scientology can't help you?

Are you here to prove that you cannot help others with Scientology?

Is there anything, discreditable to you, going on back home which is liable to be found out by reason of your being on this course?

Are you neglecting any responsibilities of yours in order to take this course?

Is there anything important that you are setting aside until after the end of this course?

Do you already know all there is to know about Scientology?

Are you here for any other reason than to become an expert auditor?

Are you coming on this course with the intention of killing off your body?

Are you coming on this course with the intention of spinning, or going insane?

Is any goal that you have for this course harmful to any dynamic?

Are you presently taking tranquilizers, drugs, or medication, of any sort?

Is there anyone you are in communication with that regularly makes a practice of discrediting Scientology, its personnel, or its organizations, to you?

Is anyone counting on you to keep something secret while you are on course?

Are you presently suffering from some bodily, or mental, condition that others have failed to alleviate?

Are you secretly worried about some condition of your body, or your mind?

Are you upset by my questions?

Is there anything about this course, or the Academy, or Scientology, that you are making allowances for?

Is there anything about your conduct as a Scientology student that others should be making allowances for?

Have you done any drinking on class days?

Have you told any other students that your instructor's data is wrong?

Have you had sex with another student?

Are you trying to get another student to have sex with you?

Have you had sex with a staff member?

Are you trying to get a staff member to have sex with you?

Have you borrowed any organization property and not returned it?

Have you invalidated, or criticized, any auditors to their preclears?

Do you intend to practice Scientology in the field differently from how you have been taught it here?

Have you coughed, or distracted others, during a lecture?

Have you done any self-auditing?

Have you done any unauthorized auditing?

Have you received any unauthorized auditing?

Have you criticized your auditor to others?

Have you been thinking unkind, or critical, thoughts about your preclear? L. Ron Hubbard?
Your instructors? Your auditor? Other students? Staff members?

Have you criticized this course, or the organization, verbally, or in writing, to non-Scientologists?

Have you criticized your instructors, or the D of T, to others?

Have you said, or done, anything to make field Scientologists think badly of the central organization, or its staff?

Is there anything here that you feel so uncomfortable about that you are thinking of leaving?

Have you received any medical, dental, or other treatment while on course without permission?

Have you tried to teach Scientology to HGC preclears who are not Scientologists?

Have you been late to any scheduled course periods?

Have you cheated on any course exams?

Have you passed off any other student's work as your own?

Have you tried to persuade any potential preclear to wait and be audited by you after the course rather than by the HGC?

Have you violated the Auditor's Code while auditing your preclear?

Have you done anything really stupid with your preclear?

Have you violated the Code of a Scientologist in any way?

Have you been absent from any course period without your instructor's knowledge or consent?

Are you in disagreement with any of the stable data of Scientology?

Have you been getting less sleep than usual?

Have you been eating less than usual?

Is there anything you are withholding from your auditor because he's "only a student"?

Have you taken tranquilizers, or drugs, of any sort?

Have you deliberately disobeyed your instructor's orders, or directions?

Have you unintentionally failed to follow your instructor's orders, or directions?

Do you have any overdue Infraction Theses?

Have you been assigned any Infraction Theses which you do not intend to do?

Have you tried to break up anyone's marriage?

Have you secretly violated any course rule, or regulation?

Have you tried to enturbulate the course, or any person connected with it?

Have you taken any other student's property?

Do you have any other student's property in your possession?

Have you taken any staff member's, or HGC pc's, property?

Do you have any staff member's, or HGC pc's, property in your possession?

Have you taken any organization property?

Have you broken, or damaged, anything belonging to the organization, or its staff?

Have you any organization property in your possession?

Have you passed any restricted data of Scientology to unauthorized persons?

Have you tried in any way to give Scientology a bad name?

Have you tried to give any Scientologist a bad name?

Are you a difficult, or unco-operative, student?

Do you have a grudge against any other student, or any staff member?

Have you tried to get any other student removed from this course?

Have you tried to make any staff member lose his job?

Have you told lies about anyone while on this course?

Have you done anything outside of course hours which you shouldn't have?

Have you been doing less than your best to become an expert auditor?

Are you doing anything which will prevent your becoming an expert Scientologist?

Have you been spending time, which should have been spent in studying Scientology, doing something else?

Are you making any Scientologist guilty of anything?

Have you been doing anything you believe is not right to obtain money for this course?

Have you done anything while on this course that you would hate to have known back home?

Have you been misapplying anything you have been taught in such a way as to make it appear that what you've been taught doesn't work?

Have you been doing anything solely because it is "the instructor's idea"?

Have you been doing anything solely because it is “L. Ron Hubbard’s idea”?

Have you been putting into practice any method, or datum, that you don’t see the reason for?

Have you done anything that would discredit Ron or Mary Sue Hubbard, or your instructors, by reason of their having trained you?

Is there anything that L. Ron Hubbard, or your instructors, should mistrust you for that you haven’t told them about?

Is there something you’ve been wondering about concerning Scientology, or Scientologists, which you haven’t asked your instructor about?

Are you withholding asking any question because you’re afraid it will sound stupid?

Have you been making a practice of getting other students to answer your questions rather than the instructor? If so, what questions? Why?

Have you been keeping other students from doing their work?

Have you been such a problem to your instructors that you’ve been robbing other students of their fair share of the instructors’ time?

Have you been writing letters home, or elsewhere, criticizing this course? The instructors? Your fellow students?

Do you regularly make a practice of gossiping about the affairs of staff, students, or preclears?

Have you tried out any processes that you’ve dreamed up yourself on staff, students, or preclears?

Have you been testing any squirrel processes on anyone?

Is there any process you are certain would resolve your case, or your pc’s case, which is not being used?

Is there anyone to whom you make a regular practice of discrediting Scientology, its organizations, or its personnel?

Are you in communication with someone who is a much better Scientologist than your instructor?

Are you in communication with someone who understands more about Scientology than L. Ron Hubbard?

Have you ever, while on course, felt that you would not achieve your goals by reason of poor auditing, or poor instructing? If so, who exactly have you made guilty of this?

Have you prevented anyone, including instructors, from achieving goals concerning you, or others, in Scientology?

Have you thought so badly of the central organization for any reason that you would under no circumstances accept a job here on completion of this course?

Are you in fairly regular communication with anyone who has a lot of ARC breaks with L. Ron Hubbard, or the central organizations? If so, what is the nature and frequency of this communication?

Are you in fairly regular communication with any group that is interested in seeing Scientology fail, or its organizations discredited?

Is anyone hostile to Scientology assisting you financially on this course?

Have you run any unauthorized processes on anyone?

Have you permitted anyone to run unauthorized processes on you?

Is anyone here counting on you to keep a secret for him?

Have you any feeling of “injured innocence” at having been asked these questions?

Have you been going to some other person rather than your D of T or instructors to get the “real data” on Scientology?

Have you been critical of the data or quality of tapes?

Have you been critical of the data in or quality of texts on Dianetics and Scientology?

Have you ever been critical of Scientology terminology?

Have you ever written critical messages to persons in Scientology about how they ran things?

Have you ever written and then destroyed critical messages addressed to L. Ron Hubbard?

How do you feel about these questions?

6106C30 SHSpec-24 Training on TR's; Talk on Auditing

[Details on running TR's, CCH's, and Prehav 13, and Routine 2]

6107C03 SHSpec-26X Routine 1A -- Problems

Routine 1A is problems processing alternated with sec checks. It is to handle cases that are too tied up with out ruds to run CCH's.

What is it that makes a problem so deadly in processing? A problem is postulate-counterpostulate, an indecisional proposition because the two sides are in balance. One can hardly confront the two data at once; the PC doesn't see the amount of confusion on it, and the confusion mounts up around each side of it. Thus you get two separate zones of confusion, each side with its stable datum, because each side has a yes and no about it. So you don't as-is the problem and it persists. That's its most basic characteristic. People get impatient with problems, so they solve them. But a problem solved has been not-ised, not as-ised. The solution of a problem is, of course, an overt against a problem. Everything in the universe is a cure for something else -- a solution. This is one reason the universe persists. Cures deteriorate and solutions become new problems. Alcohol, a century ago, was curing things. Even diseases once cured something. [Cf. sickle cell disease.] The bacteria that caused disease once cured something. Take an organization that is hammer and tongs on the subject of creativeness: the Catholic Church. They have the hatchet out on the 2D; they don't think creation should be done that can be prevented. They oppose VD campaigns because they think VD is a good thing, as a cure for sex. If you get VD, sex stops; so if sex stops, you get VD. No sex = VD because VD = No sex. Prostitution is also a no-sex proposition, so it gives a no-sex disease. Sex is a cure for no bodies, and no bodies is a cure for sex. You don't get a PC whose idea is, "Horses sleep in bed," who wasn't curing something with that idea. Every aberration he's got was a cure for something. His motionlessness is a cure for having killed so many people. If you pick up withholds on killing, he will be able to move again. Killing, too, was a cure for something -- maybe for hating people. Hate, in its turn, was a cure for associating with people whom you might damage. And Damaging people was a cure for people being people, etc. An aberration is a cure that doesn't cure, that you don't understand.

This all goes back to confusion's and stable data. If you have two confusion's and two stable data opposed to each other, which you don't confront, you get an endurance, because you never as-is the thing; you solve it. PC's who go through vias continually on an auditing command have some problem they've never looked at as a problem. When you run problems of comparable magnitude, you've taken the via of curing the problem off automatic and sneakily gotten the PC to take a look at the problem. Certain conditions that are designed to cure other conditions actually create them. E.g. a snake's venom makes a snake antipathetic, and snakes have venom because people (and other animals) don't like them.

The willingness to solve problems but not to as-is them is the basis for Q and A. People don't like getting the question fully duplicated as the answer. This is because they are trying to solve some very fundamental confusion they have. An effective method of teaching is to try to find the source of the question.

If you try to cure confusion, it continues. Duress and punishment are the results of despairing of solving someone's problems. Jails [and mental hospitals] are the cure for confusion's about people. This seems awfully drastic, but it is born out of despair. The effect of jails is to merely educate criminals more into hating people.

There is a way to make a correct and frontal attack on these confusion's. They often stem from withholds, so a Joburg will help. You may note that a PC may look a bit confused as he tries to find the problem he was solving. A problem, remember, is a multiple confusion. There are two solutions or ideas involved, each with its own confusion -- an encysted confusion. So one tries to back off from it, which only pulls the problem along. This is why thinking of a solution makes the problem mass move in. You can't really escape your own ideas.

Thought mass is basically composed of problems. It endures because it's not confronted. Given enough of this, the PC will be overwhelmed, and will dramatize being a problem, one which is insoluble. So you keep worrying about the PC because the PC is a problem. A PC who says he has had no gain is saying, "I'm a problem -- Solve me!" Your chances of doing it are poor. He's got two confusion's And can't confront either. PCs whose needles keep rising are not-confronting a problem. You ask, "How are you doing?" The PC says, "Fine." The needle rises. You ask, "What happened?" The PC says, "Nothing." It's discouraging. They can't tell you what it is because they can't confront it. CCH's will saw through this, but slowly.

A slow-gain case is heavy on comm lag, or not quite on the subject when he's talking. The comm lag stems from no-confront; so does the alter-is, which is a dissociation from the confusion. You ask the PC if he's got a problem. He gets upset because he can't confront it and knows he can't, and he wants to avoid it altogether.

Phenomena observed in the field stem from problems, on a no-confront or inverted basis. In fields of stress or duress, religious cults make their finest harvest. They offer an escape from problems. The reason Alcoholics Anonymous doesn't cooperate with scientology is that they have (for their very existence) a contrary datum: "Alcoholism can't be cured." You can't do anything about it, so you might as well join A.A.

No matter where you go, you can never get away from yourself. If you try to pretend you are not where you are, you get a dispersal of location; you'll be buttered all over the universe. The guy who permeates everything without being anywhere is trying to escape his problems, which all carry a no-confront. You put motion and action into a thought process, and they become inextricably tangled up, inextricably, that is, short of scientology processing.

All this is a prelude to a very simple killer process, for the PC for whom all life is a problem. The difficulty for the PC is a series of ridged problems. The ridges people have trouble with surrender on this one command, which is horrendous to run because it moves very slowly at first and turns on fierce somatics: "Recall a problem." You must be very careful to get the question answered on "Recall a problem"; you should ask, "What problem was that?" and make sure he is not giving you a generality instead of a specific problem. The PC will come up with some interesting solutions, which will suddenly turn awful. He'll discover he's been both sides of various conflicts, each side to solve losing on the other. If the PC does a locational on some object he's used to solve a problem of boredom, he'll come uptone to interest. This is another reason touch assists work. (More details on running Routine 1A).

6107C04 SHSpec-27X Problems and Solutions

Only LRH could get a simplicity on auditing problems. Usually when one tries to look at them, he just gets confused. The only mistake psychiatry made about psychosis was to try to understand it, since it's basically incomprehensible -- that's its whole character. Then they have to use heroic measures, which fail and leave them no place to turn. The common denominator of psychosis is problems, of course.

When the problems can't be associated with the solutions any longer, you get solutions to no-problems, which is psychosis. When a psychosis has been objectively described, there's a missing datum: what problems is this behavior a solution to? [Cf. R.D. Laing and J. Haley] The lack of this datum makes the psychosis incomprehensible. You cannot cure a psychosis by addressing the psychosis, or, more generally, you can't cure an aberration by addressing the aberration. This is because in so doing, you are running the still in the middle of the motion, the stable datum in the middle of the confusion, the solution. You're trying to cure the solution and not looking at the confusion. You are looking at the cure, which won't move out unless you get the motion off it. The whirlpool wouldn't whirl without the motionless center, but the center is motionless only because it has motion around it. You should take the whirlpool off the motionless piece, not the other way around.

Here you have confusion and the stable datum, motion and no motion, sound and silence, absolute location and change. If you try to get the motionless points out, all you get is new motionless points. All that is wrong with a thetan is what is wrong at the lower end of the scale. At the highest level, a thetan can be motionless; at the lowest level, he has to be. It's a matter of determinism. At the lower levels, motionlessness is not determined by postulate, but by the mechanics of motion.

If you want to see someone stiffen and go still, stand a fellow up, shake your hands in front of his face; produce a lot of motion, and say, "There's the motion!" At this point, the fellow will sort of freeze, as he becomes a stable datum. But this doesn't work well as a demonstration, because the observers will also all go still in a sort of stupidity. They won't confront the motion; they'll put a barrier up against it and become still, so the motion will duplicate them, and they will butter themselves all over the universe and become agitated. Auditing motionlessness just makes more motionlessness in the bank. Stillnesses identify more rapidly than motion. In psychosis, the person is being stillness. The worst example of this is catatonia.

There can't be such a thing as an "average" individual; there can only be someone who is trying to be a lot of other individuals and is therefore buttered all over the universe in terms of beingness. He'll be obsessively a still; the next step down is going round the bend. The operations this universe uses to try to make one assume the Average are so numerous that one accents them as normal. Insanity is the adoption of a solution to the exclusion of all other solutions in the absence of a problem.

If a person confronts no problems, takes no responsibility for them, and goes into being a solution, all problems go on automatic; they just go on all around him. There can be a million problems, but there's only one solution: him. A psychiatrist is being an obsessive solution also. He never really cures anything; he just persists with his ineffective solutions, which just hold the problem in place. He isn't aware that psychosis is a problem. He's handling people who are being obsessive solutions, so he becomes one too. The psychiatrist is the society's solution, just as his solution is shock treatment. Psychotics don't realize others have problems or that they're being problems to others. Psychiatry's research has been a search for solutions, but they hate solutions and they don't recognize the problem.

Man has made the mistake all along the track of not realizing that if there's a solution, there must have been a problem. Look at the "ten" commandments. Actually there's 162 -- pages

of them. These are moral codes. And “moral codes are a series of solutions to problems which are neither confronted nor analyzed.” Almost all the bible’s commandments are prompted by the obsessive crimes of the time. Several are solutions to VD. That was a problem that descended on them that they knew nothing about, so they looked for solutions. They already had various areas of no-sex; they had already prevented true ethicality by inventing immorality with a bunch of new morals. A lot of religions, also, encourage facing motionlessness, e.g. by getting you to turn inward, contemplate the stillness within, meditate, face Mecca, etc. This is the basic operation of the track.

“I believe it’s perfectly all right to do anything you want to to people as long as you don’t say it’s something else or try to convince people you’re doing something else ... as long as other people are not ... completely ploughed under by it.” The greatest good for the greatest number of dynamics gives a lot of latitude. The main crime is the entering in of a not-know. That’s the only real evil there is.

When a person reaches a stage of being an obsessive solution, with total not-know on what he’s being a solution to, or when one is to being terribly still, he doesn’t know what motion he’s being still to counteract; obsessive stillness enters. The bug factor here is the not-know in all this. Where you have someone solving problems, you don’t have an evil. It’s OK to solve problems. But an individual who has put all problems on automatic can’t solve problems, except with some fantastic liability of cave-in, terror stomach, etc. He doesn’t dare solve a problem. There are gradients of this. There are people who can solve a minor problem but not a major one. They’ll try to protect you from a problem by preventing you from solving a problem by feeding you extraneous data. This is not to confuse you; it’s to protect you. [E.g. the pedant who doesn’t want to make a mistake and doesn’t want you to make a mistake either.]

When you see someone sitting in the middle of a catastrophe, one of two things is happening. Either the stuff is avalanching in faster than he can cope with it but he’s trying to cope, or he doesn’t even know it’s a catastrophe; he doesn’t even see all the papers all over the floor and the account book being used for a doormat. That’s the condition of the thetan sitting in his bank. He feels he’s got it all straight and the trouble is all over there. Since, you can’t see the clutter, you say, “Well, he’s behaving oddly. But that’s not the situation; he’s confronting “no-ly”. It is all not-ised.

When you run something in an orderly fashion, you will at once get something done. In the first place, you’re giving the PC an orderliness to confront, and he finds out there’s some motion that can be confronted. Where you have individuals who are totally insane, you have no confront of problems, so Routine 1A won’t work. It doesn’t go as far south as the CCH’s. But it works on most people, including the guy who thinks he’s in such good shape that he doesn’t need any auditing. If you run problems on him, he’ll go, “Hm.... Ridges? Where did this come from?” The bank starts going solid; somatics turn on. He’ll see there were some problems around. Their masses start showing up.

This is the first time we’ve had a good cure for this type of mass. It bypasses the liability of curing it. We’re enough on top of the mechanisms of existence to pull the Overt-Motivator sequence without falling athwart of its consequences. Similarly with the problem-solution sequence. You can thus solve all the PC’s problems without squashing him, unlike psychiatry, which also tried to solve all of his problems.

ROUTINE 1A

Here is the first refinement of the Routines.

It sometimes happens that certain auditors cannot get results with CCHs and it also happens that certain pcs have heavy constant problems that prevent SOP Goals assessment, the problems being *hidden standards* by which all auditing progress is judged.

It also happens that Problems as a subject is the only reason why cases fail to advance (as in rudiments). Therefore problems are probably why some people clear easily and others don't.

Considerations about the stable datum and the confusion also lead toward the auditing of problems as such. For a problem consists of two opposed stable data and therefore two confusions.

The definition of a problem is "Two or more postulates in opposition to each other".

Probably all pcs should be run on Routine One. The Change Scale was aimed at handling alter-is in doing auditing commands. Auditing Problems, you will find, cures alter-isness in a case.

The full rundown on the basic Routine 1A was given to the Sthil Briefing Course Students on July 3, 1961, and the tape of this date should be studied for full data on Routine 1A. Routine 1A can however be used without serious consequences and with great benefit without all its data; at least it will get better results than poorly run CCHs and will get results anyway. Try it.

STEPS

Routine 1A only has two steps—

1. Problems
2. Security Check HCO WW Form 3 or HCO WW processing forms.

The original command was "Recall a problem". This is the fundamental command. A somewhat better command, since it increases ability and does more than merely as-is track, and since it moves pc off the 1st dynamic, follows:

"What problem could you confront?"

"What problem don't you have to confront?"

"What problem should another confront?"

"What problem wouldn't another confront?"

"What problem would be confronted by others?"

"What problem wouldn't others confront?"

Note: The third question may be “What problem could another confront?” also, whichever checks out on meter.

SEC CHECK

This is followed by a Security Check. The Security Check *must* be an HCO WW Form Sec Check and not a local version ever. A Sec Check is done with a full command of the new book *E-Meter Essentials* now being mailed from HCO WW. A Security Check is done (and so are goals) only by INSTANT READ and never by LATENT READ. If the needle falls or reacts within a tenth of a second after the question is asked pursue it, for this is an Instant Read. If it doesn't fall or react for a second or more and then reacts, do NOT pursue it or do anything about it. This is a LATENT Read. Only use the E-Meter if the pc says “No” or disclaims having done it.

If the pc owns up to a question, don't refer to the meter. Don't even look at the meter when asking a Sec question the first time. If the pc then says he hasn't done it, look at the needle and without looking at the pc ask again. Pc still says “No” or its equivalent and you get an instant read, pursue it with more questions. Never pass Sec Check question that is getting an Instant Read. It's hot. Always pass them if they only give a latent read. It's cold or it's something else. Only use the meter after a pc denies it. Increase sensitivity high, asking question again, before leaving any question which a pc disclaims.

RATIO BETWEEN PROBLEM AND SEC CHECK

Run Problems and Sec Checks one for one in terms of time. But never on the same morning or same afternoon or same evening. Never in the same session. Sec Check mornings, run Problems afternoons. Or vice versa. Or on alternate days. Don't wait for Problems to flatten before you Sec Check. Problems are a long run. Two different auditors can work on one pc, one at one time of the day, the other auditor at another time of day. The pc may ARC Break if a Problems session is cut off to Sec Check. So Sec Checks are one session, Problems are another session. And spread them apart into different auditing periods.

VALUE OF ROUTINE 1A

Routine 1A should be run on every pc at one time or another when going to or having arrived near clear. It is best run first as it speeds the auditing later, removing PIPs and altering of commands.. It does not go as far south as the CCHs but almost.

Routine 1A is extremely valuable on any case. It will give you many wins.

I believe at this time, though I have no broad data on it yet, that Routine 1A will speed up cases that are hanging fire or taking a long time to clear. Therefore use it.

6107C06 SHSpec-26 Routine 1A -- Problems

The cure for Step 6 phenomena or creative processing ill effects is a six way confront bracket on the pictures and responsibility on pictures. People who go solid on Step 6 type processes have an automaticity where, if they create anything, everything they've ever created gets created. Hence, since the bank is an individual creation, the bank beefs up. If you use these remedies, and you keep these things in mind, it would be safe to do creative processing. You can prove this by taking picture A, improving it, then looking at picture B. You will find that picture B has also improved. If you improve the PC's ability to perceive, you improve his ability to create. And it is only because the PC is doing it all himself that you can clear him. However, if you improve the PC's ability to create without improving his ability to confront, you've done him in. Art school does this; same with technical schools. If you make sure the school has only text, diagrams, and no real objects being studied, you'll cave the students in. Everything he doesn't like about the subject will eventually come to the fore, because you are running a can't have on him. It's a games condition; you are fixing it so he can't have what he's being educated in. The more theory on the mind you give someone, unaccompanied by an ability or opportunity to confront the substance of minds, thinkingness, and the beingness of life, the less reality they will have on it. So you'd do better to leave them alone in their present confusion. All training must be accompanied by confronting, particularly in the creative fields. The cure for obsessive create is confront. If the guy is creating his own aberrations, it must be that the road out would be confront. That would be the secret of clearing.

A mind is an obsessive unknowing creation, into which only a few important factors enter:

Create

Problems

Confront

Change

Responsibility

Not-know

Goals prevent the PC from looking at anything. He's always looking at tomorrow, not looking at what he's looking at. There's nothing wrong with having goals, but what you are looking for is the obsessive goal of the case. There's only one of these, and it prevents the PC from looking at any part of that goal's chain, because the goal is so obsessive that it removes his attention from that chain to something that isn't yet in the chain. When you find the terminal that represents that goal, you'll have found the terminal they've never looked at or inspected but have been. With an obsessive goal, the PC isn't in PT. He's down the future track at an imagined future point, so of course he isn't confronting where he is. One of the PC's goals leads to the person who most obsessively had that goal, which is the valence [the PC is in], and of course this is the total no-confront of the bank all bunched up in that spot. If you only looked at tomorrow and never observed the immediacy of the situation, you would eventually have as-ised any future of it at all. So it hangs in time 100%. You've never as-ised any immediacy of the situation, so it is all there on that chain, and all the future of it is as-ised. Goals processing undoes this mechanism of no-confront. You are taking off all the futures. If you did goals processing crudely and peculiarly, you could get the PC totally regressed so that only some back point of the track has any reality to him, and no present point does. If you ARC broke him, didn't keep him moving on the track, this could happen -- a right-now-ness of moments on the track. Those points are on the goals chain; they're moments where the PC wished to God he were somewhere else, but he can't be somewhere else, so all he's got left to escape to is a future. This solid scene he's looking at -- no part of it is actually observed. It's

a total overwhelm, and he's got a future there, a future postulate. So it stays on the track as a solidity, since he can't confront it. He'll hit these and bounce into the future. This could happen quite early in SOP Goals running. The more he's confronted elsewhere than the unwanted incident, the more they have as-is-ed, and the more he's fixed in the incident where he didn't want to be. When you run creative processing, these points come up easily, because he's obsessively creating them all the time.

A problem is the least confrontable thing there is, being composed of unconfrontable confusions.

Some PC's will run a total irresponsibility on problems of any kind. They will perceive no connection between having trouble in life and not confronting problems in their lives. This is the clue to slow clearing. Profiles don't change when PTP's exist.

A clue to cases is the magnitude of problem the PC comes up with. It can drive kids buggy when their parents' idea of what a problem is is grossly different from theirs. You may see someone sitting in the middle of a disaster of a dramatic or a quiet sort who is worrying about the fact that the lady next door has bought a new hat. That's the level of problem which that person can confront, and the things connected with the disaster are not problems. In fact, they're not even there. Someone could say to this lady, "Why don't you straighten all this out" and she'll think they're nuts, that there's nothing to look at, or if there was something there, there would be nothing you could do about it. You could probably do a sanity and ability test by making a list of problems by dynamics -- a prepared list -- in gradients of magnitude. You could then have the test taker just check the "problems" in each dynamic. What he checks would tell you where he lives.

HCO POLICY LETTER OF 7 JULY 1961
Issue II

CenOCon

PROCESSING SECURITY CHECK
(HCO WW Sec Form 6)

This is a Processing or a Security Check. As a Processing Check it is given in Model Session.

The following Security Check is the only one permitted on Staff Auditors or Field Auditors, in addition to HCO WW Sec Forms 3, 4 and 5.

No Security Check form may be edited or modified.

(Credit goes to Jan and Dick Halpern for preparing HCO WW Sec Forms 4, 5 and 6.)

HCO WW SEC FORM 6

HGC AUDITOR'S SEC CHECK

This check is suitable for anyone who has done a fair amount of auditing, and, also, for students in professional level courses in the later part of the course.

Have you ever told a preclear what his attitude toward someone or something ought to be?

Have you ever permitted a preclear to take control of the session?

Have you ever altered orders from L. Ron Hubbard concerning your preclear?

Are you hiding anything from the Director of Processing? (Or whatever the appropriate terminal is.)

Have you ever failed to get a preclear to carry out an auditing command?

Have you ever deteriorated a preclear's case?

When running a Model Session, have you ever omitted, or skimmed, Rudiments?

Have you ever lost your temper with a preclear?

Have you ever startled a preclear when he was on a comm lag?

Have you ever audited a preclear late at night, or in the small hours of the morning?

Have you ever, overtly or covertly, got it across to your preclear that he was wrong?

Have you ever alter-ised your instructions from the Director of Processing? (Or whatever the appropriate terminal is.)

Have you ever permitted a preclear to blow session? To blow an intensive?

Have you failed to find out whether your preclear was getting adequate food and rest?

Have you permitted a preclear to have secrets from you?

Have you ever been late for a scheduled auditing session?

Have you ever failed to show up at all for a scheduled auditing session?

Have your sessions frequently run overtime?

Have you ever blamed the pc for running overtime?

Have you frequently ended sessions early?

Have you ever blamed your preclear for his case's not advancing?

Have you ever blamed the D of P, or L. Ron Hubbard for your preclear's case not advancing?

Have you ever ignored, forgotten, or failed to put into practice L. Ron Hubbard's orders regarding your preclear?

Have you ever ignored, forgotten, or failed to put into practice orders from the D of P regarding your preclear?

Have you some sort of hidden standard as to what a preclear should be like?

Do you think that everybody really has the same troubles as you?

Is there any sort of preclear that you are certain you cannot help?

Is there any sort of preclear that you would far rather not help?

Has auditing a preclear ever had a bad effect on you? If so, whom did you make guilty?

Have you ever used the wrong process on a preclear?

When you have made a technical flub, did you hurry on without calling it to the preclear's notice?

Have you ever justified it to the preclear?

Have you ever shown up, sloppily dressed and badly groomed, to audit a preclear?

Have you had a lot of trouble confronting your preclears?

Have you ever Q-and-A'd with a preclear?

Have you ever failed to flatten a process when it was still biting?

Have you ever jammed a preclear into a one-way flow and left him stuck in it?

Do you really know Model Session cold?

Have you read, understood, and put into use the material in the latest technical bulletins?

Have you ever, while auditing a preclear, sat there worrying about your own problems, making future plans, mocking up pleasure moments, or self auditing?

Have you ever kept on running a process that wasn't moving the Tone Arm, or changing the preclear in any way?

Have you ever audited badly?

Have you ever failed to help a preclear?

Have you failed to notice when your preclear's case has changed, and tried to audit the person he was yesterday?

Have you ever gone on a machine when auditing?

When auditing Tone 40, have you failed to place an intention in the preclear's head on each command and acknowledgement to the best of your ability?

Have you ever, deliberately or carelessly, gone out of communication with your preclear?

Have you ever used a preclear as a guinea pig for some process?

Have you ever used an exercise or drill from some field other than Scientology while auditing a preclear?

Have you ever audited anyone solely because you couldn't stand him the way he was?

Do you regard auditing as punishment?

Have you ever done anything to a preclear which you would be unwilling to have an auditor do to you?

Have you ever felt that you must solve the preclear's problems?

Have you ever resented it when a preclear criticized you for something which you hadn't, in fact, done?

Have you ever argued with a preclear?

Have you ever taken your preclear's advice while auditing him?

Have you ever asked a preclear to instruct you in auditing while you were auditing that person?

Have you ever failed to get good results with a case?

Do you feel that auditing is too good for psychotics, or cripples, or criminals?

Do you feel you must be kind to preclears?

Have you ever been distressed because of a preclear's physical or emotional pain under auditing?

Is there any sort of preclear you are afraid you may harm?

Is there any sort of preclear you are afraid may harm you?

Have you ever accepted for auditing a preclear you were fairly sure you couldn't or wouldn't help?

Have you ever made sexual advances or had intercourse with a preclear of either sex during an auditing session, or during the course of an intensive?

Have you ever recommended the use of liquor, or drugs, to a preclear "to relax him", or for any other reason?

Have you ever stolen from a preclear?

Have you ever audited preclears while a staff member for yourself and kept quiet?

Have you ever stolen another auditor's preclear?

Have you ever stolen a preclear from a Central Org?

Have you ever sought to persuade a preclear that you were a better auditor than his auditor?

Have you ever passed a Central Org preclear to an outside auditor?

Is there any question about the way you audit which you would hate to have the D of P, or L. Ron Hubbard, ask you?

Is there any question about your preclears which you would hate to be asked?

Is there any question the D of P, or L. Ron Hubbard, should have asked you, and hasn't?

Have you nothing further to learn about auditing?

Have you ever found it hard to become interested in a preclear's case?

Have you ever been utterly baffled by a case?

When a preclear's case is not going right, are you certain there must be something wrong with the stable data of Scientology?

Have you failed to learn, understand, and regularly employ the stable data of Scientology?

Do you hope you won't be found out?

Have you ever avoided receiving auditing yourself?

Have you ever mistrusted your E-Meter?

Is there anything mysterious to you about an E-Meter?

Is there any technical question you are afraid to ask the D of P for fear it would make you look incompetent, or stupid?

Do you think you are an incompetent, or stupid, auditor?

Do you think you audit perfectly at all times?

Have you ever believed a preclear knew more about his own case than you did?

Have you ever made the D of P guilty of anything?

Have you ever justified your actions to a preclear?

Have you ever let a preclear control you?

Have you ever falsified an Auditor's Report in any way?

Have you ever given the D of P, or L. Ron Hubbard, a false impression about your preclear's case?

Have you ever failed to get an instruction concerning your preclear clarified, if you did not understand it?

Do you think selling auditing is really a swindle?

Have you ever felt that some item in the Auditor's Code didn't really apply to your auditing?

Have you ever done anything weird, or strange, with a preclear?

Have you ever been a squirrel?

Do you feel there is anything wrong with invading a preclear's privacy?

Do you feel there is anything wrong with having your own privacy invaded?

Have you ever redramatized anything on a preclear?

Have you ever avoided running a standard process on a preclear because you didn't or wouldn't like having it run on you?

Have you ever refused to run something on a preclear because you didn't like it?

Are you avoiding using any standard process because you are not sure of your technique?

Have you ever done a bad assessment?

Have you permitted yourself to get rusty, or unfamiliar, with any standard Scientology process?

Have you forgotten any parts of the Auditor's Code?

Have you ever had a preclear you felt you *had* to help?

Have you ever had a preclear you didn't want to help?

Do you deserve to get good results with cases?

Is there any viewpoint that is absolutely intolerable to you?

Have you ever had a preclear that you couldn't stand to be, even for an instant?

Is there any case you've audited that you still feel badly about?

Have you ever felt that there was something about an auditing room that you were not responsible for?

Have you ever felt that there was something about a preclear's behavior under auditing that you were not responsible for?

Have you ever pretended you could use an E-Meter when you couldn't?

Do you believe that any preclear can influence the E-Meter in any mysterious way?

Do you believe that the preclear can control his reactive bank?

Do you believe that the preclear really knows about and understands his reactive bank?

Do you believe you can control a preclear's reactive bank?

Have you ever made a practice of so much two-way communication with the preclear that you were spending very little auditing time in getting a process run?

Have you ever run a process without feeling that it was your process?

Have you ever decided that the D of P, or L. Ron Hubbard, was the cause of some effect which you produced on a preclear?

Do you dislike auditing?

Have you ever felt that auditing another was harmful to you in any way?

Have you ever felt sorry for yourself while auditing a preclear?

Have you ever felt sorry for a preclear?

Have you ever confused social chit-chat with auditing?

Have you ever left an auditing session without ending it properly for the preclear?

Have you ever felt bound by the Auditor's Code in your relationships with everyone, in and out of session, 24 hours a day?

Have you ever permitted a preclear to throw you into session outside of regularly scheduled session time?

Have you ever made a practice of evaluating for, or invalidating, a preclear of yours between sessions?

Have you ever deliberately encouraged a preclear to believe that you were clear, or OT, when you had not in fact reached this state?

Have you ever tried to force a preclear to believe he or she was clear?

Have you ever represented yourself to a preclear as being in bad shape?

Have you ever discussed your own case with a preclear you were auditing?

Have you ever blackmailed a preclear by threatening to discontinue his auditing?

Have you ever tried to get special favors from a preclear, beyond the agreed-upon payment or remuneration?

Have you ever promised a preclear something which you were not certain you could fulfill to the letter?

Have you ever promised a preclear something you knew you could not fulfill?

Are you weak in any of the TRs? If so, which? If so, have you failed to make arrangements to be coached up on them?

Is there anything you can get away with that other auditors shouldn't do?

Have you ever gotten into a games condition with a preclear?

Have you ever deliberately or carelessly given a preclear a command which was impossible for him to execute at that time?

Have you ever used poor judgement in auditing a preclear?

Have you ever felt that you were a liability to the Hubbard Guidance Center (or appropriate terminal) as an auditor?

Is there anything about auditing which you alone in all the world know and understand?

Are you in disagreement with any current practice or theory of Scientology as L. Ron Hubbard has communicated it?

Have you ever taken orders from a preclear as to what you should run on his case?

Have you ever yanked the preclear's attention off his case by uncalled-for statements or actions?

Have you ever stopped running a process because the preclear said it was flat?

Have you ever stopped running a process because the preclear was tired of it?

Have you ever stopped a session just to talk to a preclear to amuse yourself?

Have you ever stopped running a process because you couldn't stand the preclear's somatics?

Have you ever just stopped auditing a preclear without ending a session or anything?

Have you ever walked off from a preclear who was halfway through something?

Have you ever felt you had to have a special auditor in order to hide data gotten from preclears about withholds?

Have you ever felt you would be discredited if you received auditing?

Have you ever advised preclears not be audited?

Have you ever taken a commission for secretly passing a preclear to some auditor?

Have you ever invalidated the caliber of auditing or training in a Central Organization?

Have you ever sought to convince a preclear he would injure his case if he or she went to an HGC?

Have you ever taken money for auditing you did not deliver?

Have you ever taken money from a preclear and handed him over to some student to audit for you?

Have you ever committed sharp practices in auditing?

Have you ever pestered L. Ron Hubbard with questions already to be found in bulletins?

Have you ever sought to prove auditing would not work?

Have you ever done anything to slow down L. Ron Hubbard's research?

Have you ever wasted auditing time?

What do you wish you hadn't done?

What about your auditing activities are you trying to forget?

Have you any idea it doesn't matter whether you get results or not?

Are Scientologists' or Ron's goals really false?

Are you upset by this Security Check?

METERING RUDIMENTS

The following question from HASI London, and my answer are of general interest:

“From Academy and HGC London.

Ron from Rosalie = 6/7 = 375L

Re Rudiments: Data you gave me was that falls are all one was concerned with in clearing rudiments.

I have heard all reactions should be taken into consideration—i.e. Falls, Rock Slams, Theta Bops, Sticks.

Mary Sue issued Bulletin of May 9th 1961—saying Falls, Rock Slams, Theta Bops, change of characteristic should be considered. Would you please clarify.

Best

ROS, D of T.”

“Ron from Selwyn = 6/7 = 376L

Rosalie’s query goes for me too. Best SELWYN, D of P.”

“Ros from Ron Info Selwyn Info MSH

375L2 Regarding the remark that only falls are taken into consideration while doing rudiments. This is misleading. The word ‘FALL’ is often used mistakenly or colloquially for ‘CHANGE OF NEEDLE PATTERN’ because the latter is so clumsy in phrasing. Any instant change of reaction in needle pattern is indicative of charge and so in any metering whether rudiments, assessment, sec checking, one explores and pursues all reactions of the needle which change the pattern of what the needle *was* just doing a moment before.

On rudiments ‘CHANGE OF PATTERN’, detectable when and only when the sensitivity knob is set for a third of a Dial Drop of the needle, one and one half inches, on the can squeeze test, is explored and cleared. The sensitivity knob is not advanced to see if the reaction is entirely handled when the needle reaction vanishes at one third of a Dial Drop sensitivity setting. Unless this sensitivity setting is also observed in addition to change of needle pattern the auditor will take forever to clean rudiments when it is not necessary. Rudiments exist to run enough to get the pc into session, not to audit the case by rudiments. It will be found that when any charge on PTPs, ARC Breaks, or Withholds or Room is dissipated by rudiments so that it does not produce a fall detectable with the sensitivity set for one third of a Dial Drop or any other change of pattern, the pc will be able to go into session.

As a further note when running Routine One A it is not necessary when doing the problems part of it as a main process to handle in rudiments present time problems.

When doing the Security Check part of Routine One A, PTPs can be handled to some extent. Also one does not try to get all Withholds off in running Routine One A beyond clearing them for a sensitivity knob setting of one third of a Dial Drop as these are being handled by the Security Check.

I hope this clarifies your question and related matters.
Best
RON.”

L. RON HUBBARD

6107C11 SHSpec-27 Problems and Solutions

Just going into session and running “Do fish swim?” would give gain if there were no PTP’s, ARC breaks, or W/H’s. This is hard to teach auditors, though it’s been known since 1955 that if a PTP was present, you’d get no change in profile, if an ARC break was present, you’d have a depressed graph, and if a W/H is present, you don’t even have a session. It’s weird; You’re trying to hold the PC still so that you can audit him.

A problem is a postulate-counter-postulate resulting in indecision. Any time you have a fixed stable postulate, it accumulates, or came about because of, a confusion. A problem has at least two stable data (the two opposed postulates), each surrounded by a confusion, so at a MESTy level, it looks like a confusion -- counter-confusion situation. War is one of these. Twenty years after World War II, traces of it persist as NATO, the Common Market, etc.

As for the bank, someone set up some idea that he should oppose to some other idea. However, the idea that he set up to oppose the other idea commits overtly against the other idea in that it confuses the other idea. Then it, in turn, gets back confusion, and the other idea attacks his idea, so you wind up with two opposed confusions, which then gather more confusion. This then goes down the ages as one aspect of the reactive mind. Problems have duration; thus the reactive mind has duration. How many ways could you take a problem apart? As motion, as looking at two things, as getting confusions of comparable magnitude -- all without adding a new solution. Solving problems without being stuck with a new solution has never been done before. Psychoanalysis, by contrast, lays in a new solution that produces new confusions, then more solutions. Thus you get branches and schools of psychoanalysis.

If someone has to have a solution, he didn’t confront and as-is the problem. A solution is always a no-confront; confronting produces a vanishment of the problem. If you want something to persist, just don’t confront it. This gets us back to the original mechanism of structure in this universe: preventing solution of the problems of the universe to guarantee the persistence of the universe. So anybody who solved problems with regard to the universe was persona non grata with anyone who was trying to get a total persistence of the universe. The problem is that it is impossible to create and at the same time to say that something will persist. [Things created tend to as-is] [So if we want things persisting around us.] if we can’t create, we’ve got to preserve what was created. The way to preserve it is to get in this mechanism of no-confront and solutions that we are now trying to undo in the reactive mind. This is the idea that “anyone who solves problems is a dead duck. Horrible things will happen to anyone who solves problems.” And everybody agrees 100%, and everybody does it to everyone, and you get a physical universe fact that enters the mental field. [With reference to the above quote, I think Hubbard means by “solve,” “As-is.”] This is where structure and mind take their first divergence. If you want a shakily persisting universe to persist forevermore, you’ve got to prevent a solution [As-ising] of its mysteries. You’ve got to prevent it from being confronted. So you say, “Anyone who tries to solve this thing is gonna get it.” This goes over into PC’s trying to solve their problems from day to day. The terrors of having solutions [as-isings] then bring about all these other mechanisms.

The universe poses a lot of problems: why is it here; why does time go clickety-click, etc. And a person who could be a tremendous mystery thought he could guarantee to himself a tremendous persistence. Obviously, the way to live was to be mysterious, and if you confronted nothing, you’d live on and on. So we developed a whole genus of thetan who had decided not to solve anything, because to solve something is dangerous. If you just ask a PC to solve something repetitively, masses close in on him. He dramatizes the cure of the impersistence of universes.

Basically, there’s nothing wrong with solving [as-ising] problems, but when you’ve got tremendous overtly against people who were trying to solve problems, of course it becomes impossible to solve problems. The persistence of the reactive mind is a Q and A’ing with the

physical universe. So you find that most physical universe principles that affect the mind are in the area of problems: gravity, being trapped, stillness, etc. The person gets threatened, "You solve [as-is] a problem and we'll put you in jail," so the fellow has a problem, doesn't solve a problem, doesn't confront the problem, doesn't create space between himself and the problem, and of course he gets embedded in a sort of black basalt of energy. He "solves" the problem and jails himself! He knows if you confront a problem, you get confused.

All this is a protective mechanism resulting from an upper-level creative failure. The consequences of creating showed up with step six. So after the universe was figured out on the basis of, "If you create one, there are terrible consequences"; therefore it's impossible to create another one. So your havingness would be shot to pieces if you knocked out the one you've got, because you couldn't create another one. You've already had, earlier on the track, tremendous problems on the subject of creation. It isn't enough to just create something and say, "That's it." You have to agree it's valuable and no one can ever create another one like it, etc. You make something valuable by protecting it and by never being able to replace it. These are all mechanisms of value, by which people try to get you to lay off MEST. So everyone is convinced that creation carries penalties and that you have to protect creations against being as-ised, and you get the problem sequence going. We have legends against looking -- Medusa, Pandora, etc. Another threat would be, "You realize that if you solved the problem of time, all time would cease." Actually, if you could solve the problem of time, the worst that would happen would be having to put it there for yourself again. And mass without time probably wouldn't entrap anybody, anyhow.

If you told the PC, "Face a solution," repetitively, he'd get upset. In the first place, solutions are the easiest things a thetan does and the easiest things to create, and he'd practically get his head knocked off with the confusion surrounding the solutions. You didn't have him looking at the confusions -- only the solutions, so the confusions just get more confused. Not confronting the confusions, you have no reason why any of the solutions ever occurred. If we say, "Look at the confusion," they haven't much inkling where to look. What's communicable is the package of confusion + solution which is the problem. When he looks at problems, he looks at future solutions too, so it as-ises things a bit.

You're not trying to get the fellow to solve or erase problems but to get him over his horror of problems and the piability of solving things. You're trying to get him to recover from these things which were set up on the very earliest part of the track. A person who can't confront problems hasn't much judgment, so this is the clue to judgment. Judgment can only take place in the presence of observation. We can observe synthetically when using mathematics, or when mocking something up. Judgment is absent in a person who can't confront a problem. The auditor who cannot confront the problems of the PC won't see them as problems, won't handle them, and the PC won't make progress. So this resolves auditing too; the more confrontingness a person has, the better his judgment. An auditor with judgment is a valuable auditor.

So we want to get someone familiar with problems. We start with reach and withdraw on the MEST he has problems with. Any number of processes will increase the PC's familiarity with problems.

People go off onto the collection of solutions for which no problems exist, e.g. decorative knot tying or botany. Then there are people who will have nothing to do with problems but are overwhelmed with problems. Most of these problems wouldn't seem like real problems to you, just facts, as he describes them. [E.g. "Tell me a problem." "Ok... The sidewalk."] As you enter the area of problems with a PC, you'll find him in one of these two conditions, if it's a problem he's never been able to handle:

1. Pc in an obsessive automaticity of solutions
2. Pc totally immersed in the problem as a fact.

He'll never be in the center line of, "These are problems," until he wakes up to it. When you run problems on someone, he first starts coming up with solutions, then, on a gradient, he starts to relate them to the facts, which for him appear to be problems. Or he goes into the processing announcing facts, not solutions. So it doesn't seem to you, the auditor, that you are listening to problems. It's not that he hasn't told you the whole story; The fact he's given you is, to him, a problem. It starts peeling back, onion-like, until you find eventually there was some problem it was involved in, usually with an overt in it, and he can see it all and it blows.

The way to get the PC more familiar with problems is to get him to look at them. "Recall a problem," is one way; 6-way confront bracket is another. The two can be combined with profit. You can also use, "Recall a PTP." This situated him in the time of the problem. It's a head-on type of process, with no alter-is of time. [For 6-Way Confront, see HCOB 6Jul61 "Routine 1A"]

In view of the fact that the aberration about problems was originated to protect the universe and creations, you find the early end of a problems run appearing to run forever, since it was put there to insure persistence. However, you will notice that the TA is active. This then starts deteriorating, and he'll pass to either side, either facts or solutions or cognitions. He can alternate between facts and solutions, too.

6107C14 SHSpec-29 Checking Ruds and Withholds

To clear somebody at this time, he must be in a body, just so he can be picked up and audited. A thetan who has just dropped a body has to get another one before we can clear him.

When columns A, B, C, and D consistently register low after processing, you know the PC hasn't found the auditor. This is due either to an auditor who doesn't impinge, or a PC who can't tolerate being effect or control.

A case that hangs fire has an automatic not-is, which can wipe out the needle read. He'll tell you all sorts of overts on a sec check but not consider them bad. He doesn't think it's real. He knows about it, but it's all not-ised. Don't get outraged with the auditor who missed it. He didn't really miss it. All the time you are checking the PC over, you ask about the auditing, so as to unearth the moment of not-is. You'll make it safe by putting it on a via, e.g. "Have you ever thought it wouldn't hold up your case if you didn't tell your auditor?" "Did you ever have objections to the auditing room and just fail to mention it?" "Is there any time in your life when you felt completely beyond help?" "Did you ever tell your auditor?" These are tricky questions, but you're counting on the fact that, during that fifty hours, something did get brought to view that can be re-examined when spotted. It requires a bit of cleverness to spot it. There's no sense in trying this technique before he's had any auditing; the ground hasn't been plowed yet. He's been like this all his life and thinks it's normal. The meter registers on disagreement and he doesn't have any yet. (In fact, you can use "disagreement" as a broad-sweep ruds question when nothing else will register.) The "This is normal" is in Dianetics, the Evolution of a Science, as the "Everyone knows..." The PC really knows it's not normal, but the valence he's in considers it's OK. You could ask, "What is life really like?" to find out what "normal" is to him. When we say "It's below his level of reality," we mean he has some specialized compartmented values of existence, which really have nothing to do with existence. His level of reality has nothing to do with other people. This is his reality, so it doesn't register when you ask for differences. For instance, you ask for critical thoughts; he says "No", and it doesn't register because it's all justified that he natters continually. The disagreement is in total agreement with his reality. They have everything identified with everything, so there is no sense in disagreement. The complexity of disagreement with everything is such that the disagreement is just the way things should be. Thus there is no read. An automatic not-is is an automatic disagree. You have to be clever to unveil it all. The PC has opted out of life because it was too much, but he knows he shouldn't have. He will perhaps tell you that he has led a calm, orderly life; that nothing much has happened. Actually, he just hopes he has no past.

How do you get him back into the mainstream of life? The meanest thing you can do is to ask him, "Have you ever left anyplace?" He answers. Then you hit him with, "Why?" Now you are asking for the points of departure from the main highway. You are asking, "What didn't you confront that you feel you should have confronted?" Now the meter gets active.

It can be summed up in this way, "Did you ever have anybody demand that you put your attention on something?" "Have you ever had anybody tell you that you're wrong not to have had your attention on something?" That's the basic trick. This comes up on problems. The basic trick of life: making people confront is the overt and having to confront is the motivator. All deaths, and the whole mechanism of death, comes from unwillingness to confront. So when people leave and feel they shouldn't have left, it is because there was something there that was too threatening and it keyed in death, so they did a Q and A on death and opted out of life. They were running a no-confront on people, giving people things that couldn't be confronted. If you do that, you get the idea that you can't confront. After you get that idea, you can only leave. And when you can't even leave any more, all you can do is to go nuts. When you get the why of leaving, you can ask if that's been a problem to him at any other time. You could get his PTP that way. You can ask, "Have you ever thought of blowing session?" "Why?" What you've done here is to walk around, cleverly using all the buttons that

he is using to lie there quietly unchanged. The buttons of the behavior scale can be used in this line, e.g. "prevent", which has to do with problems. The surprise element is effective in all this, so it shouldn't be rote. The PC must realize that he is being interrogated by an intelligence.

Control is associated with intelligence. The labor - management situation stems from suspiciousness of cleverness. When people are un-clever, they are easily overwhelmed by cleverness. They can protest it with a strike. Labor's basic yap is against the intelligence of management, but management is never bright enough to use intelligence as a counter-weapon. Intelligence is an altitude factor. This applies very strongly in security checking. You won't get anywhere operating as a robot. Similarly with rudiments.

If you know there is something wrong because the PC hasn't responded to the correct processes, then there has got to be something wrong with rudiments. If you can't get the PC to respond well, it's not that he is trying to hide from you consciously. He is being a dead body up in a gully covered with leaves, and you've got to work around cleverly to communicate with him so he can be gotten back into life. The trouble is that he thinks he is just lying there quietly, and he isn't. He is shooting guns and making all kinds of fuss. On the other hand, you don't want to get so helpful that he comes to rely on you totally and never looks.

6107C18 SHSpec-30 Can't Have -- Create

In 1952, the Philadelphia Doctorate Course and Scientology 8-8008 were the basic texts on havingness. Havingness is a dominant thing; it is a part of games conditions. Now we are back to games conditions and its relation to havingness. In Scientology 8-8008, we had the principle that the goal of processing is to remedy the scarcity and abundance of all things. But all that we previously had to do this was creative processing, and a lot of people couldn't run it. Now we have come up with a new way to do this and thus clear someone fast.

There is a new datum on havingness: its relation to create. After you create something, you may have it or not; create doesn't necessarily mean that you'll have. All of auditing could be considered prehavingness, hence the prehav scale. The relationship between creating and havingness has to do with the fundamental formation of the reactive bank and is very important: What a person can't have, he creates. That is the law on which man operates. It is the most fundamental law of the bank that has yet been discovered. This is how the bank is formed. E.g. whenever Italy gets beaten, they have a Renaissance, or like, when you abuse a plant, it blooms. LRH wanted a ship and couldn't buy one, so he started to build one; if a rosebush can't have a rose (if you trim it off), it creates roses. If a shipyard can't have ships, it builds ships that wear out in twenty years, so you can't have the ships either. Probably the government punishes everyone for producing in order to make them produce on a reactive basis.

There's evidently some cross-relationship that goes further than the O/W mechanism. It was described in theory in Scientology 8-8008 plus in the discussion of games conditions in The Fundamentals of Thought. Games conditions concern preventing people from having things. Things of all sorts are havingness. The thetan is only unhappy when he can't have. His idea of quality could be reformed. If you deny him anything, he'll try to obtain it (e.g. the Prohibition). Now LRH knows how to make a civilization: decide what would be good things to have and create knuckleheaded bureaus to prevent each one of them. The trouble with economics is that it tries to create demand with supply. It should use scarcity. How do you create creation? Run a broad can't have. The games condition can get so bad that if you insist on people having something, they don't want it. Police action creates crime; BBC creates rock and roll.

As long as you aren't in a games condition with the people around you, as long as you don't run a can't have or a must have on them and still have control, all will be smooth sailing. It's supposed to be a good thing on this planet to run a can't have, e.g. with strictness. But this is the way you create problems. Problems may appear to be don't have, but how did the PC get into the condition of don't have? Actually, don't have is the last ditch of can't have. Because even with a can't have, you could materialize what you don't have, maybe even build one. But the way you got into a don't have was the overt-motivator sequence. First you run a can't have on others, then they don't have, then you don't have. So if the PC doesn't have anything, it must be because he denied it. If he's got a low quality of something, he gets it thus: he can't have a good one, but nobody wants a bad one, so he's got a bad one. The test of his havingness is that he has it because nobody wants it. If nobody wants it, he can have it.

Total lack of something doesn't mean that the thetan is without it. It'll still be obsessively created in his reactive bank. The covert creativity of the bank is a remedy of havingness. That's all it is.

Now say you run a can't have on somebody on sex; then you find people running a can't have on you on the subject of sex, and you're puzzled. You'll find 2D activities are impossible, so you're likely to do a flip -- to go off in some different direction and build up various sorts of 2D activities you could have. When these also fail, you end up with them hidden from yourself but still created in the bank. So we get the downgrading quality. The degrade is on the basis of what he can have. A common denominator of pcs at the bottom is the complaint of

not being able to feel. A bit higher, they complain of not feeling as much as they'd like about things. That's a can't have on feelings. Also, the feelings degrade, and go on down the tone scale. Serenity is impossible, so the thetan becomes enthusiastic, but that's an overt, so he goes down to conservatism, but that's for bank managers, so he gets bored, but people won't let you be bored, so ... down to no feelings. But of course all these feelings are being mocked up at the back of the bank.

At the first St. Hill ACC, LRH talked about two routes: experience, and the auditing route used at that time. They are now combined, because the experiential factor is havingness. Experience is havingness, so all experience can be restored. Beingness and doingness can be junior to havingness. [But Cf. p. 42, at upper level strata, beingness is higher than doingness, which is higher than havingness, so maybe LRH is talking about a lower level stratum here.] But beingness and doingness operate on the same can't have mechanism. When you hit bottom on your own beingness, you'll mock up some very desirable beingness, and you will be that, except that you are not really being that. For instance, a kid isn't permitted to be a pilot and fly airplanes, so he mocks up being an ace aviator. A person may end up settling for a lesser and lesser beingness. Finally, he is not being much, so he mocks up a substitute reactive beingness. Little kids are not permitted to fly planes, so what do they do? They become "aviators".

What confuses people is that, while can't have produces create at a reactive level, all this can take place at an analytical level. Not all can't have triggers the obsessive create, but if you communicate the can't have in an unacceptable (can't have) way, in a good games condition, the guy may well slip into the reactive create. Absence of ARC is almost a requisite for a reactive creation by reason of a can't have. If you run a strong can't have on war in the interests of peace, war will result. Keeping the peace is not done by running a can't have on war by propaganda, etc. For instance, at the outset of World War II, no information was given out about the war; it was not considered OK to attack the enemy, yet we did get ourselves into it. When people run a can't have on things that do exist, we get a delusory state. Christian Science does this. Try running 8-C on a Christian Scientist. The insistence of a thetan on Axiom 1 is fantastic.

On some people, if you try to run a think process, they can't do it. These people must have an O/W games condition on thoughts, because they can't have a thought. If someone withholds a thought, he's running a games condition on you on the subject of "You can't have it." This will put him in a condition where he has less of it. If you can get off his withholds, i.e. get him to give you the thought, you've stopped him from playing that game condition, and he'll feel better. But why does he have these discreditable things anyway? Because they are scarce. If a thought is scarce, there has been a cut-down of a thought of activity. So the person withholds telling you about actions against the mores of society because such actions are scarce. If you can get hold of one, it's his jewel -- a scarcity. He also holds onto it because he doesn't want you to have bad thoughts about him. This is another games condition. To handle this, you could run a can't have process on thoughts, theoretically:

1. What thought haven't you permitted another to have?
2. What thought hasn't another permitted you to have?

You could see another mechanism from another theoretical process. You run, "Think of a (say, woman)." At first he gets a generality or nothing, then he thinks of specific departed women, then dead women, sick women, funerals too. You are making him examine the scarcity of women, and it runs backwards to the point where he could think of a present woman with perfect ease and get a 3D picture of her. Whatever it is you find him inverted or nonexistent on, you develop a process by which you can discharge his propensity for using that item in a games condition on others and they on him. Because you are running out stable data on this, you add a confusion, a problem, or a motion along with it. For instance, you could use, "When have you denied another a woman? When has another denied you a woman?"

What problem about women is not present now?" The "not present now" is because it is the not-is version of problem confront. This is a murderous process because it un-not-ises everything involved.

A games condition is unnatural since, in such a condition, the person becomes convinced that there is only that game, so they run the can't have, and the more they do this, the less they have of it. Eventually, it disappears from view, and they have gotten worse, not better. "Way back, people wouldn't clear because they thought it meant losing their game. When cleared, they promptly went out and aberrated themselves again to have a game. They expressed it as, "I didn't want to be detached from existence." What pinned it down was a scarcity of games. They thought being aberrated was the only game going.

The remedy of havingness of games is broadening the PC's view on the subject of games. All you have to do is knock out his fixed attention on aberrated games, so that he can look around at all the other games. If you do this, the PC will blow clear almost at once.

6107C20 SHSpec-32 Games Conditions

A games condition means an agreement of can't have amongst beings. It's have for self and can't have for others in a true games condition, but as an agreement it's can't have on all flows. It's agreement that nails it in concrete. A widespread can't have agreement gives you lots of mass. For instance the Christian prohibition on sex, which is very fundamental as a can't create. Bodies are necessary as favorite vehicles and identities, but there's a penalty in the Christian system for creating them. This results in a must-must not. It is in the field of disagreement and can be processed in various ways.

But how did you get suckered into a position like this, where you could accumulate motivators like this? You must have been party to the can't have somewhere along the line; you can't suffer any consequences you had no hand in creating, and you must have done it by agreement with a lot of others. With the disagreement you're objecting to the game you helped to create in the first place. If you get the disagreement off, you get a considerable resurgence. You could undercut it by getting all the agreements to have the game.

A games condition process seeks to isolate the basic agreements on some kind of game. "Games condition" is a derogatory term. It means a package consisting of a fixated attention, inability to escape coupled with inability to attack, to the exclusion of other games. There's nothing wrong with having games, but a game condition is unknown, arbitrary, reactive, performed outside one's choice, without his consent or will. It's a sort of mental doingness trap. In it, you've got to do things, assume a certain beingness, and have no communication with anyone not part of the game. The world thus becomes massless, timeless, spaceless, and people-less very rapidly. Most marriages that go on the rocks are in a games condition, where there's a total agreement that neither one can have anything, overlaid with another set of agreements that are in disagreement with that fundamental can't have agreement. Their tenderest moments are when they're in disagreement with the basic agreement of can't have. This gives us interesting maxims like, "Hell hath no fury like a woman scorned," which reflects the later disagreement. When two people get this fixated, the rest of the world ceases to exist. They just stay with each other and shut out the rest of the world.

Games conditions can exist on any dynamic. Wars are an example on the third or fourth dynamics. One can find portions of the track where one has repeatedly gotten into the same game, e.g. defending the capitol by being part of an interceptor squadron shooting down or being shot down by the enemy right over the middle of the airport. This was a games condition because it was an unknowing fixated activity; it did nothing effective for the society.

The clue to a games condition is that the person is doing a compulsive confront that makes it necessary for him to assume a compulsive beingness. In order to play this game, one must deny a certain havingness. The US has, in its last two wars, demonstrated itself to be in a war games condition because it cannot have the fruits of any of its victories. In a games condition, no matter what the person says, he always ends up with no havingness. So you get an obsessive beingness and doingness and a can't havingness. Everybody has a few games conditions; few have complete games conditions going. The latter are in the spin bin. When you see one of these games conditions, it defies all logic because it's obsessive. It has nothing to do with the real world. This is true of all aberration. It's out of PT. The rationale which rationalizes a games condition has holes in it. But don't try to argue someone out of it; audit him out of it. You can't educate someone out of a games condition because it's aberrated and he can't look at it analytically.

The situation of a person who can't influence his bank with thinkingness is interesting. The gradient scale of less effectiveness in this regard ends in no effectiveness. If you give such a person an auditing command, he doesn't do it, and even if he did do it, it would have no effect on the bank. Such a person breaks auditors' hearts and gives people loses. It is of interest to understand the anatomy of this phenomenon, which exists to some degree in all cases, since

clearing a person means putting him in control of the bank. We've been working on the question of how a person could get into a condition where they could not affect the bank since 1954.

The answer is withholds. The fellow is backing out of life; he's withholding as part of a games condition; denying something to someone else. The withhold gives him a can't reach, a pull-back. Multiply this by a lot of instances and you find that eventually the person practically exits from the dynamics. But this is really not possible to do, so he inverts on them. As far as he's concerned, his effort is to leave, compounded with the withhold and not-reach. Thus you get an ineffectiveness. You can't control something you can't reach and from which you are withholding yourself. The mustn't reach is really a mustn't be reached, of course. This is true especially when there is punishment involved. Punishment compounds withholds. So as we go downscale on reach, we get:

1. Ineffectiveness
2. Destructiveness (the PC can't communicate with something well enough to understand it, so when he does reach, he can only be destructive)
3. Inability even to destroy something.
4. Inability to have any influence at all, of any kind.
5. Inability even to affect his own mind.

Add up all these withholds and can't have on all dynamics and you get someone who's totally withdrawn, individuated; totally ineffective on his own bank. When he runs can't have on people, he makes them less familiar and more withdrawn from things. Then, by the overt-motivator sequence, this reacts on him, so he stops reaching and starts withholding. At 100% withhold, or 100% withdraw, he can't influence anything, including his thoughts and bank. If he reads on the meter, you know something is effecting his bank. Don't be amazed if the PC has never noticed, really, the condition he's in. He can't think or rationalize on the subject; he will buy wrong why's on it readily.

So if you run a command that you haven't tested for read, you are doing something adventurous, since if it didn't read, you're in an area where he's still totally ineffective or totally effective.

A PC can be compulsively exterior: the detached case. Freud could never help this kind of case. That's someone who is backed out of the dynamics and backed out of his head. People will tell you they feel detached. That indicates a games condition in the area where they feel detached. Most homosexuals are detached in this sense. In any area a person is in a games condition about, he is detached. How do you reverse the games condition? Find something that reads on the E-meter and is therefore something he can effect, i.e. something real to the PC. Real means, "Can the PC be effective in that sphere?" Get the PC's withholds and can't have off the subject on a gradient scale. You take off the games condition, and the PC can now reach in the area and regain effectiveness. It's basically idiotically simple, but if you violate that doingness, you don't get results in auditing. Say you want to cure psychosomatics with auditing. You can find people who are so much the effect of their psychosomatics, you can have more effect on them than they can. You can make them well, but they don't know it! So they never thank you for getting well. What you should do to avoid this situation is to assess all the person's difficulties, get the best read, get off all the person's withholds on the area, get the games conditions in the area cured, and the difficulty will right itself. You can eradicate illness and upsets, but you have to assess them first. The fact that the PC complains about something all the time doesn't prove anything. It could be a circuit or a mechanism; or it could be part of some other games condition. There is a gradient scale of difficulties. The PC

may have lots of them, but may be effective only in one area. That's where you must start. That's been the barriered line on healing and help.

If you run a command that doesn't read, the PC is ineffective in the area. Therefore it's auditor vs the PC's bank, with no help from the PC. He'll be ARC breaky, hard to audit because you're just auditing bank and the PC isn't there. This violates the basic auditing principle: auditor plus PC is greater than the bank.

6108C03 SHSpec-33 Creation and Goals

The earliest unanswered question in dianetics and scientology is, "Why does a thetan mock up bad pictures?" It's remained unanswered all these years. You almost never find anyone with a fixed pleasure moment. Old validation processing was productive of more grief charges, etc.! [Validation processing = validation effort processing "This consists of discovering moments when the preclear is successfully approaching goals; when he is successfully exerting an effort; when his self-determined effort is winning." 5110CM01 OCTSER (October Series) Self-determinism -- Effort Processing, plus Validation Straightwire, "the theory of which was to validate all the good moments of the preclear's past by having him recall them (Ability Major 5, "Ability Straightwire", page 7).]

What is this fixation on death, disaster, and invalidation?

One theoretical possibility is that he's getting even. He's been made to produce, so he mocks up a bad production. Mechanically, of course, it's something he hasn't as-is-ed because it's unpleasant, etc., but why did he agree to those mechanics in the first place? He makes an original agreement, then revolts against it. Maybe he's been made to produce lots of good things, so he revolts with this mechanism, so when he's called upon to mock up something good, he mocks up something bad. This may happen on a 1.1 level. This can be seen running pleasure moments, when the PC slips into the badness of it all. Assuming that the fellow is in revolt, this can be very overt (hi-toned) or covert, e.g. not producing but having excuses for failure or forgetting to do it at all; the latter is a lower harmonic of direct refusal. Occlusion is this level of revolt, and we let people get away with it. For instance, Hitler's around somewhere, and we allow him to get away with having forgotten who he's been. "I can't" is a covert "I won't." The mechanism is so lost it has become a way of life, not a revolt any more. The guy just mocks up bad pictures and forgets. Some civilizations on the track were really production-crazy, e.g. Arslycus, where the thetans were actively producing, mocking up matter. You couldn't get away; there were entrapment mechanisms. Production got a bad name because it was production against power of choice over production. The bank dramatizes this creation against the wish to create. The fellow doesn't want to mock up the bank, so he mocks up the bank. His will to create has been badly overwhelmed, partly because he overwhelmed others' will to create. Arslycus eventually fell apart. Some worker invented disintegration so that it could happen. This was the only possible response -- to out-create with a new idea something worse than what was happening to them.

Creation gets a bad name from enforced creation. There's another side to it. LRH has been unhappiest when he's produced so much that he gluts the market. Others decide they've been out-created, and they get unhappy too. That's not so upsetting; what's so upsetting is not having any market for your creation, no observers, no audience, etc., and not having it wanted. One does want one's creations to be admired. If you are made to produce when you don't want to, or if you think there will be no appreciation of your production, you will generally produce an overt product. One can also think that a good creation in some field will bring one into a state of victimization or some unpleasant consequence. In this case, one retreats, saying, "I can't," or "I don't have any talent," or "I haven't been educated."

In 1948, the answer to "Why does a thetan create a bank?" was that he creates something with resonance between his own tone and what he creates in the bank. This is not the whole story, though. An individual mocks up, or doesn't, in an effort to prevent his will from being overthrown on the subject of creation. He gets mechanisms to inhibit creativeness in order to protect his self-determinism. These mechanisms are what we run into in processing. This is why creative processing works, but it is also why some pcs eventually dreamed up that the bank gets solid. The mechanism was already there.

Methods of denying creation are the most fundamental thing you're dealing with in processing. We have to figure out what the guy's afraid of and disarm it on that angle. So what is he

afraid of? He's afraid of being made to do. (You can substitute "do" for "create" to avoid some mine fields.) He considers there are bad consequences to doing; he considers that you have to hit a thetan to get him to create. This is an old-old consideration; it explains things like the high birth rate amongst the lower classes. [It also explains waiting until the last moment to write a paper, and the artistic temperament and why artists seek out SP's.] If someone hits you, you'll make a picture of it. This explains to everyone that he's a victim -- he has been made to create, and he is following the law that the best way to keep from being hurt is to create. This keeps you from being beaten. The most involved point in an engram is where the fellow thinks he has mocked up the engram in full, which should keep him from further injury, then gets hit again by something else, so he mocks that up too, and then there's more injury, or something, which defeats him. His best answer to a blow was to create. That used to get him off the hook. Then he suffers defeat and an invalidation of the mechanism of creation as a defense. Then comes a total not-is of engrams, which is another defeat, and the disappearance of earlier engrams. People with invisible fields have gotten to a chronic state of believing it won't do any good to create.

This all sums up to the thetan's responses to the accumulation of all the times his choice was overwhelmed. Someone's choice is overwhelmed, so he responds in some way, in a downscale attempt to make his postulates stick, which he never gives up trying to do. The basic assumption of a thetan and the first thing he wants to do, is the communication formula: Axiom 10. It's the most fundamental game in the interrelationship of thetans anyway. From there on, he just wants to make his postulates stick. When he fails to create an effect, he will still try to create an effect [by mocking stuff up]. Routine 3 (goals processing) is effective because you are looking over all the powers of choice he has hoped to effect, most of which have failed, and running out his failed powers of choice. Running goals is a sneaky way of getting at what postulates he would like to make stick by asking what conditions he was trying to bring about. The bank is the mechanisms of all sorts that tend to defend his assertions of self, though the effect of these mechanisms is to make a mess of the PC. The disintegration of his postulates is what's wrong with him. His reaction to this is surprisingly extreme, but the bank is still trying to have the effect. The basic of the chain is an overt, which is why overts work so well in processing. Someone who is obsessively protecting anything has overts on it. He is still trying to make his basic postulate of "effect on" stick, however. Why does he make the original overt postulate? He has gotten into a games condition on creation, that's why. He has been creating against someone else, gets a lose on making nothing of the opponent's creation, so he overts against it. Early on the track, thetans specialized in goofy games and got into forgetting what they were doing. So there seems to be something wrong in the field of postulates. Theoretically, you could run a PC on, "What effect could you actually create?" This doesn't work because it is too direct; it goes straight through the mine field. To the PC, it seems unreal; he can't do it. Modifying it to, "What decision would it be all right for you to make?" would be more workable.

A thetan must have a feeling that there are motions and confusions he cannot tolerate, so he avoids them with mechanisms of creation. If a person's tolerance for motion and randomness is raised, his fears of consequences of the overthrow of his power of choice are reduced. Most fundamentally, obtaining a tolerance for motion and catastrophe would wash away the fear of fear.

The creation of a confusion is the last echelon of a postulate. The last echelon of a confusion is the creation of a confusion by omission. So we're on safe ground with pcs if we stress creation of confusions, especially by omissions. So you could use the process, "If you said nothing, what confusion would occur?" or, "What not-doingness would create a confusion.?"

Cases that don't move are the roughest ones. In catatonia, we have the last desperate effort of a thetan to make a postulate stick somewhere; it's a not-doingness. There's probably no such thing as a thetan who'd not trying to do something. All thetans are busy, if only trying to do things through omission. Thus, in asking for goals, we should ask for failed goals, secret goals, withheld goals, etc., since that leads straight to old postulates.

A PC can be so confused on the blow/create theory that just being talked to by the auditor can cause him to create something. Or below that, he'll mock up nothing while in session and get lots of ideas about it out of session. Ron handled this with short sessioning. The PC would hand up his case right after session. Then LRH would begin a new session and handle it. At this level, the PC is on a total reverse: he creates when he's not supposed to and doesn't create when he's supposed to.

Occlusion is the last answer, the last attempt to create an effect: an overt of omission. Here, you could use some far south process as, "What confusion wouldn't occur if you forgot?" This might get through to him if he's on a failed forget.

[So the dwindling spiral of creation or postulates is:

1. Postulate
2. Failed postulate
3. Creation
4. Failed creation
5. Creation of a confusion
6. Creation of a confusion by omission
7. Not-ised creation of a confusion by omission.

A tolerance of confusions, problems, motion, etc, is fine, but failed postulates is what you are trying to get with goals processing. You can also get this effect if you ask a PC what he hopes would happen if he kept on doing what he was doing. If he can't answer, you can undercut it with "What won't happen?" What shows up here will be caution, which seems laudatory, but he'll begin to realize something will happen too, as you get the not-is off. You could run off intentional overts with, "What would (or wouldn't) be damaged if you forgot it?" They are both aimed at getting the effect he's trying to produce. Or you could use, "What damage would forgettingness cause?" You're running O/W crossed with forgettingness. Etc. This is all at a high level of theory. It's a road parallel to the one through the minefield, even if you can't get the exact road.

6108C04 SHSpec-34 Methodology of Auditing -- Not-doingness and Occlusion

It's impossible to have judgment in auditing if one's TR's are out and one is worried about making mistakes in application of the tech.

On running brackets, a problem may be that the outer legs of the bracket may not be real to him at first. Reality on these legs may develop as he runs the process. This happens because of the dynamics. As he is audited, the PC gains reality on the other dynamics besides the first dynamic. The PC's ability to reach is directly reflected in his ability to conceive of someone else having an idea or action. So, as you run the process, the command you started with can be too narrow and limiting, as the PC's ideas reach further, and the commands could need to be enlarged -- more legs could be added. Each leg of the command stands as an individuated unit, without interchange among legs; each, in fact, could be run as an individual command. In view of the fact that it doesn't harm anybody to run an unreality as long as they are moving towards a reality, it would be OK to run all legs of the bracket from the outset. Try to choose a bracket and command wordings all of which fall. Remember that if you choose a command that restricts the PC, you limit his gains. Also, the PC will tend to look at the legs not being run as his reality comes up. He will have to withhold himself from those areas, tending to put them on automatic.

An auditing command can be broadened; it shouldn't be made more particular and specific. If in doubt, take the broadest form and run it from the outset. Running one which is too restricted can turn on somatics. It's legitimate to change the targets, flows, etc., but not the basic form. Don't change "how" to "when" or "could" to "would". You can drop portions of the command, too, as long as in so doing you are removing particularization. When the PC gets very free on flows, you can drop out the legs and go to the simplicity of, e.g. "Get the idea of (verb)."

An aberration is located as a total imprisonment, a total individuation. Auditing commands resolve the degree of imprisonment and individuation. As the degree lessens, you may lose TA on one leg of the process but now have it elsewhere. The TA ceases to move when the targets of the process are flat, so the rule is, before leaving the command, check it out for all variations which might produce new action. Remember that the reactive mind is an idiot, so you could miss something because of a wrong pronoun, or whatever.

The biggest barrier in dissemination is not-doingness and mis-doingness. There is an old unresolved philosophic question about the value of not-doingness: "To do or not to do?" Which is better, the active or the passive life? If you do, you get into trouble; if you don't do, you get into trouble. There's confusion on either side. For instance, LRH had a problem as a writer: whether to be super nasty if he was criticized or to be nice and let himself be criticized, thus protecting his markets and friends. There are contradictory lessons in this; of course neither answer is right. The missing datum is that they are both overts, longest continuous overt is not-doingness. Have you ever noticed the randomness that can be produced by a missing datum in a problem? A false datum can cause some confusion, but look at what a missing datum on the subject of the mind has done! How about a missing beingness? This is a near-ultimate in not-doingness. The ultimate, of course, is forgetting. You're not only doing nothing; you're not there to do it and you've forgotten. This really produces confusion. A thetan never ceases to try to have an effect on something, to put Axiom 10 in effect, no matter how many trillenia have gone by. You are trying to process someone who is in the middle of 10,000 continuous overts of omission. Doing something is apparently the least damaging type of overt. Thus withhold seems to be the more therapeutic side of O/W. It's his not-doingness which weighs on his case.

Doingness and not-doingness are not data of comparable magnitude. Not-do is enormously greater. That's why people who stop doing, even if what they have been doing is nasty, crash

when they stop; that's also why men die before women. Underneath it all, a thetan knows he's important to life and knows it's an overt not to participate. The only greater overt is to forget. This is still an attempt to create an effect. So there's a gradient scale of effect creation:

1. You do something to have an effect. (Axiom 10)
2. You create an effect by not doing something.
3. You create an effect by being absent.
4. You create an effect by forgetting.

What degree of randomness could you produce by forgetting a whole lifetime? Quite a bit. And it's an overt; and the fellow realizes it's an overt. That's the reason for whole track occlusion: the overt of forgetting. The law behind all this is that the thetan never ceases to have an effect on those targets he has chosen, and the only thing that could ever pry him loose from those fixated effects is something like scientology. He is imprisoned to the degree that he is still trying to have a hopeless effect on something. He is his own jailer. Forgetting it prevents it from ever being as-ised.

If O/W can stall a case, how much more can it be stalled by not being there, the withhold of self? How much can it be stalled by a withhold from self and being there, and from doingness and from the subject and from any knowledge of the subject and from any communication with any beingness of the subject, etc.? That's why the more occluded a case is, the harder it is to audit. So you run cases on, "What wouldn't you mind forgetting?" This gets off withholds. Or, as a general pattern for a command, "What confusion would/could forgettingness create?"

We've looked on forgettingness as a sort of passive thing; we've looked on not-doiness as the natural state of beingness. Seeing them as overts opens up new zones for processing.

6108C08 SHSpec-35 Forgettingness

The reactive mind is basically that area of occlusion which the PC is unable to contact and which contains a total identification of all things with all things and until released into the realm of havingness, continues to react upon the person, compelling him into actions, dramatizations, and computations which are not optimum to survival. We find in the reactive mind all the residual, not as-is-ed material which the individual is seeking to avoid. All the discreditable things of his existence are then contained in this area. He hangs onto them, the knucklehead! He has various mechanisms of survival connected with this, one being the justification of the aberrations he has.

Psychology makes the error of saying that one is only able to create by virtue of one's reactive mind. Faculty psychology (c. the 1500's) was an attempt to understand perception and the mind. They didn't get anywhere because they dealt with the analytical sphere and got confused by the fact that men don't always react rationally. Behaviorism overlooks the unpredictabilities of men when they don't follow the stimulus-response mechanisms.

Until scientology, a theory about man was too precious not to be carefully guarded from attack. Men went to the stake to protect the theory of faculty psychology. They threw away case histories to protect the theory of behaviorism. The abundance or scarcity of all things applies. Theories were terribly scarce. In scientology, we are looking at an abundance of theories. What we care about is what works. Former theorists didn't care whether their theories were workable or not. They just felt they should protect the theory.

The cure of a reactive bank is knowingness, because the substance of the bank is not-knowingness. There's a fourth postulate: remember. The third was forget; it is senior. It's been stressed that one should run that, rather than remember. In order of making, the four postulates are:

0. Native state: potentiality of knowing everything.

1. First postulate: not know

2. Second postulate: He had to know something.

3. Third postulate: He forgot what he knew.

4. Fourth postulate: Remember.

A thetan does this on any given subject. When you enter a school, you start by postulating you know nothing about the subject. That's really a request to find something you don't know. In other schools, you're asked to not-know and then learn a lot of nonsense.

The only thing that ever blows up a false theory is the workability of a counter-theory.

We know more about the unpredictable side of man than any other body of people on earth, so any breakthrough we make in the area is valuable. The breakthrough is in the area of forgettingness and confusion. Man wants things to be forgotten. He not only uses forgettingness as a continuous overt act; he wants forgettingness to occur. He wants all his evil deeds to be wrapped in the Stygian darkness of yesteryear. Man is basically good, so if his deeds are considered bad, then there's only one cure for them that he knows: To forget them. So, as an auditor, you can ask, "what should be forgotten?" He'll recover almost at once a screaming impulse to make something forgotten, and that is where his volition and the reactive mind cross. His volition desires occlusion; back of all his confusion is a knowable volition: he wishes a forgettingness to occur, and that wish creates a reactive bank. That is the postulate that comes ahead of everything: he must forget. So it can be reached with, "What should be forgotten?" There's a danger that this will become a forgotten point of scientology.

The postulate, "It must be forgotten," must be the most forgotten of all postulates, so it must be the one least able to be as-ised, and thus best suited to accumulate the concatenation of a bank.

The hidden standard is a cousin to this. You can handle the hidden standard by asking what is hidden about it or what should be forgotten about it -- and it blows. The PC's attention frees up and he knows processing works for him. You can ask, "What would have to happen for you to know scientology works?"; strip all the motion out of the needle, and you'll have a list of hidden standards. [More details on running of this." Any psychosomatic or livingness difficulty a person has is a difficulty because there's something about it he doesn't want known, and he wants others to forget it.

Compulsive rememberingness brings about forgettingness. One pulls it in with the must have on remembering, which postulates the likelihood of forgetting. And vice versa: someone who goes off to the South Seas so as to forget, first tries to forget with women, then with liquor, dope, then death. But all his urgency to forget keeps it there. He pushes one button and gets the other. This develops an awful confusion, which is then buried with death and occluded, forming the stimulus response mechanism of the reactive mind, because his power of choice and his postulates are being overwhelmed, even if it's him who's overwhelming them.

Restoration of memory on the whole track is the index by which you can measure case gain most easily. If someone doesn't think he's lived before, he's heavily plowed into forgettingness, while the guy who has only delusory recall on track is doing a pretended knowingness of the whole track. This is a games condition of magnitude. It's denying knowingness by giving a false knowingness. It's forgetting and remembering at the same time -- very confusing and irritating to confront. The irritation comes from one's awareness of the games condition, putting you into the position of being an unwilling opponent. If it goes on long enough, your own occlusion is assisted. The target is to occlude your track by giving false knowingness about theirs.

Confusion asks itself to be forgotten because it was never remembered. That is, it is not-known. That's what makes a confusion a confusion.

6108C11 SHSpec-38 Basics of Auditing -- Matter of Factness

A lot of auditors are doing something besides auditing: they are pressing through, introducing something in an effort of make auditing work. Probably it's because of LRH saying that the auditor has to make the auditing work, that he should be on the ball, etc. A certain apathy about results creates in itself a "grind atmosphere". Desperation or apathy alike are counter-productive. LRH audits with no doubt about what he's doing, no withdraw, no question about purpose. His auditing is very matter-of-fact because he has no doubt that he can help the PC, no doubt about the effectiveness of the process he's going to run, no doubt about the fact that the process is working, so he has a relaxedness about auditing that gives him results five times as fast because he doesn't get in his own road.

The reason an auditor doesn't flatten a process is anxiety to get the job done, which gets in the way of getting the job done. LRH doesn't artificialize the way he feels about the PC; he keeps it real, unlike other auditors, whom he heard being stilted and artificial. Be effective; help the PC; don't be hidebound. This should give faster results more easily.

Not-know and forget would have run out engrams in 1950 if they had been used then. This would have avoided a lot of grinding and sweat. You'd use a command form which includes as many dynamics as necessary, e.g. "What should remain unknown about this to the public / the government / a family / your superiors, etc.?" The occlusions that auditors were struggling with were the result of self-motivated efforts to withhold. The hang-ups in any engrams are from a desire to make these things [parts of the engram] unknown or forgotten. The pretense of knowing about it (dub-in) also blows on the not-know processing. Running engrams should not be discounted as of benefit to the case. If you get someone clear and stable, they may still find themselves with an engram there. It won't take long to run it, since he's clear. During stabilization, they're unsnarling track; they are still bumping into things which can be run. Using not-know on it makes it run even faster, since it pops the sticky point into view.

[Application of not-know to Goals processing]

6108C17 SHSpec-41 Rudiments and Valences

An E-meter ceases to register in the presence of an out-rudiment. This may fool you into thinking a process is flat. If you get the rudiments in, the process will again move the TA and needle. Keeping rudiments in is the most important part of auditing. You can find the rudiment because only the out rud will move the meter.

[Details on goals running]

A valence is a synthetic beingness, or a beingness which a PC is not but thinks he is. It can be a duplicate of any existing beingness, or a synthetic beingness created by what others have said about the other beingness. There is no such thing, really, as one's own valence". "His own valence" is just himself; he's either himself or in a valence. A valence is a package. A graph is a picture of a valence, and any change you got was because you shifted his valence. This is a very important datum. The PC will not gain in any way through any effort to alter the characteristics of a valence he's in. The PC will only change if you change the valence as a whole package, because the PC takes no responsibility for any of the now-I'm-supposed-to's or the package of characteristics which is the valence. All the person can reach is a knowingness of the identity of the valence. What does the PC use the valence for? Survival, the road out, surmounted by knowingness -- a valence is a solid knowingness; a body is a solid knowingness. A valence is an effort to get someone to know you are there, to get someone to recognize something. Therefore they are a road out of unwanted areas. Say a soldier gets hit with a mortar shell. He doesn't want to be there; he's in the wrong valence. That knowingness (valence) is now invalidated and becomes a not-knowingness. So he exteriorizes and decides that the only way to fight a war is to be a general or a war correspondent. If he can't be that, he'll keep on trying, war after war, life after life. Finally he gets it together and becomes very successful at it. Then he finds all war correspondents being shot for fomenting war. As he is shot, he decides he'll be Mata Hari. He gets a female body, moves on up the line, becomes Mata Hari in war after war. Then eventually he gets executed for that, etc. These are all efforts to solve the problem of what to do in a war. Every valence picked up is an effort to solve a problem. Valences are antiquated solutions. So you can say these identities are antiquated solutions to confusions.

The goals which go towards beingness are the more definite goals. They are the more profitable ones in auditing, because they go toward identity. A person is not himself; he is in a different knowingness as soon as he's in a valence. You can fix up a valence's broken leg, as long as it's a valence that isn't supposed to have a broken leg, which is why you can do assists on almost anyone. The only person it will fail on is someone who has a now-I'm-supposed-to of a valence. The PC has no control over this. Any PC is being dominatedly in a given valence, but may be tortured or upset by other valences which are only really the concern of the valence he is mainly in. So any PC's troubles are only the troubles of the valence he's in. The troubles are part of the now-I'm-supposed-to's of this valence. So there's no way to remedy the difficulties on the valence, because they are outside the power of the PC to touch. Here you get the oddity of, "Please audit me, but you'd better not make me well." That's what it looks like.

The valence may have somatics turning on and off as part of the package, which keep the valence from becoming something else. The PC will keep the somatics to prevent himself from becoming an unworkable solution to a future problem. Don't try to take that solution away from the PC, so long as it seems vital that it be a solution. What you've got to do is to get the PC to face up to the various factors that make that a valence. You can't make a valence well; you can move a valence. So any process run at random on a PC has a very small chance of success. This pre-selects our bag of tricks to a small bag. You must ask yourself, "Is this process going to change, familiarize, accustom the person to identity, or is it going to handle environments which make identities vital, or is it going to alter valences?" If so, it will work and stay working; if not, it won't.

What makes a valence stick the way it sticks? Let's newly define a psychotic as someone who doesn't know what's going on in his environment and who doesn't know what is going on inside himself. It's all unknown and unobserved. Neurosis is when he's got some idea of what's happening in his environment and where he is, but this is overbalanced by unknowingness. Upscale from that, you know what's happening where you are, but not what's happening inside someone else a few feet away. You don't always know what's going on with everybody. That makes a slight unknowingness. The stuck parts of your track are the points where you knew what was going on where you were, but not what was going on around you, because there are points of disagreement: there was a know facing an unknow. The unknow can get so overwhelming that one adopts a valence to solve it. You pick up a valence which knows about these things. Many scientists are solely being valences of scientists. They've got it confused with the whole track beingness of a technician. When you see the level of pretense of a valence, it becomes spotted for you; it seems artificial. Anyone who's identified himself by some set of tricks has thereby put himself in a valence. The fact that he's in a body is an obvious valence, but it's the valence that he's using the body to be that's the auditing target. Just having a body isn't necessarily a valence if he's aware of having a body, not ploughed in below his level of consciousness.

As an auditing target, a valence is the MIP package a person has composed to solve the problems of existence which he knows nothing about. It's always easier to pick up a weaker valence than a stronger one, so your logical target in auditing is the weaker one.

If your PC has a bunch of chronic somatics, they're part of the valence picture, not part of the PC. He's got to have two counter-opposed identities in order to feel pain. 1957 was when this was worked out. To have experience, he'd have to survive; to survive, he has to be something other than himself. Otherwise, he can't survive, experience, and live. You haven't a chance in handling this person until he realizes that he can live without the valence. He's been in a games condition as a valence against some environment -- which probably no longer exists. Women are particularly confused here, because at the present time, the society is in flux and has no really clear idea of where women fit in, so women have more problems finding the valence to solve the problem of situations they're not really in anyway. [Identity crisis?]

To straighten out a case, you've got to move a valence. Say a fellow has a toothache; you've got to find out who had a toothache (c. 1950 tech) and split the valences. This is more effective than putting him in comm with the tooth, since it's not his tooth. Whatever his difficulties, find out who had it or would do it. [Cf. XDN "wants handled" rundown.] You could say, "What beingness would be a good solution for a tough environment?" You process "who's" -- valences. If you want to cure a toothache, run it back and forth with, "Who would want to cure a toothache / Who would have a toothache?" and get a terminal, to cure the toothache. You already have the goal, of course. You can also use this technique for the hidden standard.

For a long time, we had the question, "Should we handle solids or significances?" The answer is, "Solids," but the further answer is that you shouldn't handle conditions of a valence. Handle the valence. This is the limitation of a touch assist. Always handle the terminal. This brings Prehav 13 into the limelight. [Prehav 13: a process which takes a list of charged terminals and combines overt running with prehav assessment and running of brackets on levels assessed out. See 6106C21 SHSpec-17 or p. 42, these notes.] Prehav 13 will also fix up rudiments.

6108C18 SHSpec-42 Control of Attention

You might think of auditing as having hundreds of rules. As long as you think of it that way, you aren't auditing. These rules are only guideposts. Back of them, your good heart will carry the day. You are trying to help the person out. All right. There are certain things his mind will and won't do. If that is what your rules are, you're fine. Rituals, as developed by religions, represent their failure to communicate the basic truths. Here is what a PC will not do: he will not go into session with his attention fixated on something else, nor will you have his interest in what you are doing. All the rudiments can be covered with, "Is your attention fixated on something? Is there any reason you won't talk to me?" Since these questions are a little too broad, you have the rudiments. He can have a fixation on a PTP of short duration, where his attention is fixed on the immediate environment. In the PTP LD, the PC also has his attention fixed on something in PT, but he also has something subjective holding his attention, something very real to him. When you don't parallel what the mind is doing with auditing, you fail in auditing.

The rate of change of attention defines relative pain, and the common features of every stuck point on the track is a sudden shift of attention. This has been known since 1950 at least. The processes being used are sufficiently strong that no matter what the PC's attention is fixed on, you can yank it away, but doing so will result in an ARC break. Furthermore, his attention won't totally come off what it was on, so you will create a new identification of what he was looking at and what you pull his attention to.

You can, of course, go too far in paralleling the mind and wind up in a Q and A. LRH has never seen a case progress when the PC's attention on PTP's of short or long duration isn't handled. If you don't handle attention fixation, you eventually get an unexpected attention shift that produces an ARC break. It isn't the minor flub you make that really causes the ARC break, though it triggers it. The ARC break is really caused by yanking the PC's attention off his PTP, and you won't find it by running O/W on the auditor. "Willing to talk to the auditor" is the other requirement for the PC to be in session. If the PC has an ARC break or a withhold, his willingness is out. With a withhold, there's another factor. The PC is sitting with a known where he is and an unknown where the auditor is, so the auditing session is a ridge. In view of the fact that the PC's attention is fixed on the withhold, even if only at a sub-awareness level, if you audit over it, you're guilty of an attention shift. The attention fix in a withhold is complicated by being an outward fix with an inward pull to keep it from getting out.

These mechanisms take priority over all of the PC's considerations and postulates, so no matter what he says, you can't go ahead and audit over it. In order to audit him, you've got to be able to put his attention where you want it. If there's a distracting noise outside, it's a waste of time to ask if it bothered him. You can assume it shifted his attention, so ask, "What were you thinking of when the noise occurred?" until there's no read and the PC feels OK about it.

Anything that happens in the auditing session is the auditor's fault. If anything goes wrong in session, it's never the PC's fault. If the auditor doesn't tell him how to get his attention off something by some acceptable gradient, it's not the PC's fault if he can't put it where you want it. Because you didn't put his attention on the things it's on when he comes into session, you're slow to take responsibility for taking it off. But if the PC doesn't make gains, it's the auditor's fault.

Just as the PC must be gotten to the point where he is at cause over his life because you can get him to erase all the aberrated points in an auditing session, there is another cause -- the auditor. This is in violation of the idea that the PC is cause of all effects. So you've got to be slippy, because you are being cause over a section of the PC's track. The only way it can happen is for him to have some willingness to do what you want him to do. So his cause must still be

there, and your direction of his cause must be acceptable to him. Otherwise, he won't be cause over that section of track called an auditing session, and if he isn't cause over it, he'll make no gain. So, to keep him at cause, you audit him with all his attention on the auditing, not splintered elsewhere. He must willingly follow your direction and have a clear view of what he's doing. You assume, incorrectly, that the PC is delicate. But in fact the only thing you can really do to a PC that's bad is not to give him a win, which can only be done by violating his attention factors. Auditing in the absence of the PC's attention is no-auditing. How do you keep his attention? Keep the ruds in.

The earliest method of clearing was highly permissive and very delicate. It amounts to this repetitive question, "What picture would it be safe to look at?" The reason it was no longer being done by 1950 was this attention factor. It hadn't been isolated, so it couldn't be articulated. Also, everybody kept dictating what picture the PC should look at. But you could clear someone with that process, and it would not be a long route. You can speed it up by getting him to use other perceptics, e.g. "What sound would it be safe for you to hear?" etc. People who don't get any pictures are just stuck in PT to avoid looking at the disaster just earlier. But you can work him around until he can confront the bank. This approach didn't run into the attention problem because it's so permissive it lets the PC put his attention where it already is. It does take gentle, smooth auditing, and it takes quite awhile. The "engram necessary to resolve the case" is actually just the picture the PC is stuck in. So you are essentially running "What picture would it be safe to look at?"

Now it goes faster. You handle his attention, gently unstick it from PTP's and ARC breaks, give him wins and confidence, don't get into games conditions with him on goals or terminals. If the session goes awry, it's because you missed an attention factor. Try to get subjective reality on this. If the PC says, "Yow! Yow! Yow! ARC break!!", you say, "What was your PTP?"

6108C22 SHSpec-43 PTPs -- Unknownnesses

[Details on goals running]

Normally a PC is ARC breaky because he is being audited over undetected PTP's, which he will not-is in order to get auditing. The auditor should suspect it, for instance, when auditing an executive. It is problems alone which give you this terrific timelessness. They show up as a sticky meter, an unchanging graph, slow reaction time, not moving around much in life. Problems stick and float forward in time, and the guy is stuck in a past moment. Another useful definition of "problem" is "unknown". A problem is an accumulation of not-knowingnesses and a consideration of the person as to the value of the not-knownnesses. Remember that the thetan is stuck to his bank, valences, etc., by mystery. Mystery is the glue of life. If you want freedom, you must restore knowledge; if you want slavery, establish ignorance. Create not-knows. So a common denominator of all problems is an unknown. A problem cannot exist in the absence of unknowingness. As the dianetic axiom puts it, "Randomity can be caused by a missing datum." [Axiom 105: An unknown datum can produce data of plus or minus randomity. Axiom 107: Data of plus or minus randomity depends for its confusion on former plus or minus randomity or absent data.] Man's difficulties were getting more and more involved because of the missing data: a technology about Man, based on the fundamental missing datum, "What is Man's nature?" or "What is Man trying to do?" When the PC runs, "Describe the problem," he may well be giving lots of aspects of the basic unknown problem. If you run unknownness on the subject of problems, you cut through to this central problem rapidly. A thetan is a mystery sandwich.

Two way comm is an inquiry of the PC as to what is going on and an invitation for him to look at it. It should be limited to such questions as, "How are you doing? What's worrying you? What is that all about?" Processes aren't two way comm. No process is involved in two way comm except 2wc. If you start a process, be sure you flatten it. This datum has never varied; it applies to running unknownness of problems. It's OK to handle a PTP by asking what unknown is connected with it. This runs PTP's fast. Use any version of the odd-numbered postulates: not-know, forget, doubted, pretended. Don't use 2wc to handle problems. You don't have to be repetitive; get all versions of not-know off of it.

[More details on running of PTP's]

Routine 1A consists of everything you can think of in terms of problems processes. It gives a total ability to confront problems without being upset by the unknownness of them. Man doesn't like having to confront the unknowns of life. It's hard to do, because there is nothing there to confront. We're back to processing loss when you process unknowns, since a loss is a not-know. So someone with lots of problems experiences a sense of loss. What is so maddening about a loss is that you don't know what is happening with the thing lost. The PC will misassign causes of loss, too. Because some terminal is gone and there is lots of unknownness on it, the guy will go to the bottom of the Prehav scale and pretend some knowingness and pretend cause. The two are closely associated. It makes someone who is a real inventor feel strange when he gets down to the Inventor's Club and the others "know all about it" and "invented it two years earlier". Someone in that state can't duplicate; if they were asked, "What did you invent?", they'd answer with some irrelevance, so that's a good rebuttal.

Pretended knowingness and pretended cause are blood brothers and continually come up together. This is at the bottom of the not-know scale because it is a substitute know. The way you handle it is not direct. You go at it by way of problems. The guy has had so many problems, he has begun to substitute false solutions. Those are the pretended knowingnesses you see on the case. So you don't process the pretended knowingnesses. You process the problems, and the PC will fly. You enter at the level of reality of what a problem is, and the false solutions and pretended cause fade out. Flattening Routine 1A means getting the guy

comfortable confronting unknowns. Then he won't be obsessively escaping from them and no longer experiencing a lot of anxiety about them. [Cf. Alan Watts' The Wisdom of Insecurity] Jealousy is basically an inability to confront the unknown. The sickness one experiences with it is not because of betrayal. It is just another aspect of the unknown of faithful/unfaithful, or "something they know that I don't," etc.

Why does a case suddenly dive into the middle of the bank and refuse to come out? The guy is unable to not ask why. There's an unknown in the incident. The guy gets some glimmer of the unknown, and he dives into it. He cannot confront an unknown and becomes hectic at the idea that an unknown exists. The oddity is that all knowingnesses are invented knowingnesses. With an inability to confront the unknown, you eventually get an inability to confront the known. Then this goes down to an inability to confront at all, so any little tiny incident of the day becomes a problem he dwells on. So don't judge by the apparent size of the problem whether he will be stuck on it. If he can't confront the unknown at all, he will be totally glued into all his unknowns all along the track.

You could run, "What unknown about an auditing session could you confront / would you rather not confront?" You will solve anybody's difficulties with auditing. You could run it on an old timer who doesn't much like auditing anymore or on someone who is having trouble learning to audit, etc. One old timer would get every PC's somatic -- because it's a mystery! He instantly snaps terminals with these unknowns. This process would blow him out. It is a very workable, specific process. It could be used for anyone who has left off doing some formerly successful activity, or someone who is having trouble learning something, e.g. a language. "What is unknown about a German?" would handle problems with the German language.

The treatment of a condition is an attempt to alter a valence without addressing the valence, and this just doesn't work. So some process addressed directly at the condition, unless it aimed at solids, like engrams, won't do it. Address the valence; find whose condition it is; handle the terminal [Cf., again XDN "wants handled" rundown]. Long lists of goals won't be that useful, but long lists of valences could be. Out of this, you could get a process for PTP's of long duration: "W/W would have (condition)? What isn't known about that person? What might you have done to him? What might you have withheld from him?" You would strip off valences and get off problems and O/W at the same time.

If you run lots of not-know, you've got to remedy havingness because the whole bank is coming unglued.

Q and A

A great deal has been said about “Q and A-ing” but few auditors know exactly what it is and *all* auditors have done it without exception up to now.

I have just completed some work that analyses this and some drills which educate an auditor out of it. With a better understanding of it, we can eradicate it. Q and A means ASKING A QUESTION ABOUT A PC’S ANSWER.

A SESSION IN WHICH THE AUDITOR Qs and As IS A SESSION FULL OF ARC BREAKS.

A SESSION WITHOUT Q and A IS A SMOOTH SESSION.

It is vital for all auditors to understand and use this material. The gain for the pc is reduced enormously by Q and A and clearing is not just stopped. It is prevented.

The term “Q and A” means that the exact answer to a question is the question, a factual principle. However, it came to mean that the auditor did what the pc did. An auditor who is “Q and A-ing” is giving session control over to the pc. The pc does something, so the auditor also does something in agreement with the pc. The auditor following only the pc’s lead is giving no auditing and the pc is left on “self audit”.

As nearly all auditors do this, no auditing is the rule of the day. Therefore I studied and observed and finally developed a precision analysis of it, for lack of which auditors, although they understood Q and A, nevertheless “Q’d and A’d”.

THE Qs AND As

There are 3 Qs and As. They are:

1. Double questioning.
2. Changing because the pc changes.
3. Following the pc’s instructions.

The Double Question

This occurs on Rudiment Type questions and is wrong.

This is the chief auditor fault and *must* be cured.

The auditor asks a question. The pc answers. The auditor asks a question about the answer.

This is not just wrong. It is the primary source of ARC Breaks and out rudiments. It is quite a discovery to get this revealed so simply to an auditor as I know that if it is understood, auditors will do it right.

The commonest example occurs in social concourse. We ask Joe, "How are you?" Joe says, "I've been ill." We say, "What with?" This may go in society but *not* in an auditing session. To follow this pattern is fatal and can wipe out all gains.

Here is a *wrong* example: Auditor: "How are you?" PC: "Awful." Auditor: "What's wrong?" In auditing you just must never, never, *never* do this. All auditors have been doing it. And it's awful in its effect on the pc.

Here is a *right* example: Auditor: "How are you?" PC: "Awful." Auditor: "Thank you." Honest, as strange as this may seem and as much of a strain on your social machinery as you'll find it, there is *no* other way to handle it.

And here is how the whole drill must go. Auditor: "Do you have a present time problem?" PC: "Yes" (or *anything* the pc says). Auditor: "Thank you, I will check that on the meter. (Looks at meter.) Do you have a present time problem? It's clean." or ".....It still reacts. Do you have a present time problem? ThatThat." PC: "I had a fight with my wife last night." Auditor: "Thank you. I will check that on the meter. Do you have a present time problem? That's clean."

The way auditors have been handling this is this way, very wrong. Auditor: "Do you have a present time problem?" PC: "I had a fight with my wife last night." Auditor: "What about?" Flunk! Flunk! Flunk!

The rule is NEVER ASK A QUESTION ABOUT AN ANSWER IN CLEANING ANY RUDIMENT.

If the pc gives you an answer, acknowledge it and check it on the meter. Don't *ever* ask a question about the answer the pc gave, no matter *what* the answer was.

Bluntly you *cannot* clean rudiments easily so long as you ask a question about a pc's answer. You cannot expect the pc to feel acknowledged and therefore you invite ARC Breaks. Further, you slow a session down and can wipe out all gain. You can even make the pc worse.

If you want gains in a session never Q and A on rudiments type questions or Form type sec check questions.

Take what the pc said. Ack it. Check it on the meter. If clean, go on. If still reacting, ask another question of a rudiments type.

Apply this rule severely. *Never* deviate from it.

Many new TR drills are based on this. But you can do it now.

Handle all beginning, middle and end rudiments exactly in this way. You'll be *amazed* how rapidly the pc gains if you do and how easily the rudiments go in and stay in.

In Prepchecking you can get deeper into a pc's bank by using his answer to get him to amplify. But never while using a Rudiment or sec check type question.

Changing because the Pc changes

This is a less common auditor fault but it exists even so.

Changing a process because the pc is changing is a breach of the Auditor's Code. It is a flagrant Q and A.

Getting change on the pc often invites the auditor to change the process.

Some auditors change the process every time the pc changes.

This is very cruel. It leaves the pc hung in every process run.

It is the mark of the frantic, obsessive alteris auditor. The auditor's impatience is such that he or she cannot wait to flatten anything but must go on.

The rule of auditing by the tone arm was the method of preventing this.

SO LONG AS YOU HAVE TONE ARM MOTION, CONTINUE THE PROCESS.

CHANGE THE PROCESS ONLY WHEN YOU HAVE RUN OUT ALL TONE ARM MOTION.

Rudiments repair processes are not processes in the full sense of the word. But even here the rule applies if to a limited extent. The rule applies this far: If a pc gets too much tone arm motion in the rudiments, and especially if he or she gets little tone arm motion in the session, you must run Prepchecking on the rudiments questions and do CCHs on the pc. Ordinarily, if you run a rudiments process in getting the rudiments in, you ignore the Tone Arm Motion. Otherwise you'll never get to the body of the session and will have Q'd and A'd with the pc after all. For you will have let the pc "throw" the session by having out rudiments and will have let the pc avoid the body of the session. So, ignore TA action in handling rudiments unless you are Prepchecking, using each rudiment in turn in the body of the session. When a rudiment is used as a rudiment, ignore TA action. When a rudiment is used in the session body for Prepchecking, pay some attention to TA action to be sure something is happening.

Don't hang a pc up in a thousand unflat processes. Flatten a process before you change.

Following the Pc's Instructions

There are "auditors" who look to the pc for all their directions on how to handle their cases.

As aberration is composited of unknowns this results in the pc's case never being touched. If the pc only is saying what to do, then only the known areas of the pc's case will get audited.

A pc can be asked for data on what's been done by other auditors and for data in general on his reactions to processes. To this degree one uses the pc's data *when* it is also checked on the meter and from other sources.

I myself have had it bad in this. Auditors have now and then demanded of me as a pc instructions and directions as to how to do certain steps in auditing.

Of course, snapping attention to the auditor is bad enough. But asking a pc what to do, or following the pc's directions as to what to do is to discard in its entirety session control. And the pc will get worse in that session.

Don't consider the pc a boob to be ignored, either. It's the pc's session. But be competent enough at your craft to *know* what to do. And don't hate the pc so much that you take his or her directions as to what to do next. It's fatal to any session.

SUMMARY

“Q and A” is slanguage. But the whole of auditing results depends upon auditing right and not “Q and A-ing”.

Of all the data above only the first section contains a new discovery. It is an important discovery. The other two sections are old but must be discovered sooner or later by any auditor who wants results.

If you Q and A your pc will not achieve gains from auditing. If you really hate the pc, by all means Q and A, and get the full recoil of it.

A session without ARC Breaks is a marvellous thing to give and to receive. Today we don't have to use ARC Break processes if we handle our rudiments well and never Q and A.

THE REASON FOR Q AND A

Q and A means "Question and Answer".

When the term Q and A is used it means one did NOT get an answer to his question. It also means not getting compliance with an order but accepting something else.

Example: Auditor: Do birds fly? Pc: I don't like birds. Auditor: What don't you like about birds? FLUNK. It's a Q and A. The right reply would be an answer to the question asked and the right action would be to get the original question answered. TR 4 (handling origins) can apply here. The moment TR 4 is violated (Ack and return the pc to original Question) and the original unanswered question is not again asked the Auditor just drifts along with the pc. Things get restimulated, nothing gets really handled or run.

In Administration the same thing can happen. The executive gives an order, the junior says or does something else, the executive does not simply TR 4 it and get the original order done, and the result is chaos.

Executive: Phone Mr. Schultz and tell him our printing order will be there this afternoon. Junior: I don't know his number. Executive: Don't you have a phone book? Junior: The phone company didn't send one this year as our bill was overdue. Executive (the fool) goes to Accounts to see what about the phone bill. Mr. Schultz never gets his call. The printing order arrives but Mr. Schultz doesn't know it

Example: Executive: Do target 21 now. Junior: I don't have any issue files. Executive: What happened to them? Junior: Mimeo goofed. Executive: I'll go see Mimeo

DISPERSAL

Q and A is simply *Postulate Aberration*.

Aberration is non-straight line by definition.

A sick thetan who is all caved in can't direct a postulate *at* anything. When he tries, he lets it wobble around and go elsewhere.

The difference between a Degraded Being and an OT is simply that the DB can't put out a postulate or intention in a direct line or way and make it hold good.

The insane are a great example of this. They are insane because they have evil intentions. But they can't even make these stick. They may *intend* to burn down the house but they usually wind up watering the rug or do some other non sequitur thing. It's not that they don't mess things up. The whole point here is that they can't even properly destroy what they intend to destroy. Even their evil intentions wobble, poor things.

But not all people who Q and A are insane.

When a person is running at *effect* he Qs and As.

He is confronted by life, he does not confront it.

He is usually a bit blind to things as his ability to look AT is turned back on him by his lack of beam power. Thus he gives the appearance of being unaware.

His emotional feeling is overwhelm.

His mental state is confusion.

He starts for B, winds up at—A.

Other not too well intentioned people can play tricks on a Qer and Aer. When they don't want to answer or comply they artfully bring about a Q and A.

Example: Bosco does not want to staple the mimeo issue. He knows his senior Qs and As. So we get this. Senior: Staple that issue with the big stapler. Bosco: I hurt my thumb. Q and A Senior: Have you been to see the Medical Officer? Bosco: He wouldn't look at it. Q and A Senior: I'll go have a word with him. (Departs.) Bosco gets back to reading "Jesse James Rides Again" humming softly to himself. For HIS trouble is, he Qs and As with the Mest Universe!

BODY Q AND A

Some people Q and A with their bodies. The body is, after all, composed of Mest. It follows the laws of Mest.

One of these laws is Newton's first law of motion: INERTIA. This is the tendency of a Mest object to remain motionless until acted upon by an exterior force. Or to continue in a line of motion until acted upon by an exterior force.

Well, the main force around that is continually acting on a human body is a thetan, the being himself.

The body will remain at rest (since it is a Mest Object) until acted upon by the thetan that is supposed to be running it.

If that being is an aberrated non-straight line being **THE BODY REACTS ON HIM MORE THAN HE REACTS ON THE BODY**. Thus he remains motionless or very slow. When the body is in unwanted motion, the being does not deter the motion as the body is acting upon him far more than he is reacting on the body.

As a result, one of the manifestations is Q and A. He wants to pick up a piece of paper. The body inertia has to be overcome to do so. So he does not reach for the paper, he just leaves the hand where it is. This would be no action at all. If he then weakly forces the motion, he finds himself picking up something else like a paper clip, decides he wants that anyway and settles for it. Now he has to invent why he has a paper clip in his hand. His original intention never gets executed.

Some people on medical lines are just there not because of actual illness but because they are just Qing and Aing with their body.

People also Q and A with themselves. They want to stop drinking and can't. They want to stop or change something about themselves or their body and then disperse off onto something else.

Freud read all sorts of dire and awful things into simple Q and A. He invented intentions the person must have that made him "sublimate". All Freud succeeded in doing was making the person introspective looking for wrong whys.

The right why was simple—the person could not go in a straight line to an objective and/or could not cease to do something he was compulsively doing.

The very word ABERRATION contains the idea of this—no straight line but a bent one.

THE CURE FOR THIS SORT OF THING (Q and A with a body) IS OBJECTIVE PROCESSES.

And a very willing and bright thetan CAN simply recognize it for what it is—not enough push!

And instead of going to the MO for a slight ache, he just pushes on through.

As the ache is a recoil of body Q and A in a lot of cases, the ache itself goes away as soon as one simply pushes through.

Painters and artists buy the idea they are benefited by aberration. "Be glad you are neurotic" was a trick being played by the late and unlamented psychiatrists on artists.

One paints because he can push into execution what he visualizes. The best painters were the least aberrated.

Greenwich Village or Left Bank artists, when they *don't* paint, never suspect it's because they just can't overcome hand inertia to push a paint brush!

People live Q and A lives. They never become what they desire to be because they Q and A with life about it.

Schopenhauer, the German philosopher of doom, even had a dirty crack about being able to *do* things: "Stubbornness is the will taking the place of the intellect." By this, one is "intellectual" if he Qs and As.

SUMMARY

People who can't get things done are simply Qing and Aing with people and life.

People who CAN get things done just don't Q and A.

All great truths are simple.

This is a major one.

Reissued from
21st ADVANCED CLINICAL COURSE
TRAINING DRILLS

NAME: Anti-Q and A TR.

COMMANDS: Basically, "Put that (object) on my knee." (A book, piece of paper, ashtray, etc can be used for object.)

POSITION. Student and Coach sitting facing each other at a comfortable distance and one at which the Coach can reach the Student's knee with ease.

PURPOSE:

- (a) To train Student in getting a Pc to carry out a command using formal communication NOT Tone 40.
- (b) To enable the Student to maintain his TRs while giving commands.
- (c) To train the Student to not get upset with a Pc under formal auditing.

MECHANICS: Coach selects small object (book, ashtray, etc) and holds it in his hand.

TRAINING STRESS: Student is to get the Coach to place the object that he has in his hand on the knee of the Student. The Student may vary his commands as long as he maintains the Basic Intention (not Tone 40) to get the Coach to place the object on the Student's knee. The Student is not allowed to use any physical enforcement, only verbal commands. The Coach should try and get the Student to Q and A. He may say anything he wishes to try and get him off the track of getting the command executed. The Student may say what he wishes in order to get the command done, as long as it *directly* applies in getting the Coach to place the object on the Student's knee.

The Coach flunks for:

- (a) Any communication not directly concerned with getting the command executed.
- (b) Previous TR.
- (c) Any upsetness demonstrated by Student.

PROCESSING

Since 1950 we have had an iron bound rule that we didn't leave pcs in trouble just to end a session.

For fifteen years we have always continued a session that found the pc in trouble and I myself have audited a pc for nine additional hours, all night long in fact, just to get the pc through.

Newer auditors, not trained in the stern school of running engrams, must learn this all over again.

It doesn't matter whether the auditor has had a policy on this or not—one would think that common decency would be enough as to leave a pc in the middle of a secondary or an engram and just coolly end the session is pretty cruel. Some do it because they are startled or afraid and "Rabbit" (run away by ending the session).

Auditors who end a process or change it when it has turned on a heavy somatic are likewise ignorant.

WHAT TURNS IT ON WILL TURN IT OFF.

This is the oldest rule in auditing.

Of course people get into secondaries and engrams, go through misemotion and session because things are running out. To end off a process or a session because of the clock is to ignore the real purpose of auditing. The oldest rules we have are

- (a) GET THE PC THROUGH IT.
- (b) WHAT TURNS IT ON WILL TURN IT OFF.
- (c) THE WAY OUT IS THE WAY THROUGH.

These now are expressed as POLICY.

A falsified auditor's report is also subject to a Court of Ethics.

Any auditor violating this policy letter is liable to an immediate Court of Ethics convened within 24 hours of the offence or as soon as is urgently possible.

Auditing at all levels works well when it is done by the book.

The purpose of Ethics is to open the way for and get in Tech.

Then we can do our job.

THERE IS NO MODERN PROCESS THAT WILL NOT WORK WHEN EXACTLY APPLIED.

Therefore in the eyes of Ethics all auditing failures are Ethics failures—PTS, Suppressive Persons as pcs, or non-compliance with tech for auditors.

And the first offence an auditor can commit is ceasing to audit when he is most needed by his pc.

Hence it is the first most important consideration of Ethics to prevent such occurrences.

Then we'll make happy pcs, Releases and Clears.

HCO BULLETIN OF 7 MAY 1969
Issue IV

Dianetic Course

(HCO BULLETIN 21 SEPT 1965 EDITED
FOR USE ON THE DIANETIC COURSE)

THE FIVE GAEs

The five Gross Auditing Errors (GAEs) are:

1. Can't handle and read an E-Meter.
2. Doesn't know and can't apply Technical data.
3. Can't get and keep a pc in session.
4. Can't complete an auditing cycle.
5. Can't complete a repetitive auditing cycle.

These are the only errors one looks for in straightening up the auditing of an Auditor.

If you look for other reasons, this is itself a gross goof. There are no others.

UPPER INDOC TRS

Following are the Upper Indoc TRs 6 to 9 inclusive.

Number: TR 6

Name: 8—C (Body Control)

Commands: Non-verbal for first half of training session. First half of coaching session, the student silently steers the coach's body around the room, not touching the walls, quietly starting, changing and stopping the coach's body. When the student has fully mastered non-verbal 8—C, the student may commence verbal 8—C.

The commands to be used for 8—C are:

“Look at that wall.” “Thank you.”
“Walk over to that wall.” “Thank you.”
“Touch that wall.” “Thank you.”
“Turn around.” “Thank you.”

Position: Student and coach walking side by side; student always on coach's right, except when turning.

Purpose: First part: To accustom student to moving another body than his own without verbal communication. Second part: To accustom student to moving another body, by and while giving commands, only, and to accustom student to proper commands of 8—C.

Training Stress: Complete, crisp precision of movement and commands. Student, as in any other TR, is flunked for current and preceding TRs. Thus, in this case, the coach flunks the student for every hesitation or nervousness in moving body, for every flub of command, for poor confronting, for bad communication of command, for poor acknowledgement, for poor repetition of command, and for failing to handle origination by coach. Stress that student learns to lead slightly in all the motions of walking around the room or across the room. This will be found to have a great deal to do with confronting. In the first part of the session student is not allowed to walk coach into walls, as walls then become automatic stops and the student is then not stopping the coach's body but allowing the wall to do it for him.

History: Developed by L. Ron Hubbard in Camden, New Jersey in October 1953, modified in July 1957 in Washington, D.C., and the commands were modified in HCO Bulletin of 16 November 1965, Issue II.

Number: TR 7

Name: High School Indoc.

Commands: Same as 8—C (control) but with student in physical contact with coach. Student enforcing commands by manual guiding. Coach has only three statements to which student must listen: “Start” to begin coaching session, “Flunk” to call attention to student error, and “That's it” to end the coaching session. No other remarks by the coach are valid on student. Coach tries in all possible ways, verbal, covert and physical, to stop student from running control on him. If the student falters, comm lags, fumbles a command, or fails to get execution on part of coach, coach says “Flunk” and they start at the beginning of the command cycle in which the error occurred. Coach falldown is not allowed.

Position: Student and coach ambulant. Student handling coach physically.

Purpose: To train student never to be stopped by a person when he gives a command. To train him to run fine control in any circumstances. To teach him to handle rebellious people. To bring about his willingness to handle other people.

Training Stress: Stress is on accuracy of student performance and persistence by student. Start gradually to toughen up resistance of student on a gradient. Don't kill him off all at once.

History: Developed by L. Ron Hubbard in London, England, in 1956.

Number: TR 8

Name: Tone 40 on an Object.

Commands: "Stand up." "Thank you." "Sit down on that chair." "Thank you." These are the only commands used.

Position: Student sitting in chair facing chair which has on it an ashtray. Coach sitting in chair facing chair occupied by student and chair occupied by ashtray.

Purpose: To make student clearly achieve Tone 40 commands. To clarify intentions as different from words. To start student on road to handling objects and people with postulates. To obtain obedience not wholly based on spoken commands.

Training Stress: TR 8 is begun with student holding the ashtray which he manually makes execute the commands he gives. Under the heading of training stress is included the various ways and means of getting the student to achieve the goals of this training step. During the early part of this drill, say in the first coaching session, the student should be coached in the basic parts of the drill, one at a time. First, locate the space which includes himself and the ashtray but not more than that much. Second, have him locate the object in that space. Third, have him command the object in the loudest possible voice he can muster. This is called shouting. The coach's patter would run something like this: "Locate the space." "Locate the object in that space." "Command it as loudly as you can." "Acknowledge it as loudly as you can." "Command it as loudly as you can." "Acknowledge it as loudly as you can." That would complete two cycles of action. When shouting is completed, then have student use a normal tone of voice with a lot of coach attention on the student getting the intention into the object. Next, have the student do the drill while using the wrong commands—i.e., saying "Thank you" while placing in the object the intention to stand up, etc. Next, have the student do the drill silently, putting the intention in the object without even thinking the words of the command or the acknowledgement. The final step in this would be for the coach to say "Start" then anything else he said would not be valid on student with the exception of "Flunk" and "That's it". Here, the coach would attempt to distract the student, using any verbal means he could to knock the student off Tone 40. Physical heckling would not be greater than tapping the student on the knee or shoulder to get his attention. When the student can maintain Tone 40 and get a clean intention on the object for each command and for each acknowledgement, the drill is flat.

There are other ways to help the student along. The coach occasionally asks, "Are you willing to be in that ashtray?" When the student has answered, then, "Are you willing for a thought to be there instead of you?" Then continue the drill. The answers are not so important on these two questions as is the fact that the idea is brought to the student's attention. Another question the coach asks the student is, "Did you really expect that ashtray to comply with that command?"

There is a drill which will greatly increase the student's reality on what an intention is. The coach can use this drill three or four times during the training on Tone 40 on an Object. As follows: "Think the thought—I am a wild flower." "Good." "Think the thought that you are sitting in a chair." "Good." "Imagine that thought being in that ashtray." "Good." "Imagine that ashtray containing that thought in its substance." "Good." "Now get the ashtray thinking that it is an ashtray." "Good." "Get the ashtray intending to go on being an ashtray." "Good." "Get the ashtray intending to remain where it is." "Good." "Have the ashtray end that cycle." "Good." "Put in the ashtray the intention to remain where it is." "Good." This also helps the student get a reality on placing an intention in something apart from himself. Stress

that an intention has nothing to do with words and has nothing to do with the voice, nor is it dependent upon thinking certain words. An intention must be clear and have no counter-intention in it. This training drill, Tone 40 on an Object, usually takes the most time of any drill in Upper Indoc, and time on it is well spent. Objects to be used are ashtrays, preferably heavy, coloured glass ashtrays.

History: Developed by L. Ron Hubbard in Washington, D.C., in 1957 to train students to use intention when auditing.

Number: TR 9

Name: Tone 40 on a Person.

Commands: Same as 8—C (Control). Student runs fine, clear-cut intention and verbal orders on coach. Coach tries to break down Tone 40 of student. Coach commands that are valid are: “Start” to begin, “Flunk” to call attention to student error and that they must return to beginning of cycle, and “That’s it” to take a break or to end the training session. No other statement by coach is valid on student and is only an effort to make student come off Tone 40 or in general be stopped.

Position: Student and coach ambulant. Student in manual contact with coach as needed.

Purpose: To make student able to maintain Tone 40 under any stress or duress.

Training Stress: The exact amount of physical effort must be used by student plus a compelling, unspoken intention. No jerky struggles are allowed, since each jerk is a stop. Student must learn to smoothly increase effort quickly to amount needed to make coach execute. Stress is on *exact* intention, exact strength needed, exact force necessary, exact Tone 40. Even a slight smile by student can be a flunk. Too much force can be a flunk. Too little force definitely is a flunk. Anything not Tone 40 is a flunk. Here the coach should check very carefully on student’s ability to place an intention in the coach. This can be checked by the coach since the coach will find himself doing the command almost whether or not he wants to if the student is really getting the intention across. After the coach is satisfied with the student’s ability to get the intention across, the coach should then do all he can to break the student off Tone 40, mainly on the basis of surprise and change of pace. Thus the student will be brought to have a greater tolerance of surprise and a quick recovery from surprise.

History: Developed in Washington, D.C., in 1957 by L. Ron Hubbard.

Purpose of these four training drills, TR 6, 7, 8 and 9, is to bring about in the student the willingness and ability to handle and control other people’s bodies, and to cheerfully confront another person while giving that person commands. Also, to maintain a high level of control in any circumstances.

HCO BULLETIN OF 22 MAY 1971
SAME TITLE

TR-8 CLARIFICATION

ADDS TO HCOB 7 MAY 68 "UPPER INDOC TR'S"
AND ADDS TO EVERY CHECKSHEET AND HAT
WHERE THIS BULLETIN APPEARS.

In the early development of TR-8 "TONE 40 ON AN OBJECT" and in the years following, the student was required to lift the object (ashtray) manually to obtain execution of his commands. (HCOB 11 June 57 Training and CCH Processes.)

In later refinements of TR-8 this action was not stated. However, it was not intended that this action fall into disuse.

We will therefore restore this action to TR-8 .

The following is to be added to HCOB 7 May 68 "Upper Indoc TR's" as the first sentence under TR-8 Training Stress.

"TR-8 is be begun with student holding the Ash Tray which he manually makes execute the commands he gives."

The Upper Indoc TRs are done TOUGH with all the previous TRs IN.

With the inclusion of this TR-8 data, they are done exactly as per HCOB 7 May 68.

DIANETIC CLEAR

HCOB 12 Sep 78 URGENT—IMPORTANT, DIANETICS
FORBIDDEN ON CLEARS AND OTs)

(This bulletin revises the definition of "Dianetic Clear," page 113, Technical Dictionary,
and the definition of "Keyed-Out Clear," page 221, Technical Dictionary.)

The state of Clear can be achieved on Dianetics.

I have now determined there is no such thing as Keyed-Out Clear. There is only a Dianetic Clear and he is a Clear.

The state of Dianetic Clear means the pc has erased his Dianetic case or mental image pictures; he has attained the ability to be at cause over mental matter, energy, space and time on the First Dynamic.

When this happens the person is not run further on Dianetics. He can be given Touch or Contact Assists (as can Scn Clears and OTs), and can be given NED for OTs once he is OT III. He is not to be given any Dianetic Auditing Assist nor any Dianetic auditing. (He can, of course, receive any actions on the Assist Summary bulletin, *excluding* R3RA.)

The Dianetic Clear, on achieving this state, can be audited on Scientology Grades 0-IV. He would not be run on the R3RA section of service facts, however. On completing Grades 0-IV, he is not run on Power, R6EW or the Clearing Course but goes onto OT I, after doing the Solo Auditor Course.

Should a pc being audited on Dianetics originate that he has achieved Dianetic Clear, or if a Dianetic auditor thinks this has occurred with his pc, the folders must be routed to an org C/S who is Clear or above and who can adjudicate.

(NOTE: No auditor or C/S must evaluate for a pc on this nor feed or coax him to any cognition, which is a comm-evable offense. Clears are made through auditing, not by feeding cognitions to pcs. This is important as someone who has not made Clear will *not* make it on the OT levels.)

Field auditors and missions would route the folders of a pc believed to be Dianetic Clear to the nearest org with a C/S who is Clear, for adjudication and declare of the state.

Such submissions must be handled promptly, so there is no delay put on any individual's progress up the Bridge.

Once declared, the pc folders must be clearly marked "DIANETIC CLEAR." The pc may then be C/Sed to receive Scientology auditing, per the above. The pc is not, however, given any further Dianetic auditing.

AUDITING THE DIANETIC CLEAR

(Ref: HCOB 1 Dec 78 PROGRAMMING THE
DIANETIC CLEAR
FOR HIS NEXT STEP
HCOB 8 Oct 70 C/S Series 20
PERSISTENT F/N
HCOB 19 Apr 72 C/S Series 77
“QUICKIE” DEFINED)

It has recently come to my attention that some auditors are delivering grades in outrageously short periods of time to Dianetic Clear pcs and only giving Quad Grades to the Dianetic Clear without making full use of the Expanded Grades. Such pcs are being denied the full gains of the grade processes due to Quickie Grades—out-tech.

From this point forward, anyone auditing a pc who is Dianetic Clear or Natural Clear, on the grades, must:

- 1) M9 and starrate HCOB 8 Oct 70 C/S Series 20 PERSISTENT F/N,
- 2) M9 and starrate HCOB 19 Apr 72 C/S Series 77 “QUICKIE” DEFINED and
- 3) Clay demo the consequences of Quickie Grades.

It is the responsibility of the C/S to see that the above checkouts occur without stopping or slowing delivery lines.

These actions will ensure that the Dianetic Clear has the opportunity to attain *all* the benefits of the grades. In addition to the immediate abilities gained from the grades being properly delivered, having his grades really IN will prevent the pre-OT from running into difficulties on the OT levels.

The grades are a very essential part of the Grade Chart and must not be delivered over a persistent F/N or skimmed on in any way. Let's *Keep Scientology Working!*

C/S Series 20

PERSISTENT F/N

A FLOATING NEEDLE can *persist*.

This fact tells you at once why you cannot do three major actions in a row in the same ten minutes.

This was the bug behind "Quickie Grades" (0 to IV in one session. This also occurred in Power when it was run all in one day). The auditor would attain a bona fide full dial F/N. The pc was still cogniting, still in a big win. The auditor would "clear the next process command", he would see an F/N. He would "clear the next process command", and see an F/N.

BUT IT WAS THE SAME F/N!

Result was that processes 2 and 3 WERE NEVER RUN ON THE CASE.

This is really what is meant by "Quickie Grades".

In 1958 we got real Releases. You could not kill the F/N for *days*, weeks.

Several processes had this effect. Today's real Clear also goes this way. You couldn't kill the F/N with an axe.

By running a lot of Level Zero processes, for instance, you can get a real swinging unkillable F/N.

It not only gets to the Examiner, it comes in at the start of the next day's session!

Now if in one session you ran all of Level Zero and went on up to Level One, you would just be *auditing a persistent F/N*. The pc would get no benefit at all from Level One. He's still going "Wow" on Level Zero.

If you ran Level Zero with one process that got a big wide floating F/N and then "ran" Level I, II, III and IV, you would have just a Level Zero Release. The pc's bank was nowhere to be found. So next week he has problems (Level I) or a Service Fac (Level IV) and he is only a Grade Zero yet it says right there in Certs and Awards log he's a Grade IV. So now we have a "Grade IV" who has Level I, II, III and IV troubles!

A session that tries to go beyond a big dial-wide drifting floating F/N only distracts the pc from his win. **BIG WIN.**

Any *big win* (F/N dial-wide, Cog, VGIs) gives you this kind of persistent F/N.

You at least have to let it go until tomorrow and let the pc have his win.

That is what is meant by letting the pc *have* his win. When you get one of these dial-wide F/Ns, Cog, VGIs WOW you may as well pack it up for the day.

GRADUAL WIDENING

In running a Dianetic chain to basic in triple you will sometimes see in one session a half dial on Flow 1, 3/4 of a dial on Flow 2, a full dial on Flow 3.

Or you may have 4 subjects to two-way comm or prepcheck in one session. First action 1/3 dial F/N. Then no F/N, TA up. Second action 1/2 dial F/N. Then no F/N. Third action 3/4 dial F/N. Fourth action full dial-wide floating swinging idling F/N.

You will also notice in the same session-long time for 1st action, shorter, shorter, shorter for the next three actions.

Now you have an F/N that anything you try to clear and run will just F/N WITHOUT AFFECTING THE CASE AT ALL.

If you audit past that you are wasting your time and processes.

You have hit an “unkillable F/N”, properly called a persistent F/N. It’s persistent at least for that day. Do any more and it’s wasted.

If an auditor has never seen this he had better get his TR0 bullbait flat for 2 hours at one unflunked go and his other TRs in and drill out his flubs. For that’s what’s supposed to happen.

F/Ns on pcs audited up to (for that session) a persistent F/N always get to the Examiner.

If you only have a “small F/N” it won’t get to the Examiner. However, on some pcs maybe that’s good enough. May take him several sessions, each one getting a final session F/N a bit wider. Then he gets an F/N that gets to the Examiner. After that, well audited on a continuing basis, the F/N lasts longer and longer.

One day the pc comes into session with a dial-wide floating swinging F/N and anything you say or do does nothing whatever to disturb that F/N.

It’s a real Release man. It may last weeks, months, years.

Tell him to come back when he feels he needs some auditing and chalk up the remaining hours (if sold by the hour) as undelivered. Or if sold by result, chalk up the result.

If the F/N is truly persistent he will have no objections. If it isn’t, he *will* object. So have him come back tomorrow and carry on whatever you were doing.

SUMMARY

The technical bug back of Quickie Grades or Quickie Power was the Persistent F/N.

This is not to be confused with a Stage 4 (sweep, stick, sweep, stick) or an ARC Broke needle (pc Bad Indicators while F/Ning).

This is not to be used to refuse all further auditing to a pc.

It is to be used to determine when to end a series of major actions in a session.

C/S Series 77

“QUICKIE” DEFINED

The reason an auditor can say he doesn't “quickie a rundown” (and none ever say they do) is because he has no definition for the word QUICKIE.

The word has been used to designate rundowns that were not completely and fully done.

It is not a slang word.

In the dictionary you will find “*Quickie* also quicky: something done or made in a hurry. Also: a hurriedly planned and executed program (as of studies).”

What happens in auditing, for instance, is a “Grade Zero Expanded” is “done” by just doing a single flow to its first F/N.

That is obviously “quickie”.

A more subtle one is to do a “PTS Rundown” with no Ethics action to begin and no check for stability, holding gain and not ill a week or two after the RD. Only if both these actions were done would one have a “Complete PTS Rundown” as it would give a PRODUCT = A PC no longer PTS.

So what makes a Quickie “completion” quickie?

Is it length of time? Not necessarily.

Is it fewness of processes? Not necessarily as Power can be done quickie simply by not hanging on for the EP and only going to F/N.

To define COMPLETE gives us the reverse of Quickie.

“COMPLETE: To make whole, entire or perfect; end after satisfying all demands or requirements. “ A Completion is “the act or action of completing, becoming complete or making complete”.

So “completing” something is not a loose term. It means an exact thing. “End after satisfying all demands or requirements” does not mean “doing as little as possible” or “doing what one can call complete without being detected”.

Anything that does not fully satisfy all requirements is QUICKIE.

So “quickie” really means “omitting actions for whatever reason that would satisfy all demands or requirements and doing something less than could be achieved”.

In short a quickie is not doing all the steps and actions that could be done to make a perfect whole.

Standard auditing actions required for ages that auditors cleared each word of each command. Yet when they went quickie they dropped this. When this was dropped, GAINS ON 75% OF ALL PCS LESSENER OR VANISHED. We are right now achieving spectacular wins on pcs just by clearing up commands and words on all lists. We are finding that these pcs did not recover and NEVER BEFORE HAD BEEN IN SESSION even though previously “audited” hundreds of hours.

By omitting an essential action of clearing commands, processing did not work because the pc never understood the auditing commands!

So quickie action did not save any time, did it? It wasted hundreds of hours!

Quickie Programs are those which omit essential steps like Vital lists or 2wcs to get data. FESs for past errors are often omitted.

To slow down the torrent of quickie actions on clearing commands HCO P/L 4 Apr 72 Issue III “Ethics and Study Tech” has Clause 4 “An auditor failing to clear each and every word of every command or list used may be summoned before a Court of Ethics. The charge is OUT TECH.”

Ethics has to enter in after Quickie Tech has gotten in. Because quickie tech is a symptom of out ethics. HCO P/L 3 April 72 (Est O Series 13) “Doing Work” and HCO P/L 4 Apr 72 (Est O Series 14) “Ethics” are vital know-how where a C/S is faced with Quickie actions—or flubby ones that will not cure.

Essential Quickie Tech is simply *dishonest*. Auditors who do it have their own Ethics out in some way.

To be sure their confront is down.

There are numerous remedies for the quickie impulse. The above mentioned Policy Letters and plain simple TR 0 are standard remedies. TR 0 properly done and completed itself usually cures it.

Quickie study in ‘67 and ‘68 almost destroyed auditing quality. LRH ED 174 Int which really pushes in Study Tech will achieve the primary reason for quickie—the auditor didn’t understand the words himself.

Wherever Quickie tendencies or false stats (the quickest quickie possible) show up, the above P/Ls had better be gotten into full use fast.

STYLES OF AUDITING

Note 1: Most old-time auditors, particularly Saint Hill Graduates, have been trained at one time or another in these auditing styles. Here they are given names and assigned to Levels so that they can be taught more easily and so that general auditing can be improved.

(Note 2: These have not been written before because I had not determined the results vital to each Level.)

There is a Style of auditing for each class. By Style is meant a method or custom of performing actions.

A Style is not really determined by the process being run so much. A Style is how the auditor addresses his task.

Different processes carry different style requirements perhaps, but that is not the point. Clay Table Healing at Level III can be run with Level I style and still have some gains. But an auditor trained up to the style required at Level III would do a better job not only of CT Healing but of any repetitive process.

Style is how the auditor audits. The real expert can do them all, but only after he can do each one. Style is a mark of Class. It is not individual. In our meaning, it is a distinct way to handle the tools of auditing.

LEVEL ZERO LISTEN STYLE

At *Level 0* the Style is Listen Style Auditing. Here the auditor is expected to listen to the pc. The only skill necessary is listening to another. As soon as it is ascertained that the auditor is listening (not just confronting or ignoring) the auditor can be checked out. The length of time an auditor can listen without tension or strain showing could be a factor. What the pc does is not a factor considered in judging this style. Pcs, however, talk to an auditor who is really listening.

Here we have the highest point that old-time mental therapies reached (when they did reach it), such as psychoanalysis, when they helped anyone. Mostly they were well below this, evaluating, invalidating, interrupting. These three things are what the instructor in this style should try to put across to the HAS student.

Listen Style should not be complicated by expecting more of the auditor than just this: Listen to the pc without evaluating, invalidating or interrupting.

Adding on higher skills like "Is the pc talking interestingly?" or even "Is the pc talking?" is no part of this style. When this auditor gets in trouble and the pc won't talk or isn't interested, a higher classed auditor is called in, a new question given by the supervisor, etc.

It really isn't "Itsa" to be *very* technical. Itsa is the action of the pc saying, "It's a this" or "It's a that." *Getting* the pc to Itsa is quite beyond Listen Style auditors where the pc won't. It's the supervisor or the question on the blackboard that gets the pc to Itsa.

The *ability* to listen, learned well, stays with the auditor up through the grades. One doesn't cease to use it even at Level VI. But one has to learn it somewhere and that's at Level Zero. So Listen Style Auditing is just listening. It *thereafter* adds into the other styles.

LEVEL ONE MUZZLED AUDITING

This could also be called rote style auditing.

Muzzled Auditing has been with us many years. It is the stark total of TRs 0 to 4 and not anything else added.

It is called so because auditors too often added in comments, Qed and Aed, deviated, discussed and otherwise messed up a session. Muzzle meant a "muzzle was put on them", figuratively speaking, so they would *only* state the auditing command and ack.

Repetitive Command Auditing, using TRs 0 to 4, at Level One is done completely muzzled.

This could be called Muzzled Repetitive Auditing Style but will be called "Muzzled Style" for the sake of brevity.

It has been a matter of long experience that pcs who didn't make gains with the partially trained auditor permitted to two-way comm, did make gains the instant the auditor was muzzled: to wit, not permitted to do a thing but run the process, permitted to say nothing but the commands and acknowledge them and handle pc originations by simple acknowledgment without any other question or comment.

At Level One we don't expect the auditor to do anything but state the command (or ask the question) with no variation, acknowledge the pc's answer and handle the pc origins by understanding and acknowledging what the pc said.

Those processes used at Level One actually respond best to muzzled auditing and worst to misguided efforts to "Two-Way Comm".

Listen Style combines with Muzzled Style easily. But watch out that Level One sessions don't disintegrate to Level Zero.

Crisp, clean repetitive commands, muzzled, given and answered *often*, are the road out—not pc wanderings.

A pc at this Level is instructed in exactly what is expected of him, exactly what the auditor will do. The pc is even put through a few "do birds fly?" cycles until the pc gets the idea. Then the processing works.

An auditor trying to do Muzzled Repetitive Auditing on a pc who, through past "therapy experience", is rambling on and on is a sad sight. It means that control is out (or that the pc never got above Level Zero).

It's the number of commands given and answered in a unit of auditing time that gets gains. To that add the correctly chosen repetitive process and you have a release in short order, using the processes of this Level.

To follow limp Listen Style with crisp, controlled Muzzled Style may be a shock. But they are each the lowest of the two families of auditing styles—Totally Permissive and Totally Controlled. And they are so different each is easy to learn with no confusion. It's been the lack of difference amongst styles that confuses the student into slopping about. Well, these two are different enough—Listen Style and Muzzled Style—to set anybody straight.

LEVEL TWO GUIDING STYLE AUDITING

An old-time auditor would have recognized this style under two separate names: (a) Two-Way Comm and (b) Formal Auditing.

We condense these two old styles under one new name: Guiding Style Auditing.

One first *guides* the pc by “two-way comm” into some subject that has to be handled or into revealing what should be handled and then the auditor handles it with formal repetitive commands.

Guiding Style Auditing becomes feasible only when a student can do Listen Style and Muzzled Style Auditing well.

Formerly the student who couldn't confront or duplicate a command took refuge in sloppy discussions with the pc and called it auditing or “Two-Way Comm”.

The first thing to know about Guiding Style is that one lets the pc talk and Itsa without chop, but also gets the pc steered into the proper subject and gets the job done with repetitive commands.

We presuppose the auditor at this Level has had enough case gain to be able to occupy the viewpoint of the auditor and therefore to be able to observe the pc. We also presuppose at this Level that the auditor, being able to occupy a viewpoint, is therefore more self-determined, the two things being related. (One can only be self-determined when one can observe the actual situation before one: otherwise a being is delusion-determined or other-determined.)

Thus in Guiding Style Auditing, the auditor is there to find out what's what from the pc and then apply the needful remedy.

Most of the processes in the Book of Remedies are included in this Level (II). To use those, one has to observe the pc, discover what the pc is doing, and remedy the pc's case accordingly.

The result for the pc is a far-reaching re-orientation in Life.

Thus the essentials of Guiding Style Auditing consist of Two-Way Comm that steers the pc into revealing a difficulty followed by a repetitive process to handle what has been revealed.

One does expert TRs but one may discuss things with the pc, let the pc talk and in general one audits the pc before one, establishing what *that pc* needs and then doing it with crisp repetitive auditing, but all the while alert to changes in the pc.

One runs at this Level against Tone Arm Action, paying little or no heed to the needle except as a centering device for TA position. One even establishes what's to be done by the action of the Tone Arm. (The process of storing up things to run on the pc by seeing what fell when he was running what's being run, now belongs at this Level (II) and will be re-numbered accordingly.)

At II one expects to handle a lot of chronic PTPs, overts, ARC Breaks with Life (but not session ARC Breaks, that being a needle action, session ARC Breaks being sorted out by a higher classed auditor if they occur).

To get such things done (PTPs, overts and other remedies) in the session the auditor must have a pc “willing to talk to the auditor about his difficulties”. That presupposes we have an auditor at this Level who can ask questions, not repetitive, that guide the pc into talking about the difficulty that needs to be handled.

Great command of TR 4 is the primary difference in TRs from Level I. One understands, when one doesn’t, by asking more questions, and by really acknowledging only when one has really understood it.

Guided comm is the clue to control at this Level. One should *easily* guide the pc’s comm in and out and around without chopping the pc or wasting session time. As soon as an auditor gets the idea of *finite result* or, that is to say, a specific and definite result expected, all this is easy. Pc has a PTP. Example: Auditor has to have the idea he is to locate and destimulate the PTP so pc is not bothered about it (and isn’t being driven *to do* something about it) as the finite result.

The auditor at II is trained to audit the pc before him, get the pc into comm, guide the pc toward data needful to choose a process and then to run the process necessary to resolve that thing found, usually by repetitive command and always by TA.

The Book of Remedies is the key to this Level and this auditing style.

One listens but only to what one has guided the pc into. One runs repetitive commands with good TR 4. *And* one may search around for quite a while before one is satisfied he has the answer from the pc needful to resolve a certain aspect of the pc’s case.

O/W can be run at Level I. But at Level II one may *guide* the pc into divulging what the pc considers a real overt act and, having that, then guide the pc through all the reasons it wasn’t an overt and so eventually blow it.

Half-acknowledgment is also taught at Level II—the ways of keeping a pc talking by giving the pc the feeling he is being heard and yet not chopping with overdone TR 2.

Big or multiple acknowledgment is also taught to shut the pc off when the pc is going off the subject.

LEVEL III ABRIDGED STYLE AUDITING

By Abridged is meant “abbreviated”, shorn of extras. Any not actually needful auditing command is deleted.

For instance, at Level I the auditor *always* says, when the pc wanders off the subject, “I will repeat the auditing command” and does so. In Abridged Style the auditor omits this when it isn’t necessary and just asks the command again if the pc has forgotten it.

In this style we have shifted from pure rote to a sensible use or omission as needful. We still use repetitive commands expertly, but we don’t use rote that is unnecessary to the situation.

Two-Way Comm comes into its own at Level III. But with heavy use of repetitive commands.

At this Level we have as the primary process, Clay Table Healing. In this an auditor must *make sure* the commands are followed exactly. No auditing command *is ever* let go of until that actual command is answered by the pc.

But at the same time, one doesn't necessarily give every auditing command the process has in its rundown.

In Clay Table Healing one is supposed to make sure the pc is satisfied each time. This is done more often by observation than command. Yet it is done.

We suppose at III that we have an auditor who is in pretty fine shape and can observe. Thus we *see* the pc is satisfied and don't mention it. Thus we see when the pc is not certain and so we get something the pc is certain of in answering the question.

On the other hand, one gives *all* the necessary commands crisply and definitely and gets them executed.

Prepchecking and needle usage is taught at Level III as well as Clay Table Healing. Auditing by List is also taught. In Abridged Style Auditing one may find the pc (being cleaned up on a list question) giving half a dozen answers in a rush. One doesn't stop the pc from doing so, one half acknowledges, and lets the pc go on. One is in actual fact handling a bigger auditing comm cycle, that is all. The question elicits more than one answer which is really only one answer. And when that answer is given, it is acknowledged.

One *sees* when a needle is clean without some formula set of questions that invalidate all the pc's relief. And one sees it *isn't* clean by the continued puzzle on the pc's face.

There are tricks involved here. One asks a question of the pc with the key word in it and notes that the needle doesn't tremble, and so concludes the question about the word is flat. And so doesn't check it again. Example: "Has anything else been suppressed?" One eye on pc, one on needle, needle didn't quiver. Pc looks noncommittal. Auditor says, "All right, on " and goes on to next question, eliminating a pc's possible protest read that can be mistaken for another "suppress".

In Abridged Style Auditing one sticks to the essentials and drops rote where it impedes case advance. But that doesn't mean one wanders about. One is even more crisp and thorough with Abridged Style Auditing than in rote.

One is watching what happens and doing exactly enough to achieve the expected result.

By "Abridged" is meant getting the exact job done—the shortest way between two points—with no waste questions.

By now the student should know that he runs a process to achieve an exact result and he gets the process run in a way to achieve that result in the smallest amount of time.

The student is taught to guide rapidly, to have no time for wide excursions.

The processes at this Level are all rat-a-tat-tat processes—CT Healing, Prepchecking, Auditing by List.

Again it's the number of times the question is answered per unit of auditing time that makes for speed of result.

LEVEL IV DIRECT STYLE AUDITING

By direct we mean straight, concentrated, intense, applied in a direct manner.

We do not mean direct in the sense of to direct somebody or to guide. We mean it is direct.

By direct, we don't mean frank or choppy. On the contrary, we put the pc's attention on his bank and anything we do is calculated only to make that attention *more* direct.

It could also mean that we are not auditing by vias. We are auditing straight at the things that need to be reached to make somebody clear.

Other than this the auditing attitude is *very* easy and relaxed.

At Level IV we have Clay Table Clearing and we have Assessment type processes.

These two types of process are both astonishingly *direct*. They are aimed directly at the Reactive Mind. They are done in a direct manner.

In CT Clearing we have almost total work and Itsa from pcs. From one end of a session to another, we may have only a few auditing commands. For a pc on CT Clearing does almost all the work if he is in session at all.

Thus we have another implication in the word "direct". The pc is talking directly to the auditor about what he is making and why in CT Clearing. The auditor hardly ever talks at all.

In assessment the auditor is aiming directly at the pc's bank and wants no pc in front of it thinking, speculating, maundering or Itsaing. Thus this assessment is a very *direct* action.

All this requires easy, smooth, steel-hand-in-a-velvet-glove control of the pc. It *looks* easy and relaxed as a style, it is straight as a Toledo blade.

The trick is to be direct in what's wanted and not deviate. The auditor settles what's to be done, gives the command and then the pc may work for a long time, the auditor alert, attentive, completely relaxed.

In assessment the auditor often pays no attention to the pc at all, as in ARC Breaks or assessing lists. Indeed, a pc at this level is trained to be quiet during the assessment of a list.

And in CT Clearing an auditor may be quiet for an hour at a stretch.

The tests are: Can the auditor keep the pc quiet while assessing without ARC Breaking the pc? Can the auditor order the pc to do something and then, the pc working on it, can the auditor remain quiet and attentive for an hour, understanding everything and interrupt alertly only when he doesn't understand and get the pc to make it clearer to him? Again without ARC Breaking the pc.

You could confuse this Direct Style with Listen Style if you merely glanced at a session of CT Clearing. But what a difference. In Listen Style the pc is blundering on and on and on. In Direct Style the pc wanders off the line an inch and starts to Itsa, let us say, with no clay work and after it was obvious to the auditor that this pc had forgotten the clay, you'd see the auditor, quick as a foil, look at the pc, very interestedly and say, "Let's see that in Clay." Or the pc doesn't really give an ability he wants to improve and you'd hear a quiet persuasive auditor voice, "Are you quite certain you want to improve that? Sounds like a goal to me. Just something, some ability you know, you'd like to improve."

You could call this style One-Way Auditing. When the pc is given his orders, after that it's all from the pc to the auditor, and all involved with carrying out that auditing instruction.

When the auditor is assessing it is all from the auditor to the pc. Only when the assessment action hits a snag like a PTP is there any other auditing style used.

This is a very extreme auditing style. It is straightforward—direct.

But when needful, as in any Level, the styles learned below it are often also employed, but never in the actual actions of getting CT Clearing and Assessment done.

(Note: Level V would be the same style as VI below.)

LEVEL VI ALL STYLE

So far, we have dealt with simple actions.

Now we have an auditor handling a meter and a pc who It's and Cognites and gets PTPs and ARC Breaks and Line Charges and Cognites and who finds Items and lists and who must be handled, handled, handled all the way.

As auditing TA for a 2 1/2 hour session can go to 79 or 125 divisions (compared to 10 or 15 for the lowest level), the *pace* of the session is greater. It is this pace that makes perfect ability at each lower level vital when they combine into All Style. For each is now faster.

So, we learn All Style by learning each of the lower styles well, and then observe and apply the style needed every time it is needed, shifting styles as often as once every minute!

The best way to learn All Style is to become expert at each lower style so that one does the style correct for the situation each time the situation requiring that style occurs.

It is less rough than it looks. But it is also very demanding.

Use the wrong style on a situation and you've had it. ARC Break! No progress!

Example: Right in the middle of an assessment the needle gets dirty. The auditor can't continue—or shouldn't. The auditor, in Direct Style, looks up to see a puzzled frown. The auditor has to shift to Guiding Style to find out what ails the pc (who probably doesn't really know), then to Listen Style while the pc cognites on a chronic PTP that just emerged and bothered the pc, then to Direct Style to finish the Assessment that was in progress.

The only way an auditor can get confused by All Style is by not being good at one of the lower level styles.

Careful inspection will show where the student using All Style is slipping. One then gets the student to review that style that was not well learned and practice it a bit.

So All Style, when poorly done, is very easy to remedy for it will be in error on one or more of the lower level styles. And as all these can be independently taught, the whole can be co-ordinated. All Style is hard to do only when one hasn't mastered one of the lower level styles.

SUMMARY

These are the important Styles of Auditing. There have been others but they are only variations of those given in this HCO Bulletin. Tone 40 Style is the most notable one missing. It remains as a practice style at Level One to teach fearless body handling and to teach one to get his command obeyed. It is no longer used in practice.

As it was necessary to have every result and every process for each Level to finalize Styles of Auditing, I left this until last and here it is.

Please note that none of these Styles violate the auditing comm cycle or the TRs.

MUTTER TR

NAME: Mutter TR.

PURPOSE: To perfect muzzled auditing comm cycle.

COMMANDS: "Do fish swim?" "Do birds fly?"

POSITION: Student and coach sit facing each other a comfortable distance apart.

TRAINING STRESS:

1. Coach has student give command.
2. Coach mutters an unintelligible answer at different times.
3. Student acknowledges.
4. Coach flunks if student does *anything* else but acknowledge.

(Note: This is the *entirety* of this Drill. It is not to be confused with any other Training Drill.)

SCIENTOLOGY 0

LISTEN STYLE AUDITING

There are two ways to run Listen Style Auditing—1. As a number of teams directly under an auditing supervisor and 2. As an individual auditor. Correct training procedure at Level 0 is to have the auditor do co-audit style until confident and then train him to do the same thing individually.

LISTEN STYLE CO-AUDIT

The Co-audit version is merely to get the student to do auditing without having to assume too much responsibility.

In this version it is really the instructor who is doing the auditing. He starts the session and tells the auditor to give the commands and acknowledge the answers. If this relationship is understood it makes the supervision of a Level 0 group of teams much easier.

The procedure for running a Listen Style Co-audit is as follows:

1. Instructor gets the auditors to seat their pcs in their chairs and then sit down.
2. He writes up on a board the exact wording of the process to be used.
3. He asks students if the room is alright for them to be audited in.
4. He tells them what is going to be run in the session (R Factor) and cleans up any questions on the part of pcs (obviously, stress is on getting them able to talk to anyone).
5. He tells auditors and pcs that all the auditor is permitted to do is to give the command and acknowledge the answers. If pc says anything that cannot be handled with an acknowledgement the auditor will put out his hand behind him and wait for an instructor.
6. He tells the auditors to keep their auditor's reports.
7. Instructor then says "Start of Session". And tells the auditors to give the command. No goals or rudiments are set or done.

Notes: Students should be taught that before they give an acknowledgement they should understand pc's answer. They are permitted therefore to ask pc to amplify an answer or to explain a word so that they (the auditors) understand the answer.

If a student puts out his hand the instructor goes to session and without ending it handles what needs handling and then lets session go on. The instructor is careful not to become the pc's auditor completely as transference will set in and pcs will invent trouble to get more attention. Instructor should have a meter handy so that in the case of an ARC Break he can

quickly do an assessment. In doing the ARC Break Assessment he is of course careful not to audit the pc, only to locate and indicate the by-passed charge.

At end of period, Instructor says "Commence ending your sessions." He waits a bit and then says: "Tell your auditor any gains you've made in the session. Auditors write them down." Waits again and then says "Alright, I'm going to end the session now. End of Session." Instructor then gives whatever instruction is necessary either to end the period or to get the room ready for the next period or gives a break, etc.

LISTEN STYLE, INDIVIDUAL

This is done exactly the same as the Co-audit version but in this case of course the auditor handles the session. It goes like this:

1. The auditor seats the pc in his or her chair and then sits down across from the pc, knees a few inches from the pc's. A table is used, or just two chairs, the auditor's report being kept on a clip board. There is, of course, no meter.

2. The auditor takes the exact auditing command to be used from his text book, bulletin or notes.

3. He asks the pc if it is all right to audit the pc in the room and if not, makes things right by adjusting the room or location of auditing.

4. He tells the pc the purpose of such sessions (Reality Factor) "I want to get you used to talking to another." "I want to improve your reach," etc. It's the auditor's goal at this level, not the pc's. Pcs don't get a chance to have goals in Listen Style as they would set goals they can't attain at this level and wouldn't have enough reality on auditing anyway to be sensible about it. So, only an R Factor is used—no goals. The auditor also tells the pc *exactly* how long the session will be.

5. The auditor tells the pc that all he is going to do is to listen and try to understand the pc, and that all he wants the pc to do is talk on the selected subject the auditor will give him and that if he veers off, the auditor will call it to his attention.

6. The auditor then quickly starts his auditor's report.

7. The auditor says "Start of Session".

8. The auditor gives the command from his text, bulletin or notes. The command must have something to do with telling people things or communicating, and may also specify a subject to talk about.

9. Further commands are given only when the pc loses track of the subject and wants to know what it was (see Routines for Level 0 for exact handling of commands).

10. When the pc says something and obviously expects a response, the auditor signifies he has heard, using any normal means.

11. When the pc says something the auditor doesn't grasp, the auditor asks the pc to repeat it or amplify it so that the auditor does *hear* it in the fullest sense of the word. (See "The Prompters" below. Only 4 are allowed.)

12. When the pc stops talking, the auditor must adjudicate whether the pc is simply no longer interested in the subject, or has become unwilling to talk about some bit of it. If the

auditor believes the pc has stopped because of embarrassment or some similar reason, the auditor has The Prompters, the only things he is allowed to use.

Prompter (a) "Have you found something you think would make me think less of you?"

Prompter (b) "Is there something you thought of that you think I wouldn't understand?"

Prompter (c) "Have you said something you felt I didn't understand. If so, tell me again."

Prompter (d) "Have you found something you haven't understood? If so, tell me about it."

(The student must know these prompters by heart.) He uses as many as needed, in the sequence given, to start the pc talking again.

The auditor must not start a new subject or process just because the pc can't bring himself to go on talking. The whole essence of Level 0 is to get the pc up to being willing *to* talk about anything to anyone. Thus any coaxing is also allowed. Threats are forbidden. (a) (b) (c) or (d) usually handle. These are the commonest reasons people cease talking. Mere forgetting is handled just by reminding the pc of the subject.

13. New Processes (or new subjects in a Routine which are in essence new processes) are started only when the pc has brightened up and become quite able by reason of getting comfortable about the last one. Realizing that the whole target of Level 0 is to get people willing to talk about anything to others, a regained ability on a subject governs when to start a new process. If the auditor can answer to himself this question in the affirmative, then he can go to a new process, "Is this pc able to talk freely to or about (subject of last process)?" If so, it's all right to select a new question from the same routine or a new Routine (more rarely) and ask it now. But it is never all right to prevent a pc from talking by butting in with a new question. One *never* asks amplifying questions at Level 0. Commentary type questions are also out. The auditor listens to the question's answers and only interrupts when he truly hasn't heard or didn't grasp some point. No over and over repetitive use of commands is made, of course, as that's Level One. The Commands are given rarely, same commands, but only to get the pc going again. Staccato repetitive commands and brief pc answers are *not* for Level 0.

14. Toward the end of the auditing period, the auditor warns, "The session time is about over. We'll have to be ending shortly."

15. When the pc has given an extra comment or two, the auditor says, "We're closing the session now. Time is up. Have you made any gains in this session?"

16. The pc's answers are *quickly* noted.

17. The auditor says, "End of Session."

Note: Pcs of course often keep on talking and make it hard to end a session. End it anyway. If this seems to shock the pc, point out the time the session ended as originally set and say also, "You'll be getting more auditing and we'll take that up in the next session." You'll *always* have trouble ending a session if you fail to put in its time in the R Factor (Reality Factor) in 4 above. As the auditor notes the time in his report (see 4 above) he must say, "This session will go until _____ (hours and minutes) precisely." Thus he has an out for ending it. An auditor must never run beyond that time set, and must, of course, audit until it is reached. This, by the way, does not just hold good for Level 0. It is very good practice for all levels in regular sessions. The only exception is the assist where one is auditing toward a definite gain. In general auditing one seeks to obtain general gains not sudden momentary spurts.

The auditor, whether in co-audit or individual session at this and the next level, will soon become impressed with this fact: the more he himself says during the session, the less gain the pc gets. Therefore, aside from the above, the auditor does very little in the session and is paid handsomely for it in pc gains.

EXPANDED LOWER GRADES

CHART OF ABILITIES GAINED

Ref: C/S Series 93 New Grade Chart

This chart is used by the examiner when a pc is sent for "Declare?" on a grade.

The examiner first checks the pc's auditing folder to see that every process of a Grade being attested to has been run to true End Phenomena for each process.

He then puts the pc on the meter noting TA and needle behaviour.

The PC then makes a statement to the examiner which indicates that the pc actually made the end result of a Grade.

The examiner gets the pc to state what ability he has attained.

The pc may not state the exact wording on the Grade Chart but must attest to the ability gained as written as well.

LEVEL

ABILITY GAINED

GROUP PROCESSES

Awareness that change is available

LIFE REPAIR

Awareness of truth and the way to personal freedom

ARC STRAIGHTWIRE

Knows he/she won't get any worse

DIANETIC CASE COMPLETION

A well and happy human being

GRADE O COMMUNICATIONS
RELEASE

Ability to communicate freely with anyone on any subject

GRADE I, PROBLEMS RELEASE

Ability to recognize the source of problems and make them vanish

GRADE II, RELIEF RELEASE

Relief from the hostilities and sufferings of life

GRADE III, FREEDOM RELEASE

Freedom from the upsets of the past and ability to face the future

GRADE IV, ABILITY RELEASE

Moving out of fixed conditions
and gaining abilities to do new
things

O-IV EXPANDED GRADE PROCESSES - QUADS

PART A

ARC STRAIGHTWIRE

This Bulletin gives a checklist of the Expanded Quad Grade Process Commands. It is not all the possible processes for this level. If more are needed to attain full EP for the level, additional processes can be found in LRH Bulletins, Books, Tapes, PABs and other issues.

Each process is run to its full End Phenomena of F/N, Cog, VGIs. Any previously run are rehabbed or completed and and missing flows run.

A copy of this checklist is placed in the folder of a pc being run on Expanded Grades and the processes checked off with the date each is run to EP.

On any of these processes where the pc answers only" yes" or that he did it, find out what it was by asking" What was it?" This keeps in the itsa line from pc to auditor. (Reference HCOB 30 June 62.)

This Bulletin does not replace Source data.

GRADE ZERO QUADS O-O, O-A-OB

Ref: HCO B 11 Dec 64 SCIENTOLOGY 0 PROCESSES

26 Dec 64 ROUTINE 0-A EXPANDED

STEP ONE: AUD-PC CLEARANCE

OOF-A1 “What are you willing for me to talk to you about?”
“What would you like me to tell you about that?”

TO EP _____

OOF-A2 “What are you willing to talk to me about?”
“What would you like to tell me about that?”

TO EP _____

OOF-A3 “What are you willing for me to talk to others about?”
“What would you like me to tell others about that?”

TO EP _____

*OOF-A0 “What are you willing to tell about yourself?”
“What would you like to say about that?”*

TO EP _____

STEP TWO: O-O

OOF-1 “What are you willing for another to talk to you about?”
“What would you like him/her to tell you about that?”

TO EP _____

OOF-2 “What are you willing to talk to another about?”
“What would you like to tell another about that?”

TO EP _____

OOF-3 “What are you willing for another to talk to others about?”
“What would you like him/her/them to tell others about that?”

TO EP _____

*OOF-0 “What are you willing to let yourself talk about?”
“What would you like to say about that?”*

TO EP _____

STEP THREE - OA

Auditor chooses person by making a canned list of people it would be difficult to talk to or listen to and taking each item in turn. (Ref: HCQ B 26.12.64 0-A EXPANDED.) The item being run must read in the command when the command is cleared for O-A and O-B.

OA F-1 “If could talk to you what would he talk about?”
“Alright, if he/she were talking to you about that, what would he/she say exactly?”

TO EP _____

OA F-2 “If you could talk to what would you talk about?”

“Alright, if you were tarking to about that, what would you say exactly?”
(Pc is expected to speak as though talking to the subject chosen.)

TO EP _____

OA F-3 (Auditor chooses 2 people who would have difficulty talking to each other)

“If could talk to what would he/she/they talk about?”
“Alright, if was talking to about that what would he/she/they say exactly?”

TO EP _____

OA F-0 “If you could talk about yourself what would you talk about?”
“Alright, if you were talking about that what would you say exactly?”

TO EP _____

STEP FOUR - OB

(Per HCO B 11.12.64 ZERO PROCESSES)

(Auditor makes a canned list (not from the pc but himself) of everything he can think of that is banned for any reason from conversation or is not generally corlsiderecl acceptable for social communication, See HCO B 11.12.64.)

OB F-1 “What are you willing to have someone else tell you about _____?”
“Who else could he/she say those things to?”

TO EP _____

OB F-2 “What are you willing to tell me about _____?”
“Who else could you say those things to?”

TO EP _____

OB F-3 “What are you willing to have someone tell others about _____ ?”
“Who else could another say those things to?”

TO EP _____

OB F-0 “What are you willing to let yourself say about _____?”
“Who else could you say those things to?”

TO EP _____

HAVINGNESS

F-1 “What solid could another have you understand?”

TO EP _____

F-2 “What solid could you have another understand?”

TO EP _____

F-3 “What solid could *others have* others understand?”

TO EP _____

F-0 “*What solid could you have yourself understand?*”

QUICKIE OBJECTIVES

Ref: HCOB 12 Apr 62, CCHs PURPOSE
HCOB 11 Jun 57, TRAINING & CCH PROCESSES
HCOB 3 Feb 59, FLATTENING A PROCESS
CREATION OF HUMAN ABILITY
CONTROL AND THE MECHANICS OF SCS
HCOB 14 Aug 63, LECTURE GRAPHS (No. 5 on
pg 342 of Tech Vol V)

Recent investigations into the effectiveness of Drug RDs including their rate of repair and re-repair revealed a marked tendency to quickie Objectives.

Failure to run Objectives fully and completely, especially on a case with an extensive drug history can set up the pc for less than optimum gain on Dianetics. A Drug RD without full and complete Objectives is not a Drug RD.

TWO-WAY COMM

The easiest and very out tech way to quickie Objectives is to run some commands and then put the pc on the meter and 2WC to F/N or do some fast "rehab." But did the Objective process ever get run? What actually F/Ned, the Objective or the 2WC? Any Objectives run this way are invalid.

The tech of Objectives is extensive and still very much in force. *They have their own EPs* and with these they are fully run to actual change for the pc. Only this is valid handling of Objectives.

CURE

The way to handle auditors who quickie Objectives is a full W/Cing of the subject and a big clay demo of the purpose of Objectives and a big clay demo of what effect Objectives have on running a Drug RD and R3R. Then get the auditor's own Objectives flattened.

Any Drug RD that needs to be repaired or redone must include a careful study of the Objectives to see if they were honestly run and if the valid Objective EPs on the processes themselves were obtained. Where the Objective was obviously quickied just R-Factor the pc you are going to flatten it and do so. If the EP of an Objective was questionable you can ask the pc what happened and if he F/Ns on a real Objective EP fine, otherwise flatten the process.

A fully completed Drug RD with Objectives sets the stage for the pc to fly up the Grade Chart so do it right the first time.

CANCELS BTB 4 JANUARY 1972RB
"0-IV EXPANDED GRADE
PROCESSES - TRIPLES
PART C GRADE 1 PROCESSES"

(*Revisions in italics*)

0-IV EXPANDED GRADE PROCESSES - QUADS

PART C

GRADE 1 PROCESSES

This *BTB* gives a checklist of the Expanded *Quad* Grade Process commands. It is not all the possible processes for this level. If more are needed to attain full EP for this level additional processes can be found in LRH Bulletins, Books, Tapes, PABs and other issues.

Each process is run to its full end phenomena of F/N, Cog, VGIs. Any processes previously run are rehabbed or completed and any missing flows run. A copy of this checklist is placed in the folder of a pc being run on Expanded Grades and the processes checked off with the date each is run to EP.

On any of these processes where the pc answers only yes or that he did it find out what it was by asking "What was it?" This keeps in the itsa line from the pc to auditor. (Ref: 30 June 62 HCOB)

THIS BTB DOES NOT REPLACE THE ORIGINAL SOURCE MATERIALS.

LEVEL "I" PROBLEMS

1. **CCH's I to X**

See Refs: HCOB 2 Aug 62 CCH ANSWERS
HCOB 7 Aug 62 CCH'S MORE INFO
BTB 12 Sep 63 CCH DATA
HCOB 1 Dec 65 CCH'S

CCH I:

"Give me that hand"

CCH II:

Tone 40 8-C

"You look at that wall." "Thankyou."
"You walk over to that wall." "Thankyou."
"You touch that wall." "Thankyou."
"Turn around." "Thankyou."

CCH III:

Hand Space Mimicry

“Put your hands against mine, follow them and contribute to their motion.”
“Did you contribute to their motion?”

Gradually increase the space between pc and auditor hands per HCOB 12
Sept 63 CCH DATA.

On increased distance:

- (1) Use: “Put your hands facing mine about one inch (or whatever distance is used) away, follow them and contribute to their motion.”

NOTE: When distance increases auditors chair gets moved back, and auditors chair is always between pc and door.

CCH IV: Ref: HCOB 1 Dec 65

Book Mimicry

(No set commands)

Repeat CCH 1, 2, 3, 4 through and through until all are FLAT and the pc has reached full EP per LRH HCOBs.

CCH X: Ref. HCOB 11 Jun 57 TRAINING & CCH PROCESSES

Tone 40 - Hold it still

“Look at that (indicated room object).”
“Walk over to that (indicated room object).”
“Touch that (indicated room object).”
“Hold it still.”
“Did you hold it still?”

TO EP

R2-67 OBJECTS

“Locate some objects.”

Run repetitively. Pc looks at them and notices what they are.
TO EP

3-PART LOCATION PROCESS:

Ref: PAB 153 1 Feb 59

Locational

“Notice that _____.” “Thankyou.”
(Auditor points to object but NOT in pc’s direction.)
TO EP

Locational, Body and Room

“Look at that _____.” “Thankyou.”
“Look at your _____ (foot, hand, knee etc.)” “Thankyou.”
TO EP

Run alternatively:
Objective Show Me

“Show me that _____.” “Thankyou.”

Run above at first, and then alternate with

“Show me your _____ (foot, hand, knee etc.)” “Thankyou.”
TO EP

OPENING PROCEDURE BY DUPLICATION - R2 - 17

Ref: HCOB 4 Feb 59 OP PRO BY DUP
BTB 24 Oct 71 OP PRO BY DUP - END PHENOMENA
CREATION OF HUMAN ABILITY

Have pc handle and place book on table, bottle on another table.

“Look at that _____.” “Walk over to it.”
“Pick it up.” “What is it’s colour?”
“What is it’s temperature?” “What is it’s weight?”
“Put it down in exactly the same place.”

Done alternately with a book and a bottle.

TO EP

START, CHANGE, STOP

Ref: CLEAR PROCEDURE Issue I
HCOB 2 Feb 61 UK CASES DIFFERENT
PAB 97
HCOB 29 SEP 58

NOTE: Keep a solid comm line with pc when giving commands.

STAND STILL: (NOTE: On a very bad off case you can run SCS on an object; use same commands.)

“Now I want you to get your body moving down the room when I so indicate and when I tell you to ‘stand still’, I want you to make that body stand still. Do you understand that?” “Good.”

“Stand still.”
“Did you make that body stand still?”
“Thankyou.”

START

“I am going to tell you to start. And when I tell you to start, you start the body in that direction. Do you understand that?”
“Good.” “Start”
“Did you start that body?” “Thankyou.”

TO FLAT POINT

STOP

“I am going to tell you to get the body moving in that direction. Some where along the line I will tell you to stop. Then you stop the body. Do you understand that?”

“Good.” “Get the body moving.”
“Stop.” “Did you stop the body?”
“Thankyou.”

TO FLAT POINT

CHANGE

“Do you see that spot?” “Good.” “We will call that spot A. Now you stand here. OK.” “Now do you see that other spot?” “Good.” “We’ll call that spot B.” “Alright, now when I ask you to change the body, I want you to change the body’s position from A to B. Do you understand that?”

The preclear says he does and the auditor stepping back from the preclear says “Change.” The preclear then changes the body’s position. Similarly in using the various points and combinations of points A, B, C & D, the auditor runs the preclear on change until that particular process seems to be flat or goes to EP.

TO FLAT POINT

These steps (as above) are now repeated as they will have unflattened. Each is re-flattened in turn and run over and over again.

TO EP PER ABOVE
REFERENCES

CONTROL TRIO:

Ref: PAB 137 & PAB 146

1. “Get the idea of having that (indicated object).”
TO EP

2. “Get the idea that it is all right to permit that (indicated object) to continue.”
TO EP

3. “Get the idea of making that (indicated object) disappear.”
TO EP

GOALS:

Ref: PAB 137 & PAB 146

1. “What are you absolutely sure will happen in the next 2 minutes?”

Auditor 2 way comms it, to pc certainty and gradually increases span of time: 1 hr, 3 days, 1 week, 3 months, 1 year etc.
TO EP

2. “Tell me something that you would like to do in the next 2 minutes.
TO EP

OR

 1. “Tell me something that you are sure will be there in 2 minutes.” Etc.
TO EP

 2. “Tell me something that you would like to have in the next 2 minutes.”
TO EP

OPENING PROCEDURE SOP 8 - C:

Ref: PAB 34. Creation of Human Ability.

PART A

1. Select objects in room, direct pc's attention to them.
2. "Do you see that _____?" "Go over to it and put your hand on it."
"Now look at _____." "Now walk over and put your hand on it."

(This is done with various objects without specifically designating spots of a more precise nature than an object until pc is very certain that he is in good communication with these objects & the walls & other parts of the room.)

3. PART A HAS BEEN ENLARGED by the auditor's selecting exact spots. eg.

"Do you see that 'black mark' on the 'left arm of that chair'?"
 "All right, go over to it and put your finger on it."
 "Now take your finger off it."

4. Done until the pc has uniform perception of any and all objects in the room.

PART B

5. "Find a spot in this room." "Go over to it and put your finger on it."
"Now let go of it."
6. Done until pc freely selecting spots in the room - this means that his perception of the room has become uniform.

TO EP

PART C

7. "Find a spot in the room." "Make up your mind when you are going to touch it and then touch it." "Make up your mind when you are going to let go of it and then let go."
8. Run the process repetitively until all comm lags are reduced and until the pc's very certain he's seeing, selecting, and touching the spots and to F/N, Cog, VGIs. (Check for F/N on the meter. If no F/N check for unflat or overrun and handle accordingly.)

TWC CHECKSHEETS
TWC, USING WRONG QUESTIONS

Two Way Comm is not an art. It is a science which has exact rules.

Foremost in the rules is:

DON'T USE A LISTING QUESTION IN TWO WAY COMM.

By a "listing question" is meant any question which directly or indirectly calls for items in the pc's answer.

Use of "who", "what", "which" instantly turns a TWC into a listing question.

Listing questions are governed by the rules of Listing and Nulling.

If you use a listing question accidentally in TWC you can get the same bad reactions from a pc that you would get on a wrongly done list.

The reason for pc upsets in TWC is hidden as it is not apparently a listing process, rarely gets the correction a bad list would get.

Asking "who" or "what" or "which" during a TWC after the main question can also turn it into a Listing and Nulling process.

TWC questions **MUST** be limited to feelings, reactions, significances. They must **NEVER** ask for terminals or locations.

EXAMPLE: "Who upset you?" in TWC causes the pc to give items. This is a LIST. "What are you upset about?" does the same thing. "Which town were you happiest in?" is also a LISTING question NOT a TWC question. Any of these results in the pc giving items. They are not then nulled or correctly indicated. The pc can get VERY upset just as he would with a wrong list. Yet the session is not a "listing session" so never gets corrected.

EXAMPLE: "How are you doing lately?" is an example of a correct TWC question. It gets off charge and gets no list items. "Are you better these days than you used to be?" "How have you been since the last session?"

"What happened" is different than "What illness", "What person", "What town" which are listing questions.

REPAIR

When other things fail to locate the upset of a pc look into TWC processes in the folder and treat them as L&N processes where the pc has answered with items. The relief is magical.

C/S Series 14

C/Sing 2 WAY COMM

The C/S is liable to make most of his C/S errors in C/Sing 2 Way Comm.

The reasons for this are

1. 2 way comm IS auditing.
2. The errors that can be made in any auditing can be made in 2 way comm;
3. Untrained or poorly trained auditors do not always respect 2 way comm as auditing.
4. Errors in 2 way comm become masked since the procedure is loose.
5. Earlier C/Ses on the case may have missed the easily missed 2 way comm errors.

RULES OF C/Sing 2 WAY COMM

- A. The C/S must recognize that 2 way comm *is* auditing. Therefore it follows all the rules of auditing.
- B. Any error that occurs in other auditing can occur in 2 way comm auditing. Errors in a 2 way comm session must be carefully looked for as they easily can be masked in the worksheet.
- C. Auditors must be persuaded by the C/S to make notation of *auditing* essentials in 2 way comm as of senior importance to pc's text (which is also made note of in the W/S).
- D. The questions asked in 2 way comm can be very incorrect just as rote processes can be.
- E. An auditor must be trained as a 2 way comm auditor (Class II). Otherwise he will Evaluate, Q and A and commit other faults.
- F. If an ARC Break occurs early in a 2 way comm session and is not handled as such the rest of the session is audited over an ARC Break and can put a pc into a sad effect.
- G. A pc with a PT problem not being handled in the 2 way comm will get no gain.
- H. A pc with a W/H in a 2 way comm session will become critical, nattery and/or get a dirty needle.
- I. Two way comm processes must be flattened to F/N. If an F/N doesn't occur then the subject didn't read in the first place or the auditor Qed and Aed or evaluated or changed the subject or the TRs were out or the pc's ruds were out.

- J. A two way comm subject chosen must be tested for read in that session before being used for 2 way comm.
- K. Improper 2 way comm questions can plunge the pc into an out rud situation not then handled. "Is anything upsetting you?" or any mention of upsets by the auditor is the same as asking for an ARC Break. "Has anything been troubling— worrying you lately?" is the same as asking for a PTP. "Who aren't you talking to?" is asking for W/Hs.
- L. The subject of major processes should be kept out of 2 way comm C/Ses, auditors' questions and 2 way comm assessment lists (ARC Brks, Problems, overts, changes or any major auditing subject, as they are too heavy, being the buttons of the bank).
- M. The C/S should only let Class II or above auditors do 2 way comm sessions.
- N. A rud going out in a two way comm session must be put in by the auditor.
- O. A 2 way comm session should end in an F/N.
- P. Auditors whose 2 way comm sessions do not end in F/N must be taught to check the subject for read before using, not to Q and A, not to Evaluate and given a refresher on 2 way comm tapes and HCO Bs.
- Q. In a 2 way comm session that flubs the C/S must be careful to isolate the errors just as in any other auditing session that flubs and put them right.
- R. A 2 way comm subject that reads on test and doesn't F/N on 2 way comm must be checked for O/R (if TA went up) and rehabbed by the 1965 Rehab method, or Prepchecked or just continued.

The whole point to all of this is that a 2 way comm session IS auditing. It is delivered by the auditor, C/Sed and remedied like any other session.

Also it is usually being run on a delicate pc who is more affected by errors than pcs being given other processes.

THE ASSESSMENT OF HELP

You should realize at this stage that we are still feeling around for the most adequate and fastest method of running HELP. Everything which has been given to you thus far is near the mark, and pre-sessioning, model session and flattening help are right on the mark. However there are certain things that make auditors unhappy with running help. Chief amongst these is the fact that it is a tremendously restimulative process when one has not had any run. This means that we had better get the staff theta clearing course or staff co-auditing going fast on a supervised basis.

The second thing is that help does not flatten very easily on a late specific terminal. Of course, this is true of all processes. But help is a peculiar process and is slower on late terminals than other buttons, and here is why.

Help resolves cases because it is the basis of all association, and as you know association leads to identification. And identification is the basis of all mental upsets. The action of help is not aberrative. The failure to help is what does it, or the lack of things to help. However all valences and all identification stem from this button and no other. Now do lights dawn and bells ring? Help is the button which, if run, settles all difficulties with association and identification and all problems of beingness.

Thus there is something peculiar about help which is not true of any other button. Any help run is a gain even (Gawdelpus) if it is left wholly bogged with a half hour comm lag. All bits of help run are chewing away at all tangles of identification. So chew away and to the Dickens with it. Any help run is better than no help run. And because the PC is a bundle of aberrated identifications, any help run untangles some of him. And any help run on any terminal tends to "get at" any other terminal.

So that's why help run in any old way will sooner or later make the grade. But this is no reason to believe there are not also smart ways to run help.

Any late specific terminal, being so confounded far from basic-basic on the time track, runs tough and endlessly. Therefore as always it is better to run general terminals than to run specific terminals. However in the case of a PTP you can go ahead if you have to and run help on the PTP personnel, but as soon as the edge is off the PTP for Heaven's sakes shift to the general form of the specific terminals you have been running, and flatten those a lot or a little.

Keep a very close record of what you have run on help as the only precaution you have to take, and when the PC is running toward mest clear check back with help on these terminals and make sure they are flat. When a lot of help has been run on basic material then of course you will find that what ran very arduously before will now run much better. It is almost a waste of time to run specific terminals, but still you must run things that are real to the PC, and if only yesterday was real to him then you are stuck with running the PC on later terminals or even specific terminals.

A much faster way to run help than by sorting out real terminals on an E-Meter (which is still necessary sometimes) is to do an assessment on the PC using help and the dynamics, and finding a button that is entirely off dynamic and that the PC can't imagine helping. This is a trigger to a case. Unusual results happen very fast.

Another way to go about this is a simple questioning of the PC on the subject of his dislikes. Watch the meter and when you get a silly reaction on a dislike, like a rock slam or a heavy drop or a sudden theta bop, then pick this out, make a general form out of it that registers like the first mention, and run that on the PC. This is a rather loose and sometimes misleading assessment. But remember that all help run leads to untangling all buttons and so it is a perfectly good approach, and as the PC gets run on something he is awful darn sure he ought to be run on he is often very happy and co-operative in this. Whereas on a dynamic assessment he is made intensely curious as he didn't know he was aberrated on what you found out. In other words just asking the PC what is wrong with him, getting it into a general form that registers on the meter and running Help O/W or concept help on it, is good reasonably fast processing. It is better than assessing for just a terminal that drops or for a specific late terminal that drops.

As a comment it should be noted that help is the last thing that folds up in the dwindling spiral of aberration. About the first thing that folds up is interest. But when it is gone there are still three buttons left on which the person can function. The next one to go is communication. This becomes a contest of overts as in the ARC breaky case. Anybody below this lives his or her life this way. The next one to vanish is control. So don't be surprised to find somebody around who does plenty of overts and who can't stand control who can yet be run on help and who can still function in life. When interest, communication, control and help are gone, that's it. You haven't got a person left. So beware people who are below help. Beware of them in living. But in auditing when you can't get HELP to bite at all (and if he can talk to you you can get help to bite) you have nothing left but the CCHs. You can make it on them too but with tremendous investment in hours. And when you've got the CCHs flat then you can start running help.

But as I said above I have not yet been able to say the PERFECT way of running help. I am still investigating it like mad and am giving you all the gen as it comes visible. However have patience with me. I have learned that people not only have it twisted a bit, they've got it shattered, and that's the majority of people. So we're in there slugging away and we're making clears, and if I get hold of any faster ways to do you'll be the first to get the gen.

HCO BULLETIN OF 30 MAY 1960
SAME TITLE

DYNAMIC ASSESSMENT ON HELP

Marilynn Routsong has written the following on how to do a Dynamic Assessment on Help after observing a demonstration by Ron:

Once you have a preclear well pre-sessioned, you are going to enter into a model session and run Help and run Help and run Help. Now there are lots of ways of running Help. One extremely valuable way is to clear Halp on the Dynamics. Recalling the rule on running terminals not conditions, you are going to run Help on terminals which he can't help that have gone out of kilter on the Dynamics. In other words, the PC conceived at some time that he was unable to help a certain terminal and he has misaligned it on the Dynamics. He probably misplaced it to the Dynamic on which he felt there was some sort of help or some such - the misplacement will shake out in cognitions as it is being run.

To discover what terminal to run a Dynamic Assessment as follows:

In doing a Dynamic Assessment you are not actually auditing, but looking for a terminal to audit. However, you will be doing 2 way communication and you will find things blowing off with 2 way comm, so some auditing will occur. If it does, fine! What you can resolve with 2 way communication, by all means, do so. You are looking for the terminal that 1. does not resolve with 2 way communication 2. the PC can conceive no way of helping the terminal, and 3. the terminal is misplaced on the Dynamics. Example - you've assessed and ended up with a fish (an actual 5th Dynamic terminal) which the PC cannot conceive of being able to help and which the PC, you discover on careful questioning, really thinks of as a sort of spiritual thing (7th Dynamic). Sounds odd? It is! You will stop being surprised after running a few on your own.

To do a Dynamic Assessment you are going to use an E-Meter. The lead in per the E-Meter is to ask the PC about Help on the various Dynamics. In other words, you put the PC on the E-Meter (model session) and ask him what he thinks about Help on the First Dynamic (or self or whatever terminology is necessary to get the idea of the First Dynamic across to the PC) - then you ask what thinks about Help on the Second Dynamic (appropriate terminology) then the Third, Fourth and so on across the Dynamics. As you are asking you observe the E-Meter. You are looking for a change in needle or Tone Arm pattern, as a clue to the misplaced terminal that he cannot help. Now note this - A RISING NEEDLE MEANS YOU HAVE TRIPPED THE TERMINAL YOU ARE LOOKING FOR AND HAVE MISSED IT (GONE PAST IT) AND ARE NOW ASKING THE WRONG QUESTION. To find the terminal again continue to go through the Dynamics as above until you get the one that stops the rise. Question closely on terminals on this Dynamic pertaining to help. Two way communication may clear it off - if so, fine! Or it may be a lock on the one you are looking for - in which case it would not quite fit the conditions of no help conceivable and Dynamically misplaced but there would be charge on it - ie. on a PC the rising needle stopped on Fourth Dynamic. PC was questioned on what he thought of a Fourth Dynamic - PC said people - all races of people. PC was asked about Help on these people - PC was then thinking about brown people and was thinking that Help to brown people always turned out wrong. (betray). However, note - in spite of change action on E-Meter and the fact that it stopped a rise, PC could conceive of trying to help brown people and it was on the right Dynamic - so you blow off on this what you can with 2 way communication, make a mental note that it is probably a lock on the terminal you are looking for.

Now, once you have assessed the Dynamic and in your questioning you have found a "No Help" terminal that is Dynamically misplaced you are going to run some form of Help on the terminal - in spite of the fact that the PC can't conceive of helping it. Example - PC assessed and

discovered to have “sun” on the Eighth Dynamic and he couldn’t conceive of helping a sun. PC was run on “Think of helping a sun” alternated with “Think of not helping a sun” (light form of Help O/W - the usual form of “How have you helped a sun?” “How have you not helped a sun?” would have taxed the PC heavily to answer).

You may expect, comm lags of course and also a sense of relief when the PC gets an answer, to say the least. You will also find the PC being very curious and interested in the terminal. You can expect somatics and the PC will run through bands of forgetfulness, propitiation, destroy, etc., all the way up to free (not compulsive) Help on these terminals. At this time you will find he has a null needle on Help on the terminal and the terminal will be on the correct Dynamic. If you are running a very specific terminal (ie. PC’s mother, not a mother) the PC may run out of answers. If so, you assess per the E-Meter what the general terminal is for this specific one and run Help on the general one until the needle is null for that general terminal. At any rate, on any specific terminal you run, you also run the general terminal.

Now you may find several terminals that fit the category you are looking for. A bad off case will hang up on many or all Dynamics. Then it beoomee a matter of Auditor judgement which one to run. It would probably be best to run the one that shows the greatest action, on the E-Meter.

Let’s say now that you’ve found a terminal, and run it on Help until it is null (by the way, at this point you will find it on the correct Dynamic). The next thing you do is reassess the Dynamics all over again as before. You will find they all assess differently than before as you will have shifted the PC’s bank in running the former terminal. You find another terminal and run Help on it.

In the event you round more than one terminal in the first assessment, you do NOT go to a second terminal without reassessment. After running Help flat (null) on a terminal you always to a complete reassessment.

In doing an assessment you do not question the PC on the Dynamics with an auditing type question as you are not at this time trying to put the PC in session. Example - you would not ask “How could you help yourself?” This is an auditing question. You could say “How about Help on the First Dynamic?” (or other terminology denoting it) or “What do you think about Help on the First Dynamic?”. You just want the PC to be considering Help on these Dynamics. Got the idea? (Of course, once you have assessed the terminal you use an auditing command to run the terminal.)

You assess, find a terminal he can’t conceive of helping that is Dynamically misplaced, run it null on Help, assess again, find it is null, reassess, and so on until the PC is null on Help across the dynamics and you can’t get a blip on the E-Meter on any sort of discussion of Help on any Dynamic, or any terminal on any Dynamic.

You would only do a Dynamic Assessment on Help once the PC has been well pre-sessioned and the Dynamic Assessment and running Help on the terminal as assessed would be run only in a model session. You are in effect running out failure to help. Failure to help is the basic of aberration. Out of failure to help stems compulsive Help, overt acts, Help - Betray, betrayals, criminality. So you see where you are taking your PC when you run out his failures to help. Yes, you are going to clear him.
